Managing 569,000 acres (27% of the RFO) as VRM Class III would allow moderate changes to the landscape. While specific impacts would depend on the type and location of projects, they would range from minor to moderate. Class III areas should still support a wide variety of recreational opportunities and experiences. The remaining area, 1,029,500 acres (48% of the RFO), would continue to be managed as VRM Class IV, which allows for major modification of the landscape. Class IV areas would allow for development of recreation-related facilities, if necessary, and would continue to support and possibly enhance motorized recreation opportunities such as driving for pleasure, vehicle-supported camping, and OHV riding. The non-motorized recreation experience could be diminished in areas in which the surface is disturbed and the landscape altered. Impacts would be long term, and depending on what projects are proposed, could range from minor to major.

Impacts from Special Status Species

SSS were not specifically addressed in existing plans. All federal actions would be subject to the requirements of the Endangered Species Act of 1973, as amended. For recreation resources, this would include such things as facility construction, issuance of Special Recreation Permits, or trailhead improvements. Any action potentially affecting any listed threatened or endangered species would require the appropriate level of Section 7 consultation with U.S. Fish and Wildlife Service (USFWS). Necessary mitigation, such as timing and avoidance, would be implemented to protect listed plant and animal species. If adequate mitigation could not be applied to the proposal, it would be relocated or denied.

Impacts from Fish and Wildlife

Improving wildlife habitat would help maintain or improve fish and wildlife populations, which would be beneficial for recreation opportunities such as wildlife viewing, hunting, and fishing. Depending on the scope and intensity of habitat improvement efforts, impacts to recreational opportunities could be mixed. Modification of physical recreational settings could have impacts similar to those described in the Impacts to Vegetation section. Impacts could range from negligible to moderate.

Impacts from Wild Horses and Burros

The Canyonlands Herd Management Area (HMA) would continue to be managed as a wild burro HMA, resulting in the opportunity for the public to view the wild burros while in the Robbers Roost area. Although considered a negligible benefit because few visitors seek that experience alone and only a portion see the wild burros, it could enhance their recreation experience.

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness characteristics on lands outside of WSAs are proposed under this alternative, resulting in no impacts to recreation.

Impacts from Recreation

Limiting or controlling recreation activities to support the *Standards for Public Land Health* and *Guidelines for Recreation Management* for BLM Lands in Utah and to protect resources could result in some localized closures or limitations on public use. The impacts would be dependent on the extent of the closures/limitations necessary, but they would be expected to be negligible to minor.

Continuing to manage a large portion of the RFO as an ERMA would allow a variety of recreational opportunities in a less structured setting. No new SRMAs would be established. Yuba Reservoir SRMA would continue to be managed by the Fillmore FO (and is therefore not addressed in this Proposed RMP revision). Under this alternative, emphasis would be placed on maintaining a non-structured setting, subject to change as recreation uses change. Special management objectives to maintain the desired recreational opportunities and settings for specific areas would not be realized. In the long term, moderate

impacts could result as visitation increases and new recreation activities develop. Potential user conflicts and degradation of the resource settings due to overuse are possible.

SRPs would continue to be issued on a case-by-case basis with no management plan direction for issuance of commercial, competitive, organized group, and vending permits. Given substantial increases in workload as permit applications increase, the current case-by-case authorization is inefficient. This process may eventually preclude some recreation providers from making available certain recreation opportunities. This could lead to minor-to-moderate impacts, which could increase as demand for SRPs increase.

Impacts from Travel Management

Under Alternative N, 1,636,400 acres (77% of the RFO) would continue to be open for cross-country vehicle travel, the most of any alternative. Conflicts between motorized and non-motorized users and the potential for resource degradation would continue to increase, which could result in a long-term, moderate impact to recreation settings and opportunities. Recreation settings would be maintained and protected within the 277,600 acres (13%) designated as limited for OHV use and the 4,315 miles of routes open to motorized use would provide access. The 214,000 acres (10%) of the RFO designated as closed to OHV use would further maintain and protect the semi-primitive to primitive setting in those areas.

No restrictions would be placed on motorized use off of designated routes for parking/staging and access to campsites, except within WSAs. There are also no decisions for the use of motorized vehicles for retrieval of game kills. This would continue to enhance some motorized activities but could result in long-term minor-to-major impacts to resources and recreation settings.

Impacts from Lands and Realty

Land tenure decisions include criteria regarding the disposal and acquisition of lands with high-value recreation opportunities. These decisions could enhance the recreation opportunities and management of areas if high-value recreation and access are considered.

The four ACECs and five developed recreation sites in the Henry Mountains would be proposed for withdrawal from mineral entry, making the total withdrawn and proposed withdrawal acreage 169,480 (8% of the RFO). This could protect existing recreational opportunities within the ACECs and protect investments at the recreation sites.

If wind or solar energy were developed in the lands managed by the RFO, it could adversely affect the recreation setting. Introducing large wind structures and solar arrays would be noticeable. Depending on the setting and opportunities in the area, this type of development could displace some recreational visitors. The impact would range from minor to major, depending on the extent of development of these energy alternatives.

Impacts from Minerals and Energy

Recreation settings, opportunities, and experiences could be impacted during all phases of minerals development. Minerals-related exploration, development, and access road and infrastructure construction would create surface disturbances, noise, and light pollution. These impacts would be greatest if development occurred in semi-primitive to primitive areas with natural-appearing landscapes. Concentrations of wells or other mineral infrastructure could also result in localized changes to the recreational opportunities and experiences available in that area.

Adherence to best management practices outlined in mining laws, plans of operation, pertinent restrictions, standard terms and conditions, etc., would help minimize such impacts. Closing 459,700

acres to fluids mineral leasing, withdrawing 169,480 acres to mineral entry, and closing 459,700 acres to mineral material disposal would eliminate risks to recreation settings from minerals management within those areas. The potential for development varies within different portions of the planning area (Table 4-39). However, development potential is low in the eastern portion of the planning area, where the majority of the primitive to semi-primitive, natural-appearing landscapes occur and where development would be most likely to impact recreation settings and experiences.

Overall, impacts to recreation would be minor.

Impacts from Special Designations

Wild and Scenic Rivers

Management of the 12 eligible Wild and Scenic River segments (135 miles)—to protect their outstandingly remarkable values, free-flowing nature, and tentative classification—would maintain the recreation settings along those segments. The majority of these segments are tentatively classified as "wild" and the decision would support the semi-primitive and primitive recreation opportunities. Portions of the Dirty Devil River, Robbers Roost Canyon, Twin Corral Box Canyon, and all of the Beaver Wash Canyon, No Mans Canyon, Larry Canyon, and Sams Mesa Box Canyon overlap with WSAs that provide similar protection of recreation settings. Overall, the impact from this decision would be negligible.

Areas of Critical Environmental Concern

Continuing the present management of the four existing ACECs would maintain the primitive and semi-primitive non-motorized recreational opportunities in those areas.

Alternative A

Impacts from Water Resources

Impacts would be similar to those discussed under Alternative N. The buffer zone around natural springs would be reduced to 330 feet, increasing the camping opportunities slightly over Alternative N.

Impacts from Vegetation and Fire and Fuels Management

Impacts from vegetation and fire and fuels management would be similar to those discussed under Alternative N except that maximum treatment acreage limits would be established (averaging 73,600 annually for all treatments). This may result in greater success for restoring the landscape to its natural condition, further enhancing recreation experiences and settings.

In addition, the buffer zone along streams would be reduced to 330 feet, increasing the camping opportunities slightly over Alternative N.

Impacts from Visual Resources

Under Alternative A, 446,900 acres (21% of the RFO) would be designated as VRM Class I (these acres are within the WSAs). The character of the landscape in these areas would be maintained and enhanced, especially for those users seeking the opportunity for solitude and primitive/unconfined recreation in an undeveloped landscape. Recreation projects and developments would only be allowed if they were consistent with VRM class objectives. Any impacts would be localized and would range from negligible to minor, depending on the type of project. There would be 392,800 acres (18% of the RFO) designated as VRM Class III, slightly less than Alternative N. The remaining 1,288,300 acres (61% of the RFO) would be designated as VRM Class IV, the most of any alternative.

Impacts from Special Status Species

Closing and reclaiming roads to avoid or reduce habitat fragmentation could have a minor to moderate effect on recreational opportunities. The level of impact would depend on the number of roads closed or the amount of recreation use the road receives. Proposed management for SSS and raptor habitats would result in species-specific buffers and seasonal, temporal, and spatial restrictions. These restrictions would likely have the greatest effect on commercial recreation permit holders, making some proposed trips uneconomical to offer and difficult logistically, but impacts are expected to be minor. If restrictions become necessary in areas managed as open to cross-country OHV use, the effect on the recreational opportunities would have a minor to moderate effect. Under this alternative, the opportunities for cross-country OHV use (e.g., open OHV areas) have been reduced by 56% from Alternative N. These closures of open OHV areas would be more noticeable to those recreational users seeking a cross-country experience.

Impacts from Fish and Wildlife

Impacts would be similar to those described under Alternative N. Cross-country OHV use would be limited in some habitat areas, which would restrict public land users from creating new routes in these areas, thus protecting the general recreation setting and decreasing conflicts between users. The impact would be minor to moderate.

Impacts from Wild Horses and Burros

Impacts would be the same as those described for Alternative N.

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness characteristics on lands outside of WSAs are proposed under this alternative, resulting in no impacts to recreation.

Impacts from Recreation

Impacts under this alternative would be similar to Alternative N in regards to decisions supporting rangeland health and protecting resources.

Under Alternative A, 514,500 acres (24% of the RFO) would be managed under five SRMAs. Management objectives through the development of activity plans would provide visitors with higher quality recreation opportunities through the more focused and effective management of the desired settings, activities, and experience opportunities appropriate for each SRMA. Factory Butte, Big Rocks, and Sahara Sands SRMAs would focus on motorized recreation opportunities and provide a variety of riding experiences (e.g., Mancos Shale hill climbs, rock crawling, and sand dunes). The Dirty Devil and Otter Creek SRMAs would maintain the dispersed recreation opportunities. Impacts to recreation settings would range from negligible to moderate, as these SRMAs would maintain the experiences and opportunities currently occurring in these areas. The remainder of the lands would be managed as an extensive recreation management area, which would continue to support a variety of recreational opportunities in a less structured setting. However, with 1,613,500 acres (76%) of the area receiving no specific management direction for recreation opportunities, there would continue to be conflicts between user groups seeking varied experiences that may be viewed as incompatible. These impacts could range from minor to moderate and would continue to increase as recreation uses grow and change.

The use of management decisions for the issuance of SRPs provides direction regarding the types of permits that would be issued, areas in which some types of permits would not be appropriate, and thresholds for organized group permits. These decisions would allow for a variety of SRPs to be issued while providing greater resource protection. Processing would also be streamlined by having management

plan criteria to compare to applications. The benefits to applicants would be minor to moderate, depending on the complexity of their proposal.

Impacts from Travel Management

Alternative A would designate 449,000 acres (21% of the RFO) as open to cross-country OHV use. These managed open play areas would provide a variety of motorized opportunities scattered throughout the management area. The areas identified as open include most of the areas currently being used for cross-country OHV recreation, which would be beneficial for motorized users. The remainder of the management area, 1,679,000 acres (79% of the RFO), would be limited to designated routes with a total of 4,312 miles of routes, similar to Alternative N. Limiting OHV use to designated routes within a larger portion of the area would maintain and enhance the recreation experiences for the majority of users and reduce conflicts. Opportunities for cross-country motorized use would be reduced; however, the impacts from this alternative would be negligible to minor. Designating no closed areas could reduce opportunities for solitude and primitive/unconfined recreation. Areas within WSAs currently closed to any motorized use would be available for limited OHV use on designated, inventoried routes consistent with the IMP. This would be an increase of 18 miles of inventoried routes available over Alternative N. The overall impacts would be minor, due to the low number of miles, but could potentially impact opportunities for primitive recreation along those routes.

Management decisions to limit parking/staging and motorized access for camping would continue to provide those recreation opportunities while maintaining the overall recreation settings. Allowing non-motorized, wheeled game carriers to retrieve game kills outside of WSAs would continue to enhance hunting opportunities.

Impacts from Lands and Realty

The impacts would be the same as described for Alternative N.

Impacts from Minerals and Energy

The impacts would be similar to those described under Alternative N. Areas closed or withdrawn for minerals are slightly less in this alternative: 446,900 acres closed to oil and gas leasing, 154,700 acres withdrawn from mineral entry, and 446,900 acres closed to salable mineral disposal. Overall, impacts to recreation would still be minor.

Impacts from Special Designations

Wild and Scenic Rivers

No eligible river segments would be managed as suitable for inclusion in the National Wild and Scenic River System under Alternative A. However, 98 of the 135 miles of eligible WSR segments are within WSAs that would continue to be managed under the IMP, providing protection of the recreation settings. The majority of the eligible Dirty Devil River segment and all of the eligible Robbers Roost Canyon, Twin Corral Box Canyon, Beaver Wash Canyon, No Mans Canyon, Larry Canyon and Sams Mesa Box Canyon segments would receive management protection from the proposed Dirty Devil SRMA, retaining the semi-primitive to primitive recreation settings in those areas. Overall, the potential for impacts to recreation under this alternative would be negligible.

Areas of Critical Environmental Concern

No ACECs are proposed for designation under Alternative A. There would no longer be protective ACEC management for the four existing ACECs. However, three of the four existing ACECs are within WSAs, which would continue to protect the relevant and important values and preserve the recreation setting in those areas. Removing protective ACEC management prescriptions for North Caineville Mesa could

result in changes to the recreation setting and opportunities if surface disturbance and development were to occur. However, due to the topography and lack of access, the probability of impacts would be low.

Proposed RMP

Impacts from Water Resources

Impacts would be the same as described under Alternative A.

Impacts from Vegetation and Fire and Fuels Management

Impacts would be the same as described under Alternative A.

Impacts from Visual Resources

Under the Proposed RMP, the acreage and impacts for VRM Class I lands would be the same as described under Alternative A (446,900 acres, or 21% of the RFO). Under this alternative, 249,800 acres (12% of the RFO) would be designated as VRM Class II; 393,100 acres (18% of the RFO) would be designated as VRM Class III; and the remaining 1,038,200 acres (49% of the RFO) would be designated as VRM Class IV. The VRM Class II and III acres would be less than in Alternatives N and C, but more than Alternatives A and D. VRM Class IV acreage would be more than in Alternatives N, C, and D, but less than Alternative A. Although future recreation-related projects would be restricted in Class I and II areas, this would maintain the recreation settings and the visual components of the landscape. Any adverse impacts to recreation would be localized and would range from negligible to minor.

Impacts from Special Status Species

Closing and reclaiming roads to avoid or reduce habitat fragmentation could have a minor to moderate effect on recreational opportunities. The level of impact would depend on the number of roads closed or the amount of recreation use the road receives. Proposed management for SSS and raptor habitats would result in species-specific buffers and seasonal, temporal, and spatial restrictions. These restrictions would likely have the greatest effect on commercial recreation permit holders, making some proposed trips uneconomical to offer and difficult logistically, but impacts are expected to be minor. If restrictions become necessary in areas managed as open to cross-country OHV use, the effect on the recreational opportunities would be minor to moderate. Under this alternative, the opportunities for cross-country OHV use in open OHV areas have been reduced by 77% from Alternative N. Therefore, further closures of open OHV areas would be noticeable to those recreational users seeking a cross-country experience. Conflicts between motorized users and safety concerns could increase by further concentrating motorized use into smaller open areas.

Impacts from Fish and Wildlife

Impacts would be less than those described under Alternative A. Cross-country OHV use would be limited to designated routes in most wildlife habitat areas, protecting the general recreation setting and decreasing conflicts between users in additional areas.

Impacts from Wild Horses and Burros

Impacts would be similar to those described under Alternative N. As management prescriptions would increase the burro herd and its genetic viability, the potential for viewing the burros could also increase, increasing beneficial impacts.

Impacts from Non-WSA Lands with Wilderness Characteristics

Under the Proposed RMP, 78,600 acres (4% of the RFO) would be managed with the goal of protecting, preserving, and maintaining the wilderness characteristics of non-WSA lands with wilderness characteristics. Motorized uses would be limited to designated routes, resulting in areas that currently

exist as semi-primitive motorized settings becoming semi-primitive and non-motorized in terms of remoteness, reducing motorized recreational opportunities in some areas. Other areas as closed because of other resource management decisions. Coupled with the adjoining WSAs, the Proposed RMP would result in 525,500 acres (25% of the RFO) being managed for semi-primitive motorized use along designated routes to primitive recreation away from these routes. This would be a beneficial impact for the recreationists seeking a more semi-primitive to primitive experience. Maintaining OHV use along designated routes would maintain access into many of these areas, although there would be portions of these areas that would become more difficult and physically unfeasible for many visitors, which would impact those who seek motorized recreation opportunities. A total of 3,739 miles of routes would be limited to designated routes with seasonal closures or size/width restrictions for motorized travel under the Proposed RMP, a reduction of 576 miles from Alternative N. The need to hike for long distances across dry benchlands to reach preferred destinations could displace some users seeking a semi-primitive to primitive experience.

Impacts from Recreation

Impacts under the Proposed RMP would be similar to Alternative A, with the exception that the acreage and locations of the proposed SRMAs change somewhat. Under the Proposed RMP, 860,390 acres (40% of the RFO) would be managed under five SRMAs. Factory Butte and Big Rocks SRMAs would focus on motorized recreation opportunities and provide a variety of riding experiences (e.g., Mancos Shale hill climbs, rock crawling).

Some users of the proposed Factory Butte SRMA are repeat visitors, but many are visiting the area for the first time and will need to have information available at entrance points and on the ground in order to comply with the motorized designations. Providing increased information on the ground through kiosks and improved signage would better educate the public regarding the types of uses they can participate in, helping them avoid illegal use or reducing misconceptions for visitors from out of the area that illegal use is taking place. It also allows them to choose an area where the recreation uses are consistent with the experience they seek.

While it is preferable that topographic barriers be used when possible—which is the case with a portion of the boundary for the Factory Butte OHV Play Area RMZ—the majority of the boundaries there are not distinct topographic barriers; therefore, fencing or carsonite posts would be necessary (Appendix 18). The proposed Factory Butte OHV Play Area RMZ includes the Swing Arm City Open Area (2,600 acres) and Caineville Cove Inn Open Area (100 acres). Providing clear and enforceable boundaries for the OHV open areas would lead to less confusion among riders as to where the boundary is located, resulting in greater compliance with management prescriptions and a reduction in possible citations that negatively impact the recreational experience.

The addition of improved amenities should provide a positive benefit for visitors to the area. The addition of improved access into the OHV open area, loading/unloading ramps, and restrooms would be beneficial for the health and safety of visitors to the area. Providing one all-weather access road into the OHV Play Area RMZ would improve the safety for visitors. There are currently several user-developed access routes—two of which are close to a curve in the highway, making visibility an issue. In addition, during inclement weather, this area can quickly become impassable, making it difficult to get off of Highway 24. The improved access road would allow visitors to get safely off of the highway before stopping, parking, or unloading. Providing loading/unloading ramps would give visitors a safer option to unload machines on a surface level with their truck or trailer bed. Although some visitors to the OHV open area are in self-contained camping units, other visitors to the OHV open area and surrounding areas do not have self-contained units. The addition of restrooms would provide for appropriate sanitation and help protect the health and safety of all visitors to the area.

The Henry Mountains, Dirty Devil, and Capitol Reef Gateway SRMAs would focus on dispersed recreation opportunities. These SRMAs would maintain the experiences and opportunities currently occurring in these areas, which range from semi-primitive motorized to primitive. The remainder of the lands, 1,267,610 acres (60% of the RFO), would be managed as an extensive recreation management area that would continue to support a variety of recreational opportunities in a less structured setting. This alternative provides more of a balance and variety of structured (SRMA) and non-structured (ERMA) opportunities than any of the other alternatives and should reduce the potential for conflicts between user groups seeking varied experiences.

Impacts from Travel Management

Less than 1% (9,890 acres) of the RFO would be open to cross-country OHV use under this alternative. Conflicts between non-motorized and motorized users would be reduced overall but would continue due to motorized users being displaced from historical use areas. Conflicts between motorized users and safety concerns could increase by concentrating motorized use into small, managed open areas. This alternative would result in moderate-to-major impacts to motorized users seeking a cross-country motorized experience. Designating 1,908,210 acres (90% of the RFO) as limited and 209,900 acres (10% of the RFO) as closed to OHV use would maintain and enhance the recreation experiences in those areas. Designation of 4,277 miles of routes would be a reduction from what is available in Alternatives N and A. Limiting OHV use to designated routes within a larger portion of the area would maintain and enhance the recreation experiences for the majority of users and reduce conflicts. Opportunities for primitive recreation would be greater than in Alternative A through the designation of some closed acres.

Management decisions to limit parking/staging and motorized access for camping and game retrieval would be similar to Alternative A. Distances for motorized access would be reduced from 300 feet in Alternative A to 150 feet in the Proposed RMP, which would reduce opportunities slightly.

Impacts from Lands and Realty

The impacts would be similar to those described under Alternative N. The two potential ACECs, one suitable wild river, and five developed recreation sites in the Henry Mountains would be proposed for withdrawal from mineral entry; combined with the existing withdrawals, a total acreage of 176,200 (9% of the RFO) would be withdrawn from mineral entry and be precluded from surface disturbance due to mining activity. This would be a slight increase over Alternatives N and A and would help maintain the recreation settings and protect investments at developed recreation sites. Limiting the areas in which these developments take place would reduce the potential for impacts from wind and solar energy development. These criteria would protect areas in which these types of developments would have the greatest impact on recreational opportunities (e.g., WSAs, WSR corridors, ACECs, areas open to oil and gas leasing with NSO, and VRM Class I and II areas).

Impacts from Minerals and Energy

The impacts would be similar to that described under Alternative A. Areas closed or proposed for withdrawal for minerals are slightly more than Alternative A: 447,300 acres closed to oil and gas leasing, 176,200 acres withdrawn from mineral entry, and 601,800 acres closed to salable mineral disposal.

Impacts from Special Designations

Wild and Scenic Rivers

The impacts from WSR decisions would be similar to those discussed under Alternative N. Under this alternative, only the Fremont River (Fremont Gorge) would be recommended and managed for suitability as a WSR. Some other eligible segments would still receive protective management from overlapping WSAs. Overall, impacts would be negligible.

Areas of Critical Environmental Concern

Under this alternative, two ACECs would be designated: North Caineville Mesa and Old Woman Front. Management prescriptions to protect the relevant and important values for these 2,530 acres, such as closing the areas to OHV use and NSO for minerals would preserve the semi-primitive-non-motorized to primitive recreation opportunities in these areas. Overall, the impact would be negligible.

Alternative C

Impacts from Water Resources

Impacts would be similar to those discussed under Alternative N. The buffer zone around natural springs would be increased to 660 feet, reducing the camping opportunities slightly over Alternative N.

Impacts from Vegetation and Fire and Fuels Management

Under Alternative C, impacts would be similar to those discussed under Alternative N except that only treatment methods that mimic natural processes would be used to achieve or maintain *Fundamentals of Rangeland Health* and desired vegetation condition, including control of noxious weeds and invasive species. No control measures would be implemented to control insect pests. These processes would be the least disturbing and may not alter recreational patterns in the short term as much as other techniques. However, these treatment methods could be ineffective for managing vegetation or controlling invasive species in some areas, resulting in repeat treatments and impacting the recreation setting and experiences in the long term.

Impacts would be similar to those discussed under Alternative N. The buffer zone along streams would be increased to 660 feet, reducing the camping opportunities slightly over Alternative N.

Impacts from Visual Resources

Under Alternative C, the acreage and impacts for lands designated as VRM Class I would be the same as described under Alternative A and the Proposed RMP (446,900 acres, or 21% of the RFO). Under this alternative, 230,600 acres (11% of the RFO) would be designated as VRM Class II; 509,100 acres (24% of the RFO) would be designated as VRM Class III; and the remaining 941,400 acres (44% of the RFO) would be designated as VRM Class IV. Designating the majority of the RFO as VRM Class III or IV could result in large areas of moderate to major modifications in the existing character of the landscape, which could alter the recreation settings. However, less of the RFO would be designated in these VRM classes than in Alternatives N, A, or the Proposed RMP, resulting in less potential impacts to recreation as compared to those alternatives.

Impacts from Special Status Species

Closing and reclaiming roads to avoid or reduce habitat fragmentation could have a minor to moderate effect on recreational opportunities (e.g., reducing access while improving semi-primitive to primitive opportunities). The level of impact would depend on the number of roads closed or the amount of recreation use the road receives. Proposed management for SSS and raptor habitats would result in species-specific buffers and seasonal, temporal, and spatial restrictions. These restrictions would likely have the greatest effect on commercial recreation permit holders, making some proposed trips uneconomical to offer and difficult logistically, but impacts are expected to be minor. There would be no effects to recreational users from SSS restrictions in open OHV areas because none are proposed in this alternative.

Impacts from Fish and Wildlife

Impacts would be the same as those described under the Proposed RMP.

Impacts from Wild Horses and Burros

Impacts would be the same as those described under the Proposed RMP.

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness characteristics on lands outside of WSAs are proposed under this alternative, resulting in no impacts to recreation.

Impacts from Recreation

Impacts under this alternative would be similar to the Proposed RMP. Under this alternative, 930,000 acres (44% of the RFO) would be managed under four SRMAs. Management of the Henry Mountains, Dirty Devil, Capitol Reef Gateway, and Sevier Canyon SRMAs would provide specific direction to maintain and enhance the semi-primitive motorized and primitive recreation settings in those areas. No SRMAs would be established to emphasize cross-country motorized opportunities because there are no open OHV areas proposed in this alternative. This alternative would result in minor-to-moderate impacts and could result in increased conflict by displacing some users whose activities may no longer be consistent with the types of SRMAs proposed.

Impacts from Travel Management

Under Alternative C, no areas would be available for cross-country OHV use. This would result in a major impact to motorized users seeking a cross-country motorized experience. That specific recreation opportunity would no longer exist within the RFO. Designating 1,445,000 acres (68% of the RFO) as limited and 683,000 acres (32% of the RFO) as closed to OHV use would maintain and enhance the recreation experiences in those areas. Designation of 3,192 miles of routes would be a reduction of 1,123 miles of routes from what is available under Alternative N, resulting in minor-to-moderate impacts for access to recreation destinations. The potential for primitive recreation opportunities would be enhanced over Alternatives N, A, and the Proposed RMP by having additional acres closed to OHV use.

Management decisions to limit parking/staging off of designated routes would be reduced to 25 feet, and campsites with motorized access would be designated. This alternative would preclude the use of mechanized game carriers. These decisions would further protect resources and semi-primitive to primitive settings but would displace some users. These decisions would result in minor-to-moderate impacts to recreational opportunities that are dependent on access, dispersed camping, and game retrieval by potentially limiting these opportunities.

Impacts from Lands and Realty

The impacts would be similar to those described under the Proposed RMP. The acreage recommended for withdrawal from mineral entry would increase to 331,100 acres (16% of the RFO) and include all or parts of eight ACECs, all suitable WSR segments, and the five developed recreation sites in the Henry Mountains. This is a 7% increase over the Proposed RMP, which would further reduce surface disturbance, maintain the recreation settings, and protect investments at the recreation sites.

Impacts from Minerals and Energy

The impacts would be similar to those described under the previous alternatives. The areas closed or withdrawn from mineral entry would increase over the previously discussed alternatives, providing additional protection of the recreation settings in the more undeveloped portions of the planning area: 586,300 acres closed to oil and gas leasing; 331,100 acres withdrawn from mineral entry; and 586,300 acres closed to salable mineral disposal.

Impacts from Special Designations

Wild and Scenic Rivers

Impacts would be the same as those described under Alternative N.

Areas of Critical Environmental Concern

Under this alternative, all potential ACECs would be designated, totaling 16 areas with 886,810 acres (42% of the RFO). Management prescriptions to protect the relevant and important values—such as closing or limiting areas to OHV use, designating Class A scenery outside WSAs as VRM Class II, and NSO for minerals—would complement other recreation decisions and preserve the recreation settings in those areas. Overall, the impact would be negligible to minor.

Alternative D

Impacts from Water Resources

Impacts would be the same as those described under Alternative C.

Impacts from Vegetation and Fire and Fuels Management

Impacts would be the same as those described under Alternative C.

Impacts from Visual Resources

Under Alternative D, the acreage designated as VRM Class I would be 1,129,600 acres (53%), the most of any alternative. This alternative would designate 66,700 acres (3%) of the RFO as VRM Class II; 355,100 acres (17%) as VRM Class III; and the remaining 576,600 acres (27%) as VRM Class IV. This alternative would have the most VRM Class I and II acreage of any of the alternatives, providing the most protection for undeveloped recreation settings and the visual components of the landscape. VRM Class III and IV acreage would be the least under this alternative, providing the least opportunities for the development of facilities for those visitors seeking a more developed setting or if facilities are necessary for resource protection. This may result in moderate site-specific impacts.

Impacts from Special Status Species

Impacts would be the same as those described under Alternative C.

Impacts from Fish and Wildlife

Impacts would be the same as those described under the Proposed RMP.

Impacts from Wild Horses and Burros

Impacts would be the same as those described under the Proposed RMP.

Impacts from Non-WSA Lands with Wilderness Characteristics

Under Alternative D, 682,600 acres (32% of the RFO) would be managed with the goal of protecting or preserving the wilderness characteristics of non-WSA lands with wilderness characteristics. Implementation of this alternative would result in major impacts to recreational settings and opportunities. These areas would be closed to motor vehicle use, resulting in large areas that currently exist as semi-primitive motorized settings becoming semi-primitive, non-motorized in terms of remoteness, effectively reducing motorized recreational opportunities. Coupled with the adjoining WSAs, this alternative would result in 1,129,500 acres (53% of the RFO) being managed for semi-primitive to primitive non-motorized recreation. This would be a beneficial impact for the recreationists seeking a more semi-primitive to primitive experience. However, it should be noted that because of the large areas that would be closed to OHV use, access into many of these areas would become more difficult and physically unfeasible for

many visitors, which would impact those who seek motorized recreation opportunities. A total of 3,043 miles of routes would be designated as open for motorized travel under this alternative, a reduction of 1,272 miles from Alternative N. This would include access routes to some existing trailheads (e.g., Angel Trail East, Robbers Roost Spring, Larry's Canyon, and Horseshoe Canyon [Deadman's Trail]). The need to hike for long distances across dry benchlands to reach canyon destinations would also displace some users seeking a semi-primitive to primitive experience.

Impacts from Recreation

Impacts would be similar to Alternative C except that the SRMA acreage is much larger under Alternative D than in any other alternative. Under this alternative, 1,358,100 acres (64% of the RFO) would be managed under seven SRMAs. Management of the Henry Mountains, Dirty Devil, portions of the Capitol Reef Gateway, portions of East Fork Sevier River, San Rafael Swell, Little Rockies, and Labyrinth Canyon SRMAs would be managed to maintain and enhance primitive and semi-primitive recreation. The remainder of the Capitol Reef Gateway and E. Fork Sevier River SRMAs would be managed for dispersed recreation. Managing 64% of the FO for semi-primitive to primitive recreation with large areas closed to OHV use would benefit those recreationists seeking that type of experience. However, some existing trailheads (e.g., Angel Trail East, Robbers Roost Spring, Larry's Canyon, and Horseshoe Canyon [Deadman's Trail]) would no longer be accessible by vehicle, and some primitive recreationists may be displaced because of longer hiking distances on the dry benchlands to reach destinations in the canyons. These impacts would be greatest in the Henry Mountains, Dirty Devil, and San Rafael Swell SRMAs. No SRMAs would be established to emphasize cross-country motorized opportunities because there are no open OHV areas proposed in this alternative. This alternative would result in moderate-to-major impacts and could result in increased conflict by displacing users whose activities may no longer be consistent with the types of SRMAs proposed.

Impacts from Travel Management

The impacts of Alternative D would be similar to Alternative C. However, there would be minor to moderate beneficial and adverse impacts from designating 1,155,200 acres (54% of the RFO) as closed to OHV use. Managing large closed areas would maintain a primitive recreation setting and provide improved opportunities for non-motorized experiences, solitude, and unconfined recreation. This management would benefit recreationists seeking a primitive recreation experience. However, some existing trailheads (e.g., Angel Trail East, Robbers Roost Spring, Larry's Canyon, and Horseshoe Canyon [Deadman's Trail]) would no longer be accessible by vehicle, and some primitive recreationists may be displaced because of longer hiking distances to reach destinations in the canyons. There would continue to be 972,800 acres (46% of the RFO) designated as limited to OHV use. Designated routes would total 3,043 miles, the least of any alternative. This would improve semi-primitive to primitive opportunities but would displace motorized users, including those wanting to access existing trailheads to more remote areas. The potential effects to all recreationists using motorized vehicles to access the area would be greatest in this alternative.

The impacts in this alternative for parking/staging and motor vehicle access to campsites and game retrieval would be the same as described under Alternative C.

Impacts from Lands and Realty

The impacts would be similar to those described under the Proposed RMP. The acreage recommended for withdrawal from mineral entry would increase to 903,900 acres (42% of the RFO) and include all or portions of eight ACECs, all suitable WSR segments, and the five developed recreation sites in the Henry Mountains. It would also include all non-WSA lands with wilderness characteristics, which would ensure protection of wilderness characteristics and the setting needed to support primitive and unconfined forms

of recreation in these areas. This would significantly reduce surface disturbance, maintain semi-primitive to primitive recreation settings, and protect investments at the recreation sites.

Impacts from Minerals and Energy

The impacts would be similar to those described under Alternative C. This alternative would provide the most protection of recreation settings by closing 1,160,500 acres to fluids mineral leasing, withdrawing 903,900 acres to mineral entry, and closing 1,160,500 acres to mineral material disposal. Overall, the impacts to recreation would be negligible to minor under Alternative D.

Impacts from Special Designations

Wild and Scenic Rivers

Impacts would be the same as those described under Alternative N.

Areas of Critical Environmental Concern

Under this alternative, the impacts from ACEC designations would be similar to those discussed for non-WSA lands with wilderness characteristics. ACEC management prescriptions would be adjusted in this alternative for consistency with management decisions for non-WSA lands (e.g., restrictions on surface disturbances and OHV use).

4.4.4 Travel Management

This section describes potential impacts on travel management resulting from the implementation of management actions for other resource programs. Impacts on resources and resource uses resulting from implementation of the travel management program are discussed in those particular resource sections of this chapter.

The travel management program provides for ingress, egress, and access in the RFO. The transportation network consists of 4,380 miles of roads and trails, mostly unpaved, that provide access into and across the RFO. Various individuals rely on this network to access livestock operations, mining properties, utility and communication facilities, range and wildlife developments, wildfire prevention/management and suppression, recreation sites, as well as the public lands in general for a myriad of recreational activities, and intermingled private and state-owned lands. Management decisions that involve changes to miles of roads open for public or administrative use, number of acres open to off-road travel, or specific travel restrictions (vehicle size, seasonal restrictions, etc.) would affect access into and across the RFO. The following discussion of the effects on transportation and access focuses on management actions that restrict or facilitate travel management opportunities. Impacts on opportunities for OHV use are addressed in the recreation impact analysis.

This analysis describes the degree of access and the extent of usable transportation systems within the RFO and its effects on both motorized travel. This includes decisions that would limit the degree of travel opportunities and the ability to access certain portions of the decision area. The majority of motorized access issues are related to OHV use; this form of transportation provides a major source of travel opportunities. Mechanized travel involves primarily mountain bikes but could also include other forms of non-motorized vehicles.

Impacts to travel management, as defined above (e.g., via state-maintained highways and BLM-maintained system roads) would be anticipated primarily from route designations and the implementation of management actions that consolidate public land through purchases, exchanges, and disposal of isolated tracts.

Methods and Assumptions

The analysis was based on the following assumptions:

- The transportation network, as defined by alternative, will remain in place throughout the life of the plan.
- The BLM will evaluate RS-2477 assertions under a separate process and criteria than this planning process.

Impact analyses and conclusions are based on interdisciplinary team knowledge of resources in the RFO, review of existing literature, and information provided by other agencies. Effects are quantified when possible. In absence of quantitative data, best professional judgment was used. Spatial analyses were conducted using GIS data and analyses. Impacts are described using ranges of potential impacts or in qualitative terms, if appropriate.

Environmental Consequences

Impacts to travel management would likely result from actions proposed under the following resource programs:

- Special Status Species

- Fish and Wildlife
- Non-WSA Lands with Wilderness Characteristics
- Recreation
- Travel Management
- Lands and Realty
- Special Designations.

Other programs were determined to have little or no impact on travel management.

Alternative N: No Action

Impacts from Special Status Species

No special management is proposed in Alternative N to protect SSS. However, current policy and practices call for the protection of threatened and endangered species habitat by mitigating disturbances and prohibiting activities that destroy, adversely modify, or fragment critical habitat. Extensive limitations are not anticipated. Therefore, the overall impact to travel management would be negligible.

Impacts from Fish and Wildlife

Management strategies to avoid or reduce habitat fragmentation would include such practices as reclaiming redundant roads, reclaiming roads no longer serving intended purpose, and reducing road densities. There could be some effects on travel management, depending on the number of roads reclaimed and the existing uses of those roads, but extensive limitations are not anticipated. Motorized use would continue to be seasonally closed in the Swap Mesa and Cave Flat areas from December 20 through March 20 for the protection of bison crucial habitat. Overall, impacts to travel management and access would be negligible.

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness character on those lands outside of WSAs are proposed under this alternative, so no impacts to travel management would occur.

Impacts from Recreation

No recreation management decisions are proposed in Alternative N that would affect travel management. The entire RFO (with the exception of Yuba Reservoir, which is managed by the Fillmore FO) is identified and managed as an ERMA. Management of recreation in ERMAs is restricted to custodial actions only, with no special prescriptions identified that would limit or control recreational activities, including OHV use.

Impacts from Travel Management

Under Alternative N, the majority of public lands (1,636,400 acres, 77% of the RFO) are open to motorized cross-country vehicle travel. While not all of these acres are used for cross-country travel, there are certain uses and activities that take users off established routes. Harvesting fuelwood, pine nut, and other woodland products; wildlife viewing; livestock management; and dispersed camping and hunting are some of the reasons other than motorized adventure riding that these open OHV areas are used. There are 277,600 acres (13% of the RFO) designated as limited for the protection of various resources (e.g., cultural, soils, wildlife, and plant habitats) including portions of WSAs. Of the total routes identified for the planning area, 4,315 miles are open to motorized travel, including 42 miles of inventoried routes in WSAs that would continue to be available for travel. There would be 65 miles of routes closed. Within the open and limited OHV areas, there would be no restrictions on motorized use off of designated routes for the purposes of parking/staging and access to campsites, except within WSAs. The remainder of the

RFO (214,000 acres, or 10%) is closed to OHV use. It should be noted that route designations are implementation decisions and that the resulting transportation network could change over time.

Travel throughout the RFO is expected to increase due to population growth and increased demand for recreation opportunities on public lands. One of the growing demands is for access to open areas for OHV use. As more of the public lands throughout the state restrict cross-country access, the large areas left open in the RFO could draw more interest, putting other resources at risk. In the long term, this could result in area closures (either through plan amendment or emergency order) if unacceptable impacts to resources are determined to be occurring. Impacts to travel management would be negligible to minor in the short term but could increase if additional closures become necessary.

Impacts from Lands and Realty

The disposal of 280 acres identified in the Mountain Valley Management Framework Plan (MFP) would reduce the overall amount of BLM lands available to the public for access. Due to the extremely small acreage involved, impacts would be negligible. The development of wind or solar energy could adversely affect access and travel management if access were restricted into those areas or through voluntary displacement if significant development took place. Exploration and development would be considered on a case-by-case basis. Impacts would be site specific.

Impacts from Special Designations

Wilderness Study Areas

In this alternative, the use of motorized vehicles would be limited to existing routes in 259,900 acres of the WSAs, with 42 of the 60 inventoried miles of routes designated for use by motorized vehicles. The routes that are open in WSAs would continue to allow for public access to valid existing rights, grandfathered rights, recreational and trailhead access, and for general use, in accordance with the IMP. The remaining 187,000 acres of the WSAs would be closed to motorized use. The development of new routes would not be authorized within these areas.

Wild and Scenic Rivers

The 135 miles of eligible river segments would be managed to protect their outstandingly remarkable values, free-flowing nature, and tentative classification. No management decisions are proposed to restrict access in these areas. Motorized use within these segments would be according to existing OHV designations. Many of the segments are remote and are within WSAs where motorized access is closed or limited to inventoried routes. Only 35 miles of routes exist within the eligible river segments. Therefore, the overall impact to access and travel management would be minor.

Areas of Critical Environmental Concern

The four existing ACECs would continue to be managed for the protection of their relevant and important values. These areas are and would continue to be closed to OHV use, which would not provide any additional opportunities for this type of use.

Alternative A

Impacts from Special Status Species

The impacts from the protection of threatened and endangered species habitat would be similar to Alternative N. Strategies incorporated into this alternative (e.g., closing and reclaiming roads; using species-specific buffers; and seasonal, temporal, and spatial restrictions) could affect travel management within habitat areas, but extensive limitations are not anticipated. Management actions would limit OHV use to designated routes in sage-grouse lek and nesting habitats but do not include area closures or seasonal restrictions. Route restrictions proposed in this alternative for protection of all SSS resources

total 249 miles (6% of the total designated route miles). These restrictions would have minor, site-specific impacts on travel and access in the RFO.

Impacts from Fish and Wildlife

Impacts from management strategies to avoid or reduce habitat fragmentation would be the same as described under Alternative N. Management actions would limit OHV use to designated routes in bison crucial habitat but do not include area closures or seasonal restrictions. Overall, impacts to travel management and access would be minor.

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness character on those lands outside of WSAs are proposed under this alternative, so no impacts to travel management would occur.

Impacts from Recreation

Decisions to maintain and improve the Piute, Great Western, and other motorized trail systems would benefit OHV users and maintain and improve access in these areas.

Five SRMAs, totaling 514,500 acres (24% of the RFO), are proposed under Alternative A. Management of these SRMAs would provide for public access in some SRMAs and would enhance motorized use (specifically cross-country access) in other areas.

Motorized use would be limited to designated routes in a portion of the Otter Creek SRMA (1,900 acres) and all of the Dirty Devil SRMA (290,000 acres). Portions of the Dirty Devil SRMA that were closed in Alternative N would be limited to designated routes (inventoried routes within WSAs) improving access slightly.

Factory Butte (199,700 acres), Big Rocks (9,300 acres), Sahara Sands (12,300 acres), and a portion of the Otter Creek (1,300 acres) SRMAs would be managed as OHV open areas to enhance a motorized recreational experience and provide additional support (signing, interpretation, and facilities) for these motorized activities as necessary. Enhanced management would support travel management decisions for these areas. The overall impacts to travel management from recreation decisions in this alternative would be minor.

Impacts from Travel Management

Under Alternative A, 449,000 acres (21% of the RFO) would be open to motorized cross-country vehicle travel. These OHV areas would be managed as designated open areas with a variety of riding opportunities: sand dunes, Mancos Shale hill climbs, trials motorcycle, rock crawling, and community play areas. This would be a reduction in OHV open areas of 1,187,400 acres from Alternative N. While not all of these acres are used for cross-country travel, there are traditional uses that take users off established routes. Reducing the open acreage from 77% in Alternative N to 21% in this alternative significantly reduces the opportunities for cross-country OHV use and some historical uses. Fuelwood, pine nut, and other woodland products harvesting; wildlife viewing; livestock management; and dispersed camping and hunting are some of the uses other than motorized adventure riding that currently take place in these open OHV areas. As travel throughout the RFO increases, including demand for open OHV areas, this alternative may not sufficiently meet the needs for off-road access for OHV and other casual uses. However, cross-country use could still be allowed for permitted uses such as livestock management and products harvesting. If open OHV areas are not large enough to absorb the levels of use, conflicts between OHV users and safety concerns could increase. Impacts to travel management in the RFO would be moderate.

The remainder of the RFO (1,679,000 acres, or 79%) would be limited to designated routes and trails. Of the total route miles, 4,063 miles would be designated as open for use in this alternative, 249 miles of routes would be designated with seasonal closures or size/width restrictions, and 68 miles would be closed. The total designated route miles include 60 miles of inventoried routes within WSAs. Motor vehicles would be allowed to pull off of a designated route up to 100 feet on either side of the centerline for the purposes of parking/staging and to use existing spur routes for the purpose of accessing established campsites within 300 feet of the centerline of designated routes except in WSAs. This would allow for safe passage of vehicles on routes and continued access to many historic camping sites. These designations would continue to provide access within the majority of the RFO. Under this alternative, only 3 fewer miles of routes would be open to the public compared to Alternative N. It should be noted that route designations are implementation decisions, and the resulting transportation network could change over time. Impacts for general access using a road network would be negligible.

Impacts from Lands and Realty

The availability of approximately 13,400 acres for disposal could reduce the overall amount of BLM lands available to the public for access. Due to the small acreage involved, impacts would be minor and site specific. The development of wind or solar energy could adversely affect access and travel management if access were restricted into those areas or through voluntary displacement if significant development took place. Impacts would be site specific and dependent on future interest in this type of development.

Impacts from Special Designations

Wilderness Study Areas

The impacts would be similar to those described in Alternative N, except that OHV use within all 466,900 acres of the WSAs would be limited to designated routes. All 60 miles of inventoried ways within the WSAs would be designated as available for motorized use, in accordance with the IMP. This would be an increase of 18 miles of ways from the designations in Alternative N. This would slightly increase public access into these areas. Overall, impacts would be negligible to minor.

Wild and Scenic Rivers

No eligible river segments are recommended for suitability under this alternative, and no protective measures are proposed, resulting in no impact to travel management.

Areas of Critical Environmental Concern

There are no ACECs proposed for designation under this alternative, resulting in no impact to travel management.

Proposed RMP

Impacts from Special Status Species

The impacts would be similar to those described under Alternative A. Under the Proposed RMP, route restrictions are proposed with a total of 538 miles (11% of the total designated routes) of designated routes, an increase of 277 miles over Alternative A (Table 4-37). Management actions would limit OHV use to designated routes in all Greater sage-grouse habitats including breeding (leks), nesting, brood-rearing, and wintering, but would not include area closures. These restrictions would have site-specific impacts on travel and access in the RFO.

Table 4-37. Impacts from Special Status Species on Travel Management, by Alternative

	Alternative N	Alternative A	Proposed RMP	Alternative C	Alternative D
Miles of Restricted Routes	Subject to existing laws and regulations	249	538	591	591
Percent of the Total Designated Routes	-	0	11%	19%	19%
Increase in Miles Over Alternative A	-	0	+277	+342	+342

Impacts from Fish and Wildlife

Impacts from management strategies to avoid or reduce habitat fragmentation would be the same as described under Alternatives N and A. Management actions would limit OHV use to designated routes in 806,700 acres of deer and elk crucial winter range and close 4,500 acres; and limit OHV use to designated routes in bison crucial habitat but do not include area closures. Seasonal restrictions would be addressed on a case-by-case basis. Overall impacts would depend on the number of restricted miles necessary, but extensive limitations are not anticipated.

Impacts from Non-WSA Lands with Wilderness Characteristics

Under the Proposed RMP, motorized use on the 12 non-WSA lands with wilderness characteristics 78,600 acres (4% of the RFO) would be limited to designated routes for the preservation, protection, and maintenance of wilderness characteristics. Therefore, there would be no impacts to motorized users from this management. However, in these non-WSA lands with wilderness characteristics, mechanized use would also be limited to designated routes. This would reduce mechanized access in these areas, resulting in minor impacts.

Impacts from Recreation

Decisions to maintain and improve the Piute, Great Western, and other motorized trail systems would benefit OHV users and maintain and improve access in these areas.

Five SRMAs, totaling 860,390 acres (40% of the RFO), are proposed under the Proposed RMP, an increase of 345,890 acres over Alternative A. In most cases, the proposed SRMA areas and acreages are different than in Alternative A. Management of these SRMAs could restrict public access in some SRMAs and would continue to enhance motorized use (specifically cross-country access) in other SRMAs.

The Dirty Devil SRMA (290,500 acres) would propose to close the canyons within the SRMA to OHV use, with the remainder of the area limited to designated routes. Impacts to travel management would be similar to Alternative N. The majority of the routes that would be closed is within current closed WSA acreage or areas closed by the OHV Management Plan for the Henry Mountains.

The Capitol Reef Gateway SRMA (12,800 acres) proposes to close the Fremont Gorge WSA and Fremont Gorge itself to OHV use, with the remainder of the area limited to designated routes. Impacts to travel management would be similar to Alternative N. The Fremont Gorge WSA is closed in both alternatives. Few route miles exist within the Fremont Gorge.

The Henry Mountains SRMA (532,600 acres) does not include specific management prescriptions for motorized use. It would be managed according to the OHV area designations in Chapter 2 of this PRMP/FEIS.

The overall impacts to travel management from the proposed Dirty Devil, Capitol Reef Gateway, and Henry Mountains SRMAs would range from negligible to minor.

The Factory Butte (24,400 acres) OHV Play Areas RMZ (8,500 acres) and Big Rocks (90 acres) SRMAs would continue to be managed as OHV open areas to provide a motorized recreational experience and to allow for additional support (signing, interpretation, and facilities) of these motorized activities as necessary. However, the total acreage of these SRMAs is significantly less than that proposed for support of OHV open areas in Alternative A (221,300 acres), resulting in substantially less open areas in the Proposed RMP. While fencing in the Factory Butte SRMA (Appendix 18) would affect cross-country travel, it would assist visitors in knowing where boundaries are located. Additionally, several user-developed access routes have been established off of Highway 24 into the Swing Arm City OHV Open Area. This presents a safety hazard, especially with the two access routes to the east, which are near a curve in the Highway. Access into the Swing Arm City OHV Open Area would be restricted to one upgraded entrance off of Highway 24. Although the additional user-developed routes would no longer be available for travel, developing one entrance that is properly marked would help alleviate the current safety hazard. Also, by upgrading the surface of the one access road to an all-weather gravel surface for a distance into the open area, visitors would be able to get completely clear of the highway before stopping, parking, unloading, etc. Overall impacts to cross-country access under this alternative would range from moderate to major.

Impacts from Travel Management

Under the Proposed RMP, 9,890 acres (less than 1% of the RFO) would be open to motorized cross-country vehicle travel. These OHV areas would be managed as designated open areas with a variety of riding opportunities: Mancos Shale hill climbs, trials motorcycle, rock crawling, and community play areas. However, reducing the open acreage from 77% in Alternative N to less than 1% in this alternative significantly reduces the opportunities for cross-country OHV use and some historical uses. As travel throughout the RFO increases, including demand for open OHV areas, this alternative may not sufficiently meet the needs for off-road access for OHVs and other casual uses. Open OHV areas may not be large enough to absorb the levels of use, resulting in conflicts between OHV users and safety concerns. Impacts to off-road travelers would be moderate to major.

This alternative would designate 1,908,210 acres (90% of the RFO) as limited to designated routes and trails, the largest acreage of all the alternatives. Of the total route miles, 3,739 miles would be designated as open in this alternative and 538 miles of routes would be designated with seasonal closures and/or size/width restrictions. The total designated route miles include 59.5 miles of inventoried ways within WSAs. There would be 345 miles of routes closed to motorized use. Motor vehicles would be allowed to pull off of a designated route up to 50 feet on either side of the centerline for the purposes of parking/staging and to use existing spur routes to access established campsites within 150 feet of the centerline of designated routes. This would allow for safe passage of vehicles on routes and continued access to many historic camping sites. In the long term, the significant reduction of open acres and miles of routes could increase the traffic on the remaining designated routes. This could increase the number of conflicts and safety concerns on certain heavily used routes. Impacts would range from minor to moderate.

There would be 209,900 acres (10% of the RFO) closed to OHV use under this alternative. The majority of these acres are within WSAs where few inventoried ways occur. The overall impacts would be negligible to minor.

Impacts from Lands and Realty

Impacts would be the same as those described under Alternative A.

Impacts from Special Designations

Wilderness Study Areas

The acres of WSAs designated as limited and closed to OHV use would be the same as Alternative N. Of the 60 miles of total inventoried ways within the WSAs, 45 miles would be designated as open for motorized use as long as use is non-impairing, in accordance with the IMP. This would be an increase of 3 miles of designated ways over Alternative N and a slight decrease from Alternative A. Overall, the impact to access and travel management would negligible to minor.

Wild and Scenic Rivers

Under the Proposed RMP, one river segment totaling 5 miles would be recommended as suitable for inclusion in the National Wild and Scenic River System. Management prescriptions would close this river segment to OHV use within one-quarter mile of the high water mark on each bank of the river.

Areas of Critical Environmental Concern

Under this alternative, two ACECs would be designated: North Caineville Mesa and Old Woman Front. Management prescriptions to protect the relevant and important values for these 2,530 acres would close the areas to OHV use. There are no routes identified within these areas, and there would be no impact to travel management.

Alternative C

Impacts from Special Status Species

The impacts would be similar to those described under the Proposed RMP since management actions would limit OHV use to designated routes in all Greater sage-grouse habitats including breeding (leks), nesting, brood-rearing, and wintering, but would not include area closures. Under this alternative, proposed route restrictions would increase to 591 miles (19% of the total designated routes), which is an increase of 342 miles over Alternative A and 108 miles more than in the Proposed RMP.

Impacts from Fish and Wildlife

Impacts from management strategies to avoid or reduce habitat fragmentation would be the same as described under the previous alternatives. Under this alternative 142,000 acres of deer and elk crucial winter range and 189,000 acres of crucial bison habitat would be closed to OHV use, 26% of the total closed acres under this alternative. These management decisions would reduce motorized access and result in site-specific, minor impacts.

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness character on those lands outside of WSAs are proposed under this alternative, so no impacts to travel management would occur.

Impacts from Recreation

Four SRMAs, totaling 930,000 acres (44% of the RFO), are proposed, which would be slightly higher than under the Proposed RMP. However, under this alternative, all SRMAs could restrict public access and no SRMAs would be proposed to enhance motorized use (specifically cross-country access) because there are no areas open to cross-country motorized travel.

The Dirty Devil SRMA would be increased to 375,800 acres, 85,300 acres more than under the Proposed RMP. Proposed management prescriptions would close the WSR segments to OHV use except for the Poison Springs/North Hatch Canyon road corridor. Where the SRMA overlaps WSAs and the Dirty Devil ACEC, the travel management decisions for those areas would apply. The remainder of the SRMA would be limited to designated routes. Impacts to travel management and access from this proposed SRMA would be moderate.

Impacts from the proposed Capitol Reef Gateway SRMA (12,800 acres) would be similar to those discussed under the Proposed RMP. The area closed to OHV use would increase by including the VRM Class II areas, but few routes occur in these areas.

Impacts from the proposed Henry Mountains SRMA (533,900 acres) would be the same as discussed under the Proposed RMP.

Management decisions for the proposed Sevier Canyon SRMA (7,500 acres) would limit OHV use to designated routes. Impacts to travel management from this proposed SRMA would be negligible.

Impacts from Travel Management

Under Alternative C, vehicle travel would be allowed only on designated routes, with no areas open to motorized cross-country travel. All 1,636,400 acres previously open (Alternative N) would be limited to designated routes or closed. This would be a decrease of 9,390 acres open to OHV use as compared to the Proposed RMP. Traditional uses that take public land visitors off designated routes (e.g., wood products harvesting, wildlife viewing, dispersed camping and hunting), along with motorized adventure riding, would be greatly limited in this alternative. Impacts to off-road travelers would be moderate to major.

This alternative would designate 1,445,000 acres (68% of the RFO) as limited to designated routes and trails, fewer acres than in Alternatives A or the Proposed RMP. The remainder of the area (683,000 acres, 32% of the RFO) would be closed to motorized travel, including all WSAs. Of the total route miles, 2,601 miles would be designated as open in this alternative and 591 miles of routes would be designated with seasonal closures or size/width restrictions. There would be 1,188 miles of routes closed to motorized use, 984 more miles of closed routes than in the Proposed RMP. In the long term, allowing no open acreage for cross-country OHV travel and significantly reducing the miles of routes available for public uses could increase the traffic on those designated routes. Motor vehicles would be allowed to pull off of a designated route up to 25 feet of either side of the centerline for the purposes of parking/staging. Depending on the location and factors such as viewing distance along the road, 25 feet may not allow for vehicles to park and still safely allow for the passage of other vehicles on the road. Restricting camping with motorized access to designated campsites would limit access and possibly restrict use of some historic camp areas. This could increase the number of conflicts and safety concerns on certain heavily used routes. Impacts would range from moderate to major.

Impacts from Lands and Realty

Under this alternative, no lands would be available for FLPMA Section 203 sales, which would result in no reduction in the overall amount of BLM lands available to the public for access.

The development of wind or solar energy could adversely affect access and travel management if access were restricted into those areas or through voluntary displacement if significant development took place. Impacts would be site specific and dependent on future interest in this type of development.

Impacts from Special Designations

Wilderness Study Areas

In Alternative C, all WSAs and all of the 60 miles of inventoried routes within WSAs would be closed. Closing these routes would affect access by the public for recreational and trailhead access, as well as general use. Impacts would be most noticeable in locations where routes to existing trailheads, such as those accessing the Dirty Devil River and Horseshoe Canyon, would no longer be available for use by motorized vehicles. The impacts would be site specific and range from minor to moderate, depending on the length and destination of the route.

Wild and Scenic Rivers

Under Alternative C, all 12 eligible river segments, totaling 135 miles, would be recommended as suitable for inclusion in the National Wild and Scenic River System. Management prescriptions would close these river segments to OHV use within one-quarter mile of the high water mark on each bank of the river segment. The exception would be the Poison Spring road that crosses the Dirty Devil River, which would remain open for motorized travel. Many of the segments are remote and occur within WSAs. Only 35 miles of routes exist within the eligible river segments. Therefore, the overall impact to access and travel management would be minor.

Areas of Critical Environmental Concern

Under this alternative, all potential ACECs (16 areas totaling 886,810 acres, or 42% of the RFO) would be designated. Management prescriptions to protect the relevant and important values include closing or limiting the ACECs to OHV use.

Portions of the Badlands and Henry Mountains ACECs would be closed to OHV use by ACEC management prescriptions. Within the Badlands ACEC, the mesa tops would be closed to OHV use; within the Henry Mountains ACEC, No Man's Mesa would be closed to OHV use. All of the potential Old Woman Front ACEC would be closed to OHV use. However, these areas do not contain motorized routes, so there would be no impact.

All of the potential Rainbow Hills ACEC (4,000 acres), including 26 miles of routes, would be closed to OHV use by ACEC management prescriptions. Due to the number of routes within this relatively small area, this could result in site-specific, moderate impacts for access and travel management.

Alternative D

Impacts from Special Status Species

The impacts would be similar to those described under Alternative C. The total miles of designated routes would be lower under this alternative. The proposed miles of route restrictions would be 591 (19% of the total designated routes), which would be the same as in Alternative C.

Impacts from Fish and Wildlife

Impacts from management strategies to avoid or reduce habitat fragmentation would be the same as described under the previous alternatives, except that this alternative would have the most acreage closed for fish and wildlife protection. Under this alternative, 142,000 acres of deer and elk crucial winter range and 189,000 acres of crucial bison habitat would be closed to OHV use. These management decisions would greatly reduce motorized access and result in moderate impacts.

Impacts from Non-WSA Lands with Wilderness Characteristics

Under this alternative, all non-WSA lands with wilderness characteristics (682,600 acres, 32% of the RFO) would be closed to OHV use for the protection of those values. Closures to motorized use would

increase by 472,200 acres over Alternative C due to this proposed management decision, greatly reducing motorized access and resulting in moderate impacts.

Impacts from Recreation

Seven SRMAs, totaling 1,358,100 acres (64% of the RFO) are proposed, which would be the most acreage of any of the alternatives and 20% higher than under Alternative C. Under this alternative, all SRMAs would restrict public access and no SRMAs would be proposed to enhance motorized use (specifically cross-country access) because there are no acres open to cross-country motorized travel.

The East Fork Sevier River SRMA (59,500 acres) would close non-WSA lands with wilderness characteristics to OHV use.

The San Rafael Swell SRMA (127,100 acres) would close the mesa tops and non-WSA lands with wilderness characteristics to OHV use.

The Dirty Devil SRMA would be increased to 383,900 acres, 8,100 acres more than under Alternative C, and would close WSAs and non-WSA lands with wilderness characteristics to OHV use.

The Capitol Reef Gateway SRMA would be increased to 168,800 acres, 156,000 acres more than under Alternative C, and would close the Fremont Gorge WSA, Fremont Gorge WSR corridor, and non-WSA lands with wilderness characteristics to OHV use.

The Henry Mountains SRMA would be decreased to 479,500 acres. Management actions would close the WSAs and non-WSA lands with wilderness characteristics to OHV use.

The Labyrinth Canyon SRMA (75,300 acres) would close WSAs and non-WSA lands with wilderness characteristics to OHV use.

The Little Rockies SRMA (64,000 acres) would be closed to OHV use for the protection of WSA and non-WSA lands with wilderness characteristics.

Managing 64% of the RFO as SRMAs emphasizing primitive and semi-primitive recreation with large areas closed to OHV use would impact travel management and all access into these areas. Some existing trailheads (e.g., Angel Trail East, Robbers Roost Spring, Larry's Canyon, and Horseshoe Canyon [Deadman's Trail]) would no longer be accessible by motorized vehicles. The overall impact to travel management would range from moderate to major under this alternative.

Impacts from Travel Management

The impacts of this alternative would be similar to Alternative C. Vehicle travel would be allowed only on designated routes, with no areas open to motorized cross-country travel. All 1,636,400 acres currently open (Alternative N) would either be limited to designated routes or closed. Alternative D proposes the most acreage to be closed, including all WSAs and non-WSAs with wilderness characteristics (1,155,200 acres, or 54% of the RFO). Alternative D would also designate the least miles of routes as open or open with restrictions and the most closed route miles. Of the total route miles, 2,493 miles would be designated as open, 550 miles would be designated with seasonal closures or size/width restrictions, and 1,242 miles of routes would be closed to motorized use. Restrictions on parking/staging and motorized access to campsites would be the same as Alternative C. The potential for traffic, accidents, and conflicts experienced by travelers on the designated routes would be greater than that experienced under the other alternatives due to the limited miles of routes open to the public. The decisions in this alternative could result in a major impact to travel and access within and across the RFO for the recreating public, permitted users, researchers, and federal and state agencies.

Impacts from Lands and Realty

Impacts would be the same as those described under Alternative C.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative C.

Wild and Scenic Rivers

Impacts would be the same as those described under Alternative C.

Areas of Critical Environmental Concern

Under this alternative, all potential ACECs (16 areas totaling 886,810 acres, or 42% of the RFO) would be designated. Management prescriptions to protect the relevant and important values include closing or limiting areas to OHV use.

As in Alternative C, the mesa tops in the Badlands ACEC, No Man's Mesa in the Henry Mountains ACEC, and all of the Old Woman Front and Rainbow Hills ACECs would be closed to OHV use. The impacts would be the same as discussed for Alternative C.

Under Alternative D, management prescriptions would also close portions of the Badlands, Bull Creek, Fremont Gorge/Cockscomb, Henry Mountains, Kingston Canyon, Little Rockies, Quitchupah, and Thousand Lakes Bench ACECs, and all of the Dirty Devil, Horseshoe Canyon, and Lower Muddy Creek ACECs that include non-WSA lands with wilderness characteristics. The overall impacts to travel management from closure of non-WSA lands were discussed above under the Impacts from Non-WSA Lands with Wilderness Characteristics section.

4.4.5 Lands and Realty

The following discussion highlights the primary differences between alternatives and their anticipated impacts on the lands and realty program. Included in the lands and realty program are land-tenure adjustments (e.g., sales, exchanges, acquisitions); withdrawals, classifications, and segregations; and ROWs and other land use authorizations (e.g., leases, easements, and permits). This section focuses on how other resources potentially impact the lands and realty program by limiting or preventing realty actions.

The purpose of the lands and realty program is to facilitate management of the RFO's lands and resources. The program adapts according to changing land management and resource needs and issues. As such, lands and realty program actions generally result in beneficial impacts within the RFO with regard to multiple use objectives. In addition, the presence of other resources could prevent lands and realty actions from being carried out and, thus, they are considered adverse impacts on the lands and realty program.

The only types of direct impacts to the lands and realty program occur when other resources prevent or make it considerably more difficult to complete a transaction. For example, mitigating measures to protect resource values required for a ROW substantially increases processing costs and timeframes required to complete the transaction and temporarily delays the transaction. Generally, there are no indirect impacts to the lands and realty program.

Methods and Assumptions

The analysis was based on the following assumptions:

- The BLM would continue to process land tenure adjustments.
- Lands identified for FLPMA Section 203 sale may be sold or otherwise disposed of within the life of the plan.
- Disposal of small, isolated parcels of public land would decrease the cost of public land administration in the RFO and enhance efficient management of remaining public lands.
- The disposal of small, isolated parcels would decrease conflicts between public land users and private landowners.
- Lands and interests in lands could be acquired from willing landowners by purchase, exchange, or donation.
- Non-federal land, interests in land (including access and conservation easements), and water rights would be considered for acquisition when they are within administratively designated areas or contain important resources (e.g., WSAs, ACECs, critical habitat, lands supporting listed species, riparian-wetland areas).
- Existing withdrawals would continue.
- The demand for communication sites and ROW corridors would increase within the life of this plan.
- ROW holders may maintain their use and access at their discretion consistent with the terms of their ROW grant.

Environmental Consequences

Impacts to lands and realty would likely result from actions proposed under the following resource programs:

- Visual Resources

- Special Status Species
- Fish and Wildlife
- Fire and Fuels Management
- Non-WSA Lands with Wilderness Characteristics
- Travel Management
- Lands and Realty
- Special Designations.

Other programs were determined to have little or no impact on lands and realty.

Alternative N: No Action

Impacts from Visual Resources

Implementing VRM guidelines would increase the design and siting requirements for ROWs and other land use authorizations and affect associated costs on new or amended ROWs. Such restrictions may also restrict placement and could possibly delay availability of energy supply (by restricting pipelines, transmission lines, and wind and solar projects) and could create dead zones or delay availability of communications service. Such requirements could require utility lines and communication sites to be installed in less desirable locations or areas with more restrictions on accessibility or construction. There would also be an increased potential that requests for new or amended and renewed ROWs at existing sites would be denied as available space decreases.

ROWs would not occur in VRM Class I areas and would generally not occur in Class II areas because of the requirements to preserve or retain the existing character of the landscape. Under this alternative, none of the lands managed by the RFO are classified as VRM Class I. ROWs and other land use authorizations proposed on the 529,500 acres (25% of the RFO) within VRM Class II areas would be redesigned, moved, or otherwise restricted.

Managing for VRM Classes III and IV would allow the greatest flexibility for ROWs and other land use authorizations. VRM Classes III and IV allow more changes to the landscape and are less restrictive of ground-disturbing activities. Under this alternative, 569,000 acres would be managed as VRM Class III and 1,029,500 acres would be managed as Class IV. Thus, the majority of the RFO (75%) would be available for siting of ROWs.

Impacts from Special Status Species

Land tenure adjustments would be affected by the management decision to generally retain all habitat for federally-listed and candidate species in federal ownership. The presence of SSS may preclude the issuance of some land use authorizations and place restrictions on others (such as timing restrictions on construction or other ground-disturbing activities, or siting restrictions to avoid habitat areas). For example, under this alternative, surface disturbing activities are prohibited near Greater sage-grouse leks from March 1 through July 15 and within sage grouse brooding/nesting habitat from April 1 through June 15.

Seasonal limitations within 1 mile of bald eagle nest sites, within one-half mile of bald eagle winter concentration areas, and year-round restrictions on ground-disturbing activities within one-half mile of bald eagle nest sites could limit access and could delay project construction of new ROWs or reconstruction of existing ROWs.

The reintroduction of endemic or non-endemic SSS may potentially impact lands and realty depending upon the species and the use restrictions or conservation measures applied.

Impacts from Fish and Wildlife

Proposed decisions for fish and wildlife could restrict some ROWs and other land use authorizations by location or season. In order to avoid or reduce habitat fragmentation, ROW applicants would be encouraged (or even required, in some locations) to collocate facilities. Seasonal or spatial restrictions for bison, mule deer, and elk could delay construction of new ROWs or reconstruction of existing ROWs. Prohibiting surface-disturbing activities from November 1 through May 15 (6½ months each year) could make it difficult to complete some projects. Where seasonal restrictions limit the time available to complete activities, relocation of surface facilities could be required. Impacts to issuance of ROWs would likely be minimal because areas in which habitat restrictions apply are likely not areas in which demand for ROWs is high.

Impacts from Fire and Fuels Management

Wildland fire use, appropriate management response, and prescribed fire suppression activities could potentially adversely impact ROWs (e.g., power lines and communication sites), facilities, and adjacent non-BLM lands; however, long-term impacts could be beneficial due to the reduction of high-severity fires. Post-fire rehabilitation improvements could affect adjacent non-BLM lands (e.g., reduced erosion and less chance of alien plant invasion). Impacts to lands and realty would be minor.

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness characteristics on lands outside of WSAs are proposed under this alternative, resulting in no additional restriction on lands and realty.

Impacts from Travel Management

Impacts to lands and realty from travel management would result from reduced access to the public lands, and, therefore, reduced opportunities for land use authorizations. Generally, the more area open to OHV use, the greater the opportunity for activities authorized under a land use permit or ROW. Under this alternative, 1,636,400 acres (77%) of the RFO would be open to motorized vehicles, allowing opportunities for these types of activities over a large portion of the RFO.

Motorized vehicles would be limited to existing, designated, and maintained routes on 277,600 acres (13%) of the RFO, which would limit opportunities for land use authorizations to areas along those designated routes if the activity required motorized vehicle access for construction, operation, or maintenance (unless administrative access was granted for such purposes). Under this alternative, 4,315 miles of routes in the RFO would be open to motorized use.

The remainder of the RFO (214,000 acres, or 10% of the RFO) would be closed to motorized vehicle use, which would result in restrictions on land use authorizations beyond the restrictions that already would occur as a result of avoidance or exclusion areas for land use authorizations. Land use authorizations that do not require motorized vehicle use (such as minimum impact filming activities) would not be affected.

Impacts from Lands and Realty

Under this alternative, 280 acres identified as available for FLPMA Section 203 sale in the existing land use plans would continue to be available pending site-specific environmental analysis. Inholdings within the wilderness study areas and four existing ACECs would be priorities for acquisition.

The purpose of designating corridors is to reduce or eliminate resource and land use conflicts. One major inhibitor to the timely review and approval of ROWs for a major energy facility is the effort involved in selecting a suitable route for the facility while minimizing the environmental impacts created by its construction, operation, and continued maintenance. This includes the requirement that suitable alternative routes be identified and reviewed at the same level of scrutiny as the preferred route. One way

to help alleviate this inhibitor and help streamline the authorization process is to identify and designate utility corridors in RMPs. If a corridor is designated as such in the plan, then it has already been determined to be the "preferred route" and other alternative routes need not be addressed. If the project proponent uses the designated corridor as the proposed route, then the proponent would only be required to do on-the-ground environmental studies to determine if the route is suitable for the construction of the project. This simplifies the permitting process and can save considerable time as well as costs.

This alternative designates no utility corridors. Therefore, the benefits described above to the lands and realty program would not be realized.

Impacts from Special Designations

Wilderness Study Areas

Continued management of WSAs under the IMP would limit surface-disturbing actions that could result in impairment of wilderness values. Thus, WSAs are exclusion areas for ROWs and are unavailable for land disposals. However, land use authorizations that would not impair wilderness values (such as minimum impact filming) could be authorized and. in fact. would provide the appropriate setting for these types of activities. Inholdings within the WSAs would be a priority for acquisition, consolidating federal land ownership and improving manageability of public lands in these areas.

Wild and Scenic Rivers

Management actions to protect the outstandingly remarkable values, free-flowing nature, and tentative classification of all eligible river segments affect the availability of these areas for lands and realty actions. As such, these river corridors (12 segments, 135 miles) would be managed as avoidance areas for ROWs, which could result in denying ROWs or requiring realignment of the proposed ROW around the avoidance area. These restrictions would increase the cost of construction or preclude authorization of the ROW altogether. However, because these areas are remote in location, impacts to lands and realty should be negligible.

Areas of Critical Environmental Concern

Management actions for protection of relevant and important values of ACECs affect the availability of these areas for lands and realty actions. Along with continuing the designations of Beaver Wash Canyon, North Caineville Mesa, and South Caineville Mesa ACECs, proposals under Alternative N would allow no uses that would cause irreparable damage to relevant and important values. As such, these ACECs (14,780 acres) would be managed as avoidance areas for ROWs. However, because these areas are small in extent and are remote in location, impacts to lands and realty should be negligible.

Land tenure adjustments would focus on acquisition of non-federal land within the ACECs. Over time, this would lead to a consolidated land pattern within these special designations, a benefit to other resource programs.

Alternative A

Impacts from Visual Resources

The types of impacts experienced under this alternative would be similar to those described under Alternative N. This alternative designates fewer areas as VRM Classes I and II (446,900 acres as VRM Class I, and 0 acres as VRM Class II). This alternative designates more acres as VRM Classes III and IV than any of the alternatives, which would provide the least restrictions on design and siting of ROWs and other land use authorizations.

Impacts from Special Status Species

Impacts would be similar to those described under Alternative N, except that there are fewer restricted areas under Alternative A. For example, surface-disturbing activities within sage-grouse brooding habitat would be restricted from April 1 through June 15 in Alternative N, but no restrictions apply in Alternative A. This would result in increased opportunities for land use authorizations under Alternative A. However, impacts to the lands and realty program would be minimal because areas in which habitat restrictions apply are likely not areas in which demand for ROWs is high. Land use authorizations that do not involve surface-disturbing activities would not be affected by these restrictions.

Impacts from Fish and Wildlife

Impacts would be similar to those described under Alternative N.

Impacts from Fire and Fuels Management

Impacts would be the same as those described under Alternative N.

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness characteristics on lands outside of WSAs are proposed under this alternative, resulting in no additional restrictions on lands and realty.

Impacts from Travel Management

The types of impacts that would be experienced as a result of travel management would be similar to those described under Alternative N. However, this alternative designates 449,000 acres (21%) of the RFO as open to motorized vehicles; motor vehicles would be limited to designated routes on 1,679,000 acres (79%) of the RFO; and 0 acres would be closed to motorized vehicle use. The amount of open areas, although greatly reduced as compared to Alternative N, would provide relatively unrestricted opportunities for land use authorizations.

The remainder of the RFO would have motorized/mechanized use limited to designated routes, which would limit opportunities for land use authorizations to areas along those designated routes if the activity required motorized vehicle access for construction, operation, or maintenance (unless administrative access was granted for such purposes). Under this alternative, 4,312 miles of routes in the RFO would be open to motorized use.

No areas would be closed to motorized/mechanized use, with no accompanying restrictions (at least from travel decisions) on land use authorizations.

Impacts from Lands and Realty

One hundred and eighteen parcels totaling 13,400 acres are identified as available for sale under FLPMA Section 203 and could be sold pending site-specific environmental analysis. These sales would improve the manageability of the public land estate by disposing of parcels isolated or difficult to manage and could provide opportunities for community expansion. Conversely, grazing land, open space, wildlife habitat, and land available for other public land uses would be lost. Inholdings within the wilderness study areas would be priorities for acquisition, consolidating federal land ownership and improving manageability of public lands in these areas.

Under this alternative, 25 utility corridors would be designated (Appendix 5). Of these, 12 would be one-half mile in width and the remaining 13 would be 800 feet in width. These corridors follow existing utility lines or highway corridors. This would minimize adverse environmental impacts and the proliferation of separate ROWs in these areas, as well as help streamline the process for the authorizing energy transmission facilities and other utility ROWs.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

No river segments are recommended as suitable WSRs under this alternative.

Areas of Critical Environmental Concern

No ACECs are proposed for designation under this alternative.

Proposed RMP

Impacts from Visual Resources

The types of impacts experienced under this alternative would be similar to those described under Alternative A, except that more acres would be designated as VRM Classes I and II (696,700 acres, or 33% of the RFO), and fewer areas as VRM Classes III and IV (1,431,300 acres). This would result in less area where ROWs and other land use authorizations could be sited, which could affect associated costs to the ROW/permit applicant by requiring relocation or changes in project design to meet the VRM class objectives. This could also restrict or delay availability of communications service if suitable sites cannot be found.

Impacts from Special Status Species

Impacts would be similar to those described under Alternative N, except that the Proposed RMP has more restrictions on surface disturbing activities in Greater sage-grouse habitat including oil and gas leasing subject to major constraints (NSO) within ½ mile of leks and prohibiting surface disturbing or otherwise disruptive activities within sage-grouse winter habitat from December 15 through March 14 (see Appendix 11 for exception, waivers, and modifications). However, because 97 percent of sage grouse winter habitat is within mule deer crucial habitat, which has a timing limitation on surface disturbing activities from December 15 through April 15, the sage grouse winter timing limitation would only result in surface disturbing restrictions on an additional 2,200 acres. The restrictions could limit access and could delay project construction of new ROWs or reconstruction of existing ROWs, or result in siting restrictions. Restrictions on surface disturbing activities within Greater sage-grouse habitat are greater under the Proposed RMP than under any of the other alternatives. However, impacts to the lands and realty program are expected to be minimal because sage-grouse habitats are not typically areas in which demand for ROWs is high. Land use authorizations that do not involve surface-disturbing activities would not be affected by these restrictions.

Impacts from Fish and Wildlife

Impacts would be similar to those described under Alternative N, except that there are more restricted areas under the Proposed RMP. For example, activities within crucial desert bighorn sheep habitat would be restricted from April 15 through June 15 in the Proposed RMP, but no restrictions on surface-disturbing activities within bighorn sheep habitat would apply in Alternative N. However, impacts to the lands and realty program would be minimal because areas in which habitat restrictions apply are likely not areas in which demand for ROWs is high. Land use authorizations that do not involve surface-disturbing activities would not be affected by these restrictions.

Impacts from Fire and Fuels Management

Impacts would be the same as those described under Alternative N.

Impacts from Non-WSA Lands with Wilderness Characteristics

Approximately 78,600 acres within the RFO would be managed to maintain non-WSA wilderness characteristics. In addition to managing these areas as ROW avoidance areas, they would not be available for disposal and would be designated as VRM Class II. Avoiding placement of ROWs and associated surface disturbance in order to protect the wilderness values in these areas could re-route pipelines, power lines, and other infrastructure that may be needed for mineral-related activities, community enhancement, or development of inholdings.

Within the Proposed RMP, the boundaries of the Red Desert and Notom Bench non-WSA lands managed to maintain wilderness characteristics have been adjusted to exclude the existing powerline rights-of-way, plus a 1,000 foot buffer for future use and expansion. The boundary of the Little Rockies non-WSA area has been off-set from the adjacent State Highway 276 right-of-way corridor. These adjustments would minimize potential impacts to future ROW corridors.

Impacts from Travel Management

The types of impacts that would be experienced as a result of travel management would be similar to those described under Alternative N. However, this alternative designates only 9,890 acres (less than 1% of the RFO) as open to cross-country motorized vehicle use. This could limit the opportunities for land use authorizations if the connected activity required cross-country travel (unless administrative access was granted for such purposes). In addition, motorized users seeking that type of recreational opportunity would be concentrated into that relatively small area, which could result in conflicts with the holder of the land use authorization.

This alternative would close 209,900 acres (10% of the RFO) to motorized use, which would eliminate all opportunities for land use authorizations requiring motorized vehicle access. The remainder of the RFO (1,908,210 acres) would have motorized/mechanized use limited to designated routes, which would limit opportunities for land use authorizations to areas along those designated routes if the activity required motorized vehicle access for construction, operation, or maintenance (unless administrative access was granted for such purposes). Under this alternative, 4,277 miles of routes in the RFO would be open to motorized use.

Impacts from Lands and Realty

One hundred and eighteen parcels totaling 13,400 acres are identified as available for sale under FLPMA Section 203 and could be sold pending site-specific environmental analysis (same as Alternative A). These sales would improve the manageability of the public land estate by disposing of parcels that are isolated or difficult to manage and could provide opportunities for community expansion. Conversely, grazing land, open space, wildlife habitat, and land available for other public land uses would be lost. Inholdings within WSAs, one suitable WSR corridor (Fremont River in Fremont Gorge), and two ACECs (North Caineville Mesa and Old Woman Front) would be priorities for acquisition, consolidating federal land ownership and improving manageability of public lands in these areas.

The same utility corridors designated under Alternative A would also be designated in the Proposed RMP, resulting in the same impacts.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Management actions to protect the outstandingly remarkable values, free-flowing nature, and tentative classification of all suitable river segments affect the availability of these areas for lands and realty actions. Under this alternative, one river corridor (5 miles) is recommended as suitable and would be managed as an avoidance area for ROWs, which could result in denying ROWs or requiring realignment of the proposed ROW around the avoidance area. These restrictions would increase the cost of construction or preclude authorization of the ROW altogether. However, because these areas are remote in location, impacts to lands and realty should be negligible.

Areas of Critical Environmental Concern

Impacts would be similar to those described under Alternative N, except that fewer areas would be designated as ACECs (two ACECs, totaling 2,530 acres). Thus, potential impacts on the lands and realty program (in the form of fewer ROW avoidance areas and fewer focus areas for acquisition of inholdings) would be reduced.

Alternative C

Impacts from Visual Resources

The types of impacts experienced under this alternative would be similar to those described under the Proposed RMP, except that fewer acres would be designated as VRM Classes III and IV (1,450,500 acres). This would result in less area where ROWs and other land use authorizations could be sited, which could affect associated costs to the ROW/permit applicant. This could also restrict or delay availability of communications service if suitable sites cannot be found.

Impacts from Special Status Species

Impacts would be similar to those described under the Proposed RMP.

Impacts from Fish and Wildlife

Impacts would be similar to those described under Alternative N, except that there are additional restrictions for protection of wildlife habitat areas under Alternative C. For example, OHV use on 142,000 acres of deer and elk crucial winter range and 189,000 acres of crucial bison habitat would be closed under this alternative. This could limit opportunities for land use authorizations that require motorized vehicle use for access. However, impacts to the lands and realty program should be minimal because areas in which habitat restrictions apply are likely not areas in which demand for ROWs is high. Land use authorizations that do not involve surface-disturbing activities would not be affected by these restrictions.

Impacts from Fire and Fuels Management

Impacts would be the same as those described under Alternative N.

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness characteristics on lands outside of WSAs are proposed under this alternative, resulting in no additional restrictions on lands and realty.

Impacts from Travel Management

The types of impacts experienced as a result of travel management would be similar to those described under the Proposed RMP. However, this alternative designates no areas as open to motorized vehicles. The lack of open areas would eliminate opportunities for land use authorizations if the connected activity required cross-country travel (unless administrative access was granted for such purposes).

This alternative would close 683,000 acres (32% of the RFO) to motorized use, which would eliminate all opportunities for land use authorizations requiring motorized vehicle access. The remainder of the RFO (1,445,000 acres) would have motorized/mechanized use limited to designated routes, which would limit opportunities for land use authorizations to areas along those designated routes if the activity required motorized vehicle access for construction, operation, or maintenance (unless administrative access was granted for such purposes). Under this alternative, 3,192 miles of routes in the RFO would be open to motorized use.

Impacts from Lands and Realty

No lands are identified as available for sale under FLPMA Section 203; hence, there would be no beneficial or adverse impacts to the federal land ownership pattern. Inholdings within the WSAs, all suitable WSR corridors, and all ACECs would be priorities for acquisition, which would consolidate the ownership pattern in these special designations.

The same utility corridors designated under Alternative A would also be designated in the Proposed RMP, resulting in the same impacts.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Impacts would the same as those described under Alternative N.

Areas of Critical Environmental Concern

The types of impacts experienced from the designation of ACECs would be similar to those described under Alternative N, except that significantly more areas would be designated as ACECs (16 areas, totaling 886,810 acres). Thus, potential impacts on the lands and realty program (in the form of many more ROW avoidance areas and more focus areas for acquisition of inholdings) would be substantially greater.

Alternative D

Impacts from Visual Resources

The types of impacts experienced under this alternative would be similar to those described under Alternative C, except that even fewer acres would be designated as VRM Classes III and IV (931,700 acres). This alternative would be the most restrictive on where ROWs and other land use authorizations could be sited and would be most likely to affect associated costs to the ROW/permit applicant, and most likely to delay or restrict availability of communications service in some areas.

Impacts from Special Status Species

Impacts would be the same as those described under the Proposed RMP.

Impacts from Fish and Wildlife

Impacts would be similar to those described under Alternative C, except that there are additional restrictions for protection of wildlife habitat areas under Alternative D. For example, OHV use on 258,000 acres of deer and elk crucial winter range and 207,000 acres of crucial bison habitat would be closed under this alternative. This alternative could limit opportunities for land use authorizations that require motorized vehicle use for access—the most of any alternative. However, impacts to the lands and

realty program should still be minimal because areas in which habitat restrictions apply are likely not areas in which demand for ROWs is high. Land use authorizations that do not involve surface-disturbing activities would not be affected by these restrictions.

Impacts from Fire and Fuels Management

Impacts would be the same as those described under Alternative N.

Impacts from Non-WSA Lands with Wilderness Characteristics

Approximately 682,600 acres within the RFO would be managed to preserve non-WSA wilderness characteristics. In addition to managing these areas as ROW exclusion areas, they would not be available for disposal and would be designated as VRM Class I. Prohibiting ROWs and associated surface disturbance in order to protect the wilderness values in these areas would preclude pipelines, power lines, and other infrastructure that may be needed for mineral-related activities, community enhancement, or development of inholdings.

In order to protect wilderness characteristics values, lands identified for disposal in the Notom Bench and Dogwater Creek non-WSA lands with wilderness characteristics would be retained in federal ownership. This would preclude the augmentation of contiguous private ranchlands in these areas.

All 682,600 acres of non-WSA lands with wilderness characteristics would be proposed for mineral withdrawal under this alternative. This would preclude extraction of all locatable minerals, including uranium and vanadium, from these lands, subject to valid existing rights.

Protecting wilderness characteristics lands would preclude designation of the full widths of ROW corridors along Highway 24 within Wild Horse Mesa, Red Desert, Fremont Gorge, and Notom Bench non-WSA lands with wilderness characteristics. In addition, corridor widths would be limited to outside non-WSA lands along State Highways 95, 276, and 62 within Little Rockies, Fiddle Butte, Rocky Ford, Phonolite Hill, and Kingston Ridge non-WSA lands. Narrowing the corridors could preclude some future ROWs, especially large electrical lines, because lines would have to be sited too close together, which could result in sparking and other electrical interference.

Impacts from Travel Management

The types of impacts experienced as a result of travel management would be similar to those described under Alternative C. Similar to Alternative C, this alternative designates no areas as open to motorized vehicles, which would eliminate opportunities for land use authorizations if the connected activity required cross-country travel (unless administrative access was granted for such purposes).

This alternative would close significantly more (1,155,200 acres, or 32%) of the RFO to motorized use, which would eliminate all opportunities for land use authorizations requiring motorized vehicle access. The remainder of the RFO (972,800 acres) would have motorized/mechanized use limited to designated routes, which would limit opportunities for land use authorizations to areas along those designated routes if the activity required motorized vehicle access for construction, operation, or maintenance (unless administrative access was granted for such purposes). Under this alternative, 3,043 miles of routes in the RFO would be open to motorized use. This alternative would provide the least opportunity for land use authorizations requiring motorized vehicle access.

Impacts from Lands and Realty

No lands are identified as available for sale under FLPMA Section 203; hence, there would be no beneficial or adverse impacts to the federal land ownership pattern. Inholdings within non-WSA lands

with wilderness characteristics areas, WSAs, suitable WSR corridors, and ACECs would be priorities for acquisition, which would consolidate the ownership pattern in these areas.

Under this alternative, the same utility corridors designated under Alternative A would also be designated in the Proposed RMP, except that widths for four of the corridors (along State Highways 95, 276, and 62) would be narrower to avoid non-WSA lands. As described above (in the Non-WSA Lands with Wilderness Characteristics section), narrowing the corridors could preclude some future ROWs, especially large electrical lines, because lines would have to be sited too close together. Impacts from designating the other 21 corridors would be the same as described under Alternative A.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Impacts would be the same as those described under Alternative C.

Areas of Critical Environmental Concern

Impacts would be the same as those described under Alternative C.

4.4.6 Minerals and Energy

4.4.6.1 Leasable Minerals

Oil and Gas

Oil and gas resources within the RFO would be available for leasing under the alternatives, as depicted in Table 4-38. Alternative A would make the most land (79% of the lands managed by the RFO) available for oil and gas leasing; Alternative D, the least (45%). Likewise, Alternative A would impose the fewest restrictions on exploration and development; Alternative D would be the most restrictive. Maps 2-34, 2-35, 2-36, 2-37, and 2-38 show the leasing categories by alternative.

Table 4-38. Oil and Gas Leasing Categories, Acres, and Percentage of RFO

Leasing Categories		Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
Open	Standard Lease Terms	1,236,500 ac 58%	860,600 ac 40%	608,700 ac 29%	491,900 ac 23%	290,200 ac 14%
	Controlled Surface Use or Timing Stipulations	409,200 ac 19%	820,500 ac 39%	917,500 ac 43%	901,100 ac 42%	634,000 ac 30%
Open	No Surface Occupancy	22,600 ac 1%	0 ac 0%	154,500 ac 7%	148,700 ac 7%	43,300 ac 2%
	Total Open	1,668,300 ac 78%	1,681,100 ac 79%	1,680,700 ac 79%	1,541,700 ac 72%	967,500 ac 46%
Closed to Leasing		459,700 ac 22%	446,900 ac 21%	447,300 ac 21%	586,300 ac 28%	1,160,500 ac 54%

Mineral potential for oil and gas is assessed in the *Mineral Potential Report for Sanpete, Sevier, Wayne, and Garfield Counties, Richfield Field Office* (BLM 2005b), which is available for review on the planning project website at http://www.blm.gov/ut/st/en/fo/richfield/planning.html. In addition, a Reasonably Foreseeable Development (RFD) scenario was developed for oil and gas activities in the planning area in conformance with IM 2004-089 (Appendix 12). The RFD is a prediction of the number of wells to be drilled, acreage of surface disturbance, and a rating of activity (development potential), based on the assumptions and analysis in the Mineral Potential Report. Table 4-39 is a summary of the RFD. The RFD does not differentiate between activities on public versus non-public lands. In the RFD, the planning area is divided into four areas, based on USGS oil and gas plays and predicted activity within the plays.

Table 4-39. Reasonably Foreseeable Development for Oil and Gas

Defined Area	General Area	Number of Wells Predicted	Surface Disturbance Geophysical (Acres)	Surface Disturbance Wells (Acres)	Oil and Gas Occurrence Potential*	Development Potential*
Areas 1 & 2	Piute, Wayne, and Garfield counties	45 wells	240 ac	540 ac	Wayne and Garfield Counties and Eastern Piute	Low

Defined Area	General Area	Number of Wells Predicted	Surface Disturbance Geophysical (Acres)	Surface Disturbance Wells (Acres)	Oil and Gas Occurrence Potential*	Development Potential*
					County Are High Potential; Western Piute County and the Antimony Area Are Moderate	
Area 3	Eastern Sevier and Sanpete Counties—Wasatch Plateau Area	49 wells	360 ac	1,100 ac	High	Moderate
Area 4	Western Sevier and Sanpete Counties—Sevier and Sanpete Valleys	360 wells	4,500 ac	1,440 ac	High**	High
Total		**454 wells**	**5,100 ac**	**3,080 ac**		

* Oil and gas occurrence potential and development potential are based on the *Mineral Potential Report* and RFD, respectively. In the RFD, development potential is defined as the relative likelihood of activity, not development per se. The *Mineral Potential Report* stated that development is likely in Areas 3 and 4 and unlikely in Areas 1 and 2. The RFD modified the development potential, based on published information available after the completion of the *Mineral Potential Report*.
**Area 4 includes the Sevier Frontal Thrust play and other plays. Given the overlap of the plays, the potential is based on the thrust play.

Most oil and gas activity is predicted in the western part of the planning area in Area 4 in association with the Sevier Frontal play, also referred to as the Central Utah Thrust play, which generally encompasses the Sevier and Sanpete Valleys and adjacent ranges. Area 3 is located in the vicinity of the Wasatch Plateau and includes conventional gas as well as coalbed methane gas. Areas 1 and 2 include the southern parts of the planning area in Piute, Wayne, and eastern Garfield counties, as well as several plays associated with the Paradox Basin province and the Permo-Triassic Unconformity play.

Methods and Assumptions

The analysis for impacts to oil and gas assumes:

- Oil and gas activity—exploration, drilling, and production, if paying quantities of oil or gas are discovered—would be managed according to applicable law, federal regulations, and onshore orders and would be managed to mitigate impacts to other resources according to BMPs appropriate to the site/location.
- The RFD is a reasonable prediction of oil and gas activity for the planning horizon.

Environmental Consequences

Impacts to oil and gas activity would most likely result from actions proposed for the management of the following resources:

- Soil Resources and Water Resources
- Cultural Resources
- Visual Resources
- Special Status Species
- Fish and Wildlife
- Non-WSA Lands with Wilderness Characteristics
- Recreation
- Lands and Realty
- Special Designations.

Other programs were determined to have little or no impact on oil and gas leasing and development.

Alternative N: No Action

Impacts from Soil Resources and Water Resources

Managing public lands to protect soil and water would have an impact on oil and gas activity as mitigations would be developed that would modify proposed oil and gas operations when an application, such as a Notice of Intent (NOI) for Geophysical Exploration or Application for Permit to Drill (APD), is received by the BLM. Most mitigation would be required based on the federal regulations, the standard lease terms, and best management practices. Oil and gas operations would be restricted by a major leasing constraint on lands with steep slopes, canyon walls, or muddy and wet conditions, and where watersheds may be impaired. These areas are specifically:

- Moroni Slopes, Blue Hills, and Dirty Devil River Canyons (no occupancy or other surface disturbances where grades of slopes are greater than 50%)
- Dirty Devil River canyons (no occupancy within the canyon)
- Municipal water supplies (no occupancy or other surface disturbance)
- Live water (no occupancy or other surface disturbance within 500 feet).

The slope restriction would have an adverse impact on exploration and development by disallowing occupancy for drilling and surface facilities. Vertical drilling is preferred over directional, as vertical wells are less expensive to drill and are more likely to be successful. The above areas are specified by legal description and are protected by a lease stipulation, which has provisions for exceptions, waivers, or modifications in some areas.

Impacts from Cultural Resources

Managing public lands to protect cultural resources would impact oil and gas activity as mitigations or restrictions would be developed that would modify proposed oil and gas operations when an application, such as an NOI for Geophysical Exploration or APD, is received by the BLM. Archaeological sites and sites eligible for the National Register would be avoided, and mitigation would be required as consistent with the federal laws and regulations and the standard lease terms. Modifying proposed exploration and development would have adverse impacts by delaying the time required for approval.

Oil and gas operations would be subject to NSO in the following areas:

- Bull Creek Archaeological District
- Susan Rockshelter Archaeological Site
- Fish Cove Archaeological Site.

NSO would preclude drilling or other facilities on the above sites and would have an adverse impact on exploration and development. If the proposed subsurface target is beneath one of the above sites, the drilling would need to be by directional methods, which would increase drilling costs and would decrease the likelihood of successful exploration.

Cultural resources within four existing ACECs—Beaver Wash Canyon, North Caineville Mesa, South Caineville Mesa, and the Gilbert Badlands—would be protected by additional management prescriptions for those designated areas. The existing ACECs are open to leasing subject to major constraints (NSO), except for Beaver Wash Canyon, which is closed to leasing.

Impacts from Visual Resources

Managing visual resources on public lands would have an impact on oil and gas activity as mitigations would be developed that would modify proposed oil and gas operations when an application, such as an NOI for Geophysical Exploration or APD, is received by the BLM. Based on the VRM class, mitigations would be developed consistent with the guidelines of the VRM classes and the federal laws and regulations and standard lease terms. The VRM guidelines for the RFO are VRM Class I, 0 acres, which is 0% of public land within the RFO; VRM Class II, 529,000 acres, which is 25%; VRM Class III, 569,000 acres, which is 27%; and VRM Class IV, 1,029,500 acres, which is 48%. The WSAs (446,900 acres) would be managed as VRM Class I, although they may be designated in other VRM classes. An area designated VRM Class II would allow for minimal change to its landscape character, thus oil and gas activity would be very restricted, or activities may need to be redesigned or moved depending on the proposed oil and gas operation. This restriction would preclude drilling on the surface and preclude surface facilities, unless these meet the VRM objective. The restriction could require drilling to be by directional methods from adjacent land, which would increase cost and would decrease the likelihood of success of wildcat wells. Areas designated VRM Class IV would allow for major modifications of the landscape, thus oil and gas activity would be minimally impacted compared to VRM Class II.

The following areas are designated as NSO:

- Utah Highway 24 in places in the vicinity of Torrey
- Utah Highway 95 at North Wash
- Notom Road east of Capitol Reef National Park.

The land subject to NSO is within 1,320 feet of the centerline of the roadway unless the oil and gas activity is not visible from the highway or road. NSO would preclude drilling or other facilities within the above highway corridors and would have an adverse impact on exploration and development. If a proposed subsurface target is within one of the above corridors, the drilling would need to be by directional methods from adjacent land, which would increase drilling costs and would decrease the likelihood of successful exploration.

Impacts from Special Status Species

All oil and gas federal actions would be subject to the requirements of the Endangered Species Act of 1973, as amended. Any action potentially affecting any listed threatened or endangered species would require the appropriate level of Section 7 consultation with (USFWS). Necessary mitigation, such as timing and avoidance, would be implemented to protect listed plant and animal species, subject to applicable federal laws, regulations, and lease terms. Applicable lease notices for subject SSS that may be present would be attached to a lease when authorized. The mapped sage-grouse strutting (leks) and nesting (brooding) areas within the Parker Mountain planning area would be subject to a seasonal restriction for oil and gas exploration and development. Surface disturbing activities would be prohibited near Greater sage-grouse leks from March 1 through July 15 and within sage grouse brooding/nesting

habitat from April 1 through June 15. Distance or timing restrictions for SSS would have an adverse impact on oil and gas operations. Requirements for SSS inventories may result in relocating proposed well sites or other surface facilities and delays in permitting oil and gas operations. Seasonal restrictions would have adverse impacts to oil and gas exploration and development if a proposed deep well could not be feasibly drilled and completed within the open season, precluding drilling deep exploration targets. Distance restrictions would require directional drilling instead of vertical drilling, which would increase drilling cost, and directional drilling in wildcat areas would have less likelihood of success. Because the Parker Mountain planning area, where Greater sage-grouse leks are located, has low oil and gas development potential, impacts resulting from sage-grouse stipulations are expected to be low. There are currently only four sage-grouse leks in this area although that number could increase in the future.

Impacts from Fish and Wildlife

Management of wildlife habitat would have an impact to oil and gas exploration and development through imposing restrictions for when oil and gas activity would be allowed. Crucial winter range for deer, elk, antelope, and bison have seasonal restrictions for when exploration and development may occur. In addition, pronghorn (antelope) kidding range and bison yearlong range are seasonally restricted for oil and gas activity. These timing restrictions affect when oil and gas exploration and development would be allowed. Seasonal restrictions would have adverse impacts to oil and gas exploration and development, as a company would need to schedule activities during the open season. Equipment, such as drill rigs and work crews, would not necessarily be available during the open season. Delays in permitting proposed operations and contracting necessary equipment and crews would increase costs for exploration and development. On deeper wells, the seasonal restrictions would preclude drilling deep targets when the well could not be feasibly drilled and completed within the open season. Habitat for these animals that is open to leasing subject to minor constraints, such as timing restriction, would be open or closed as shown in Table 4-40 below.

Table 4-40. Oil and Gas Leasing Stipulations within Crucial Wildlife Habitat—Alternative N

			Deer	Pronghorn	Bison	Elk
Open	Standard Lease Terms	Acres	225,400 ac	23,600 ac	89,400 ac	82,300 ac
		% Habitat	40%	23%	36%	39%
Open	Timing or Controlled Surface Use Restrictions	Acres	243,800 ac	73,300 ac	44,600 ac	124,900 ac
		% Habitat	43%	71%	18%	59%
	No Surface Occupancy	Acres	8,500 ac	5,300 ac	500 ac	4,900 ac
		% Habitat	1%	5%	<1%	2%
Closed		Acres	91,500 ac	500 ac	116,400 ac	100 ac
		% Habitat	16%	1%	46%	<1%

The CSU, NSO, and Closed designations are not necessarily imposed for the protection of wildlife but because the wildlife habitat is enclosed within those areas. This alternative would have the least impact on oil and gas exploration, as the land subject to habitat restrictions or closure would be the least under this alternative.

Impacts from Non-WSA Lands with Wilderness Characteristics

Under this alternative, no actions to maintain wilderness characteristics on lands outside of WSAs are proposed, resulting in no impact to oil and gas exploration and development.

Impacts from Recreation

Under this alternative, no SRMAs would be established. The following areas would be subject to NSO:

- Jet Basin
- Pink Cliffs
- Star Springs
- Fremont River Gorge
- Otter Creek.

The NSO designation reduces the opportunity for oil and gas exploration and development because drilling and surface facilities would be disallowed. If subsurface targets beneath the above sites were drilled, then directional drilling would be necessary. Drilling directional wells is more expensive than drilling vertical wells, and directional drilling is less likely to be successful in wildcat areas.

The following areas would be closed to leasing:

- Little Rockies
- Beaver Wash Canyon.

In closed areas, oil and gas resources would not be explored and would not be available for development.

Impacts from Lands and Realty

The following areas would be open to leasing subject to major constraints (NSO):

- Cemeteries
- Landfills, existing and closed
- Lands managed under Recreation and Public Purpose Act lease.

The following areas would be closed to leasing:

- Incorporated municipalities.

Limiting the above areas subject to NSO or closure to leasing would affect oil and gas exploration and development. The NSO areas would reduce the opportunity for oil and gas exploration and development because drilling from the NSO-restricted surface and other surface facilities would be disallowed. If subsurface targets beneath the above sites were drilled, then directional drilling would be necessary. Drilling directional wells would be more expensive than drilling vertical wells, and directional drilling would be less likely to be successful than vertical drilling in wildcat areas. In closed areas, undiscovered oil and gas resources would not be explored and would not be available for development.

Impacts from Special Designations

Wilderness Study Areas

WSAs, encompassing 446,900 acres, would be closed to leasing for oil and gas exploration and development. The WSAs are within the low activity area (low development potential area) in the RFD scenario for oil and gas, where the prediction is for one well per year or 45 wells for the planning horizon.

However, none of those wells were predicted for WSAs, as the RFD does not apply to lands that are closed to leasing by law, which is the case for WSAs. Closing WSAs to leasing is required by law; therefore, the decisions in this PRMP/FEIS would not impact oil and gas exploration and development within WSAs.

Wild and Scenic Rivers

Managing 12 eligible WSR corridors totaling 135 miles would affect oil and gas exploration and development by limiting surface-disturbing activities within the river corridors. No decision would be made under this alternative for suitability. There are 98 miles (73% of the total miles) of the eligible river segments that are within WSAs, which are closed to leasing. The management prescription for the 37 miles of river segments outside of WSAs would vary in management from open subject to standard terms to closed to leasing. The eligible rivers are within areas with high potential for the occurrence of oil and gas with a predicted low activity level (development potential), except Quitchupah Creek, which has a predicted moderate activity level. The protected corridor for WSRs, where designated as such, is one-quarter mile of the high water mark on each bank of the river segment. The management of WSRs outside of WSAs would have adverse impacts to oil and gas exploration and development. The NSO segments would require directional drilling and no surface facilities, which would increase cost and would decrease the likelihood of successful exploration. In the segments closed to leasing, oil and gas resources would not be explored and would not be available for development.

Areas of Critical Environmental Concern

The four existing ACECs would affect oil and gas exploration and development. At Beaver Wash, 4,800 acres are closed to leasing. At Gilbert Badlands, 3,680 acres, and at North and South Caineville Mesas, 2,200 and 4,100 acres, respectively, are subject to NSO. At Beaver Wash, which would be closed to leasing, oil and gas resources would not be explored and would not be available for development. At Gilbert Badlands and the Caineville Mesas ACECs, oil and gas exploration and development would be impacted by requiring the relocation of well sites and surface facilities. The relocation of well sites would require directional drilling. Such impacts would increase the cost of exploration and would affect the likelihood of successful exploration.

Alternative A

Impacts from Soil Resources and Water Resources

Managing public lands to protect soil and water would have an impact on oil and gas activity as mitigations would be developed that would modify proposed oil and gas operations when an application, such as an NOI for Geophysical Exploration or APD, is received by the BLM. Most mitigation would be required based on the federal regulations, the standard lease terms, and best management practices. In order to protect soil and water, controlled surface use would establish the following minor constraints:

- Exploration and development would not be allowed within 330 feet of live water
- Exploration and development would not be allowed within 330 feet of a spring
- Exploration and development would not be allowed within zones of hydric soils
- Exploration and development within areas of high potential for wind erosion, as identified by the Natural Resources Conservation Service (NRCS), would require plans for soil stabilization or signing
- Exploration and development on slope gradients that are 30% or greater would require appropriate design in the surface use plan of operations.

The above CSU requirements would have provisions for exceptions, modifications, and waivers as addressed in Appendix 11, but they could require redesign or result in the inability to develop oil and gas in some locations.

Slopes that have a gradient that is greater than 30% would be subject to CSU. This moderate constraint would be subject to exception or modification, based upon adequate design for the control or reduction of erosion.

Managing for the above soil and water conditions would add costs and delays to permitting oil and gas exploration activities, although most of the above-stated conditions would require a relocation of less than 660 feet. Where the relocation is more than 660 feet for a proposed drilling site, directional drilling would be required instead of vertical, which would increase costs and decrease the likelihood of successful exploration.

Impacts from Cultural Resources

Impacts to oil and gas activity from the management of cultural resources would be similar to those described under Alternative N, except designated areas with specific protection for cultural resources (e.g., ACECs with culturally relevant and important values) are not proposed in this alternative. Oil and gas exploration and development would be mitigated by requirements imposed for site-specific applications as consistent with the federal laws and regulations and the standard lease terms. Mitigation would require avoidance of cultural resources and such mitigation would impact oil and gas exploration and development through an increased cost for cultural resource inventories and relocation of proposed wells and surface facilities.

Impacts from Visual Resources

The types of impacts experienced from visual resource management would be similar to, but slightly less than, those described under Alternative N, due to the following changes to the designated VRM classes: VRM Class I, 446,900 acres (21% of the RFO); VRM Class II, 0 acres (0%); VRM Class III, 392,800 acres (18%); and VRM Class IV, 1,288,300 acres (61%). VRM Class I would impact oil and gas exploration as surface disturbance would be disallowed, unless appropriate mitigation met the objective of this VRM class; however, the VRM Class I lands are also WSAs that are closed to oil and gas leasing. Thus VRM Class I designations, in effect, do not impact oil and gas. VRM Classes III and IV designated lands would have minimal impact on oil and gas, although there could be some delays and added costs to develop mitigations, such as use of appropriate paint colors, building facilities in a manner that blends better with the landscape, and other minor changes in operations. The impacts to oil and gas activity from visual resources would be the least in Alternative A.

Impacts from Special Status Species

The types of impacts experienced from management of SSS would be similar to those described under Alternative N, except a one-quarter mile seasonal buffer (March 15 through June 1) for no surface disturbance or permanent structure would be imposed around sage-grouse leks. In this alternative, there would not be a timing restriction for brooding (nesting) areas imposed as a lease stipulation, thus any timing or distance restriction would be imposed at the time of an application for exploration and development, based on applicable federal laws and regulations and the standard lease terms. Requiring the one-quarter mile seasonal buffer would result in delaying development activities or relocating wells or facilities and could result in directional drilling to a subsurface target. Completing species inventories, selecting relocated sites, and directional drilling would increase delays in permitting and the costs of exploration and development, and directional drilling would decrease the likelihood of successful exploration. Seasonal restrictions would have adverse impacts to oil and gas exploration and development when a proposed deep well could not be feasibly drilled and completed within the open season,

precluding drilling deep exploration targets. Because the Parker Mountain planning area, where sage-grouse leks are located, has low oil and gas development potential, impacts resulting from sage-grouse stipulations are expected to be low. There are currently only four sage-grouse leks in this area although that number could increase in the future. This alternative would be the least restrictive for oil and gas exploration and development and would thus result in the least impacts to those activities.

Impacts from Fish and Wildlife

Under this alternative, there would be no special stipulations for oil and gas leasing. However, mitigation may still be applied for wildlife crucial habitats at the time of exploration and development, and mitigation for desert bighorn sheep would also be included under this alternative. Although the CSU, NSO, and closed acreage within Table 4-41 below are not necessarily imposed for the protection of wildlife, wildlife habitat is enclosed within those areas. The requirement of mitigation for wildlife species, if necessary, would most likely occur for the acres in the CSU category, which is the most CSU acres of any of the alternatives, and could result in impacts to oil and gas exploration and development. Seasonal restrictions would have adverse impacts to oil and gas exploration and development, as a company would need to schedule activities during the open season. Equipment, such as drill rigs and work crews would not necessarily be available during the open season. Delays in permitting proposed operations and contracting necessary equipment and crews would increase costs for exploration and development. On deeper wells, seasonal restrictions would preclude drilling deep targets, when the well could not be feasibly drilled and completed within the open season.

Table 4-41. Oil and Gas Leasing Stipulations within Crucial Wildlife Habitat—Alternative A

			Deer	Pronghorn	Bison	Bighorn	Elk
Open	Standard Lease Terms	Acres	400 ac	0 ac	200 ac	8,700 ac	100 ac
		% Habitat	<1%	0%	<1%	4%	<1%
	Timing or Controlled Surface Use Restrictions	Acres	477,300 ac	102,700 ac	134,300 ac	121,200 ac	212,100 ac
		% Habitat	84%	100%	54%	53%	100%
	No Surface Occupancy	Acres	0 ac	0 ac	0 ac	0 ac	0 ac
		% Habitat	0%	0%	0%	0%	0%
Closed		Acres	91,500 ac	0 ac	116,400 ac	97,400 ac	0 ac
		% Habitat	16%	0%	46%	43%	0%

Impacts from Non-WSA Lands with Wilderness Characteristics

Impacts would be the same as for Alternative N.

Impacts from Recreation

Under this alternative, five SRMAs would be established: Dirty Devil/Robbers Roost, Big Rocks, Sahara Sands, Otter Creek, and Factory Butte. Only Dirty Devil/Robbers Roost would be specifically managed for semi-primitive and primitive recreation. However, other than the portion of this SRMA within designated WSAs, the lands would be subject to standard lease terms and minor constraints for oil and

gas activity. Thus, the SRMAs would generally not impose stricter restrictions on oil and gas exploration and development.

Impacts from Lands and Realty

Impacts would be the same as described under Alternative N.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as described under Alternative N.

Wild and Scenic Rivers

Under this alternative, no eligible river segments would be recommended as suitable for wild and scenic designations. There would be no impact to oil and gas activity.

Areas of Critical Environmental Concern

No ACECs would be designated, and the four existing ACECs in Alternative N would no longer be designated as such. There would be no impacts to oil and gas from ACEC designations. Relevant and important values for the potential ACECs would be protected by applicable federal laws and regulations and the standard lease terms.

Proposed RMP

Impacts from Soil and Water

The impacts would be the same as those described under Alternative A.

Impacts from Cultural Resources

Impacts would be similar to those described under Alternative N, except designated areas with specific protection for cultural resources are not proposed in this alternative. Thus, no impacts associated with those restrictions would occur. Oil and gas exploration and development would be mitigated by requirements imposed at the time of review of site-specific applications as consistent with federal laws and regulations and the standard lease terms. Mitigation, if required, would include avoidance of cultural resources and such mitigation would impact oil and gas exploration and development through an increased cost for cultural resource inventories and relocation of proposed wells and surface facilities.

Two ACECs would be designated and the management prescription for those two areas would provide additional protection for cultural resources. These ACECs would be open to leasing subject to major constraints (NSO), which could make development of oil and gas unfeasible. These ACECs are:

- North Caineville Mesa
- Old Woman Front.

NSO would require directional drilling and no surface facilities, which would increase cost and would decrease the likelihood of successful exploration, as directional drilling is more expensive and less successful for exploration than vertical drilling.

Impacts from Visual Resources

The types of impacts experienced as a result of visual resource management would be the same as those described under Alternative N, except the designated VRM classes are changed as follows: VRM Class I, 446,900 acres (21% of the RFO); VRM Class II, 249,800 acres (12%); VRM Class III, 393,100 acres

(18%); and VRM Class IV, 1,038,200 acres (49%). VRM Classes I and II would impact oil and gas exploration, as surface disturbance would be disallowed, unless appropriate mitigation met the objective of these VRM classes. The VRM Class I designated lands are also WSAs that are closed to the leasing of oil and gas; thus VRM Class I designations, in effect, do not impact oil and gas. VRM Class II would preclude drilling on the surface and preclude surface facilities, unless it meets the VRM objective, and the restriction could require drilling to be by directional methods from adjacent land, which would increase cost and would decrease the likelihood of success of wildcat wells. VRM Classes III and IV designated lands would have minimal impact on oil and gas, although there could be some delays and added costs to develop mitigations, such as appropriate paint colors, building facilities in a manner that blends better with the landscape, and other minor changes in operations. This alternative has more VRM Classes I and II acres than Alternatives N or A, which would result in more restrictions to oil and gas activities.

Impacts from Special Status Species

The types of impacts experienced as a result of SSS management would be similar to those described under Alternative N, except that the Proposed RMP has greater restrictions on surface disturbing activities within Greater sage-grouse habitat. These restrictions include managing the area as open to oil and gas leasing subject to major constraints (NSO) within ½ mile of Greater sage-grouse leks and prohibiting surface disturbing or otherwise disruptive activities within 2 miles of a lek from March 15 through July 15, and within sage-grouse winter habitat from December 15 through March 14 (see Appendix 11 for exceptions, waivers, and modifications). However, because 97 percent of sage grouse winter habitat is within mule deer crucial habitat, which under the Proposed RMP has a timing limitation on surface disturbing activities from December 15 through April 15, the sage grouse winter timing limitation would only result in surface disturbing restrictions on an additional 2,200 acres. The NSO and the 2-mile buffer would require relocating wells or facilities at a greater distance than in Alternatives N and A, and could require directional drilling to a subsurface target. Completing species inventories, selecting relocated sites, and directional drilling would increase delays in permitting and the costs of exploration and development, and the greater distance for directional drilling would further decrease the likelihood of successful exploration. Seasonal restrictions would have adverse impacts to oil and gas exploration and development when a proposed deep well could not be feasibly drilled and completed within the open season, precluding drilling deep exploration targets. The winter timing limitation is not expected to affect oil and gas development since access to this winter habitat is limited. Because Parker Mountain, where sage-grouse leks are located, has low oil and gas development potential, impacts resulting from sage-grouse stipulations to protect breeding and brood-rearing habitat are expected to be low. There are currently only four sage-grouse leks on BLM land on Parker Mountain although that number could increase in the future.

Impacts from Fish and Wildlife

The impacts to oil and gas exploration and development from wildlife management would be similar to Alternative N, except the acreage of habitat under each open or closed designation changes, and habitat has been added for desert bighorn sheep which would impose restrictions on oil and gas exploration and development (Table 4-42). Exceptions, waivers and modifications to the seasonal restrictions (Appendix 11) in some cases would allow development activities to occur. Maps 3-5, 3-6, and 3-7 show crucial wildlife habitat for the alternatives. Seasonal restrictions would have adverse impacts to oil and gas exploration and development, as a company would need to schedule activities during the open season. Equipment, such as drill rigs and work crews, would not necessarily be available during the open season. Delays in permitting proposed operations and delays in contracting necessary equipment and crews would increase costs for exploration and development. On deeper wells, seasonal restrictions would preclude drilling deep targets, when the well could not be feasibly drilled and completed within the open season. Designated NSO areas would require directional drilling and no surface facilities, which would increase

cost and would decrease the likelihood of successful exploration. In the areas closed to leasing, oil and gas resources would not be explored and would not be available for development.

Leasing stipulations within crucial wildlife habitat are shown in Table 4-42 below:

Table 4-42. Oil and Gas Leasing Stipulations within Crucial Wildlife Habitat—Proposed RMP

			Deer	Pronghorn	Bison	Bighorn	Elk
Open	Standard Lease Terms	Acres	0 ac	0 ac	0 ac	0 ac	0 ac
		% Habitat	0%	0%	0%	0%	0%
	Timing or Controlled Surface Use Restrictions	Acres	689,400 ac	204,000 ac	120,000 ac	86,700 ac	263,900 ac
		% Habitat	87%	98%	46%	38%	99%
	No Surface Occupancy	Acres	36,500 ac	4,700 ac	16,000 ac	43,200 ac	2,500 ac
		% Habitat	5%	2%	6%	19%	1%
Closed		Acres	68,600 ac	0 ac	122,600 ac	97,500 ac	450 ac
		% Habitat	9%	0%	47%	43%	0%

Impacts from Non-WSA Lands with Wilderness Characteristics

Under the Proposed RMP, a total of 78,600 acres of non-WSA lands with wilderness characteristics would be managed to protect, preserve, and maintain the naturalness and outstanding opportunities for solitude and primitive recreation within these areas. The 12 non-WSA lands with wilderness characteristics would require NSO stipulations that could limit exploration and development of oil and gas resources. These non-WSA lands with wilderness characteristics encompass approximately 4% of the acreage of public lands in the RFO and are located in the eastern part of the RFO.

The planning area has been divided into four geographic areas, defined by USGS plays and assessment units. These are (1) the eastern portion of Wayne and Garfield counties (generally east of R. 12 E.), which is underlain by true Paradox Basin plays (USGS-2101, USGS-2102, USGS-2103, and USGS-2105); (2) the southern part of the planning area, as defined by the Permo-Triassic Unconformity Play (USGS-2106); (3) the Wasatch Plateau, defined by the Cretaceous Sandstone Play (USGS-2107), but also including CBNG in the Ferron, Emery, and Blackhawk coals; and (4) the area from the eastern boundary of the Sevier Frontal Zone Play (USGS-1907) to the western boundary of the planning area.

All of the non-WSA land with wilderness characteristics managed to maintain their wilderness characteristics (approximately 78,600 acres) would be in the low activity RFD area, Areas 1 and 2 combined. No non-WSA lands with wilderness characteristics would be managed to specifically maintain those characteristics within the moderate or high activity RFD areas, Areas 3 and 4 respectively. Although only three wells per year are predicted in RFD Areas 1 and 2 during the plan life (45 in the low activity areas), the restrictions on leasing could affect the opportunity to explore for oil and gas resources and to develop any resources that may be discovered.

Impacts from Recreation

Under this alternative, five SRMAs would be established—Henry Mountains, Dirty Devil/Robbers Roost, Capitol Reef Gateway, Factory Butte, and Big Rocks—which would result in greater impacts to oil and gas than under Alternatives N and A. The Henry Mountains, Dirty Devil/Robbers Roost, and Capitol Reef Gateway SRMAs would provide opportunities for primitive and semi-primitive motorized and non-

motorized recreation. The portion of the Dirty Devil/Robbers Roost SRMA with Class A scenery, outside of WSAs, would be subject to NSO. These SRMAs are within a low activity RFD area (Areas 1 and 2 combined) that is predicted to have 3 wells per year or 45 wells during the plan life. The NSO designation would reduce the opportunity for exploration and development by requiring no surface disturbance within those designated areas and would require directional drilling and no surface facilities, which would increase cost and would decrease the likelihood of successful exploration.

The Factory Butte and Big Rocks SRMAs would provide opportunities for cross-country OHV use. Providing opportunities for OHV recreation would not preclude oil and gas exploration and development, although there could be delays in permitting any proposal for drilling or other surface facilities and requirements to relocate such.

The NSO area within the Dirty Devil/Robbers Roost SRMA, in part, overlaps existing oil and gas leases. These leases have been pending conversion to combined hydrocarbon leases since 1984, and the drafting of an EIS for tar sand leasing under the Energy Policy Act of 2005 is in progress by the BLM. These pending leases have pre-existing rights to the use of the surface for exploration and development. Issues related to permitting wells in areas with NSO would delay approval and would impose stricter environmental standards than currently addressed under the lease terms of the pending leases.

Impacts from Lands and Realty

Impacts would be the same as described under Alternative N.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as described under Alternative N.

Wild and Scenic Rivers

One eligible segment would be recommended for suitability with a tentative classification of wild. The Fremont Gorge of the Fremont River would be closed to leasing Given that the corridor would be one-quarter mile from the high water mark on each bank of the Fremont River, oil and gas activity would be precluded from the Fremont Gorge. The Proposed RMP would result in greater impacts to oil and gas than Alternative A but less than Alternatives N, C, and D.

Areas of Critical Environmental Concern

North Caineville Mesa would remain a designated ACEC (2,200 acres), and Old Woman Front ACEC (330 acres) would be designated. Both would restrict oil and gas activity through an NSO constraint that would require directional drilling and no surface facilities, which would increase cost and would decrease the likelihood of successful exploration. This alternative would result in greater impacts to oil and gas than Alternative A but less than Alternatives N, C, and D.

Alternative C

Impacts from Soil Resources and Water Resources

The types of impacts would be the same as Alternative A, except the buffer around live water and springs would increase to 660 feet.

Impacts from Cultural Resources

Management of cultural resources would impact oil and gas activity the same as Alternative N, including Bull Creek Archaeological District for the protection for cultural resources but not the Susan Rockshelter site. Oil and gas exploration and development would be mitigated by requirements imposed at time of

review of site-specific applications as consistent with the federal laws and regulations and the standard lease terms. Mitigation, if required, would include avoidance of cultural resources, and such mitigation would impact oil and gas exploration and development through an increased cost for cultural resource inventories and relocation of proposed wells and surface facilities.

Sixteen ACECs would be designated and the management prescription for these areas would provide additional protection for cultural resources. Those ACECs are:

- Badlands (includes North and South Caineville Mesas and Gilbert Badlands)
- Bull Creek Archaeological District
- Dirty Devil (includes Beaver Wash Canyon)
- Fremont Gorge/Cockscomb
- Henry Mountains (includes No Man's Mesa)
- Horseshoe Canyon
- Kingston Canyon
- Little Rockies
- Lower Muddy Creek
- Old Woman Front
- Parker Mountain
- Quitchupah
- Rainbow Hills
- Sevier Canyon
- Thousand Lakes Bench
- Special Status Species.

Impacts to oil and gas exploration and development from the designation of these ACECs are addressed under that section.

Impacts from Visual Resources

The types of impacts experienced as a result of visual resource management would be the same as described under Alternative N. The designated VRM classes are changed as follows: VRM Class I, 446,900 acres (21% of the RFO); VRM Class II, 230,600 acres (11%); VRM Class III, 509,400 acres (24%); and VRM Class IV, 941,400 acres (44%). VRM Classes I and II would impact oil and gas exploration, as surface disturbance would be disallowed unless appropriate mitigation met the objective of these VRM classes. The VRM Class I designated lands are also WSAs that are closed to the leasing of oil and gas; thus VRM Class I designations, in effect, do not impact oil and gas. VRM Class II would preclude drilling on the surface and preclude surface facilities, unless they meet the VRM objective, and the restriction would require drilling to be by directional methods from adjacent land, which would increase cost and would decrease the likelihood of success of wildcat wells. VRM Classes III and IV designated lands would have minimal impact on oil and gas, although there could be some delays and added costs to develop mitigations, such as appropriate paint colors, building facilities in a manner that blends better with the landscape, and other minor changes in operations. The acres within VRM Classes I and II that would result in the greatest restrictions to oil and gas activities are similar to the acreages in the Proposed RMP.

Impacts from Special Status Species

The types of impacts experienced as a result of SSS management would be similar to those described under the Proposed RMP, although Alternative C has fewer restrictions on surface disturbing activities in

sage grouse habitat. Completing species inventories, selecting relocated sites, and directional drilling which may be required to protect SSS, would increase delays in permitting and the costs of exploration and development, and the greater distance for directional drilling would further decrease the likelihood of successful exploration. Seasonal restrictions would have adverse impacts to oil and gas exploration and development when a proposed deep well could not be feasibly drilled and completed within the open season, precluding drilling deep exploration targets. Because Parker Mountain, where sage-grouse leks are located, has low oil and gas development potential, impacts resulting from sage-grouse stipulations are expected to be low. There are currently only four sage-grouse leks on BLM land on Parker Mountain although that number could increase in the future.

Impacts from Fish and Wildlife

Impacts would be similar to those described under the Proposed RMP. The habitat acres open to leasing with restrictions would be reduced to 73% of the mule deer habitat, 34% of bison habitat, 32% of Desert bighorn sheep habitat, and 95% of the elk habitat. The habitat acres designated as NSO and closed to oil and gas leasing would increase, varying from 0-67% depending on the species, resulting in a greater impact to oil and gas exploration and development over the Proposed RMP. Seasonal restrictions would have adverse impacts to oil and gas exploration and development, as a company would need to schedule activities during the open season. Equipment, such as drill rigs and work crews, would not necessarily be available during the open season. Delays in permitting proposed operations and contracting necessary equipment and crews would increase costs for exploration and development. On deeper wells, seasonal restrictions would preclude drilling deep targets when the well could not be feasibly drilled and completed within the open season. Designated NSO areas would require directional drilling and no surface facilities, which would increase costs and would decrease the likelihood of successful exploration. In the areas closed to leasing, oil and gas resources would not be explored and would not be available for development.

Leasing stipulations within crucial wildlife habitat are shown in Table 4-43 below:

Table 4-43. Oil and Gas Leasing Stipulations within Crucial Wildlife Habitat—Alternative C

			Deer	Pronghorn	Bison	Bighorn	Elk
Open	Standard Lease Terms	Acres	100 ac	0 ac	0 ac	3,400 ac	100 ac
		% Habitat	<1%	0%	0%	1%	<1%
	Timing or Controlled Surface Use Restrictions	Acres	412,800 ac	102,700 ac	84,400 ac	71,700 ac	201,000 ac
		% Habitat	73%	100%	34%	32%	95%
	No Surface Occupancy	Acres	31,200 ac	0 ac	15,800 ac	23,200 ac	10,500 ac
		% Habitat	5%	0%	6%	10%	5%
Closed		Acres	125,100 ac	0 ac	150,700 ac	129,000 ac	600 ac
		% Habitat	22%	0%	60%	57%	<1%

Impacts from Non-WSA Lands with Wilderness Characteristics

Impacts would be the same as described under Alternative N.

Impacts from Recreation

Under this alternative, four SRMAs would be established: The Henry Mountains, Capitol Reef Gateway, Dirty Devil/Robbers Roost, and Sevier Canyon. In the Henry Mountains SRMA, Class A scenery would be closed to leasing and areas within the viewshed of Capitol Reef National Park would be NSO; in the Dirty Devil/Robbers Roost SRMA, Class A scenery would be NSO or closed to leasing; in the Capitol Reef Gateway SRMA, the Fremont Gorge would be NSO; and in the Sevier Canyon SRMA, the Highway 89 corridor within the bottom of the canyon would be NSO. The portion of these SRMAs that are designated as NSO or closed to leasing, outside of WSAs, is within a low activity RFD area (Areas 1 and 2 combined) that is predicted to have three wells per year or 45 wells during the plan life. The NSO designation would reduce the opportunity for exploration and development by requiring no surface disturbance within those designated areas that would require directional drilling, resulting in increased costs and decreased likelihood of successful exploration. The areas closed to leasing would preclude any opportunities for oil and gas exploration and development. This alternative would result in greater impacts to oil and gas from recreation than Alternatives N, A, and the Proposed RMP.

The NSO and closed areas within the Dirty Devil/Robbers Roost SRMA, in part, overlaps existing oil and gas leases. These leases have been pending conversion to combined hydrocarbon leases since 1984, and the drafting of an EIS for tar sand leasing under the Energy Policy Act of 2005 is in progress by the BLM. These pending leases have pre-existing rights to the use of the surface for exploration and development. Issues related to permitting wells in areas with NSO would delay approval and would impose stricter environmental standards than currently addressed under the lease terms of the pending leases. The closure to leasing would be in conflict with the terms of the pending leases.

Impacts from Lands and Realty

Impacts would be the same as described under Alternative N.

Impacts from Special Designations

Impacts from Wilderness Study Areas

Impacts would be the same as described under Alternative N.

Wild and Scenic Rivers

Under this alternative, 12 eligible river segments would be recommended as suitable as WSRs, resulting in greater impacts to oil and gas than Alternatives N, A, and the Proposed RMP. All 12 of the segments would be closed to leasing, which would preclude any oil and gas activity, including any development of oil and gas resources.

Areas of Critical Environmental Concern

Sixteen ACECs encompassing approximately 886,810 acres would be designated. The specific relevant and important values and management prescriptions would vary by ACEC. Major constraints and areas closed to leasing would impact oil and gas activity, as the ACECs overlap lands that have a high potential for oil and gas with a predicted low activity level (development potential). In this alternative, ACEC management prescriptions would result in 516,199 acres being closed to leasing, 73,511 acres being subject to NSO, and 297,100 acres being open with standard lease terms, seasonal restrictions, or controlled surface use. Closure to leasing would preclude any oil and gas exploration and development of such resources. NSO designations would require directional drilling and no surface facilities, which would increase cost and would decrease the likelihood of successful exploration. Relocation of a well may eliminate a reasonable chance of success, by moving the well site too far from the drilling target.

Approximately 882,300 acres of the ACECs would be in the low activity RFD area, Areas 1 and 2 combined. Although only three wells per year are predicted (45 for the plan life), the designation of ACECs with major constraints and closure to leasing would affect the opportunity to explore for oil and gas resources and to develop any resources that may be discovered. In addition, existing leases overlap, in part, ACECs in the vicinity of the Dirty Devil River, Awapa Plateau (Parker Mountain), Kingston Canyon, and Marysvale Canyon (Sevier Canyon). The existing leases in the vicinity of the Dirty Devil River are leases that have been pending conversion to a combined hydrocarbon lease since 1984 and the current, ongoing drafting of an EIS for tar sand leasing under the Energy Policy Act of 2005. The Sevier Canyon ACEC is almost totally leased at this time and would be subject to valid existing rights. An attempt to impose NSO on a pre-existing lease or an attempt to revoke a pre-existing lease could lead to litigation.

RFD Area 3 would contain only 510 acres of ACECs. The opportunity for oil and gas exploration would be minimally impacted by the ACEC designations.

RFD Area 4 would be impacted by the management decision for NSO at the Rainbow Hills ACEC that encompasses 4,000 acres. The ACEC is presently encompassed by authorized oil and gas leases, and the producing oil field in this RFD area overlaps this ACEC. The existing leases are valid existing rights to the ACEC designation, and those leases are not subject to NSO. An attempt to impose NSO on a pre-existing lease or an attempt to revoke a pre-existing lease could lead to litigation. Although directional drilling has been used as a BMP at the Covenant field, NSO, if followed, would decrease opportunities for exploration and development in the lands designated as an ACEC.

Alternative D

Impacts from Soil Resources and Water Resources

The types of impacts would be similar to those described under Alternative A, except the buffer around live water and springs would increase to 660 feet.

Impacts from Cultural Resources

Impacts would be the same as described under Alternative C.

Impacts from Visual Resources

The types of impacts experienced as a result of visual resource management would be the same as described under Alternative N, except the designated VRM classes are changed as follows: VRM Class I, 1,129,600 acres (53% of the RFO); VRM Class II, 67,700 acres (3%); VRM Class III, 355,100 acres (17%); and VRM Class IV, 576,600 acres (27%). The impacts to oil and gas activity from visual resources would be the greatest in this alternative. VRM Classes I and II would impact oil and gas exploration, as surface disturbance would be disallowed unless appropriate mitigation met the objective of these VRM classes. The VRM Class I designated lands include WSAs, which are closed to the leasing of oil and gas. However, under this alternative, approximately 700,000 additional acres would be designated as VRM Class I, which would disallow any change to the landscape character. VRM Class II would preclude drilling on the surface and surface facilities, unless they meet the VRM objective, and the restriction would require drilling to be by directional methods from adjacent land, which would increase cost and would decrease the likelihood of success of wildcat wells. Relocation of a well, depending on the distance, may move the well site too far from the drilling target to have a reasonable chance of success. This alternative contains the most VRM Classes I and II acres, resulting in the greatest impacts to oil and gas exploration and development. VRM Classes III and IV designated lands would have minimal impact on oil and gas, although there could be some delays and added costs to develop mitigations, such as appropriate paint colors, building facilities in manner that blends better with the landscape, and other minor changes in operations.

Impacts from Special Status Species

Impacts would be the same as described under Alternative C.

Impacts from Fish and Wildlife

Impacts would be similar to those described under the Proposed RMP, except that the habitat acres open to leasing with restrictions would be reduced to 53% of the deer habitat, 12% of bison habitat, 2% of bighorn sheep habitat, and less than 1% of elk habitat. The habitat acres closed to oil and gas leasing would increase, varying from 0-94% depending on species. Alternative D would result in the most acres closed and the greatest impact to oil and gas exploration and development of all the alternatives. Leasing stipulations within crucial wildlife habitat are shown in Table 4-44 below.

Table 4-44. Oil and Gas Leasing Stipulations within Crucial Wildlife Habitat—Alternative D

			Deer	Pronghorn	Bison	Bighorn	Elk
Open	Standard Lease Terms	Acres	100 ac	0 ac	0 ac	1,100 ac	100 ac
		% Habitat	<1%	0%	0%	<1%	<1%
	Timing or Controlled Surface Use Restrictions	Acres	300,000 ac	102,700 ac	30,500 ac	5,500 ac	172,700 ac
		% Habitat	53%	100%	12%	2%	81%
	No Surface Occupancy	Acres	15,500 ac	0 ac	4,700 ac	6,900 ac	10,500 ac
		% Habitat	3%	0%	2%	3%	5%
Closed		Acres	253,600 ac	0 ac	215,700 ac	213,800 ac	28,900 ac
		% Habitat	44%	0%	86%	94%	14%

Impacts from Non-WSA Lands with Wilderness Characteristics

Under this alternative, a total of 682,600 acres of non-WSA lands with wilderness characteristics would be managed to protect the naturalness and outstanding opportunities for solitude and primitive recreation within these areas. All non-WSA lands with wilderness characteristics would be closed to leasing, which would preclude exploration and development of oil and gas resources. The non-WSA lands with wilderness characteristics encompass approximately 33% of the acreage of public lands in the RFO and are mostly located in the eastern part of the RFO.

Most of the non-WSA land with wilderness characteristics (approximately 667,360 acres) would be in the low activity RFD area, Areas 1 and 2 combined, and approximately 94% of the non-WSA lands with wilderness characteristics would be concentrated in the general geographic area of the Henry Mountains, Awapa Plateau, and the canyon lands of the Colorado Plateau. Approximately 19,240 acres are within the moderate activity RFD area, Area 3. Non-WSA lands with wilderness characteristics are not identified within the high activity RFD area, Area 4. Although only three wells per year are predicted in the low and moderate activity RFD areas during the plan life (45 or 49 total in the low or moderate activity areas, respectively), the closure to leasing would affect the opportunity to explore for oil and gas resources and to develop any resources that may be present. Managing the non-WSA lands as closed to oil and gas leasing could reduce the opportunity to discover oil and gas resources in 33% of the RFO.

In addition, non-WSA lands with wilderness characteristics, in part, encompass existing federal oil and gas leases at Dirty Devil/French Springs, Flat Tops, and Wild Horse Mesa. The Flat Tops area is mostly leased for oil and gas. These leases have pre-existing rights to the use of the surface for exploration and development. However, there would be issues related to location of wells and surface facilities in areas with wilderness characteristics that could delay approval and would impose stricter environmental standards than currently addressed under the lease terms of these pre-existing leases. An attempt to impose NSO on a pre-existing lease or an attempt to revoke a pre-existing lease could lead to litigation.

In addition, the non-WSA lands in the eastern part of the Dirty Devil/French Springs area encompass authorized oil and gas leases that are within the Tar Sands Triangle Special Tar Sands Area (STSA). These leases have been pending conversion to combined hydrocarbon leases since 1984, and BLM is currently drafting an EIS for tar sand leasing under the Energy Policy Act of 2005. These pending leases have pre-existing rights to the use of the surface for exploration and development. Issues related to the location of wells and surface facilities in areas with wilderness characteristics could delay approval and would impose stricter environmental standards than currently addressed under the lease terms of the pending leases.

Impacts from Recreation

Under this alternative, seven SRMAs would be established—Henry Mountains, Dirty Devil, Capitol Reef Gateway, East Fork Sevier River, San Rafael Swell, Little Rockies and Labyrinth Canyon—resulting in the greatest potential for impacts to oil and gas of any of the alternatives. The Henry Mountains, Capitol Reef Gateway, Dirty Devil/Robbers Roost, Little Rockies, San Rafael Swell, and Labyrinth Canyon SRMAs would provide opportunities for primitive and semi-primitive motorized and non-motorized recreation; the East Fork Sevier River SRMA would be for primitive and semi-primitive and roaded natural recreation. Most of the acreage in each of these SRMAs, except the East Fork Sevier River, would be closed to leasing. There would be areas open subject to NSO, minor constraints, and standard lease terms. The portion of these SRMAs that are designated as NSO or closed to leasing, outside of WSAs, is within a low activity RFD area (Areas 1 and 2 combined) that is predicted to have three wells per year or 45 wells during the plan life. The NSO designation would reduce the opportunity for exploration and development by requiring no surface disturbance within those designated areas and would require directional drilling and no surface facilities, which would increase cost and would decrease the likelihood of successful exploration. The areas closed to leasing would preclude any opportunities for oil and gas exploration and development.

The NSO and closed areas within the Dirty Devil/Robbers Roost SRMA, in part, overlap existing oil and gas leases. These leases have been pending conversion to combined hydrocarbon leases since 1984, and BLM is currently drafting an EIS for tar sand leasing under the Energy Policy Act of 2005. These pending leases have pre-existing rights to the use of the surface for exploration and development. Issues related to the location of wells and surface facilities in areas with NSO and closed to leasing would delay approval and would impose stricter environmental standards than currently addressed under the lease terms of the pending leases. The closure to leasing would be in conflict with the terms of the pending leases. An attempt to impose NSO on a pre-existing lease or an attempt to revoke a pre-existing lease could lead to litigation.

Impacts from Lands and Realty

Impacts to oil and gas would be the same as for Alternative N.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as described under Alternative N.

Wild and Scenic Rivers

Impacts would be the same as described under Alternative C.

Areas of Critical Environmental Concern

Impacts would be similar to those described under Alternative C, except that additional acres within the ACECs (33% of the RFO) would be closed to oil and gas leasing for the protection of non-WSA lands with wilderness characteristics (discussed in detail for that resource). This alternative would result in the greatest impacts to oil and gas.

Energy Policy and Conservation Act (EPCA) Evaluation by Alternative

The environmental consequences of proposed decisions on oil and gas resources were determined according to Energy Policy and Conservation Act guidance, per IM 2003-233.

In the EPCA, Congress required federal agencies to estimate oil and gas resources in five oil and gas provinces in the western United States and assess impediments to development. Two of the provinces, the Greater Paradox Basin and the Green River Basin, overlap the lands managed by the RFO.

The results of the EPCA analysis relative to the lands managed by the RFO are displayed below. Oil and gas resource data (volumetric data on the amounts of undiscovered oil and gas resources within the EPCA basins within the lands managed by the RFO) are shown for all alternatives, and data on leasing stipulations that would be imposed under the alternatives are shown for Alternative A, the Proposed RMP, and Alternative C. These estimates are mathematical projections, based on geologic and production parameters, and broad-based, regional assumptions.

Alternative N. Based on the 2003 EPCA report, the estimated oil and gas resources in each oil and gas leasing designation are summarized in Table 4-45.

Table 4-45. Technically Recoverable, Undiscovered Resources in Designated Open and Closed Areas—Alternative N

Oil and Gas Leasing Designation	Area		Total Liquids[1]		Total Natural Gas[2]	
	Acres	Square Miles	Barrels per Square Mile[3]	Million Barrels	Cubic Feet per Square Mile[4]	Billion Cubic Feet of Gas
Open Subject to No Surface Occupancy	22,600	36	0–20,000	0–1	0–500,000,000	0–18
Closed	459,700	719	0–20,000	0–14	0–500,000,000	0–359

1. Includes oil, natural gas liquids, and liquids associated with natural gas reservoirs.
2. Includes associated dissolved and non-associated natural gas.
3. Estimate from U.S. Department of the Interior (USDI), U.S. Department of Agriculture (USDA), U.S. Department of Energy (USDOE) 2003, p. 2–15.
4. Estimate from USDI, USDA, USDOE 2003, p. 2–20.

The land managed by the RFO is predominantly rated as high potential for oil and gas and subordinately as moderate potential with different confidence ratings. (Refer to the *Mineral Potential Report* [BLM 2005b].) In addition, activity related to oil and gas has been forecast in an RFD scenario (Appendix 12). In the RFD, the western part of the lands managed by the RFO in the vicinity of the Sevier and Sanpete Valleys is most likely to see oil and gas development related to the Sevier Frontal play (also referred to as

the Central Utah Thrust play), and this part of the land managed by the RFO is predominantly open to leasing with standard lease terms or a seasonal stipulation for wildlife critical habitat. The timing stipulations for wildlife habitat could impact proposed operations by altering the timing of exploration; however, the stipulation would not disallow most exploration.

Most of the public lands open to oil and gas leasing subject to NSO or closed to leasing are in the eastern part of the lands managed by the RFO. Allowing NSO or closing areas to leasing would have greater impacts to exploration and development than standard lease terms or controlled surface use or timing stipulations. Exploration would be precluded in the closed areas and could be precluded in the areas with NSO. At this time, oil and gas development is not foreseen in the eastern part of the RFO; however, in any wildcat area, when oil or gas are discovered in paying quantities, a forecast for exploration can quickly change from exploration to development.

Alternative A. Based on the 2003 EPCA report, the estimated oil and gas resources in each oil and gas leasing designation are summarized in Table 4-46 and on Map 4-1.

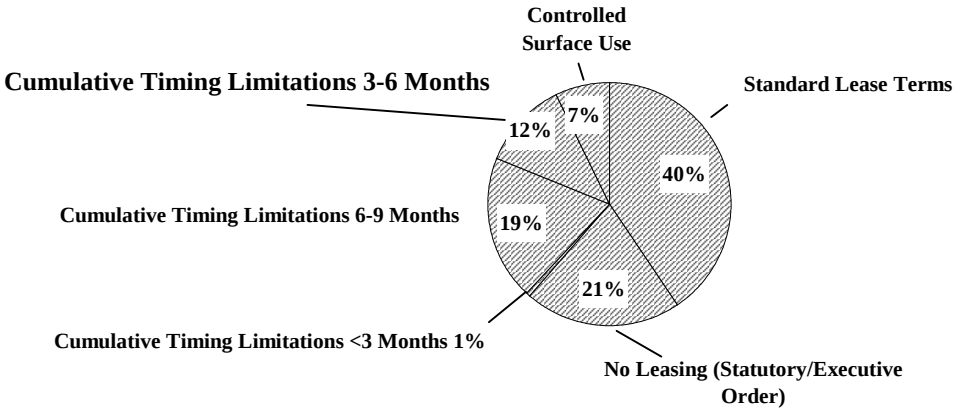
Table 4-46. Technically Recoverable, Undiscovered Resources in Designated Open and Closed Areas—Alternative A

Oil and Gas Leasing Designation	Area		Total Liquids[1]		Total Natural Gas[2]	
	Acres	Square Miles	Barrels per Square Mile[3]	Millions of Barrels of Oil	Cubic Feet per Square Mile[4]	Billions of Cubic Feet of Gas
Open Subject to NSO	0	0	0–20,000	0	0–500,000,000	0
Closed	446,900	695	0–20,000	0–14	0–500,000,000	0–348

1. Includes oil, natural gas liquids (NGLs), and liquids associated with natural gas reservoirs.
2. Includes associated dissolved and non-associated natural gas.
3. Estimate from USDI, USDA, USDOE 2003, p. 2–15.
4. Estimate from USDI, USDA, USDOE 2003, p. 2–20.

In addition, the percentage of the lands managed by the RFO in each open and closed oil and gas designation is shown in Figure 4-1. Among the alternatives, management of other resources under Alternative A would result in the most acres in the Standard Lease Terms category, thus having the least impact to oil and gas exploration and development.

Figure 4-1. Percentage of Public Lands in each Open and Closed Designation—Alternative A



Proposed RMP. Based on the 2003 EPCA report, the estimated oil and gas resources in each oil and gas leasing designation are summarized in Table 4-47 and on Map 4-2.

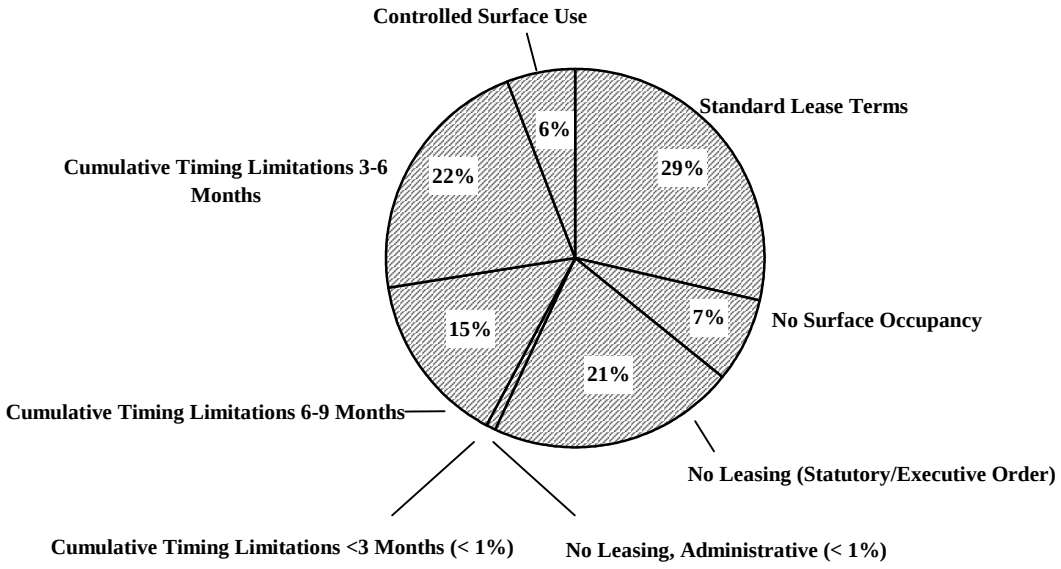
Table 4-47. Technically Recoverable, Undiscovered Resources in Designated Open and Closed Areas—Proposed RMP

Oil and Gas Leasing Designation	Area		Total Liquids[1]		Total Natural Gas[2]	
	Acres	Square Miles	Barrels per Square Mile[3]	Million Barrels of Oil	Cubic Feet per Square Mile[4]	Billion Cubic Feet of Gas
Unrecoverable NSO	28,900	45	0–20,000	0.8	0–500,000,000	1.2
Closed to leasing	447,300	699	0–20,000	6.9	0–500,000,000	8.0

1. Includes oil, NGLs and liquids associated with natural gas reservoirs.
2. Includes associated dissolved and non-associated natural gas.
3. Estimate from USDI, USDA, USDOE 2003, p. 2–15.
4. Estimate from USDI, USDA, USDOE 2003, p. 2–20.

In addition, the percentage of the lands managed by the RFO in each open and closed oil and gas designation is shown in Figure 4-2. Under this alternative, less acreage would be leased with standard lease terms and some areas would be NSO. In this alternative, proposed decisions for other resources would have more impact to oil and gas exploration and development than Alternatives N and A, but less than Alternative C.

Figure 4-2. Percentage of Public Lands in each Open and Closed Designation—Proposed RMP



Alternative C. Based on the 2003 EPCA report, the estimated oil and gas resources in each oil and gas leasing designation are summarized in Table 4-48 and on Map 4-3.

Table 4-48. Technically Recoverable, Undiscovered Resources in Designated Open and Closed Areas—Alternative C

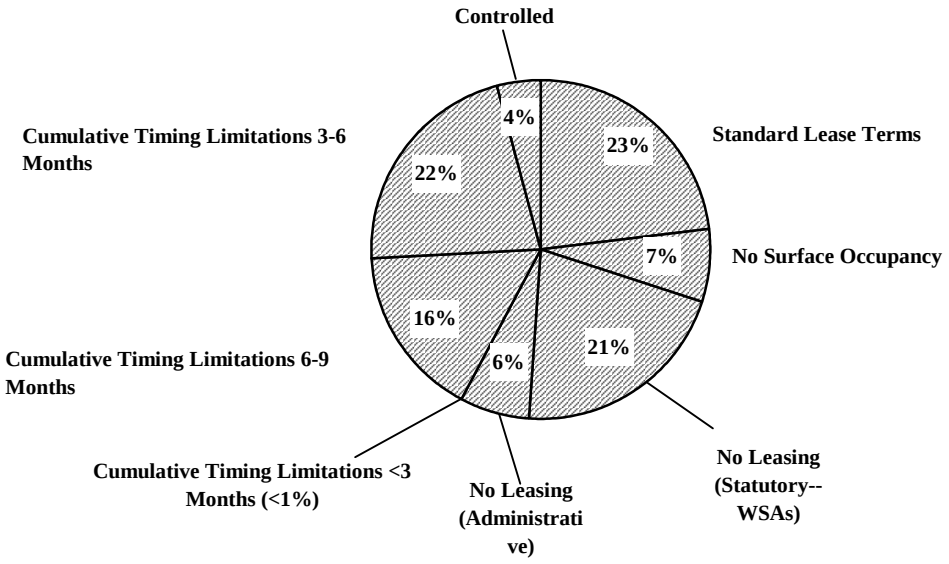
Oil and Gas Leasing Designation	Area		Total Liquids[1]		Total Natural Gas[2]	
	Acres	Square Miles	Barrels per Square Mile[3]	Million Barrels of Oil	Cubic Feet per Square Mile[4]	Billion Cubic Feet of Gas
Open Subject to NSO	148,700	233	0–20,000	0–5	0–500,000,000	0–116
Closed	586,300	916	0–20,000	0–18	0–500,000,000	0–458

1. Includes oil, NGLs and liquids associated with natural gas reservoirs.
2. Includes associated dissolved and non-associated natural gas.
3. Estimate from USDI, USDA, USDOE 2003, p. 2–15.
4. Estimate from USDI, USDA, USDOE 2003, p. 2–20.

In addition, the percentage of the lands managed by the RFO in each open and closed oil and gas designation is shown in Figure 4-3. As stated under Alternative N, the *Mineral Potential Report* and the RFD show oil and gas potential and a reasonable forecast of oil and gas activity in the lands managed by the RFO. Under Alternative C, management of other resources would have more impact to oil and gas exploration and development as compared to Alternatives N, A, and the Proposed RMP. There would be less acreage leased with standard terms and more acres leased with NSO or closed to leasing. Within NSO

areas, this would result in increased costs, decreasing the likelihood of successful exploration. Closed areas would preclude oil and gas exploration and development.

Figure 4-3. Percentage of Public Lands in each Open and Closed Designation—Alternative C



Alternative D. Based on the 2003 EPCA report, the estimated oil and gas resources in each oil and gas leasing designation are summarized in Table 4-49 and on Map 4-4.

Table 4-49. Technically Recoverable, Undiscovered Resources in Designated Open and Closed Areas—Alternative D

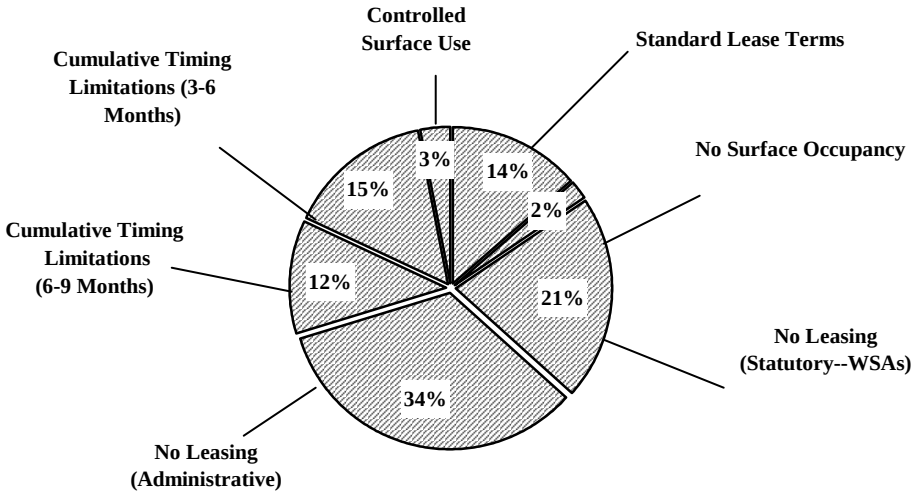
Oil and Gas Leasing Designation	Area		Total Liquids[1]		Total Natural Gas[2]	
	Acres	Square Miles	Barrels per Square Mile[3]	Million Barrels of Oil	Cubic Feet per Square Mile[4]	Billion Cubic Feet of Gas
Open Subject NSO	43,300	68	0–20,000	0–1	0–500,000,000	0–34
Closed	1,160,500	1,811	0–20,000	0–36	0–500,000,000	0–906

1. Includes oil, NGLs and liquids associated with natural gas reservoirs.
2. Includes associated dissolved and non-associated natural gas.
3. Estimate from USDI, USDA, USDOE 2003, p. 2–15.
4. Estimate from USDI, USDA, USDOE 2003, p. 2–20.

In addition, the percentage of the lands managed by the RFO in each open and closed oil and gas designation is shown in Figure 4-4. Among the alternatives, management prescriptions under Alternative D would have the greatest impact on the opportunities for oil and gas exploration and development. This

alternative would allow the least acres leased with standard terms. This alternative would have the most acres closed to leasing (55% of the RFO), precluding oil and gas exploration and development.

Figure 4-4. Percentage of Public Lands in each Open and Closed Designation—Alternative D



Geothermal Resources

Geothermal resources are leased under the Geothermal Steam Act of 1970. Through land use planning, the BLM uses the same guidelines for geothermal leasing as it does for oil and gas leasing in designating areas as open subject to standard lease terms, open subject to major or minor constraints, and closed to leasing. Lands available for geothermal leasing would follow the oil and gas leasing designations. The provisions for exceptions, modifications, and waivers would also apply to geothermal resources.

Methods and Assumptions

The analysis for impacts to geothermal resources assumes:

- Geothermal resource activity—exploration, drilling, and production if paying quantities are discovered—would be managed according to applicable law, federal regulations, and onshore orders and would be managed to mitigate impacts to other resources according to BMPs appropriate to the site/location.
- The RFD is a reasonable prediction of geothermal resource activity for the planning horizon.

Environmental Consequences

The impacts to geothermal resources would be similar to oil and gas because geothermal resources would be subject to the same leasing designations as oil and gas with differences as follows.

The high potential for the occurrence of geothermal resources is in the western part of the RFO, generally in the vicinity of the Sevier Valley, Sanpete Valley, and Marysvale. The high-potential area coincides

approximately with the Colorado Plateau–Basin and Range Transition Zone. Development of geothermal resources is not considered likely, but if it were to occur, it would most likely be in the vicinity of known hot springs and a former Known Geothermal Resource Area (KGRA) in the vicinity of Joseph and Monroe.

Tar Sands

Tar sands, or bituminous sandstone, are minerals that are subject to the Mineral Leasing Act of 1920, as amended, and the Combined Hydrocarbon Act of 1980. The Energy Act of 2005 required the BLM to develop a leasing program for tar sands. The BLM is preparing an EIS to address the leasing of tar sands. The requirements for land use planning for tar sands are similar to oil and gas leasing. The BLM may designate public land as open subject to standard terms, open subject to minor or major constraints, or closed to leasing. Exceptions, modifications, and waivers would also be allowed as described in the Tar Sands Draft RMP/EIS. One STSA, the Tar Sands Triangle, overlaps BLM lands on the Wayne and Garfield County lines in the eastern part of the RFO.

Methods and Assumptions

The analysis for impacts assumes exploration and development would be governed by the applicable laws and regulations.

Environmental Consequences

The impacts to tar sands under each alternative would be similar to oil and gas, although recognizing that the types of wells, facilities, and infrastructure necessary to explore and develop tar sands would differ from conventional oil and gas. The oil and gas leasing restrictions would apply to tar sands leasing. Existing oil and gas leases pending conversion to combined hydrocarbon leases were addressed under the discussion for oil and gas.

Coal

Federal regulations for the management of coal resources are at 43 CFR 3400. Coal resources within the planning area occur in three coal fields: the southern part of the Wasatch Plateau, Emery, and Henry Mountains. Land use planning for coal leasing requires an evaluation to determine the coal resources that have development potential by surface or underground mining methods, then a subsequent evaluation under the coal unsuitability criteria, as defined at 43 CFR 3461.5, to determine the coal resources that are acceptable for further consideration of leasing.

Alternative N: No Action

For Alternative N, the coal evaluations and unsuitability reports were completed as part of the current land use plans. The unsuitability criteria were applied to the Wasatch Plateau and Emery coal fields as one study area and to the Henry Mountains coal field as another study area.

Alternatives A–D

For Alternatives A–D, the coal resources in these three fields were evaluated in two resource reports in 2003–2004 to delineate coal with development potential that would be mined by underground or surface mining methods, based on parameters and assumptions presented in the coal evaluation reports. Those two reports, included in Appendix 8, are:

- *Coal Resources of the BLM Richfield Planning Area*, July 2003
- *Coal Resource Evaluation of the Henry Mountains Coal Field*, July 2004.

The coal resources that were determined to have development potential were additionally analyzed by applying the unsuitability criteria. These documents, included in Appendix 8, are:

- *Coal Unsuitability Report, Henry Mountains Coal Field* (draft), March 2005
- *Coal Unsuitability Report, Wasatch Plateau and Emery Coal Fields* (draft), March 2005.

Refer to Appendix 8 for acres identified for surface and subsurface mining of coal.

Methods and Assumptions

The analysis for impacts to coal assumes:

- Coal exploration and development would be managed according to federal regulations and would be managed to mitigate impacts to other resources.
- The coal resource evaluations are a reasonable estimation of the coal resources within the RFO for the planning horizon, based on the assumptions and analysis in the reports.

Because the reports for Alternative N combined the Wasatch Plateau and Emery coal fields without differentiating the resources within each field, the acreage for the Wasatch Plateau coal field is included in the discussion for that alternative. However, for Alternatives A–D, this analysis only addresses BLM-administered lands; thus, the discussion does not include the Wasatch Plateau for these alternatives. Coal resources in the southern Wasatch Plateau and Emery coal fields on the Fishlake or Manti-LaSal National Forests would be further considered in the Forest Plans for those two forests. The impact analysis for Alternatives A–D is only for BLM-administered lands.

Environmental Consequences

Impacts to coal exploration and development would most likely result from actions proposed for the management of the following resources:

- Soil Resources and Water Resources
- Cultural Resources
- Fish and Wildlife
- Visual Resources
- Non-WSA Lands with Wilderness Characteristics
- Recreation
- Special Designations.

Other programs were determined to have little or no impact on exploration and development of coal resources. There are no WSA or WSR decisions that would impact coal resources.

Alternative N: No Action

Impacts from Soil Resources and Water Resources

Managing public lands to protect soil and water would have an impact on coal resource exploration and development and could modify proposed activity, when an application is received by the BLM. The mitigations would be site-specific at the time of an application. As consistent with resource protection and applicable federal laws and regulations, mitigations would include requirements such as stockpiling topsoil for reclamation and avoiding live water by 500 feet. Such a buffer would not preclude drilling and other exploration activities and necessary facilities, such as roads, although such sites and facilities may

be relocated to avoid live water, as necessary. In the case of a mine, most likely for a surface mine, imposing a 500-foot buffer could result in a redesign of the mine and loss of recoverable coal.

Impacts from Cultural Resources

Managing public lands to protect cultural resources would have an impact on coal exploration and development, as mitigations would be developed that would modify proposed activity when an application is received by the BLM and as needed to protect cultural resources. The mitigations would be site-specific at the time of an application as consistent with applicable federal laws and regulations. Avoidance of cultural resource sites would not preclude drilling and other exploration activities, although specific drill or exploration sites and facilities, such as roads, may need to be relocated. In the case of a mine, most likely for a surface mine, avoidance of cultural resources could result in a redesign of the mine and loss of recoverable coal.

Impacts from Fish and Wildlife

Under this alternative, restrictions for wildlife, such as seasonal restraints, would apply to coal exploration and development. In the Henry Mountains coal field, 17,268 acres of coal resources are within crucial habitat, and in the Wasatch Plateau and Emery coal fields, 28,781 acres of coal resources are within crucial habitat. The crucial habitat is unsuitable for surface mining and is subject to no surface-disturbing activities during the restricted season for underground mining. The seasonal restriction would impact coal exploration by reducing the time frame during which such work could be completed. For an underground coal mine, locating portals, other facilities, and infrastructure outside of the seasonally restricted area would affect the feasibility of the coal mining and the operation of the mine. The seasonal restrictions would preclude coal development if surface facilities needed to be located within a restricted area and an exception is not applicable.

Impacts from Visual Resources

Managing visual resources on public lands would have an impact on coal resources. VRM classes of coal resources determined acceptable for further consideration of leasing are shown in Table 4-50:

Table 4-50. VRM Classes of Coal Resources, Alternative N

		Acres of Coal Resources by VRM Class			
Coal Field	**Mining Method**	**Class I**	**Class II**	**Class III**	**Class IV**
Henry Mountains	**Surface**	0	3,401	7,419	14,172
	Underground	0	25,258	29,471	66,373
Emery	**Surface**	0	1,411	3,935	6,821
	Underground	0	3,108	1,377	9,817

VRM Class I lands are unsuitable for coal leasing, and, except for WSAs, public lands are not classified as VRM Class I in this alternative. (BLM policy requires that WSAs be managed to meet VRM Class I objectives. Thus, WSAs are not suitable for coal leasing.) The objective of VRM Class II is to retain the character of the landscape with a low level of change, VRM Class III is to partially retain the character of the landscape with change that may be seen without dominating the view of the casual observer, and VRM Class IV allows for major modifications of the landscape. Mitigations as appropriate for the VRM class would be imposed on coal operations at the time of an application, as consistent with federal laws and regulations. VRM Class II would be the most restrictive of the three classes of VRM applicable here. Conforming to the objectives of VRM Class II may require relocation of drill sites and other exploration

activities and could preclude development of a coal mine, particularly a surface mine, and loss of recoverable coal. VRM Classes III and IV are less restrictive than VRM Classes I and II. The VRM Classes III and IV would not preclude exploration and development of coal resources, although proposals would be modified to be consistent with the VRM class and applicable laws and regulations.

Impacts from Non-WSA Lands with Wilderness Characteristics

Under this alternative, no actions to maintain wilderness characteristics on lands outside of WSAs are proposed, resulting in no impact to coal exploration and development.

Impacts from Recreation

In this alternative, there are no SRMAs that would impact coal exploration and development.

Impacts from Special Designations

Areas of Critical Environmental Concern

Three of the existing ACECs in this alternative would affect exploration of coal resources. Gilbert Badlands (3,680 acres) includes restrictions for steep slopes and wet and muddy conditions, and the North and South Caineville Mesas (2,200 and 4,100 acres, respectively) are subject to NSO. None of these ACECs have coal resources that are acceptable for further consideration of leasing by surface mining methods. Exploration would not be allowed within the ACECs with the NSO restriction.

Alternative A

Impacts from Soil Resource sand Water Resources

Impacts on coal exploration and development from soil and water would be similar to Alternative N, except activity would not be allowed:

- Within 330 feet of live water or springs
- Within zones of hydric soils
- On slopes greater than 30 percent.

The exceptions, modifications, and waivers as described for oil and gas leasing would apply to coal exploration and development and would be considered at the time of an application for license or lease. The impacts of the 330-foot buffer would be similar to the 500-foot buffer, as addressed in Alternative N. Disallowing exploration and development activities within areas of hydric soils and slopes greater than 30 % would preclude development of coal resources and loss of recoverable coal.

Impacts from Cultural Resources

Impacts would be the same as Alternative N.

Impacts from Fish and Wildlife

Managing public lands for wildlife habitat would have an impact on coal exploration and development by imposing seasonal restraints for crucial wildlife habitat. In the Henry Mountains coal field, 10,871 acres of coal resources acceptable for consideration of leasing with a surface mining method and 41,347 acres with an underground mining method are contained within lands subject to minor constraints, such as the seasonal crucial wildlife habitat. In the Emery coal field, 5,126 acres with an underground mining method are contained within land subject to minor constraints. The seasonal restriction would impact coal exploration by reducing the time frame during which such work would be completed. For a coal mine, the seasonal restriction would impose shut downs, if the restriction is not modified or waived. Such shut downs would affect the feasibility of the surface coal mining and would render the mine inoperable. For an underground coal mine, locating portals, other facilities, and infrastructure outside of the seasonally

restricted area would affect the feasibility of the coal mining and the operation of the mine. These impacts to coal leasing would preclude coal development, if modifications and waivers are not considered at the time of application for a lease.

Impacts from Visual Resource Management

Managing visual resources on public lands would have an impact on coal resources. VRM classes of coal resources determined acceptable for further consideration of leasing are shown in Table 4-51:

Table 4-51. VRM Classes of Coal Resources, Alternative A

		Acres of Coal Resources by VRM Class			
Coal Field	**Mining Method**	**Class I**	**Class II**	**Class III**	**Class IV**
Henry Mountains	**Surface**	0	0	290	14,378
	Underground	0	0	723	40,629
Emery	**Underground**	0	0	5,125	4,497

Public lands with acceptable resources for mining would not be designated as VRM Classes I or II under this alternative. Mitigations as appropriate for the VRM class would be imposed on coal operations at the time of an application, as consistent with federal laws and regulations. VRM Classes III and IV would not preclude exploration and development of coal resources, although proposals may need to be modified to be consistent with the VRM class and applicable laws and regulations.

Impacts from Non-WSA Land with Wilderness Characteristics

Impacts would be the same as for Alternative N.

Impacts from Recreation

Under this alternative, only the Factory Butte SRMA would overlap coal resources. The management prescription of this SRMA provides opportunities for cross-country OHV use, which would not restrict coal exploration and development.

Impacts from Special Designations

Areas of Critical Environmental Concern

No new ACECs would be designated in this alternative, and the four existing ACECs in Alternative N would no longer be designated as such. Thus, there would be no impacts to coal exploration and development from ACEC designations or the associated special management prescriptions.

Proposed RMP

Impacts from Soil Resources and Water Resources

Impacts would be the same as described under Alternative A.

Impacts from Cultural Resources

Impacts would be the same as described under Alternative N.

Impacts from Fish and Wildlife

The types of impacts from management of fish and wildlife would be the same as Alternative A, except the acreage that is restricted is different in this alternative. In the Henry Mountains coal field, 11,759

acres of coal resources acceptable for consideration of leasing with a surface mining method and 40,550 acres with an underground mining method are contained within lands subject to minor constraints, such as the seasonal crucial wildlife habitat. In the Emery coal field, 7,358 acres with an underground mining method are contained within land subject to minor constraints. This alternative has additional acreage leased with minor constraints, thus there would be greater potential for restrictions of coal development.

Impacts from Visual Resource Management

Impacts to coal exploration and development would be the same as Alternative A, except the acreage in each VRM class would change. VRM classes of coal resources determined acceptable for further consideration of leasing are shown in Table 4-52:

Table 4-52. VRM Classes of Coal Resources, Proposed RMP

		Acres of Coal Resources by VRM Class			
Coal Field	**Mining Method**	**Class I**	**Class II**	**Class III**	**Class IV**
Henry Mountains	**Surface**	0	1,219	110	13,339
	Underground	0	4,146	0	37,205
Emery	**Underground**	0	1,701	357	7,564

Public lands with acceptable resources for mining would not be designated as VRM Class I in this alternative. Mitigations as appropriate for the VRM Classes II through IV would be imposed on coal operations at the time of an application, as consistent with federal laws and regulations. VRM Class II would be the most restrictive of the three VRM classes; VRM Class IV, the least. The VRM designations would not preclude coal exploration and development, although proposals would be modified to be consistent with the VRM class and applicable laws and regulations.

Impacts from Non-WSA Land with Wilderness Characteristics

Although 78,600 acres of non-WSA lands would be managed to maintain wilderness characteristics, the prescriptions identified in Chapter 2 would not preclude coal mining; therefore, impacts would be the same as for Alternative N.

Impacts from Recreation

Under the Proposed RMP, the Henry Mountains and Factory Butte SRMAs would overlap coal resources in the Henry Mountains coal field. The Henry Mountains SRMA would provide opportunities for primitive and semi-primitive motorized and non-motorized recreation. The SRMA would not preclude coal exploration and development, but such exploration and development could be in conflict with SRMA goals and objectives.

The Factory Butte SRMA would provide opportunities for cross-country OHV use. This SRMA would not necessarily restrict coal exploration and development.

Impacts from Special Designations

Areas of Critical Environmental Concern

North Caineville Mesa would be the only designated ACEC within a coal field and would be subject to NSO. A coal resource acceptable for consideration of leasing has not been identified within this ACEC, and exploration would not be allowed due to the NSO restriction.

Alternative C

Impacts from Soil Resources and Water Resources

The types of impacts would be the same as Alternative A, except the buffer around live water and springs would be 660 feet. The impacts of the 660-foot buffer would be double the buffer distance for live water, as addressed in Alternative A, which could increase the number of drill sites and other exploration sites that may be relocated. It would also increase the possibility of redesign of a proposed mine and increase the loss of recoverable coal resources.

Impacts from Cultural Resources

Impacts would be the same as described under Alternative N.

Impacts from Fish and Wildlife

The types of impacts from management of fish and wildlife would be the same as Alternative A, except the acreage that is restricted is different in this alternative. In the Henry Mountains coal field, 9,447 acres of coal resources acceptable for consideration of leasing with a surface mining method and 33,249 acres with an underground mining method are contained within lands subject to minor constraints, such as the seasonal crucial wildlife habitat. In the Emery coal field, 7,922 acres with an underground mining method are contained within land subject to minor constraints. This alternative would allow fewer acres available for surface mining and require minor constraints for more acres of the RFO. This alternative would have greater impacts on coal resources than Alternatives N, A, and the Proposed RMP, but less impacts than Alternative D.

Impacts from Visual Resource Management

The types of impacts to coal exploration and development would be the same as Alternative A, except the acreage in each VRM class would change and VRM Class II areas would be closed to coal leasing. VRM classes of coal resources determined acceptable for further consideration of leasing are shown in Table 4-53.

Table 4-53. VRM Classes of Coal Resources, Alternative C

		Acres of Coal Resources by VRM Class			
Coal Field	**Mining Method**	**Class I**	**Class II**	**Class III**	**Class IV**
Henry Mountains	**Surface**	0	3,013	4,094	7,562
	Underground	0	8,134	10,039	23,178
Emery	**Underground**	0	1,701	357	7,564

Under this alternative, 11,147 acres of coal resources, including surface and underground resources, in the Henry Mountains coal field and 1,701 acres in the Emery coal field that are acceptable for the consideration of leasing would be precluded from any coal development or leasing due to the VRM Class II lands being closed to leasing, resulting in the loss of recoverable coal resources. Mitigations as appropriate for the VRM Classes III and IV would be imposed on coal operations at the time of an application, as consistent with federal laws and regulations. VRM Class III and IV would not preclude exploration and development of coal resources.

Impacts from Non-WSA Land with Wilderness Characteristics

Impacts would be the same as described under Alternative N.

Impacts from Recreation

Under this alternative, the Henry Mountains SRMA would overlap coal resources in the Henry Mountains coal field. This SRMA would provide opportunities for primitive and semi-primitive motorized and primitive non-motorized recreation. Class A scenery would be closed to leasing and areas within the view shed of Capitol Reef National Park would be NSO. In this SRMA, 2,012 acres of coal resources that are acceptable for the consideration of leasing by surface mining and 7,279 acres acceptable by underground mining would be subject to NSO. In addition, 418 acres of coal resources acceptable for the further consideration of leasing by surface mining and 823 acres of coal resources acceptable by underground mining would be closed to leasing. The NSO designation would reduce or eliminate the opportunity to explore and develop coal resources, depending on whether exceptions, modifications, or waivers would apply to the specific application to explore or lease coal resources. The public lands closed to leasing would not be leased for coal development.

Impacts from Special Designations

Areas of Critical Environmental Concern

Under this alternative, the potential Badlands and Henry Mountains ACECs would overlap the Henry Mountains coal field, and the potential Thousand Lakes Bench ACECs would overlap the Emery coal field. The Badlands ACEC would be closed to leasing, and the Henry Mountains ACEC would be closed to leasing in VRM Class II. The Thousand Lakes Bench ACEC would be managed to protect cultural resources, special status plants, and riparian, which could affect siting of exploration and development but would not likely preclude leasing in a large area. In the Henry Mountains coal field, 8,134 acres of coal resources acceptable for leasing by underground mining methods and 3,013 acres acceptable for surface mining methods would be closed to leasing due to the management of the two ACECs. Closing these public lands to coal leasing would preclude exploration and development of coal resources within those portions of the ACECs.

Alternative D

Impacts from Soil Resources and Water Resources

Impacts would be the same as those described under Alternative C.

Impacts from Cultural Resources

Impacts would be the same as those described under Alternative N.

Impacts from Fish and Wildlife

The types of impacts from management of fish and wildlife would be the same as Alternative A, except the acreage that is restricted is different in this alternative. In the Henry Mountains coal field, there are 2,592 acres of coal resources acceptable for consideration of leasing with a surface mining method, and 10,135 acres with an underground mining method are contained within lands subject to minor constraints, such as the seasonal timing limitations. In the Emery coal field, 3,888 acres with an underground mining method are contained within land subject to minor constraints. This alternative would allow surface mining on the fewest acres of any alternative. This alternative also has the fewest acres available for underground mining with only minor constraints, thus resulting in the greatest impact on the development of coal resources.

Impacts from Visual Resource Management

Impacts to coal exploration and development would be the same as those described under Alternative A, except the acreage in each VRM class would change and coal resources within VRM Classes I and II would be closed to leasing. VRM classes of coal resources determined acceptable for further consideration of leasing are shown in Table 4-54.

Table 4-54. VRM Classes of Coal Resources, Alternative D

		Acres of Coal Resources by VRM Class			
Coal Field	**Mining Method**	**Class I**	**Class II**	**Class III**	**Class IV**
Henry Mountains	**Surface**	10,008	706	2,358	1,627
	Underground	30,121	1,164	4,142	5,928
Emery	**Underground**	4,034	1,701	39	3,849

The acreages for the above-listed VRM Class I areas are for public lands outside WSAs and are acceptable for further consideration of leasing. Under this alternative, public lands designated as VRM Classes I and II would be closed to leasing, which would result in 41,999 acres of coal resources in the Henry Mountains coal field and 5,735 acres in the Emery coal field being precluded from any coal development. This would be a substantial impact to the availability of coal resources that are minable by the listed mining methods, as these coal resources would be unavailable for leasing. Mitigations as appropriate for VRM Classes III and IV would be imposed on coal operations at the time of an application, as consistent with federal laws and regulations.

Impacts from Non-WSA Land with Wilderness Characteristics

Under this alternative, all of the non-WSA lands with wilderness characteristics would be closed to leasing. In the Henry Mountains, 9,936 acres of coal resources that are acceptable for consideration of leasing by surface mining and 30,183 acres by underground mining would be unavailable for development. In the Emery coal field, 4,034 acres of coal resources that are acceptable by underground mining would be unavailable for leasing. These lands would be precluded from coal exploration and development. This would be a substantial impact to the availability of coal resources that are minable by the listed mining methods, as these coal resources would be unavailable for leasing.

Impacts from Recreation

Under this alternative, the Henry Mountains and Capitol Reef Gateway SRMAs would overlap coal resources. These SRMAs would provide opportunities for primitive and semi-primitive motorized and primitive non-motorized recreation. In these SRMAs, 1,480 acres of coal resources that are acceptable for the consideration of leasing by surface mining and 848 acres acceptable for the consideration of leasing by underground mining would be subject to NSO. In addition, 10,832 acres of coal resources acceptable for the further consideration of leasing by surface mining and 30,367 acres of coal resources acceptable by underground mining would be closed to leasing. The NSO designation would reduce or eliminate the opportunity to explore and develop coal resources, depending on whether exceptions, modifications, or waivers would apply to the specific application to explore or lease coal resources. The public lands closed to leasing would not be leased for coal development.

Impacts from Special Designations

Areas of Critical Environmental Concern

Impacts would be the same as those described under Alternative C.

Non-Energy Solid Leasable Minerals

These solid leasable minerals are leased under the Mineral Leasing Act of 1920, as amended, and the federal regulations at 43 CFR Part 3500. Through land use planning, the BLM may designate public land as open or closed to leasing, and the use of open areas may be restricted by special conditions. The

designations of open, open with special conditions, and closed would follow the oil and gas leasing designations to the extent practicable. The areas open with special conditions include the oil and gas open with minor constraints (timing or controlled surface use) and open with major constraints (NSO). The provisions for exceptions, modifications, and waivers would also apply to non-energy solid leasable minerals.

Methods and Assumptions

The analysis for impacts to non-energy solid leasable minerals assumes exploration and development would be regulated under all applicable laws and regulations.

Environmental Consequences

The impacts to non-energy solid leasable minerals would be similar to those impacts on oil and gas leasing and development under all alternatives. However, under Alternative N, the oil and gas leasing restrictions do not apply to these leasable minerals. Operations for solid minerals do not involve the same operations as oil and gas. Exploration for these minerals would include drilling, testing by excavating trenches or pits, bulk sampling, and other surface disturbances, and production would involve surface mines or quarries, underground mines, or in situ extraction. Additional facilities would be constructed as necessary for processing the mined or extracted mineral and for building an infrastructure, as needed, to develop a mine and to market the extracted mineral.

Non-energy solid leasable minerals are unlikely to see development during the planning horizon. Sodium and potassium as evaporitic or saline minerals have high potential in the Sevier and Sanpete Valleys, generally in association with the outcrop and mapped subsurface of the Arapien Shale. Also, such minerals have high potential in the mapped subsurface of Paleozoic strata and facies in the Paradox Basin, proper, where salt has been penetrated in deep oil and gas wells. However, neither the Sevier–Sanpete Valley area nor the Paradox Basin are likely to see exploration and development due to the relative abundance and more marketable saline resources at the Great Salt Lake in Utah. The area with high potential for salt in the Sevier and Sanpete Valleys is not encumbered by other proposed management prescriptions (such as ACECs, SRMAs, SSS, or VRM) that would preclude or substantially restrict such exploration and development. The high-potential area for salt in the Paradox Basin is encumbered in part by WSAs, ACECs, SRMAs, and VRM that would restrict such exploration and development.

Alunite or clay alteration deposits that would contain potassium are present in association with the Marysvale volcanic field. The high-potential area for such deposits is generally located in the vicinity of Marysvale. The potassium in the past has been prospected as a source of fertilizer. Such development is considered unlikely during the planning horizon. These deposits in the Marysvale field are not encumbered by other proposed management prescriptions (such as ACECs, SRMAs, SSS, or VRM) that would preclude or restrict such exploration or substantially restrict such exploration and development.

4.4.6.2 Locatable Minerals

Locatable minerals are those valuable under the U.S. mining laws, generally referred to as the 1872 Mining Law. Locatable minerals are subject to entry and location. Entry means the public land is subject to application for title to the land, (e.g., patenting under the mining laws). The BLM does not have discretion as to entry and location of mining claims on open, unappropriated, public lands and does not have the discretion to determine mitigations for mining claims at the time of location. However, the BLM does have discretion to make public lands open to entry or to close lands, (e.g., withdraw certain public lands from the operations of the mining laws). The BLM also has authority through FLPMA, the federal regulations at 43 CFR 3809, and other federal laws and regulations (i.e. 43 CFR 3715, etc.), as applicable, to regulate mining-related operations and the surface disturbances that would be incident to those

operations. The BLM regulates mining-related operations on public lands to prevent unnecessary or undue degradation and to ensure the operation is reasonably incident to mining. In WSAs, the BLM regulates mining-related operations under the IMP and as required by 43 CFR 3802, to prevent the impairment of a WSA's suitability for designation as wilderness by Congress.

Methods and Assumptions

The analysis for impacts to locatable minerals assumes that exploration and development will be governed by the applicable laws and regulations.

Environmental Consequences

Impacts to locatable minerals would likely result from actions proposed under the following resource management programs:

- Cultural Resources
- Visual Resources
- Special Status Species
- Non-WSA Lands with Wilderness Characteristics
- Recreation
- Travel Management
- Lands and Realty
- Special Designations.

Other programs were determined to have little or no impact on locatable minerals.

Alternative N: No Action

Impacts from Cultural Resources

Managing cultural resources requires BLM to make a reasonable and good faith effort to identify the potential effects of federal undertakings. All federal undertakings having the potential to adversely affect cultural resources must include mitigation measures designed to avoid the impact. This is covered by NHPA and its implementing regulations found at 36 CFR Part 800. Operations under the mining laws would be regulated to avoid unnecessary or undue degradation of the public land and cannot knowingly disturb, alter, injure, or destroy any historic or archaeological site, structure, building, or object listed or eligible for listing on the National Register of Historic Places. These requirements could result in the need for avoidance or modification of proposed operations. The Federal Government bears any costs of investigation and salvage of cultural resources. Exploration for locatable minerals under a Notice is not a federal action, as it is not approved by the BLM. However, the BLM would review the Notice and advise the operator of proposed activity that would impact cultural resources. Exploration or development under a Plan of Operations is a federal action and requires approval by the BLM. Before approval is granted, the proposed activity for locatable minerals would be reviewed as required under NEPA and all applicable laws, including NHPA. Mitigations, as consistent with the claimant's rights under the mining laws, would be imposed on proposed operations. Thus, managing cultural resources would require mining operators under the mining laws to not knowingly impact historic or archaeological sites and to immediately bring to the attention of the BLM any cultural resources that would be altered or destroyed by the mining operation. Modification or mitigation requirements would have adverse impacts by delaying the time required for approval of proposed operations.

Impacts from Visual Resources

Managing visual resources would be accomplished by managing public lands as subject to VRM Classes I through IV objectives. The current VRM classes for the RFO are Class I, 0 acres (0% of the RFO); Class II, 529,500 acres (25%); Class III, 569,000 acres (27%); and Class IV, 1,029,500 acres (48%). It should be noted that BLM policy requires WSAs to be managed to meet VRM Class I objectives. The lands within the WSAs were inventoried as VRM Class II and are represented as such in this section. However, 446,900 acres would actually be managed as VRM Class I, to preserve the existing character of the landscape. Consistent with the IMP and as required by 43 CFR 3802.3-2, operations proposed within WSAs would be mitigated to harmonize operations, to the extent practicable, with visual resources. VRM Class II objectives are more restrictive in terms of allowing changes to the landscape than Classes III and IV, with Class IV being the least restrictive. Notices would be reviewed, and the claimant would be advised of the steps necessary in order to be in conformance with the VRM class, as consistent with the claimant's rights under the mining laws. Drilling or other exploration sites and facilities could be relocated in VRM Class II areas to the extent practicable and to preserve the claimant's rights. Plans of operations would be reviewed under NEPA and approved in accordance with the VRM class and the claimant's rights. As consistent with 43 CFR 3809.5, operations would be designed to minimize and reduce adverse visual impacts and avoid or eliminate such impacts, as practical. Thus, operations may need to be relocated in order to utilize screening within the natural topography and may be modified in color, shape, and size, as consistent with a claimant's rights. This action could result in delays in authorizing proposed operations and additional costs.

Impacts from Special Status Species

All federal actions are subject to the requirements of the ESA, as amended. A plan of operations is required for operations proposed on lands or waters known to contain federally-proposed or listed threatened or endangered species or their proposed or designated critical habitats, unless the BLM allows for other actions under a land use plan or threatened or endangered species recovery plan, as stated at 43 CFR 3809.11(c)(6). The operator would be required to take such actions as may be needed to prevent adverse impacts to threatened or endangered species and habitat that may be affected by mining-related operations. Prior to approving any mining action potentially affecting any listed threatened or endangered species, the BLM must consult with USFWS under Section 7 of the ESA. As necessary and appropriate with the claimant's rights, mitigation, such as timing and avoidance, may be required to avoid or reduce potential impacts to listed species, species proposed for listing, and designated critical habitat. This could result in delays in approval of proposals. Some mitigation, such as timing and avoidance could reduce the success of or preclude some operations. Under this alternative, surface disturbing activities would be prohibited near Greater sage-grouse leks from March 1 through July 15 and within sage-grouse brooding habitat from April 1 through June 15.

Impacts from Non-WSA Lands with Wilderness Characteristics

Under this alternative, no actions to maintain wilderness characteristics on lands outside of WSAs are proposed, resulting in no impacts to mining of locatable minerals.

Impacts from Recreation

Developed recreation sites would be proposed for withdrawal from mineral entry. These sites include Hog Springs Picnic Area, Lonesome Beaver Campground, McMillan Spring Campground, Starr Springs Campground, and Dandelion Flat Picnic Area. The acreage varies but generally would be less than 20 acres at each site. Withdrawal, if executed, would preclude any operations and development of minerals under the mining laws. These recreation sites are in areas with moderate to high potential for the occurrence of locatable minerals but are considered unlikely to have mineral development.

Impacts from Travel Management

Off-highway vehicle management restricting cross-country travel would affect locatable minerals. A plan of operations would be required for any closed area, as stated at 43 CFR 3809.11(c)(5). In this alternative, there would be 214,000 acres closed to cross-country motorized travel. This may increase the processing time for the review and approval of the plan of operations under applicable federal laws and regulations. Increased processing time may also occur for the 277,600 acres where motorized use is limited to existing/designated/maintained routes. If a new access route were needed for the proposed operation, additional processing time may be necessary, resulting in project delays and additional costs.

Impacts from Lands and Realty

Under this alternative, developed recreation sites and existing ACECs (14,780 acres) would be recommended for withdrawal from mineral entry, in addition to the existing withdrawals (154,700 acres). No mining-related operations under the mining laws could occur within the withdrawn lands, resulting in a potential loss of minerals development and the associated economic benefits. These recreation sites and ACECs are generally within areas with a high potential for the occurrence of locatable minerals. Valid existing rights would be recognized in withdrawn land.

Impacts from Special Designations

Wilderness Study Areas

Managing WSAs under the federal regulations at 43 CFR 3802 and the IMP would impact locatable minerals. There are ten active, recorded mining claims within the Mount Pennell WSA and four within the Bull Mountain WSA. WSAs are not withdrawn from mineral entry. However, all mining-related operations are subject to the IMP such that actions may not impair the suitability of the WSA for inclusion in the Wilderness Preservation System; thus precluding exploration and development of locatable minerals unless the activity is non-impairing, a grandfathered use, or a valid existing right. The WSAs are within an area rated as high potential for locatable minerals, increasing the potential for adverse impacts to locatable minerals and the loss of associated economic benefits.

Wild and Scenic Rivers

Managing 12 eligible WSR corridors totaling 135 miles would affect locatable mineral exploration and development. No decision would be made under this alternative for suitability. A total of 98 miles (73% of the total miles) of the eligible river segments are also within WSAs and are thus subject to the IMP. Stream segments designated for potential addition to the National Wild and Scenic Rivers System, which includes eligible rivers, would require a plan of operations, as stated at 43 CFR 3809.11(c)(2). As the plan of operations is reviewed and approved under the applicable federal laws and regulations and as consistent with claimant's rights, mitigations may be required to protect the outstandingly remarkable values of the eligible rivers, as consistent with applicable federal laws and regulations and a claimant's rights. Requiring a plan of operations and mitigation would have adverse impacts by delaying the processing time and possibly reducing the feasibility of the proposal. Most of the eligible river segments are within areas that are rated as high potential for the occurrence of locatable minerals. However, there are no active, recorded mining claims within the eligible river segments, so potential impacts would be expected to be minor.

Areas of Critical Environmental Concern

Four ACECs are designated: Beaver Wash (4,800 acres), Gilbert Badlands (3,680 acres), North Caineville Mesa (2,200 acres), and South Caineville Mesa (4,100 acres). These ACECs are proposed for withdrawal from mineral entry, which would preclude any mining-related activity. If the above areas are designated as ACECs but not withdrawn, any proposed mining-related operation would require a plan of operation, as required at 43 CFR 3809.11(c)(3). As part of the review and approval of the plan of operations,

mitigations would be required. As these ACECs are subject to NSO or no leasing under oil and gas, a similar restriction under the mining laws would not be consistent with a claimant's rights. NSO is inconsistent with the claimant's right to occupy and use public land, reasonably incident to the mining laws. However, where consistent with claimant's rights, drilling and exploration sites and other facilities would be relocated and the critical resource(s) would be avoided. These requirements would likely result in delays due to processing time. These four ACECs are within an area rated as high potential for the occurrence of locatable minerals; however, development is considered unlikely.

Alternative A

Impacts from Cultural Resources

Impacts would be the same as those described under Alternative N.

Impacts from Visual Resources

The types of impacts from management of visual resources would be the same as Alternative N, except the VRM class designations under Alternative A would be Class I, 446,900 acres (21% of the RFO); Class II, 0 acres (0%); Class III, 392,800 acres (18%); and Class IV, 1,288,300 acres, (61%). The VRM Class I areas are coincident with WSAs, and exploration and development under the mining laws would be managed as consistent with the regulations at 43 CFR 3802. These regulations would preclude any activity for locatable minerals unless the activity is non-impairing, a grandfathered use, or a valid existing right. As required at 43 CFR 3802.3-2, operations proposed within WSAs would be mitigated to harmonize operations, to the extent practicable, with visual resources. Under this alternative, there would be no areas classified as VRM Class II, which is more restrictive in terms of allowing changes to the landscape than VRM Classes III and IV. This would result in fewer restrictions in terms of project modifications. This alternative would result in the least impacts to locatable mineral development.

Impacts from Special Status Species

Impacts would be similar to those described under Alternative N, although Alternative A has no stipulation on surface disturbing activities within Greater sage-grouse brooding/nesting habitat. Therefore, this alternative is less restrictive than Alternative N. The lease stipulations and notices for oil and gas leasing would be used as guidelines, as consistent with federal laws and regulations, the claimant's rights, and in recognition that operations for oil and gas and mining differ in scale, scope, and types of exploration and development. As practical and consistent with federal laws and regulations, proposed operations may be relocated to avoid SSS habitat. This action would result in delays in authorizing proposed operations.

Impacts from Non-WSA Lands with Wilderness Characteristics

Impacts would be the same as those described under Alternative N.

Impacts from Recreation

Developed recreation sites would not be withdrawn from mineral entry. There would be no impact to locatable minerals, although any proposed mining operation would be regulated to prevent unnecessary or undue degradation.

Impacts from Travel Management

The types of impacts would be similar to Alternative N. However, under this alternative, there would be no areas designated as closed to motorized use. Therefore, there would be no requirement to file a plan of operations for locatable minerals due to travel designations. Within the 1,679,000 acres where OHV use would be limited to designated routes, potential impacts would depend on the need for additional access. If additional access routes were necessary, more processing time may be necessary to authorize that

access, thus delaying operations and increasing costs. This alternative is the least restrictive to locatable minerals.

Impacts from Lands and Realty

Impacts would be similar to those described under Alternative N, except that no new areas would be proposed for withdrawal from mineral entry. Thus, impacts to mining of locatable minerals would be slightly less than under Alternative N.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

The 12 eligible WSR corridors would be released as a potential addition to the National Wild and Scenic Rivers System. These corridors would be managed for unnecessary or undue degradation under 43 CFR 3809, except within WSAs or where other planning decisions may affect the regulation of mining-related activity. This would result in fewer restrictions and less processing time from what was described under Alternative N.

Areas of Critical Environmental Concern

No ACECs would be designated, and the four existing ACECs in Alternative N would no longer be designated as such. Operations under the mining laws would be regulated for the prevention of unnecessary or undue degradation, and a plan of operations would be required only if required under other applicable regulations. This would result in less restrictions or delays than under Alternative N.

Proposed RMP

Impacts from Cultural Resources

Impacts would be the same as those described under Alternative N.

Impacts from Visual Resources

The types of impacts from management of visual resources would be similar to those described under Alternative N, except the VRM class designations for this alternative would be Class I, 446,900 acres (21% of the RFO); Class II, 249,800 acres (12%); Class III, 393,100 acres (18%); and Class IV, 1,038,200 acres (49%). The VRM Class I areas are coincident with WSAs. The VRM Class I lands would be managed as consistent with the regulations at 43 CFR 3802 for exploration and development under the mining laws. These regulations would preclude any activity for locatable minerals unless the activity is non-impairing, a grandfathered use, or a valid existing right. As required at 43 CFR 3802.3-2, operations proposed within WSAs would be mitigated to harmonize operations, to the extent practicable, with visual resources. This alternative would have more acres classified as VRM Classes I and II and fewer acres as VRM Classes III and IV than under Alternatives N and A. This could result in the need for additional modifications of proposals and greater impacts to locatable minerals.

Impacts from Special Status Species

Impacts would be similar to those described under Alternative A, however, the Proposed RMP has more restrictions on surface disturbing activities within Greater sage-grouse habitat. These restrictions include NSO and timing limitations to protect breeding, brood-rearing, and winter habitats (see Appendix 11 for exceptions, waivers, and modifications). However, because 97 percent of sage grouse winter habitat is within mule deer crucial habitat, which under the Proposed RMP has a timing limitation on surface

disturbing activities from December 15 through April 15, the sage grouse winter timing limitation would only result in surface disturbing restrictions on an additional 2,200 acres. Limitations on surface disturbing activities within Greater sage-grouse habitat are greater under the Proposed RMP than under any of the other alternatives. Such limitations could reduce the success of or preclude some mining operations.

Impacts from Non-WSA Lands with Wilderness Characteristics

Although 78,600 acres of non-WSA lands would be managed to maintain wilderness characteristics, the prescriptions identified in Chapter 2 would not preclude the mining of locatable minerals, therefore, impacts would be the same as for Alternative N.

Impacts from Recreation

The impacts would be similar to Alternative N, except that additional developed recreation sites would be proposed for withdrawal from mineral entry. These sites include Lonesome Beaver Campground, McMillan Spring Campground, Starr Springs Campground, Dandelion Flat Picnic Area, Hog Springs Picnic Area, Otter Creek Reservoir Recreation Sites, Kingston Canyon Recreation Site, and Koosharem Picnic Area. The acreage varies but generally would be less than 20 acres at each site. Withdrawal, if executed, would preclude any operations under the mining laws and would preclude development of locatable minerals. These sites are in areas with moderate to high potential for the occurrence of locatable minerals but are considered unlikely to have mineral development.

Impacts from Travel Management

The types of impacts from travel management would be similar to Alternative N. A plan of operations would be required for any closed area as stated at 43 CFR 3809.11(c)(5). In this alternative, there would be 209,900 acres designated as closed to motorized use. The impact would include an increased processing time for the review and approval of the plan of operations under applicable federal laws and regulations. There would be 1,908,210 acres of the RFO limited to designated routes. The potential for impacts to mining operations within the limited areas would depend on the need for additional access. If additional access routes were necessary, more processing time may be required to authorize that access. This alternative would result in greater potential for impacts to mining than Alternatives N and A.

Impacts from Lands and Realty

Under this alternative, the following areas would be recommended for withdrawal from mineral entry:

- North Caineville Mesa ACEC
- Old Woman Front ACEC
- Fremont River (Fremont Gorge) suitable wild river within one-quarter mile of the high water mark on each bank of the river segment
- Developed recreation sites, including Lonesome Beaver Campground, McMillan Spring Campground, Starr Springs Campground, Dandelion Flat Picnic Area, Hog Springs Picnic Area, Otter Creek Reservoir Recreation Sites, Kingston Canyon Recreation Site, and Koosharem Picnic Area.

The impacts would be similar to Alternative N, except that the total acreage of the proposed new withdrawals would increase to 21,500 (this is in addition to the existing 154,700 acres withdrawn). This would result in a greater potential for impacts to mining-related operations than under Alternatives N and A. These recreation sites and ACECs are generally within areas with a moderate to high potential for the occurrence of locatable minerals. Valid existing rights would be recognized.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as described under Alternative N.

Wild and Scenic Rivers

One eligible segment—Fremont River (Fremont Gorge)—would be recommended for suitability and would be recommended for withdrawal from mineral entry, which would preclude any mining-related operations under the mining laws. Stream segments recommended suitable for potential addition to the National Wild and Scenic Rivers System, would require a plan of operations as stated at 43 CFR 3809.11(c)(2). If a plan of operations is reviewed and approved under the applicable federal laws and regulations, mitigation would be required to protect the outstandingly remarkable values of the suitable rivers consistent with a claimant's rights. However, there are no active, recorded mining claims within these suitable segments, and only one river segment (5 miles long) would be recommended for suitability with a tentative classification as wild under the Proposed RMP. The potential for impacts would be minor.

Areas of Critical Environmental Concern

North Caineville Mesa (2,200 acres) would remain as a designated ACEC, and Old Woman Front (330 acres) would be designated as an ACEC. These ACECs are proposed for withdrawal from mineral entry, and a withdrawal would preclude any mining-related activity and development of locatable minerals. If the above areas are designated as ACECs but not withdrawn, any proposed mining-related operation would require a plan of operation as required by applicable regulations. As part of the review and approval of a plan of operations, mitigations would be required. As these ACECs are subject to NSO under oil and gas, a similar restriction under the mining laws would not be consistent with a claimant's rights. NSO is inconsistent with the claimant's right to occupy and use public land, reasonably incident to the mining laws. However, where consistent with claimant's rights, drilling and exploration sites and other facilities would be relocated and the critical resource(s) would be avoided. These two ACECs would be in areas designated as high potential (North Caineville Mesa) and low potential (Old Woman Front) for the occurrence of locatable minerals; however, exploration and development are considered unlikely.

Alternative C

Impacts from Cultural Resources

Impacts would be the same as described under Alternative N.

Impacts from Visual Resources

The types of impacts from management of visual resources would be similar to those described under Alternative N, except the VRM class designations under Alternative C would be Class I,446,900 acres (21% of the RFO); Class II, 230,600 acres (11%); Class III, 509,100 acres (24%); and Class IV, 944,100 acres (44%). The VRM Class I areas are coincident with WSAs. The VRM Classes I and II acres would increase slightly over the Proposed RMP, resulting in a slightly greater potential for impacts to locatable minerals.

Impacts from Special Status Species

Impacts would be similar to those described under the Proposed RMP although Alternative C has fewer restrictions on surface-disturbing activities within Greater sage-grouse habitat.

Impacts from Non-WSA Lands with Wilderness Characteristics

Impacts would be the same as described under Alternative N.

Impacts from Recreation

Impacts would be the same as described under the Proposed RMP.

Impacts from Travel Management

Impacts from travel management would be similar to those described under the Proposed RMP, except the acres closed to motorized use and requiring a plan of operations would increase to 683,000 acres. The remainder of the RFO would be limited to designated routes, requiring additional processing time if additional access is needed. This alternative would result in greater impacts to locatable minerals than Alternatives N, A, and the Proposed RMP but fewer than Alternative D.

Impacts from Lands and Realty

Under this alternative, the following areas would be recommended for withdrawal from mineral entry:

- Rainbow Hills ACEC (in total)
- Old Woman Front ACEC (in total)
- Recommended suitable Wild and Scenic Rivers within one-quarter mile of the high water mark on each bank of the river segment.
- Developed recreation sites, including Lonesome Beaver Campground, McMillan Spring Campground, Starr Springs Campground, Dandelion Flat Picnic Area, Hog Springs Picnic Area, Otter Creek Reservoir Recreation Sites, Kingston Canyon Recreation Site, and Koosharem Picnic Area
- VRM Class II portions of the following ACECs from mineral entry: Dirty Devil/North Wash ACEC, Fremont Gorge/Cockscomb ACEC, Badlands ACEC, Henry Mountains ACEC, Horseshoe Canyon ACEC, and Little Rockies ACEC.

The impacts would be the same as Alternative N, except that the total acreage of proposed new withdrawals would increase to 176,400 (this is in addition to the existing 154,700 acres of withdrawals). These withdrawals, if executed, would preclude any mining-related operations and development of minerals under the mining laws. This would result in a greater potential for impacts to mining-related operations than under Alternatives N, A, and the Proposed RMP. These recreation sites, WSRs, and ACECs are generally within areas with a moderate to high potential for the occurrence of locatable minerals. Valid existing rights would be recognized in withdrawn lands.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as described under Alternative N.

Wild and Scenic Rivers

All 12 eligible river segments (135 miles) would be recommended for suitability for inclusion in the National Wild and Scenic Rivers System and would be recommended for withdrawal from mineral entry, increasing the potential for impacts to locatable minerals over Alternatives N, A, and the Proposed RMP. Stream segments recommended for potential addition to the National Wild and Scenic Rivers System, which includes eligible rivers, would require a plan of operations. If a plan of operations is reviewed and approved under applicable federal laws and regulations, mitigation would be required to protect the outstandingly remarkable values of the eligible rivers consistent with a claimant's rights. These requirements would have adverse impacts by delaying the processing time and possibly reducing the feasibility of the proposal. Most of the eligible river segments are within areas that are rated as high potential for the occurrence of locatable minerals. There are no active, recorded mining claims within the eligible river segments.

Areas of Critical Environmental Concern

Sixteen ACECs would be designated. Table 4-59 includes a list of the ACECs and the acreage for each. The total acreage included in the potential ACECs would be 886,810 acres. These potential ACECs, in whole or part, would be withdrawn from mineral entry, and a withdrawal would preclude any mining-related activity and development of locatable minerals. If the above areas are designated as ACECs but not withdrawn, any proposed mining-related operation would require a plan of operations. As part of the review and approval of the plan of operations, mitigation would be required. As these ACECs are subject to NSO or closed to leasing under oil and gas, similar restrictions under the mining laws would not be consistent with a claimant's rights. NSO and closed to leasing are inconsistent with the claimant's right to occupy and use public land, reasonably incident to the mining laws. However, where consistent with claimant's rights, drilling and exploration sites and other facilities would be relocated and the critical resource(s) would be avoided. These requirements would likely result in delays due to processing time. Mining claims are actively recorded on lands within the potential Dirty Devil/North Wash, Henry Mountains, Badlands, Fremont Gorge/Cockscomb, Sevier Canyon, and Rainbow Hills ACECs. Most of these ACECs would be in areas designated as high potential for the occurrence of locatable minerals and include lands where mineral exploration and development have occurred in the past and would occur in the future depending on market conditions. This alternative would result in greater impacts than under Alternatives N, A, and the Proposed RMP, due to the increase in potential ACEC acreage.

Alternative D

Impacts from Cultural Resources

Impacts would be the same as described under Alternative N.

Impacts from Visual Resources

The types of impacts from management of visual resources would be similar to those described under Alternative N, except the VRM class designations for this alternative would be Class I, 1,129,600 acres (53% of the RFO); Class II, 66,700 acres (3%); Class III, 355,100 acres (17%); and Class IV, 576,600 acres (27%). VRM Class I areas outside of WSA boundaries include 682,600 acres. VRM Class I is the most restrictive class and allows for minimal or no change to the landscape. VRM Class II requires retention of the character of the landscape with a low level of change. This alternative would have the greatest impact on locatable minerals, as VRM Class I is increased by 60% compared to Alternative A, the Proposed RMP, and Alternative C, and VRM Class II is also increased compared to the other alternatives. This alternative would result in the greatest potential for necessary project modifications resulting in processing delays, additional costs, and possibly reducing the feasibility of proposals.

Impacts from Special Status Species

Impacts would be the same as described under Alternative C.

Impacts from Non-WSA Lands with Wilderness Characteristics

Under this alternative, all 29 areas (682,600 acres) of non-WSA lands with wilderness characteristics would be recommended for withdrawal from entry under the mining laws. No exploration and development of locatable minerals could occur within these withdrawn lands. Due to increased acres of withdrawals, the potential for adverse impacts to mineral development would be greatest under this alternative. Valid existing rights would be recognized in withdrawn lands.

Impacts from Recreation

Impacts would be the same as those described under the Proposed RMP.

Impacts from Travel Management

The types of impacts experienced from travel management would be similar to those described under Alternative N, except there would be 1,155,200 acres designated as closed to motor vehicle use. The remainder of the RFO would be limited to designated routes. This alternative is the most restrictive to locatable minerals and would result in the greatest potential for impacts, such as processing delays and increased costs of development, throughout the RFO.

Impacts from Lands and Realty

Under this alternative, the following areas would be recommended for withdrawal from mineral entry:

- Rainbow Hills ACEC
- Old Woman Front ACEC
- All suitable wild and scenic rivers within one-quarter mile of the high water mark on each bank of the river segment
- All areas identified as non-WSA lands with wilderness characteristics
- Developed recreation sites, including Lonesome Beaver Campground, McMillan Spring Campground, Starr Springs Campground, Dandelion Flat Picnic Area, Hog Springs Picnic Area, Otter Creek Reservoir Recreation Sites, Kingston Canyon Recreation Site, and Koosharem Picnic Area
- VRM Class II portions of the following ACECs from mineral entry (see ACEC prescriptions for details): Dirty Devil/North Wash ACEC, Fremont Gorge/Cockscomb ACEC, Badlands ACEC, Henry Mountains ACEC, Horseshoe Canyon ACEC, and Little Rockies ACEC.

The impacts would be the same as described under Alternative N, except the total acreage proposed for new withdrawals would increase to 749,200; this is in addition to the 154,700 acres of existing withdrawals. This would be the most acres of proposed withdrawals of any of the alternatives, resulting in the greatest potential for adverse impacts. These withdrawals, if executed, would preclude any mining-related operations and development of minerals under the mining laws. These recreation sites, WSRs, and ACECs are generally within areas with a moderate to high potential for the occurrence of locatable minerals. Valid existing rights would be recognized.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as described under Alternative N.

Wild and Scenic Rivers

Impacts would be the same as described under Alternative C.

Areas of Critical Environmental Concern

The types of impacts would be the same as those described under Alternative C. However, ACEC management prescriptions under Alternative D include additional restrictions for non-WSA lands with wilderness characteristics, which would result in greater impacts to locatable minerals. This alternative is the most restrictive to locatable minerals.

4.4.6.3 Salable Minerals

Salable minerals are subject to disposal under the Act of July 31, 1947, which is commonly called the Materials Act. The BLM's policy is to make mineral materials available unless detrimental to the public

interest, to protect public land resources and the environment, and to minimize damage to public health and safety. Through land use planning, the BLM may designate public land as open or closed to disposals, and the open areas may be designated with special conditions. The designations of open, open with special conditions, and closed would follow the oil and gas leasing designations to the extent practicable. Open with special conditions would include the oil and gas open with minor constraints (timing or controlled surface use) and open with major constraints (NSO). The provisions for exceptions, modifications, and waivers would also apply to salable minerals.

Methods and Assumptions

The analysis for impacts to salable minerals assumes exploration and development would be regulated under the subject laws and regulations.

Environmental Consequences

The impacts to salable minerals would be similar to impacts to oil and gas exploration and development. However, under Alternative N, the oil and gas leasing restrictions do not apply to salable minerals. Operations for salable minerals do not involve the same operations as oil and gas; however, there are similarities in that exploration and development for salable and fluid minerals require use of public lands and result in disturbances related to that exploration and development. Exploration for salable minerals would include drilling with smaller drill rigs than generally used for oil and gas, testing by excavating trenches or pits, extracting bulk samples, and other activities that would involve surface disturbances. Production would involve surface mines or quarries and associated surface facilities, which would include roads and could include conveyors, crushers, screens, and other equipment. Generally, excavating and hauling equipment would remain onsite during production activities. Please see the oil and gas discussion on the differences between alternatives in leasing categories, and maps 2-34, 2-35, 2-36, 2-37 and 2-38.

Differences between impacts to salable mineral operations and to oil and gas operations would include:

- Timing restrictions could preclude development of a salable mineral resource. Construction and drilling of a well may be reasonably completed during the open season for oil and gas exploration and development. Once development is completed, maintenance of facilities for production can be accomplished by a reduced presence of humans and equipment during the restricted season. For salable minerals, production would involve excavating and removing mineral materials from a quarry or pit, the materials would usually be processed for use at the quarry, and that mineral product would be hauled from the site to a place of use. Production of mineral materials requires that humans and equipment be onsite during the restricted season; production cannot continue during a seasonally restricted period if humans and the necessary equipment are not in use. Operations for salable minerals may not be profitable if shut-downs are required for seasonal periods. Thus, a seasonal restriction could make a salable mineral operation unprofitable and could preclude development of the mineral material.
- CSU or distance buffers could preclude development of a salable mineral. A well site for oil and gas may be relocated, and the well may still be practically and feasibly drilled to a subsurface target, allowing for exploration and development of the oil and gas resources. However, moving a proposed salable mineral pit may preclude development of the mineral resource, if the targeted resource is not present or if mining or extraction is not practical or feasible at the relocated site.
- NSO may preclude development of a salable mineral. An oil and gas well may be practically and feasibly directionally drilled from a well pad that is not located vertically above the subsurface, and oil and gas may be produced by a directionally drilled well. However, NSO requirements for salable minerals would, in most cases, preclude mineral development, as the mineral resource would not be available for mining and extraction.

4.5 IMPACTS TO SPECIAL DESIGNATIONS

4.5.1 Wilderness Study Areas

Pursuant to FLPMA and BLM policy, WSAs are managed according to the IMP to protect their suitability for wilderness designation until such time as Congress acts on the BLM's recommendations. This analysis does not consider the impact of the IMP on other resources and resource uses or on the wilderness characteristics of the WSAs; that analysis was conducted in the Utah Statewide Wilderness FEIS (BLM 1990b).

WSAs would be managed pursuant to the non-impairment standard, and as such, the BLM cannot allow activities to occur within WSAs that would impair their suitability for preservation as wilderness. Therefore, significant impacts on WSAs (e.g., impairment) would not occur under any of the alternatives. Although impacts on natural resources within WSAs could occur from a variety of uses, they would be non-impairing and therefore would not result in long-term impacts to the wilderness characteristics of the WSAs.

There are 11 WSAs within the RFO totaling 446,900 acres. All except one are located east of Capitol Reef National Park. The Fremont Gorge WSA is located west of Capitol Reef National Park. All are located in Wayne County or Garfield County. The management of WSAs focuses on maintaining the wilderness characteristics of appearance of naturalness, outstanding opportunities for solitude, or primitive, unconfined recreation. Size and management guidelines have already been established for these areas.

Federal law and BLM policy require that WSAs be closed to oil and gas leasing. This management direction protects the wilderness characteristics of the WSAs, and the BLM has no discretion to direct otherwise through planning. Thus, the RMP makes only two management decisions specific to WSAs:

- VRM class designations (BLM policy requires that WSAs be designated as VRM Class I)
- Designation of each WSA as either closed or limited to off-highway vehicle use (as displayed in Table 4-55).

In addition, route designation decisions (which are implementation decisions) will also be analyzed in this PRMP/FEIS (as displayed in Table 4-55).

Table 4-55. OHV Area and Way Designations within WSAs

		Alternative N (No Action)	Alternative A	Proposed RMP	Alternatives C and D
OHV Area Designations	**Management Direction**	Continue current OHV designations (closed and limited) and allow vehicle use on identified ways. (Map 2-12)	Designate all WSAs as limited to OHV use and allow vehicle use on all designated ways. (Map 2-13)	Designate WSAs as either limited or closed to OHV use and allow vehicle use on identified ways. (Map 2-14)	Designate all WSAs as closed to OHV use and allow no vehicle use on inventoried ways. (Maps 2-15 and 2-16)
	Acres closed	187,000	0	175,300	446,900

		Alternative N (No Action)	Alternative A	Proposed RMP	Alternatives C and D
	Acres limited	259,900	446,900	271,600	0
OHV Route Designations	**Miles Accessible**	41.5 (Map 3-10)	51.6 (Map 2-17)	59.5 (Map 2-18)	0 (Maps 2-19 and 2-20)

Management actions that could impact these characteristics include managing for the presence or absence of ways and trails, use of motorized vehicles along these ways, construction of fences and other range or wildlife improvements, management of native vegetation communities, land tenure adjustments, or other actions that result in surface-disturbing activities.

Methods and Assumptions

The analysis is based on the following assumptions:

- Managing WSAs according to the IMP will protect wilderness characteristics of WSAs in a manner that will not "impair the suitability of such areas for preservation as wilderness" (FLPMA Section 603(c))
- Management actions that enhance biological or environmental characteristics would improve the wilderness quality and suitability of the WSAs.

Environmental Consequences

Impacts to WSAs could result from actions proposed under the following resource programs:

- Fire and Fuels Management
- Recreation
- Travel Management
- Lands and Realty.

Other programs were determined to have little or no impact on WSAs.

Alternative N: No Action

Impacts from Fire and Fuels Management

During and immediately after fire events, access to WSAs and enjoyment of opportunities for primitive recreation associated with them may be restricted or impaired. Full suppression of wildland fires in these areas may be implemented to control fire size and severity, protecting these opportunities. Wildfire suppression activities could result in short-term impacts, including disturbance to soils, surfaces, and groundwater; watershed functions; and vegetation conditions. Impacts would be minimized by post-fire rehabilitation efforts. There would also be impacts to solitude due to the presence of firefighters and equipment during fire events, but this would be short term. Appropriate management response within a WSA could limit the use of mechanical suppression activities or other techniques for reducing these impacts. Temporary disturbances may occur to resources and values; however, these effects would be short term while wilderness values are assessed on a long-term scale.

Long-term impacts associated with the use of an appropriate management response to wildfire suppression, wildland fire use, and the planned actions of prescribed fire and non-fire fuel treatments on WSAs are the decreased risk of large severe wildfire events and the overall improved ecological health. With the removal of hazardous fuels, a trend towards increasing the preservation of naturalness and

opportunities for primitive recreation would be in place. Because fire is a natural and necessary event in maintaining ecological health, a WSA's natural character would not only be protected but also likely enhanced.

Impacts from Recreation

Visitors may have outstanding opportunities for solitude or primitive and unconfined recreation when the sights, sounds, and evidence of other people are rare or infrequent; where visitors can be isolated, alone, or secluded from others; where the use of the area is by non-motorized, non-mechanical means; and where no or minimal developed recreation facilities are encountered. High concentrations of recreation users (large group sizes or frequent group encounters) would decrease outstanding opportunities for solitude in WSAs. Continued increases in non-motorized recreation users would reduce opportunities for solitude in those areas. Additionally, large numbers of recreationists in WSAs, especially in the narrow canyons associated with some of the WSAs, would increase the impact to campsites, decreasing the naturalness of WSAs in specific locations. Increasing use of campsites results in increased areas of compacted soils, reducing vegetation and creating unnatural openings in the vegetation. Human waste and trash also increases, especially when campsites are located in confined areas such as canyons.

Impacts from Travel Management

Use of motorized vehicles within WSAs could impact wilderness characteristics. Under Alternative N, some identified ways within the Mount Ellen—Blue Hills WSA and all of the Fremont Gorge, Horseshoe Canyon, Fiddler Butte, and French Springs WSAs would continue to be available for motor vehicle use on the designated way, which would temporarily impact solitude and opportunities for primitive recreation in areas adjacent to the ways. The rugged terrain of these areas has presented a barrier to vehicle intrusions in the past and would likely continue to do so in the future, although advancing vehicle technology could allow vehicles to enter and impact areas they have not been able to access in the past.

Impacts from Lands and Realty

Acquiring inholdings within WSAs would improve their manageability and preclude non-conforming uses on what are currently non-federal (state and private) lands. Lands within WSAs are not available for ROWs or disposal, precluding impacts to wilderness characteristics from these actions.

Alternative A

Impacts from Fire and Fuels Management

Impacts would be the same as those described under Alternative N.

Impacts from Recreation

Under this alternative, the Dirty Devil SRMA would overlap the Dirty Devil, Horseshoe Canyon South, and French Spring/Happy Canyon WSAs. Managing the lands that surround the WSAs for semi-primitive recreation would complement WSA management. However, management under the IMP is usually more restrictive than SRMA prescriptions, so no additional benefit to wilderness characteristics would result from SRMA management.

Impacts from Travel Management

OHV use within WSAs could impact wilderness characteristics. OHV area and route designations by alternative are shown in Table 4-55. Under Alternative A, all WSAs would be designated as limited to OHV use, with 51.6 miles of ways designated as available for use, which is the most of any alternative. The potential impacts to naturalness and solitude from vehicle intrusions would be the greatest among the alternatives, because more ways would be designated than under any other alternative.

Impacts from Lands and Realty

Impacts would be the same as those described under Alternative N.

Proposed RMP

Impacts from Fire and Fuels Management

Impacts would be the same as those described under Alternative N.

Impacts from Recreation

The Dirty Devil, Henry Mountains, and Capitol Reef Gateway SRMAs overlap the Dirty Devil, Horseshoe Canyon South, French Spring/Happy Canyon, Fremont Gorge, Mount Ellen—Blue Hills, Bull Mountain, Mount Pennell, and Mount Hillers WSAs. Managing the lands that surround the WSAs for semi-primitive motorized and non motorized recreation would complement WSA management. However, management under the IMP is usually more restrictive than SRMA prescriptions, so no additional benefit to wilderness characteristics would result from SRMA management.

Impacts from Travel Management

Use of OHVs within WSAs could impact wilderness characteristics, however this use is mitigated by the IMP wherein BLM would restrict or close use on routes that do not meet with non-impairment standards. OHV area and route designations for this alternative are shown in Table 4-55. Area designations under the Proposed RMP would be similar to Alternative N, but an additional 18 miles of ways would be designated as open to motor vehicle use, resulting in more potential impacts to wilderness characteristics than Alternatives N, C, and D but less than Alternative A.

Impacts from Lands and Realty

Impacts would be the same as those described under Alternative N.

Alternative C

Impacts from Fire and Fuels Management

Impacts would be the same as those described under Alternative N.

Impacts from Recreation

Impacts would be the same as those described under Alternative N.

Impacts from Travel Management

Use of OHVs within WSAs could impact wilderness characteristics. OHV area and route designations by alternative are shown in Table 4-55. Under Alternative C, all WSAs would be closed to motorized use, which would eliminate any short-term impacts, thereby preserving opportunities for solitude and primitive recreation.

Impacts from Lands and Realty

Impacts would be the same as those described under Alternative N.

Alternative D

Impacts from Fire and Fuels Management

Impacts would be the same as those described under Alternative N.

Impacts from Recreation

The types of impacts would be the same as those described under the Proposed RMP and Alternative C but would include more acres of WSAs and lands adjacent to the WSAs being included within SRMAs. The Dirty Devil, Henry Mountains, Capitol Reef Gateway, Labyrinth Canyon, and Little Rockies SRMAs would overlap with all 11 WSAs, complementing the management within those areas.

Impacts from Travel Management

Impacts would be the same as those described under Alternative C.

Impacts from Lands and Realty

Impacts would be the same as those described under Alternative N.

4.5.2 Wild and Scenic Rivers

This section discusses impacts to wild and scenic rivers (WSRs) that would occur from actions associated with the management of other resources. Analysis of impacts to WSRs is limited to the river segment corridor, which includes the viewshed within one-quarter mile of the high water mark on each bank of the river segment. In many cases, the corridor would be limited to the canyon in which the river segment is located.

The Wild and Scenic River Act includes three possible tentative classifications: "wild," "scenic," or "recreational." These classifications are based on the type and degree of human development associated with the river and the lands adjacent to the river corridor at the time of inventory. Tentative classification also dictates the types of activities and development allowed within the river corridor. "Wild" rivers are the most restrictive of the three classifications and are associated with rivers free of impoundments, generally are inaccessible except by trail, contain shorelines and watersheds that are essentially primitive, and have waters that are unpolluted. "Scenic" rivers are slightly less restrictive than "wild" rivers, accessibility to "scenic" rivers is generally easier and can include existing routes; however, "scenic" rivers are generally free of impoundments and contain shorelines and watersheds that are largely primitive and undeveloped. "Recreational" rivers have the least restrictions placed on them and include rivers that are readily accessible by roads, trails, or railroads; may have some development along their shorelines; and may have substantial evidence of human activity.

Outstandingly remarkable values and the criteria associated with each value are as follows:

- **Scenic.** Diversity of view, special features, seasonal variations, cultural modifications.
- **Fish.** Habitat quality, diversity of species, values of species, abundance of fish, natural reproduction, size and vigor of fish, quality of experience, cultural and historical importance, recreational importance, and access.
- **Recreational.** Length of season, diversity of use, flow, character of run, scenery and naturalness, access, level of use, associated opportunities, attraction, sites, and facilities.
- **Wildlife.** Habitat quality, diversity of species, abundance of species, natural reproduction, size and vigor of species, quality of experience, cultural and historic importance, recreational importance, and access.
- **Geologic.** Feature abundance, diversity of features, and educational or scenic.
- **Historic.** Significance, site integrity, education and interpretation, listing, and eligibility.
- **Cultural.** Significance, current uses, number of cultures, site integrity, educational and interpretation, listing, and eligibility.
- **Ecologic.** Species diversity, ecological function, rare communities, and educational and scientific.

Methods and Assumptions

The analysis of impacts to WSRs includes an evaluation of where management actions may be inconsistent with the tentative classification given to all eligible or suitable segments as well as potential impacts to the outstandingly remarkable values of any eligible or suitable segment. Impacts to the tentative classification of the segments for each alternative will be discussed first, followed by impacts associated with the segment's outstandingly remarkable values.

River segments determined to be eligible for further consideration in land use planning, along with their outstandingly remarkable values and tentative classification, are identified in Table 4-56. Details of the eligibility and classification process are included in Appendix 2.

Table 4-56. Wild and Scenic River Eligibility and Tentative Classification

River or River Segment		Outstandingly Remarkable Value(s)	Tentative Classification	Miles within WSA	BLM Miles	Total Miles
Dirty Devil Complex	Dirty Devil River	Scenic, recreation, geologic, fish and wildlife, and cultural	Wild	35	54	57
	Beaver Wash Canyon	Scenic and ecological	Wild	6.8	6.8	6.9
	Larry Canyon	Scenic, recreation, wildlife and ecological	Wild	4	4	4
	No Mans Canyon	Scenic, recreation, and cultural	Wild	7.1	7.1	7.1
	Robbers Roost Canyon	Scenic, recreation, historic, and cultural	Wild	28	31	33
	Sams Mesa Box Canyon	Scenic and wildlife	Wild	9.5	9.5	9.5
	Twin Corral Box Canyon	Scenic and wildlife	Wild	8	9	10
Fish Creek		Cultural	Scenic	0	0.25	0.25
Fremont River	Fremont Gorge	Scenic	Wild	0	5	6
	Capitol Reef National Park to Caineville Ditch Diversion	Scenic and geologic	Recreational	0	4	6
Maidenwater Creek		Scenic, recreation, geologic, fish and wildlife, and ecological	Scenic	0	3	4
Quitchupah Creek		Cultural	Recreational	0	1.4	1.4
Total				**98.4**	**135.05**	**145.15**

Suitability, the process of deciding which rivers to recommend for addition to the National Wild and Scenic River System, is part of the resource management planning process. The suitability process is described in Appendix 3. Suitability varies by alternative, as summarized in Table 4-57.

Table 4-57. Suitability Recommendations by Alternative

Alternative N	Alternative A	Proposed RMP	Alternative C	Alternative D
A suitability decision would not be made. All 12 eligible river segments (135 miles) would continue to be managed to protect their outstandingly remarkable values, free-flowing nature, and tentative classification.	No eligible river segments would be designated as suitable.	A 5 mile segment of the Fremont River in Fremont Gorge would be designated and managed as a suitable wild and scenic river. This segment would be managed to protect its outstandingly remarkable values, free flowing nature and tentative classification of wild	All 12 eligible river segments (135 miles) would be designated and managed as suitable WSRs. They would be managed to protect their outstandingly remarkable values, free-flowing nature, and tentative classification.	

Environmental Consequences

Impacts to the outstandingly remarkable values of the eligible WSRs could result from actions proposed under the following resource management programs:

- Vegetation and Fire and Fuels Management
- Cultural Resources
- Visual Resources
- Special Status Species and Fish and Wildlife
- Non-WSA Lands with Wilderness Characteristics
- Livestock Grazing
- Recreation
- Travel Management
- Lands and Realty
- Minerals and Energy
- Special Designations.

Other programs were determined to have little or no impact on WSRs.

Alternative N: No Action

Under this alternative, 12 segments, totaling 135 miles, have been identified as eligible for consideration for suitability and, as dictated by policy, would be managed to protect their free-flowing nature, outstandingly remarkable values, and tentative classification until such time as a suitability determination is made. Eight segments (126 miles) are tentatively classified as "wild," two segments (5 miles) are "recreational," and two segments (3 miles) are tentatively classified as "scenic."

Impacts from Vegetation and Fire and Fuels Management

Allowing for habitat restoration could result in evidence of human activity from surface disturbance along the 126 miles of segments tentatively classified as "wild"; however, these impacts would be short term in duration and would not likely result in a change to the tentative classifications. Performing land treatments to reduce soil loss and maintain vegetation structure would impact WSRs by assisting in maintaining plant diversity and preserving the ecological condition of the segments. Management actions

to maintain soil levels and vegetation cover, manage noxious weeds, and enhance wildlife habitat could have short-term impacts on wildlife, scenic, ecological, and recreational outstandingly remarkable values by removing vegetation and increasing the potential for erosion and sedimentation, visual intrusions, and loss of habitat; however, over the long term, such actions would likely increase age and species diversity of plant communities, which would improve or maintain these values.

Indirect protections from management of riparian areas would be provided to eligible river segments due to not allowing new surface disturbance within 500 feet of riparian-wetland areas. This would maintain the integrity of these areas and also provide indirect protections to many of the segments' outstandingly remarkable values, such as scenic and wildlife.

Impacts from Cultural Resources

Management actions associated with cultural resources would be compatible with all 135 miles identified as eligible for suitability because allowable activities and the degree of development within the river corridors would not change and future activities would be minimized or prohibited. In some instances, if inventories and collection were to occur within river corridors, short-term impacts could result from associated surface disturbance, particularly segments with "wild" classifications; however, over the long term, these impacts would not likely affect tentative classification of the segment. Law and policy guiding cultural resources management would provide indirect protection to those segments that contain cultural or historic outstandingly remarkable values by placing restrictions on surface-disturbing activities. Additionally, indirect effects from these restrictions could also occur to segments containing scenic, recreational, fish, wildlife, and ecological outstandingly remarkable values by providing additional protections within the management of these values. Allowing for inventories and collection within river corridors could potentially cause short-term impacts associated with surface-disturbing activities; however, over the long term, these impacts from associated mitigation measures would be negligible and, in some instances, may provide additional values to segments, particularly if a significant cultural resource was found.

Impacts from Visual Resources

Most of the eligible river segments would continue to be managed as VRM Class II. This requires that the existing character of the landscape be retained and allows only low-level changes to the landscape. This would minimize, but not eliminate, impacts from surface-disturbing activities to eligible WSRs where scenery was identified as the outstandingly remarkable value.

Impacts from Special Status Species and Fish and Wildlife

Management actions associated with SSS and fish and wildlife would be compatible with the tentative classifications of all 12 segments because allowable activities and the degree of development within the river corridor would not change and future activities would be minimized or prohibited. In some instances, short-term impacts could occur within "wild" segments from surface disturbance associated with habitat improvements from the increased potential for erosion and sedimentation impacting water quality and the natural character of the area. In some instances, these actions could also result in short-term impacts to the rivers' wildlife, fish, ecological, scenic, and recreational outstandingly remarkable values from any associated improvement or development actions; however, over the long term, these actions would likely assist in upholding the segment's outstandingly remarkable values by maintaining or improving habitat values.

Additionally, legal and policy requirements for protecting SSS habitats would protect eligible river segments where the SSS are the outstandingly remarkable value.

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness characteristics on lands outside WSAs are proposed under this alternative, resulting in no additional protection for WSR outstandingly remarkable values.

Impacts from Livestock Grazing

Proposed decisions to manage livestock grazing could have minor and localized effects on some outstandingly remarkable values. Most river segments are inaccessible to cattle and, although livestock grazing would be allowed within all eligible river corridors, impacts to the outstandingly remarkable scenic and recreational values would be minimal because management of livestock grazing is subject to the *Fundamentals of Rangeland Health*. However, there is a potential that certain rangeland improvements (e.g., fencing, water crossings) could be incompatible in some of the segments tentatively classified as "wild" from visual intrusions to the natural character of the area.

Impacts from Recreation

Under this alternative, there are no SRMAs; therefore, SRMA management would have no impact on eligible rivers.

Impacts from Travel Management

Off-highway vehicle use could impact outstandingly remarkable values and tentative classification of the eligible river segments. Under this alternative, some eligible WSR segments, including the Fremont River east of Capitol Reef National Park, Quitchupah Creek, Fish Creek, Maidenwater Creek, and the Dirty Devil River north and south of the Dirty Devil WSA, would continue to be open to cross-country OHV travel, leaving these areas vulnerable to vehicle intrusions that could adversely impact recreational, scenic, cultural, and wildlife outstandingly remarkable values. The rugged terrain in some of these areas has presented a barrier to vehicle intrusions in the past and would likely continue to do so in the future, although advancing vehicle technology could allow vehicles to enter—and affect—areas they have not been able to access in the past. Eligible river segments within WSAs would be closed or limit OHV use to existing identified routes, which would preclude or reduce threats to outstandingly remarkable values.

Impacts from Lands and Realty

No proposed actions from lands and realty would impact the tentative classification or outstandingly remarkable values of the eligible segments identified under this alternative because allowable lands and realty actions and the degree of development within the corridor would be minimized or prohibited due to BLM's policy of managing eligible river segments to protect their free-flowing nature, outstandingly remarkable values, and tentative classification. Thus, these river segments would be managed as ROW avoidance areas, which would provide additional protection to the outstandingly remarkable values of the segments by eliminating any surface disturbance or visual intrusions associated with such development actions.

Because the BLM has no control over potential modifications to a river's shoreline or any other type of development on non-public lands, impacts could occur in these areas. Land tenure adjustments that would result in the acquisition of non-BLM lands within these river corridors would provide opportunities to better manage outstandingly remarkable values and to mitigate any efforts that could impact the segments' tentative classification or free-flowing nature.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

There would be no impacts from oil and gas exploration and development to the outstandingly remarkable values of eligible river segments within WSAs (98 of the 135 total miles) because all WSAs are closed to

oil and gas leasing under all alternatives. The leasing categories of the 37 miles of eligible river segments outside WSAs (for all alternatives) are shown in Table 4-58.

Table 4-58. Oil and Gas Leasing in Eligible River Segments Outside WSAs

Eligible River Segment	Alternative N (No Action)	Alternative A	Proposed RMP	Alternatives C and D
Dirty Devil River North	Open subject to moderate constraints (timing limitation, CSU)	Open subject to standard terms and conditions	Open to leasing subject to major constraints (NSO)	Closed to leasing
Dirty Devil River South	Open subject to moderate constraints (timing limitation, CSU)	Open subject to standard terms and conditions	Open to leasing subject to major constraints (NSO)	Closed to leasing
Dirty Devil Tributaries Outside WSA	Open subject to standard terms and conditions	Open subject to standard terms and conditions	Open to leasing subject to major constraints (NSO)	Closed to leasing
Fremont Gorge	Open to leasing subject to major constraints (NSO)	Open subject to moderate constraints (timing limitation, CSU)	Open to leasing subject to major constraints (NSO)	Closed to leasing
Fremont River Below Capitol Reef National Park	Open subject to moderate constraints (timing limitation, CSU)	Open subject to moderate constraints (timing limitation, CSU)	Open subject to moderate constraints (timing limitation, CSU)	Closed to leasing
Fish Creek	Open to leasing subject to major constraints (NSO)	Open subject to moderate constraints (timing limitation, CSU)	Open subject to moderate constraints (timing limitation, CSU)	Open to leasing subject to major constraints (NSO)
Maidenwater Creek	Open subject to standard terms and conditions and closed to leasing	Open subject to standard terms and conditions	Open subject to moderate constraints (timing limitation, CSU)	Closed to leasing
Quitchupah Creek	Open subject to standard terms and conditions	Open subject to standard terms and conditions and open subject to moderate constraints (timing limitation, CSU)	Open subject to standard terms and conditions and open subject to moderate constraints (timing limitation, CSU)	Closed to leasing

Although portions of these river segments are open to oil and gas leasing with standard or minor stipulations under Alternative N, the oil and gas leasing stipulations for Alternative N (Appendix 11) also require NSO within 500 feet of each side of a perennial stream, which would help protect outstandingly

remarkable values. This would reduce the potential for surface-disturbing activities and their associated visual impacts. The remainder of the eligible river segments would be closed to leasing or open to leasing subject to major constraints (NSO), which would further protect outstandingly remarkable values. The potential for impacts to eligible river segments would be minor.

Leasable Minerals—Coal

No coal resources were identified within the eligible WSR corridors, except for Quitchupah Creek, which is located within the Emery coal field, where development is not expected before 2030. If coal resources were developed within the corridor, there would be potential for disturbance and impacts to the cultural values within that eligible segment.

Non-Energy Solid Leasable Minerals

Under this alternative, leasing within one-quarter mile of the high water mark on each bank of the river segment of eligible WSRs would be prohibited, so outstandingly remarkable values would be protected.

Locatable Minerals

While there could be potential impacts from mineral development to the outstandingly remarkable values of eligible rivers, the likelihood of mineral development within the eligible river corridors is small, given their remote location and lack of known mineralization. Impacts from mineral exploration and development would be mitigated by the requirement of federal regulations that a plan of operations be submitted for any operations causing surface disturbance greater than casual use in areas recommended for potential addition to the National Wild and Scenic River System.

Salable Minerals

Under this alternative, disposal of salable minerals within one-quarter mile of the high water mark on each bank of the river segment of eligible WSRs would be prohibited, so outstandingly remarkable values would be protected.

Impacts from Special Designations

Wilderness Study Areas

Nearly three-quarters of the eligible river miles (98 of the 135 total miles) are within WSAs, encompassing most of the Dirty Devil River and its side drainages. WSA management pursuant to the IMP would continue to have a beneficial impact on all outstandingly remarkable values within these segments by limiting development within these river corridors.

Wild and Scenic Rivers

No suitability determination would be made under Alternative N, and the outstandingly remarkable values of all eligible river segments would continue to be protected by policy until suitability determinations are made.

Areas of Critical Environmental Concern

Continued management of the Beaver Wash ACEC for its relict vegetation (closed to OHV use, closed to oil and gas leasing, unavailable for livestock grazing, acquisition of inholdings, and recommending for mineral withdrawal) would protect the ecological outstandingly remarkable value of the Beaver Wash eligible river segment. Continued management of the other three existing ACECs would have no impact on the other eligible river segments because no segments are located within those ACECs.

Alternative A

Impacts from Vegetation and Fire and Fuels Management

Under Alternative A, maximum treatment acreage limits would be set (averaging 73,600 acres annually for all treatments). No target (maximum or minimum) treatment acreage limits would be set under Alternative N. It is therefore likely that in some years, fewer acres would be treated under that alternative; however, in other years (when there are numerous wildland fires) more acres could be treated because the 2005 Land Use Plan Amendment for Fire and Fuels Management allows the full range of fire and fuels management actions to achieve ecosystem sustainability.

Under this alternative, no river segments would be recommended as suitable, which means that outstandingly remarkable values would not necessarily be protected. However, if these treatments were to occur in eligible WSR corridors, the types of impacts experienced would be similar to those described under Alternative N.

Impacts from Cultural Resources

Impacts would be the same as those described under Alternative N.

Impacts from Visual Resources

The impacts on outstandingly remarkable values of the eligible rivers would depend on the VRM classification of the lands within the river corridor. The eligible river segments within WSAs (98 of the 135 total miles) would be designated as VRM Class I, which would protect the scenic outstandingly remarkable values. River segments outside WSAs where scenery was identified as an outstandingly remarkable value (Dirty Devil and tributaries outside WSA, Fremont Gorge, Fremont River below Capitol Reef National Park, and Maidenwater Creek) would be designated as VRM Classes III or IV because no river segments would be recommended as suitable and no special management to protect outstandingly remarkable values is proposed under this alternative. Thus, management activities that could adversely impact the scenic values could occur in these river corridors.

Impacts from Special Status Species and Fish and Wildlife

Impacts would be similar to those described under Alternative N, with the exception of the 37 miles of river segments outside WSAs. However, legal and policy requirements for protecting SSS habitats would protect eligible river segments where the habitat overlaps a river segment.

Allowing for habitat restoration could result in evidence of human activity from surface disturbance along the 126 miles of segments tentatively classified as “wild”; however, these impacts would be short term in duration and would not likely result in a change to the tentative classifications. Management actions to enhance wildlife habitat could have short-term impacts on wildlife, scenic, ecological, and recreational outstandingly remarkable values by removing vegetation and increasing the potential for erosion and sedimentation, visual intrusions, and loss of habitat; however, over the long term, such actions would likely increase age and species diversity of plant communities, which would improve or maintain these values.

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness characteristics on lands outside WSAs are proposed under this alternative, resulting in no additional protection for WSR outstandingly remarkable values.

Impacts from Livestock Grazing

Impacts would be similar to those described under Alternative N. Providing no protective management for outstandingly remarkable values would allow more potential for certain rangeland improvements and associated surface disturbance, which could affect outstandingly remarkable values.

Impacts from Recreation

Proposed decisions to identify SRMAs could impact outstandingly remarkable values. Under Alternative A, management direction for the proposed Dirty Devil SRMA would complement the recreational outstandingly remarkable value identified in the eligible Dirty Devil River segment and several of its tributary segments because of the emphasis on providing primitive and semi-primitive recreation opportunities.

Proposed decisions to establish the Factory Butte SRMA with emphasis on motorized recreation could potentially impact outstandingly remarkable values of the eligible Fremont River segment from Capitol Reef National Park to the Caineville Diversion. Management for cross-country OHV use could result in surface disturbances and impacts, such as crushing vegetation, compacting soil, and contrasts in visual components within the river corridor, thus impacting the outstandingly remarkable values of this eligible river segment.

No other proposed SRMAs would overlap with eligible WSR segments under this alternative.

Impacts from Travel Management

OHV use could impact outstandingly remarkable values. Within most of the eligible river corridors, OHVs would be limited to designated routes, reducing impacts relative to Alternative N. Fremont Gorge would be open to cross-country OHV use, although the ruggedness of the gorge would prevent most vehicles from entering the area. The Fremont River from Capitol Reef National Park to the Caineville Ditch Diversion would remain open to cross-country OHV use. Terrain would limit motorized access in some locations. However, cross-country OHV use could result in surface disturbance, so impacts to outstandingly remarkable values could occur. Eligible river segments within WSAs would not be affected by OHVs.

Impacts from Lands and Realty

Under Alternative A, none of the eligible river segments would be recommended as suitable or managed to protect their free-flowing nature, outstandingly remarkable values, and tentative classification. The eligible river segments would not be included in withdrawals or ROW avoidance areas, which could result in proposals for surface-disturbing activities within some of the eligible river corridors such as development of ROWs or mining-related activities. These areas could be disposed of under a land tenure adjustment (removing land from management under federal laws and regulations), and inholdings could be acquired (which would bring lands under federal jurisdiction, subject to management under federal laws and regulations). There would continue to be protection from lands and realty actions for 98 of the 135 eligible river miles located within WSAs. The potential for impacts to the remaining 37 miles would be dependent on future proposals. This alternative would provide the least protection for the eligible river segments and, as discussed above, could result in impacts to the outstandingly remarkable values from development of ROWs or other land use actions, as well as development of lands if disposed from public ownership.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

This alternative would allow the greatest impacts from oil and gas leasing among all of the alternatives because all eligible segments outside WSAs (37 miles) would be open to leasing under standard terms or controlled surface use or timing stipulations. However, all eligible river segments except Quitchupah Creek are within an area identified as having low potential for oil and gas development. (Quitchupah Creek is located within an area identified as having moderate potential for gas development.) Because development of oil and gas within these areas is unlikely in the next 15 years, the possibility of such development impacting outstandingly remarkable values of any eligible river is minimal.

Leasable Minerals—Coal

Impacts would be the same as those described under Alternative N.

Non-Energy Solid Leasable Minerals

The 98 miles of eligible river segments located within WSAs would be closed to leasing, indirectly providing protection of the outstandingly remarkable values for those areas. There would be potential for leasing and development within the remaining 37 miles of eligible rivers, which could result in surface-disturbing activities within those corridors. This alternative would result in the least protection for the eligible river segments.

Locatable Minerals

There could be potential impacts from mineral exploration and development to the outstandingly remarkable values of eligible rivers as portions of the segments have a high potential for locatable minerals and no eligible rivers would be recommended as suitable in this alternative. There has been increasing interest in uranium adjacent to the Dirty Devil River corridor in the vicinity of Poison Spring and North Hatch Canyons, which could result in increased mineral-related traffic on the existing road that crosses the river. The 98 miles of eligible river segments located within the WSAs would be subject to the standards of 43 CFR 3802 and the IMP, which do not allow for impairment to the suitability for inclusion in the Wilderness Preservation System and thus would protect outstandingly remarkable values in these areas. This alternative would result in the least protection for the eligible river segments from locatable mineral exploration and development.

Salable Minerals

Proposed operations for salable minerals are subject to the oil and gas leasing restrictions. Live water would be protected by a buffer of 330 feet, subject to an appropriate exception when there are no practical alternatives and impacts can be fully mitigated. Outstandingly remarkable values would be protected by mitigation to stabilize soil, to prevent unnecessary erosion, and to revegetate disturbed surfaces.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

No eligible river segments would be recommended as suitable under Alternative A, and the outstandingly remarkable values would receive no special management. Other proposed decisions in this alternative could allow adverse impacts to eligible river segments outside the WSAs, as discussed in other sections of this WSR analysis.

Areas of Critical Environmental Concern

No ACECs are proposed under this alternative, so there would be no protection of outstandingly remarkable values from ACEC designation and management.

Proposed RMP

Impacts from Vegetation and Fire and Fuels Management

Impacts would be similar to those described under Alternative A, except within the one river segment (5 miles) recommended for suitability. This river segment (Fremont Gorge) would be managed to protect the outstandingly remarkable values. Proposed treatments in this area would only be allowed if it was determined that they would not result in impacts to the suitability or tentative classification of the river segments.

Impacts from Cultural Resources

Impacts would be the same as those described under Alternative N.

Impacts from Visual Resources

The impacts on the outstandingly remarkable values of the eligible rivers not recommended suitable would depend on the VRM classification of the lands within the river corridor. The eligible river segments within WSAs (98 of the total 135 miles) would be designated as VRM Class I, which would directly protect the scenic, as well as indirectly protect the other outstandingly remarkable values. River segments outside WSAs would be designated as VRM Class II, which would retain the character of the existing landscape. This would minimize, but not eliminate, possible impacts to the scenic, as well as the other, outstandingly remarkable values in these river segments.

The five mile segment of the Fremont River in Fremont Gorge managed as a suitable wild and scenic river would be designated as VRM Class II. This VRM classification would retain the character of the existing landscape and complement the management objectives for this river segment.

Impacts from Special Status Species and Fish and Wildlife

Impacts would be similar to those described under Alternative A, except that one river segment (5 miles) would be recommended as suitable under the Proposed RMP, which would ensure protection of the outstandingly remarkable values in that segment.

Impacts from Non-WSA Lands with Wilderness Characteristics

Under the Proposed RMP, no suitable river segments are included in non-WSA lands being managed for the protection of wilderness characteristics. Under the Proposed RMP, 4 miles of eligible wild and scenic river segments would be included within non-WSA areas managed to maintain wilderness characteristics. The Little Rockies non-WSA area would include a portion of the Maidenwater Creek eligible river segment and the Red Desert non-WSA area would include a portion of the Fremont River – Capitol Reef NP to Caineville Diversion river segment. The prescriptions to maintain wilderness characteristics would provide indirect protection to the outstandingly remarkable values and tentative classifications along these river miles.

Impacts from Livestock Grazing

Impacts would be the same as those described under Alternative N.

Impacts from Recreation

Proposed decisions to establish SRMAs could impact outstandingly remarkable values. Management direction under the Proposed RMP for the Capitol Reef Gateway SRMA would complement the tentative

wild classification of the Fremont Gorge suitable WSR because of the emphasis on providing primitive and semi-primitive recreation opportunities.

Management direction for the Dirty Devil and Henry Mountains SRMAs would complement the recreational outstandingly remarkable values identified in the eligible Dirty Devil River segment, several of the Dirty Devil River tributary segments, and Maidenwater Creek because of the emphasis on providing primitive and semi-primitive recreation opportunities. No other proposed SRMAs would overlap with eligible WSR segments in the Proposed RMP.

Impacts from Travel Management

OHV use can impact outstandingly remarkable values. Under the Proposed RMP, the one river segment designated as a suitable wild and scenic river (Fremont Gorge – 5 miles), tentative classification of wild, would be closed to OHVs. This OHV designation would preclude impacts from motorized use.

The eligible segments not recommended for suitability in the Proposed RMP, within WSAs (the Dirty Devil tributaries) would also be closed to vehicle use. Other eligible segments would be within areas where OHVs would be limited to designated routes, so impacts would be confined to designated routes. Thus, outstandingly remarkable values would not likely be adversely impacted by OHV use under the Proposed RMP.

Impacts from Lands and Realty

Impacts would be similar to Alternative A, except that only 32 miles of eligible river segments (which are not recommended as suitable or not within WSAs) would be unprotected and at risk from potential surface-disturbing activities. Under the Proposed RMP, decisions for lands and realty would complement the management and protection for the one river segment (5 miles) recommended for suitability. These river segments would be recommended for withdrawal from mineral entry, managed as ROW avoidance areas, and no wind and solar energy development would be allowed. This would provide additional protection to the outstandingly remarkable values of the segments by eliminating any surface disturbance or visual intrusions associated with such development actions. All or the majority of the Beaver Wash Canyon, Larry Canyon, No Man's Canyon, Dirty Devil River, Robbers Roost Canyon, Sams Mesa Box Canyon, and Twin Corral Box Canyon eligible segments (98 of 121 miles) are located within WSAs and would continue to be protected by IMP management.

Because the BLM has no control over potential modifications to a river's shoreline or any other type of development on non-public lands, impacts could occur in these areas. Management actions to acquire non-BLM lands within the river corridors would provide opportunities to better manage outstandingly remarkable values and to prevent any actions that could impact the segments' tentative classification or free-flowing nature.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

The Proposed RMP would reduce the level of impact compared to Alternative A by recommending 1 river segment (5 miles; tentative classification "wild") as suitable and managing the river corridor as closed to oil and gas leasing. All remaining eligible river segments, except Quitchupah Creek, are within an area identified as having a low activity level (low development potential) for oil and gas. Quitchupah Creek is located in an area identified as having moderate activity (moderate development potential) for oil and gas. River segments not recommended as suitable within WSAs would continue to be protected by the IMP.

Leasable Minerals—Coal

Impacts would be the same as those described under Alternative N.

Non-Energy Solid Leasable Minerals

Under the Proposed RMP, leasing within one-quarter mile of the high water mark on each bank of the river segment of suitable WSRs would be prohibited, so outstandingly remarkable values would be protected in the Fremont Gorge (5 miles; tentative classification "wild"). In addition, no surface disturbance would be allowed within the 100-year floodplain or 330 feet of riparian areas, subject to an appropriate exception when there are no practical alternatives and impacts can be fully mitigated. It is important to note that of the remaining segments, 98 miles are within WSAs (which are closed to leasing), leaving 32 miles on which ground-disturbing activities could potentially impact outstandingly remarkable values. This alternative would provide less protection to outstandingly remarkable values than Alternatives N, C, or D but would provide more protection than Alternative A.

Locatable Minerals

While there could be potential impacts from mineral development to the outstandingly remarkable values of eligible rivers, the likelihood of mineral development within the eligible river corridors is small given their remote location and lack of known mineral deposits. Under this alternative, one suitable WSR corridor (Fremont Gorge, 5 miles; tentative classification "wild") would be recommended for withdrawal from mineral entry, precluding new mining claims in these areas. Impacts from mineral exploration and development would be mitigated by the requirement of federal regulations that a plan of operations be submitted for any operations causing surface disturbance greater than casual use in areas designated for potential addition to the National Wild and Scenic River System.

Salable Minerals

Under the Proposed RMP, disposal of salable minerals within one-quarter mile of the high water mark on each bank of the river segment of suitable WSRs would be prohibited, so the outstandingly remarkable values of the Fremont Gorge (5 miles; tentative classification "wild") would be protected. In addition, no surface disturbance would be allowed within the 100-year floodplain or 330 feet of riparian areas, subject to an appropriate exception when there are no practical alternatives and impacts can be fully mitigated. It is important to note that of the remaining segments, 98 miles are within WSAs, which are closed to disposal of salable minerals. This alternative would provide less protection to outstandingly remarkable values than Alternatives N, C, or D but more protection than Alternative A.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Under this alternative, the Fremont Gorge eligible river segment would be recommended as suitable with a tentative classification of "wild" and would be managed to protect its outstandingly remarkable values. Additionally, this river segment would be recommended for withdrawal from mineral entry and identified as an ROW avoidance area, protecting the outstandingly remarkable values from these types of surface-disturbing activities.

The remaining eligible segments are recommended non-suitable because the values identified would be protected by alternative protection methods. Outstandingly remarkable values within these other eligible segments would be managed according to management direction contained elsewhere in this RMP. All or

the majority of the Beaver Wash Canyon, Larry Canyon, No Man's Canyon, Dirty Devil River, Robbers Roost Canyon, Sams Mesa Box Canyon and Twin Corral Box Canyon eligible segments (98 of 130 miles) are located within WSAs and would continue to be protected by IMP management. The 32 miles of eligible rivers not recommended for suitability located outside the WSAs would receive protection through existing laws, regulations and specific resource decisions within the Proposed RMP for Riparian, VRM, non-WSA lands with wilderness characteristics, SRMAs and Travel Management. Those protections are discussed in more detail within those resource sections of this analysis and the Wild and Scenic River Suitability Evaluation Report (Appendix 3).

Areas of Critical Environmental Concern

ACEC designations in this alternative do not overlap any eligible WSR segments, so there would be no impacts to outstandingly remarkable values from ACEC management.

Alternative C

Impacts from Vegetation and Fire and Fuels Management

There would be no impacts to WSRs under this alternative, as all 12 eligible river segments would be recommended as suitable for inclusion in the National Wild and Scenic River System. Proposed treatments in these areas would only be allowed if it was determined that they would not result in impacts to the suitability, tentative classification, or outstandingly remarkable values of the river segment.

Impacts from Cultural Resources

Impacts would be the same as those described under Alternative N.

Impacts from Visual Resources

The impacts on outstandingly remarkable values of the eligible rivers would depend on the VRM classification of the lands within the river corridor. The eligible river segments within WSAs (98 of the total 135 miles) would be designated as VRM Class I, which would protect the scenic, as well as the other outstandingly remarkable values. River segments outside WSAs would be managed as VRM Class II, which would retain the character of the existing landscape. This would minimize, but not eliminate, possible impacts to the scenic outstandingly remarkable values and would indirectly provide protection of other outstandingly remarkable values for these river segments.

Impacts from Special Status Species

Impacts would be the same as those described under Alternative N.

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness characteristics on lands outside WSAs are proposed under this alternative, resulting in no additional protection for WSR outstandingly remarkable values.

Impacts from Livestock Grazing

Impacts would be the same as those described under Alternative N.

Impacts from Recreation

Impacts would be the same as those described under the Proposed RMP.

Impacts from Travel Management

All 12 eligible WSR segments (135 miles) would be designated as suitable under this alternative, and all would be closed to motorized vehicles except for the Poison Spring Road, which is a maintained road that

crosses the Dirty Devil River segment and provides the only access to this river segment. By closing the other suitable rivers to OHV use, there would be no impact to outstandingly remarkable values or tentative classification under this alternative.

Impacts from Lands and Realty

Impacts would be similar to those described under the Proposed RMP, except that all 12 recommended suitable river segments (135 miles) would be recommended for withdrawal from mineral entry, managed as ROW avoidance areas, and not considered for wind and solar energy development. This alternative (along with Alternative D) would result in the greatest protection to river segments from lands and realty decisions.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Under this alternative, all 12 eligible rivers would be recommended as suitable, and all would be closed to oil and gas leasing. However, Fish Creek is located in an area identified as having low potential for gas development, so development of oil and gas is unlikely in the next 15 years. Consequently, the possibility of such development impacting outstandingly remarkable values of this river is minimal.

Leasable Minerals—Coal

Impacts would be the same as those described under Alternative N.

Non-Energy Solid Leasable Minerals

Under this alternative, leasing within one-quarter mile of the high water mark on each bank of the river segment of suitable WSRs would be prohibited, so outstandingly remarkable values would be protected in all 12 of the eligible rivers (135 miles).

Locatable Minerals

Under this alternative, the 12 suitable WSR corridors would be recommended for withdrawal from mineral entry, precluding new mining claims in these areas. Impacts from mineral exploration and development would be mitigated by the requirement of federal regulations that a plan of operations be submitted for any operations causing surface disturbance greater than casual use in areas designated for potential addition to the National Wild and Scenic River System. The likelihood of mineral development within the suitable river corridors is small given their remote location and lack of known mineralization. Therefore, the potential for impacts from locatable minerals would be minimal.

Salable Minerals

Under this alternative, disposal of salable minerals within one-quarter mile of the high water mark on each bank of the river segment of suitable WSRs would be prohibited, so outstandingly remarkable values would be protected in all 12 rivers.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

All eligible river segments would be recommended as suitable under this alternative and would be managed to protect their outstandingly remarkable values. Management of these river segments (including closing to OHV use, closing to oil and gas leasing, recommending for withdrawal from mineral

entry, closing to forest and woodland products harvesting, and managing as ROW avoidance areas) would protect their outstandingly remarkable values. This alternative (along with Alternative D) would best protect the eligible river segments.

Areas of Critical Environmental Concern

Under this alternative, all suitable WSR segments would be within potential ACECs. Managing the ACECs to protect relevant and important values would likely protect outstandingly remarkable values within the eligible river corridors as well, because they are often the same or similar values. This alternative (along with Alternative D) would best protect the eligible river segments.

Alternative D

Impacts from Vegetation and Fire and Fuels Management

Impacts would be the same as those described under Alternative C.

Impacts from Cultural Resources

Impacts would be the same as those described under Alternative N.

Impacts from Visual Resources

The impacts on outstandingly remarkable values of the eligible rivers would depend on the VRM classification of the lands within the river corridor. The eligible river segments within WSAs (98 of the total 135 miles) would be designated as VRM Class I, which would protect the scenic, as well as the other outstandingly remarkable values. River segments outside WSAs but within wilderness characteristic lands (33.35 miles of the Dirty Devil and tributaries outside WSA, Fremont Gorge, Fremont River below Capitol Reef National Park, and Maidenwater Creek) would also be designated as VRM Class I. There would be 0.74 miles of the Fremont River (Capitol Reef National Park to Caineville) and 1.6 miles of Maidenwater Creek designated as VRM Class II, which would also protect outstandingly remarkable values. The potential for impacts to the outstandingly remarkable values would be greatest in the 0.1 mile of the Fremont River (Fremont Gorge) designated as VRM Class III and the 0.25 miles of Fish Creek and 1.4 miles of Quitchupah Creek designated as VRM Class IV, which would allow modifications to the landscape and impact outstandingly remarkable values. However, with only 1.75 miles within these VRM designations, the potential for impacts to the outstandingly remarkable values and tentative classification would be minor.

Impacts from Special Status Species and Fish and Wildlife

Impacts would be the same as those described under Alternative N.

Impacts from Non-WSA Lands with Wilderness Characteristics

Under Alternative D, 10,500 acres (33.35 miles) of suitable WSR segments would be included within the non-WSA areas managed to protect wilderness characteristics. Because the wilderness characteristics prescriptions are more restrictive than the WSR prescriptions, (e.g., VRM Class I versus VRM Class II), the eligible segments overlapping non-WSA lands with wilderness characteristics would be afforded a measure of additional protection over that provided in Alternative C.

Impacts from Livestock Grazing

Impacts would be the same as those described under Alternative N.

Impacts from Recreation

Impacts would be the same as those described under the Proposed RMP.

Impacts from Travel Management

Impacts would be similar to those described under Alternative C, except that management for protection of non-WSA lands with wilderness characteristics would result in 33.85 additional miles of suitable wild and scenic river segments being closed to OHV use. This would provide additional protection for outstandingly remarkable values in these segments.

Impacts from Lands and Realty

Impacts would be similar to those described under Alternative C, except additional acres would be managed for the protection of non-WSA lands with wilderness characteristics, which would provide additional protection for outstandingly remarkable values in overlapping WSR segments.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Impacts would be similar to those described under Alternative C, except additional acres would be managed for the protection of non-WSA lands with wilderness characteristics, which would provide additional protection for outstandingly remarkable values in overlapping WSR segments.

Leasable Minerals—Coal

Impacts would be similar to those described under Alternative N, except additional acres would be managed for the protection of non-WSA lands with wilderness characteristics, which would provide additional protection for outstandingly remarkable values in overlapping WSR segments.

Non-Energy Solid Leasable Minerals

Impacts would be similar to those described under Alternative C, except additional acres would be managed for the protection of non-WSA lands with wilderness characteristics, which would provide additional protection for outstandingly remarkable values in overlapping WSR segments.

Locatable Minerals

Impacts would be the same as those described under Alternative C.

Salable Minerals

Impacts would be similar to those described under Alternative C, except additional acres would be managed for the protection of non-WSA lands with wilderness characteristics, which would provide additional protection for outstandingly remarkable values in overlapping WSR segments.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Impacts would be the same as those described under Alternative C.

Areas of Critical Environmental Concern

Impacts would be the same as those described under Alternative C.

4.5.3 Areas of Critical Environmental Concern

An ACEC is an administrative designation assigned by BLM for "areas within the public lands where special management attention is required." FLPMA defines an ACEC as an area…

> "…within the public lands where special management attention is required (when such areas are developed or used, or where no development is required) to protect and prevent irreparable damage to important historic, cultural, or scenic values, fish and wildlife resources, or other natural systems or processes, or to protect life and provide safety from natural hazards." (FLPMA Section 103(a))

This analysis identifies the effects of management decisions on the BLM's ability to protect against and prevent irreparable damage to the relevant and important values associated with each potential ACEC across the alternatives. Protection of relevant and important values can occur as a result of management associated with designating ACECs, management associated with other special designations (e.g., WSAs and WSRs), general management of public lands (VRM class designations, restrictions on wildlife habitat, SSS management, SRMAs), or through geographic or topographic characteristics. The most restrictive management that protects an area with relevant and important values will be the focus of the analysis. Analysis of less restrictive management that would not provide additional protection to a relevant and important value will not be addressed. For example, if part of an ACEC with scenic relevant and important values threatened by oil and gas development overlaps a WSA, the WSA management would eliminate the threat of irreparable damage. Therefore, the analysis would not address the impacts of ACEC management for those portions of the ACEC within the WSA. The BLM has separate policies and guidelines as well as criteria for establishing ACECs and WSAs. The differing criteria make it possible that the same acreages will quality as both an ACEC and a WSA but for different reasons.

In concert with BLM guidelines, the impact analysis considers management actions that "defend or guard against damage or loss" to the relevant and important values. This includes damaged values that can be restored over time as well as those that are irreparable. The management actions associated with the alternatives could either degrade or protect the relevant and important values and either cause or prevent irreparable damage to such values.

Table 4-59 lists the existing ACECs, as well as potential ACECs, by alternative.

Table 4-59. Existing and Potential Areas of Critical Environmental Concern

ACEC	Relevant and Important Values	Alternative N (Existing ACECs)	Alternative A	Proposed RMP	Alternatives C and D	% in WSAs
Existing ACECs						
North Caineville Mesa ACEC	Relict vegetation	2,200 acres	0 acres	2,200 acres	(Within Badlands ACEC)	0
South Caineville Mesa ACEC	Relict vegetation	4,100 acres	0 acres	0 acres	(Within Badlands ACEC)	100%
Gilbert Badlands RNA	Badlands geology	3,680 acres	0 acres	0 acres	(Within Badlands ACEC)	100%

ACEC	Relevant and Important Values	Alternative N (Existing ACECs)	Alternative A	Proposed RMP	Alternatives C and D	% in WSAs
Beaver Wash ACEC	Desert riparian ecosystem	4,800 acres	0 acres	0 acres	(Within Dirty Devil/North Wash ACEC)	99%
Potential ACECs						
Badlands RNA	Scenic, SSS, Natural Processes, Riparian, Relict Vegetation	0 acres	0 acres	0 acres	88,900 acres	46%
Bull Creek	Archaeological	0 acres	0 acres	0 acres	4,800 aces	0
Dirty Devil/North Wash	Scenic, Cultural, Paleontological, Wildlife, SSS	0 acres	0 acres	0 acres	205,300 acres	64%
Fremont Gorge/ Cockscomb	Cultural, Scenic, Riparian, Plant, Wildlife	0 acres	0 acres	0 acres	34,300 acres	8%
Henry Mountains	Scenic, Bison habitat, Mule deer habitat, SSS, Ecological	0 acres	0 acres	0 acres	288,200 acres	45%
Horseshoe Canyon	Scenic, Cultural, Riparian, SSS	0 acres	0 acres	0 acres	40,900 acres	92%
Kingston Canyon	Mule deer habitat	0 acres	0 acres	0 acres	22,100 acres	0
Little Rockies	Scenic, Desert Bighorn Sheep, SSS	0 acres	0 acres	0 acres	49,200 acres	76%
Lower Muddy Creek	Scenic, Riparian, SSS	0 acres	0 acres	0 acres	16,200 acres	0

Parker Mountain	Sagebrush Steppe, Sage-grouse, Utah prairie dog, Pygmy rabbit	0 acres	0 acres	0 acres	107,900 acres	0
Quitchupah	Archaeological, Native American, Riparian	0 acres	0 acres	0 acres	180 acres	0
Rainbow Hills	Mule deer, Natural system, SSS	0 acres	0 acres	0 acres	4,000 acres	0

ACEC	Relevant and Important Values	Alternative N (Existing ACECs)	Alternative A	Proposed RMP	Alternatives C and D	% in WSAs
Sevier Canyon	Mule deer, Riparian, SSS	0 acres	0 acres	0 acres	8,900 acres	0
Special Status Species	SSS	0 acres	0 acres	0 acres	15,100 acres	0
Thousand Lakes Bench	Cultural, SSS, Riparian	0 acres	0 acres	0 acres	500 acres	0
Total		**14,780 acres**	**0 acres**	**2,530 acres**	**886,810 acres**	

Methods and Assumptions

This analysis is based on the following assumption:

- Although management decisions for most resources and resource uses have RFO-wide application, ACEC management prescriptions apply only to those lands within each specific ACEC, as outlined.

Environmental Consequences

Relevant and important values identified for the ACECs and impacts to those values vary based upon the individual ACEC because the relevant and important values vary by ACEC. Thus, the discussion of impacts will be different for each ACEC. Table 4-59 identifies the relevant and important values for each ACEC.

This section is structured by ACEC, then by alternative. The ACECs are organized in the order that they appear in Chapter 2.

4.5.3.1 Existing ACECs

North Caineville Mesa ACEC

The North Caineville Mesa ACEC encompasses 2,200 acres. None of this ACEC is located within a WSA. The relevant and important value is the relict vegetation found on top of the mesa. Impacts to the relevant and important value of this ACEC could occur from the following resource management programs:

- Visual Resources
- Livestock Grazing
- Travel Management
- Lands and Realty
- Minerals and Energy
- Special Designations

Other programs were determined to have little or no impact on the relict vegetation of this ACEC. There are no WSA or WSR decisions that would impact North Caineville Mesa ACEC.

Alternative N: No Action

Impacts from Visual Resources

Scenery is not a relevant or important value of this ACEC. However, under this alternative, the ACEC is managed to meet VRM Class II objectives. This would retain the existing character of the landscape by restricting surface-disturbing activities and would provide protection to the relict vegetation on the mesa.

Impacts from Livestock Grazing

The North Caineville Mesa ACEC is unavailable for grazing. This management prescription provides protection for the relict plant community relevant and important value within this ACEC.

Impacts from Travel Management

The ACEC is closed to OHV use under this alternative, which would provide protection to the relevant and important value from this type of use.

Impacts from Lands and Realty

Under this alternative, the North Caineville Mesa ACEC would be recommended for mineral withdrawal and would be protected from locatable mineral surface disturbance. In addition, land acquisitions to acquire non-federal inholdings from willing sellers would be pursued. Both of these management actions would help to protect the ACEC's relevant and important value.

Impacts from Minerals and Energy

The ACEC is open to oil and gas leasing with NSO. This would protect the relevant and important value from surface disturbance. The ACEC would be recommended for mineral withdrawal and would be protected from locatable mineral surface disturbance. Additionally, the ACEC would be considered for withdrawal from consideration for coal development in subsequent coal planning efforts and therefore would be protected from coal mining surface disturbance.

Impacts from Special Designations

Areas of Critical Environmental Concern

The North Caineville Mesa ACEC is managed to protect its relevant and important relict vegetation community located on top of a mesa. The area would continue to be managed for the protection of its relevant and important value.

Alternative A

Impacts from Visual Resources

Under this alternative, the area would be designated as VRM Class IV. Areas designated as VRM Class IV would be subject to actions that allow for greater landscape modification and therefore greater surface disturbance. These areas could be subject to such actions as complete vegetation removal, which would drastically alter (at least in the short term) the relict vegetation on the mesa.

Impacts from Livestock Grazing

Under this alternative, the area would be available for livestock grazing, so the relict vegetation would be grazed by domestic livestock. However, management of livestock grazing in accordance with the RHS would minimize impacts to the relict plant community on North Caineville Mesa.

Impacts from Travel Management

The North Caineville Mesa area would be designated as open to OHV use under this alternative. This has the potential to lead to direct mortality of vegetation, via the crushing of plants, and indirect mortality

from increases in erosion and sedimentation. The increasing use of OHVs on BLM land can also transport noxious and invasive weed seeds from infested areas to un-infested areas. Surface disturbance associated with OHV use (e.g., crushing of vegetation and soil disturbance) has the potential to increase the susceptibility of native plant communities to weed establishment and can modify localized soil conditions to the point where they are unsuitable for establishment by native species, which could result in adverse impacts to the relict vegetation. Vehicles driving over the vegetation would crush plants and the relevant and important value could be adversely impacted.

Impacts from Lands and Realty

Under this alternative, the area would not be recommended for mineral withdrawal, and acquisition of non-federal inholdings would not be pursued. Thus, the relevant and important value of the area would not receive additional protection from lands and realty actions.

Impacts from Minerals and Energy

Under this alternative, the area would be open to oil and gas leasing with standard lease terms. Impacts to vegetation from oil and gas development would include loss or injury of plants due to excavation or trampling, burial under piles of waste material, toxic responses from use of chemicals in mineral extraction or waste pits, and increased exposure to dust and other contaminants associated with construction and use of access roads. In addition, disturbance of reclamation-limited soils could increase the opportunity for exotic plant species and noxious weed infestations. In the worst-case scenario, all vegetation would be removed from a parcel of land, and the site would be permanently altered to prevent future vegetation growth. Oil and gas development would have significant impacts to the relict vegetation of the area.

Impacts from Special Designations

Areas of Critical Environmental Concern

The North Caineville Mesa ACEC would not be designated under this alternative, and no special management prescriptions would be implemented to specifically protect the relevant and important value of the area. Potential impacts to relict vegetation could occur under this alternative.

Proposed RMP

Impacts from Visual Resources

Designation and protective management would continue for the North Caineville Mesa ACEC under the Proposed RMP and provide protection for the relict vegetation relevant and important value. Scenery is not a relevant or important value of this ACEC. However, the ACEC would be managed to meet VRM Class II objectives. This would retain the existing character of the landscape by restricting surface-disturbing activities and would provide indirect protection to the relevant and important value of relict vegetation on the mesa.

Impacts from Livestock Grazing

The North Caineville Mesa ACEC would be unavailable for grazing within the Proposed RMP. This management prescription provides protection for the relict vegetation relevant and important value within this ACEC.

Impacts from Travel Management

The ACEC would be closed to OHV use under the Proposed RMP, which would provide protection to the relevant and important relict vegetation value from this type of use.

Impacts from Lands and Realty

Under the Proposed RMP, the North Caineville Mesa ACEC would be recommended for mineral withdrawal and would be protected from locatable mineral surface disturbance. In addition, land acquisitions to acquire non-federal inholdings from willing sellers would be pursued. These management actions would help to protect the ACEC's relevant and important value of relict vegetation.

Impacts from Minerals and Energy

The ACEC would be open to oil and gas leasing with NSO. This would protect the relevant and important value of relict vegetation from surface disturbance.

Impacts from Special Designations

Areas of Critical Environmental Concern

Under the Proposed RMP, the North Caineville Mesa ACEC would continue to be designated as an ACEC and managed to protect the relevant and important relict vegetation community located on top of the mesa.

Alternatives C and D

Impacts from Visual Resources

Impacts would be similar to those described under Alternative N. The North Caineville Mesa ACEC would be included in the larger potential Badlands ACEC, which includes protection for additional relevant and important values.

Impacts from Livestock Grazing

Impacts would be similar to those described under Alternative N.

Impacts from Travel Management

Impacts would be similar to those described under Alternative N.

Impacts from Lands and Realty

Impacts would be similar to those described under Alternative N.

Impacts from Minerals and Energy

The potential Badlands ACEC, including the existing North Caineville Mesa ACEC, would be closed to oil and gas leasing under this alternative. This would protect the relevant and important value from surface disturbance. The ACEC would be recommended for mineral withdrawal and would be protected from locatable mineral surface disturbance. Additionally, the ACEC would be a candidate for withdrawal from consideration for coal development in subsequent coal planning efforts and therefore would be protected from coal mining surface disturbance, which would protect the relict vegetation from adverse impacts.

Impacts from Special Designations

Areas of Critical Environmental Concern

Impacts would be similar to those described under Alternative N.

South Caineville Mesa ACEC

The South Caineville Mesa ACEC encompasses 4,100 acres. This ACEC is located entirely within the Mount Ellen—Blue Hills WSA. The relevant and important value is the relict vegetation found on top of

the mesa. Impacts to the relevant and important value of this ACEC could occur from the following resource management programs:

- Visual Resources
- Livestock Grazing
- Travel Management
- Lands and Realty
- Minerals and Energy
- Special Designations.

Other programs were determined to have little or no impact on the relict vegetation of this ACEC. There are no WSR decisions that would impact South Caineville Mesa ACEC.

Alternative N: No Action

Impacts from Visual Resources

Scenery is not a relevant or important value of this ACEC. However, under this alternative, the ACEC is managed to meet VRM Class I objectives due to its location within the Mount Ellen—Blue Hills WSA. This would preserve the existing character of the landscape by restricting surface-disturbing activities, and it would provide protection to the relict vegetation on the mesa.

Impacts from Livestock Grazing

The South Caineville Mesa ACEC is unavailable for grazing. This management prescription provides protection for the relict vegetation on top of the mesa (this ACEC's relevant and important value) by eliminating the possibility of damage to the vegetation from grazing or trampling by livestock.

Impacts from Travel Management

The ACEC is closed to OHV use under this alternative, which would provide protection to the relevant and important value from this type of use by eliminating the possibility of damage to the vegetation from vehicles crushing plants, compacting soils, or spreading invasive species.

Impacts from Lands and Realty

Under this alternative, the South Caineville Mesa ACEC would be recommended for mineral withdrawal and would be protected from locatable mineral surface disturbance. In addition, land acquisitions to acquire non-federal inholdings from willing sellers would be pursued. Both of these management actions would help to protect the ACEC's relevant and important value.

Impacts from Minerals and Energy

The ACEC is closed to oil and gas leasing due to its location within the Mount Ellen—Blue Hills WSA. This would protect the relevant and important value from surface disturbance. The ACEC would be recommended for mineral withdrawal and would be protected from locatable mineral surface disturbance. Additionally, the ACEC would be considered for withdrawal from consideration for coal development in subsequent coal planning efforts and therefore would be protected from coal mining surface disturbance.

Impacts from Special Designations

Wilderness Study Areas

The ACEC is within the Mount Ellen—Blue Hills WSA. Continued management of WSAs under the IMP would limit surface-disturbing actions that could adversely impact relevant and important values. WSAs

are closed to oil and gas leasing, precluding any impact from oil and gas development, and they are managed as VRM Class I, which further restricts surface-disturbing activities.

Areas of Critical Environmental Concern

South Caineville Mesa ACEC is managed to protect the relevant and important relict vegetation that is found on top of the mesa. The area would continue to be managed for the protection of its relevant and important value.

Alternative A

Impacts from Visual Resources

Under this alternative, the area would be designated as VRM Class I due to its location within the Mount Ellen—Blue Hills WSA. This would preserve the existing character of the landscape by restricting surface-disturbing activities, and it would provide protection to the relict vegetation.

Impacts from Livestock Grazing

Under this alternative, the area would be available for livestock grazing, so the relict vegetation could be grazed by domestic livestock. However, management of livestock grazing in accordance with the IMP and *Fundamentals of Rangeland Health* and *Standards and Guidelines for Grazing Administration* would minimize impacts to the relict vegetation on South Caineville Mesa. Due to a lack of access to the top of South Caineville Mesa and lack of water availability, it is unlikely that this area would be grazed. Only hiking routes currently lead to the top of South Caineville Mesa; a route would need to be re-established to allow livestock to be trailed up onto the Mesa.

Impacts from Travel Management

Motorized travel in the South Caineville Mesa area would be designated as limited to designated routes under this alternative, but no routes have been identified for designation on the South Caineville Mesa and only ways identified within the WSA inventories would be available for designation. Should any routes be designated, there could be localized impacts to the relict vegetation from motorized vehicles. However, due to the non-impairment standard of the IMP (for management of WSAs), the relevant and important value would not be adversely impacted.

Impacts from Lands and Realty

Under this alternative, the area would not be recommended for mineral withdrawal, and there would be no ACEC management direction for the acquisition of non-Federal inholdings. However, because of the location of this potential ACEC within the Mount Ellen/Blue Hills WSA, lands actions such as mineral withdrawal, acquisition of non-Federal inholdings and ROW exclusion would continue to be managed as identified under the IMP. Within the WSA, acquisition of non-Federal inholdings would be pursued. Continued management of the WSA under the IMP would provide protection from surface disturbing actions.

Impacts from Minerals and Energy

Impacts would be similar to those described under Alternative N, except that the area would not be recommended for mineral withdrawal. The WSA would continue to provide protection but would not prevent surface disturbing activities associated with locatable mineral development. The IMP allows for locatable mining claims and assessment work within WSAs subject to the non-impairment clause. No motorized ways have been identified on South Caineville Mesa. Therefore, any minerals related activities and access would be by non-motorized means and the potential for surface disturbance is minimal.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Areas of Critical Environmental Concern

The ACEC would not be designated under this alternative, and no special management prescriptions would be implemented to specifically protect the relevant and important value of the area. However, because the South Caineville Mesa area is within the Mount Ellen—Blue Hills WSA, the area would be managed pursuant to the IMP, which would provide adequate protection for the relevant and important value of relict vegetation.

Proposed RMP

Impacts from Visual Resources

Under the Proposed RMP, the South Caineville Mesa would not be designation as an ACEC. However, the area would be designated as VRM Class I due to its location within the Mount Ellen—Blue Hills WSA. This would preserve the existing character of the landscape by restricting surface-disturbing activities, and it would provide indirect protection to the relevant and important value of relict vegetation.

Impacts from Livestock Grazing

Impacts would be the same as those described under Alternative A. As discussed under the analysis for Alternative A, due to lack of access to the top of South Caineville Mesa and lack of water availability, it is unlikely that this area would be grazed. Only hiking routes currently occur to the top of South Caineville Mesa. A route would need to be re-established to allow livestock to be trailed up onto the Mesa. South Caineville Mesa is located within the Mount Ellen/Blue Hills WSA. It is unlikely that construction of a route to accommodate grazing management needs would be consistent with the non-impairment standard of the IMP. Therefore, there would be no impacts to the relevant and important value of relict vegetation.

Impacts from Travel Management

Under the Proposed RMP, the South Caineville Mesa ACEC would be closed to OHV use, which would provide protection to the relevant and important value of relict vegetation on the mesa top. Closing the area to OHV use would eliminate the possibility of damage to the vegetation from vehicles crushing plants, compacting soils, or spreading invasive species.

Impacts from Lands and Realty

Under the Proposed RMP, the area would not be recommended for mineral withdrawal, and there would be no ACEC management direction for the acquisition of non-Federal inholdings. However, because of the location of this potential ACEC within the Mount Ellen/Blue Hills WSA, lands actions such as mineral withdrawal, acquisition of non-Federal inholdings and ROW exclusion would continue to be managed as identified under the IMP. Within the WSA, acquisition of non-Federal inholdings would be pursued. Continued management of the WSA under the IMP would provide protection from surface disturbing actions and it would provide indirect protection to the relevant and important value of relict vegetation.

Impacts from Minerals and Energy

Impacts would be similar to those described under Alternative N, except that the area would not be recommended for mineral withdrawal. The WSA would continue to provide protection but would not prevent surface disturbing activities associated with locatable mineral development. The IMP allows for

locatable mining claims and assessment work within WSAs subject to the non-impairment clause. However, there would be no motorized use authorized on South Caineville Mesa. Therefore, any minerals related activities and access would be by non-motorized means and the potential for surface disturbance to the relevant and important value of relict vegetation is minimal.

Impacts from Special Designations

Wilderness Study Areas

As in the other alternatives, the South Caineville Mesa ACEC is within the Mount Ellen—Blue Hills WSA. Continued management of WSAs under the IMP would limit surface-disturbing actions which provides protection for the relevant and important relict vegetation value of this ACEC. WSAs are closed to oil and gas leasing, precluding any impact from oil and gas development, and they are managed as VRM Class I, which further restricts surface-disturbing activities.

Areas of Critical Environmental Concern

The South Caineville Mesa ACEC would not be designated under the Proposed RMP, and no special management prescriptions would be implemented to specifically protect the relevant and important value of the area. However, because the South Caineville Mesa area is within the Mount Ellen—Blue Hills WSA, the area would be managed pursuant to the IMP, which would provide adequate protection for the relict vegetation relevant and important value identified within the area.

Alternatives C and D

Impacts from Visual Resources

Impacts would be similar to those described under Alternative N. The existing South Caineville Mesa ACEC would be included in the larger potential Badlands ACEC, which includes additional management protection for additional relevant and important values.

Impacts from Livestock Grazing

Impacts would be similar to those described under Alternative N.

Impacts from Travel Management

Impacts would be similar to those described under Alternative N.

Impacts from Lands and Realty

Impacts would be similar to those described under Alternative N.

Impacts from Minerals and Energy

Impacts would be similar to those described under Alternative N.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Areas of Critical Environmental Concern

Impacts would be similar to those described under Alternative N.

Beaver Wash ACEC

The Beaver Wash ACEC encompasses 4,800 acres, and 99 percent of this ACEC is located within the Dirty Devil WSA. The relevant and important value is its desert riparian ecosystem. Impacts to the relevant and important value of this ACEC could occur from the following resource management programs:

- Vegetation
- Visual Resources
- Livestock Grazing
- Travel Management
- Lands and Realty
- Minerals and Energy
- Special Designations.

Other programs were determined to have little or no impact on the desert riparian ecosystem of this ACEC.

Alternative N: No Action

Impacts from Vegetation

Under Alternative N, no surface-disturbing activities would be allowed within 500 feet of riparian areas unless it could be shown that there are no practical alternatives, all long-term impacts could be fully mitigated, and the activity would benefit and enhance the riparian area. Within the 99 percent of the ACEC located within the WSA, surface-disturbing activities would only be allowed if consistent with the IMP. This would protect the desert riparian ecosystem from surface-disturbing activities, but it could restrict potentially beneficial actions such as riparian area restoration and vegetation treatment.

Impacts from Visual Resources

Scenery is not a relevant or important value of this ACEC. However, under this alternative, all but 68 acres (which are outside the WSA) are managed to meet VRM Class I objectives due to its location within the Dirty Devil WSA. This would preserve the existing character of the landscape by restricting surface-disturbing activities, and it would provide protection to the desert riparian ecosystem. The 68 acres outside the WSA would be managed to meet VRM Class IV objectives. Areas designated as VRM Class IV would be subject to actions that allow for greater landscape modification and therefore greater surface disturbance. These areas could be subject to such actions as complete vegetation removal, which would drastically alter (at least in the short term) the vegetation in the area.

Impacts from Livestock Grazing

The Beaver Wash ACEC is unavailable for grazing from the south boundary of Section 25 northward, and fencing has been installed to restrict livestock in that portion of the ACEC. This management prescription provides protection for the desert riparian ecosystem relevant and important value within this ACEC. The remainder of the ACEC (approximately 800 acres) is available for grazing. Management of livestock grazing in accordance with the *Fundamentals of Rangeland Health* and *Standards and Guidelines for Grazing Administration* would protect this area as well.

Impacts from Travel Management

The ACEC is closed to OHV use under this alternative, which would provide protection to the relevant and important value from this type of use.

Impacts from Lands and Realty

Under this alternative, the Beaver Wash ACEC would be recommended for mineral withdrawal and would be protected from locatable mineral surface disturbance. In addition, land acquisitions to acquire non-federal inholdings from willing sellers would be pursued. Both of these management actions would help to protect the ACEC's relevant and important value.

Impacts from Minerals and Energy

The ACEC is closed to oil and gas leasing due to its location within the Dirty Devil WSA. This would protect the relevant and important value from surface disturbance. The ACEC would be recommended for mineral withdrawal and would be protected from locatable mineral surface disturbance. Additionally, the ACEC would be a candidate for withdrawal from consideration for coal development in subsequent coal planning efforts and therefore would be protected from coal mining surface disturbance. Thus, no surface-disturbing activities would be allowed, which would result in protection of the area's desert riparian ecosystem.

Impacts from Special Designations

Wilderness Study Areas

The majority of the Beaver Wash ACEC is within the Dirty Devil WSA. Continued management of WSAs under the IMP would limit surface-disturbing actions that could adversely impact relevant and important values. WSAs are closed to oil and gas leasing, precluding any impact from oil and gas development, and they are managed as VRM Class I, which further restricts surface-disturbing activities.

Wild and Scenic Rivers

The Beaver Wash Canyon eligible WSR is within the existing Beaver Wash ACEC. Although no suitability determination would be made, BLM policy requires the protection of the outstandingly remarkable values and free-flowing nature of all eligible WSRs. This interim management would provide protection of the ACEC's relevant and important values.

Areas of Critical Environmental Concern

Beaver Wash ACEC is managed to protect its relevant and important cold riparian ecosystem located in an otherwise desert environment. The area would continue to be managed for the protection of its relevant and important value.

Alternative A

Impacts from Vegetation

Under this alternative, no surface-disturbing activities would be allowed within 330 feet on each side of the stream or the 100-year floodplain, whichever is greater, unless it could be shown that there are no practical alternatives, all long-term impacts could be fully mitigated, and the activity would benefit and enhance the riparian area. This would protect the desert riparian ecosystem from surface-disturbing activities, but it could restrict potentially beneficial actions such as riparian area restoration and vegetation treatment. Although the riparian zone protection is less under this alternative, the impacts would be similar to Alternative N for the WSA portion of the potential ACEC, as surface disturbing actions would only be allowed consistent with the IMP. For the 68 acres outside of the WSA, surface disturbing actions related to vegetation treatments could occur. The potential for impacts to the relevant and important values would be limited to the 1% of the potential ACEC outside of the WSA.

Impacts from Visual Resources

Under this alternative, the area within the Dirty Devil WSA would be designated as VRM Class I. This would preserve the existing character of the landscape by restricting surface-disturbing activities, and it would provide protection to the desert riparian ecosystem. The 68 acres outside the WSA would be managed to meet VRM Class III or IV objectives. Areas designated as VRM Classes III or IV would be subject to actions that allow for greater landscape modification and therefore greater surface disturbance. These areas could be subject to such actions as complete vegetation removal, which would drastically alter (at least in the short term) the vegetation in the area. However, scenery is not a relevant or important value of this ACEC.

Impacts from Livestock Grazing

Under this alternative, the entire Beaver Wash Canyon area would be available for grazing. However, management of livestock grazing in accordance with the *Fundamentals of Rangeland Health* and *Standards and Guidelines for Grazing Administration* would minimize impacts to vegetation in the area.

Impacts from Travel Management

Motorized travel in the Beaver Wash Canyon area would be limited to designated routes under this alternative, but no routes have been identified for designation and only ways identified within the WSA inventories would be available for designation. Should any routes be designated, there could be localized impacts to vegetation from motorized vehicles. However, due to the non-impairment standard of the IMP (for management of WSAs) which applies to all but 68 acres of the potential ACEC, the potential for impacts is minimal and the relevant and important values should not be adversely impacted.

Impacts from Lands and Realty

Under this alternative, the area would not be recommended for mineral withdrawal, and acquisition of non-federal inholdings would not be pursued. Thus, the relevant and important value of the area would not receive additional protection from lands and realty actions. The 99 percent of the ACEC located in the WSA would continue to receive protection from surface-disturbing activities. Due to the non-impairment standard of the IMP (for management of WSAs) which applies to all but 68 acres of the potential ACEC, the potential for impacts is minimal and the relevant and important values should not be adversely impacted. Therefore, mineral withdrawal would not be necessary for the protection of the relevant and important value.

Impacts from Minerals and Energy

Impacts would be similar to those described under Alternative N except that the area would not be recommended for mineral withdrawal. However, surface disturbing activities associated with locatable mineral development would be subject to the non-impairment standard of the IMP (for management of WSAs) which applies to all but 68 acres of the potential ACEC. The potential for impacts is minimal and the relevant and important values should not be adversely impacted.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

The Beaver Wash Canyon eligible river segment would not be recommended as suitable under this alternative, with no special management to protect its outstandingly remarkable values and free-flowing nature. This would provide no additional protection to the area's relevant and important value.

Areas of Critical Environmental Concern

The Beaver Wash ACEC would not be designated under this alternative, and no special management prescriptions would be implemented to specifically protect the relevant and important values of the area. However, because the majority of the area is within the Dirty Devil WSA, the area would be managed pursuant to the IMP, which would provide adequate protection for the area's desert riparian ecosystem.

Proposed RMP

Impacts from Vegetation

Under the Proposed RMP, no surface-disturbing activities would be allowed within 330 feet on each side of the stream or the 100-year floodplain, whichever is greater, unless it could be shown that there are no practical alternatives, all long-term impacts could be fully mitigated, and the activity would benefit and enhance the riparian area. This would protect the desert riparian ecosystem relevant and important value from surface-disturbing activities, but it could restrict potentially beneficial actions such as riparian area restoration and vegetation treatment. Although the riparian zone protection is less in the Proposed RMP than in Alternatives N, C and D, the impacts would be similar to Alternative N for the WSA portion of the potential ACEC, as surface disturbing actions would only be allowed consistent with the IMP. For the 68 acres outside of the WSA, surface disturbing actions related to vegetation treatments could occur, but would need to be consistent with the riparian area decision. The potential for impacts to the relevant and important desert riparian ecosystem value would be limited to the 1% of the potential ACEC outside of the WSA.

Impacts from Visual Resources

Impacts would be similar to those described under Alternative A, except the 68 acres outside the WSA would be designated as VRM Class IV, which would allow greater landscape modification and therefore greater potential for surface disturbance. The potential for impacts to the relevant and important desert riparian ecosystem value from surface disturbing actions would be limited to the 1% of the potential ACEC outside of the WSA and would also be minimized by the decisions for protection of riparian areas. Scenery is not a relevant or important value of this ACEC.

Impacts from Livestock Grazing

Under the Proposed RMP, the entire Beaver Wash area would be available for grazing. However, management of livestock grazing in accordance with the *Fundamentals of Rangeland Health* and *Standards and Guidelines for Grazing Administration* and management for the protection of riparian areas would minimize impacts to the desert riparian ecosystem relevant and important value of this ACEC.

Impacts from Travel Management

Under the Proposed RMP, the portion of the Beaver Wash ACEC located within the Dirty Devil WSA would be closed to motorized use, eliminating potential impact to the desert riparian ecosystem relevant and important value within the WSA portion of the potential ACEC. The 68 acres of the potential ACEC outside the WSA would be limited to designated routes. There are only three short spur routed identified within this area and they do not occur within the riparian zone. Therefore the relevant and important desert riparian ecosystem value should not be adversely impacted.

Impacts from Lands and Realty

Under the Proposed RMP, the area would not be recommended for mineral withdrawal, and acquisition of non-federal inholdings would not be pursued. Thus, the relevant and important value of the area would not receive additional protection from lands and realty actions. The 99 percent of the ACEC located in the WSA would continue to receive protection from surface-disturbing activities. Due to the non-impairment

standard of the IMP (for management of WSAs) which applies to all but 68 acres of the potential ACEC, the potential for impacts is minimal and the relevant and important desert riparian ecosystem value should not be adversely impacted. Therefore, mineral withdrawal would not be necessary for the protection of the relevant and important value.

Impacts from Minerals and Energy

Impacts would be similar to those described under Alternative N except that the area would not be recommended for mineral withdrawal. Any surface disturbing activities associated with locatable mineral development would be subject to the non-impairment standard of the IMP (for management of WSAs) which applies to all but 68 acres of the potential ACEC. Surface disturbing activities associated with locatable mineral development outside the WSA would need to be consistent with protection measures for riparian resources. Therefore, the potential for impacts is minimal and the relevant and important desert riparian ecosystem value should not be adversely impacted.

Impacts from Special Designations

Wilderness Study Areas

As common to all alternatives, 99% of the potential Beaver Wash ACEC is within the Dirty Devil WSA. Continued management of WSAs under the IMP would limit surface-disturbing actions that could adversely impact the relevant and important desert riparian ecosystem value. WSAs are closed to oil and gas leasing, precluding any impact from oil and gas development, and they are managed as VRM Class I, which further restricts surface-disturbing activities.

Wild and Scenic Rivers

The Beaver Wash Canyon eligible river segment would not be recommended as suitable under this alternative, with no special management to protect its outstandingly remarkable values and free-flowing nature. By not designating this river segment as suitable there would be no additional protective prescriptions to the ACEC's relevant and important value.

Areas of Critical Environmental Concern

The Beaver Wash ACEC would not be designated under this alternative, and no special management prescriptions would be implemented to specifically protect the relevant and important desert riparian ecosystem value of the area. However, because the majority of the area is within the Dirty Devil WSA (99%), the area would be managed pursuant to the IMP, which would provide adequate protection for the area's desert riparian ecosystem. The 68 acres (1%) outside the WSA receives indirect protection from other resource decisions and the relevant and important desert riparian ecosystem value should not be adversely impacted.

Alternatives C and D

Impacts from Vegetation

Impacts would be similar to those described under Alternative N. The existing Beaver Wash ACEC would be included in the larger potential Dirty Devil ACEC, which includes additional management prescriptions for the protection of its relevant and important values. The buffer zone around riparian areas in which no surface-disturbing activities would be allowed would be 660 feet. This would protect the widest area around the desert riparian ecosystem from surface-disturbing activities, but it could also restrict potentially beneficial actions such as riparian area restoration and vegetation treatment.

Impacts from Visual Resources

Impacts would be similar to those described under Alternative A.

Impacts from Livestock Grazing

Impacts would be similar to those described under Alternative N.

Impacts from Travel Management

Impacts would be similar to those described under Alternative N.

Impacts from Lands and Realty

Impacts would be similar to those described under Alternative N.

Impacts from Minerals and Energy

Impacts would be similar to those described under Alternative N.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Impacts would be similar to those described under Alternative N, except that Beaver Wash Canyon would be recommended as suitable for inclusion in the National Wild and Scenic River System and tentatively classified as a wild river. The river would be managed to protect its outstandingly remarkable values and free-flowing nature, including closing to oil and gas leasing, closing to OHV use, and recommendation for withdrawal from mineral entry. These management prescriptions would provide protection of the ACEC's relevant and important value.

Areas of Critical Environmental Concern

Impacts would be similar to those described under Alternative N.

Gilbert Badlands RNA ACEC

The Gilbert Badlands RNA ACEC encompasses 3,680 acres. This ACEC is located entirely within the Mount Ellen—Blue Hills WSA. The relevant and important value is the badlands geology. Impacts to the relevant and important value of this ACEC could occur from the following resource management programs:

- Visual Resources
- Livestock Grazing
- Travel Management
- Lands and Realty
- Minerals and Energy
- Special Designations.

Other programs were determined to have little or no impact on the badlands geology of this ACEC.

Alternative N: No Action

Impacts from Visual Resources

Scenery is not a relevant or important value of this ACEC. However, under this alternative, the ACEC is managed to meet VRM Class I objectives due to its location within the Mount Ellen—Blue Hills WSA.

This would preserve the existing character of the landscape by restricting surface-disturbing activities, and it would provide protection to the geomorphology of the area.

Impacts from Livestock Grazing

The ACEC is available for grazing. However, there is little-to-no threat to the Gilbert Badlands ACEC from livestock grazing because of topographic isolation and the lack of vegetation and water within the Mancos Shale badlands to support livestock.

Impacts from Travel Management

The ACEC is closed to OHV use under this alternative, which would provide protection from this type of use to the relevant and important value of the area.

Impacts from Lands and Realty

Under this alternative, the ACEC would be recommended for mineral withdrawal and would be protected from locatable mineral surface disturbance. In addition, land acquisitions to acquire non-federal inholdings from willing sellers would be pursued. Both of these management actions would help to protect the ACEC's relevant and important value.

Impacts from Minerals and Energy

The ACEC is closed to oil and gas leasing due to its location within the Mount Ellen—Blue Hills WSA. This would protect the relevant and important value from surface disturbance. The ACEC would be recommended for mineral withdrawal and would be protected from locatable mineral surface disturbance. Additionally, the ACEC would be a candidate for withdrawal from consideration for coal development in subsequent coal planning efforts and therefore would be protected from coal mining surface disturbance. Thus, no surface-disturbing activities would be allowed, which would result in protection of the area's relevant and important value.

Impacts from Special Designations

Wilderness Study Areas

Gilbert Badlands ACEC is within the Mount Ellen—Blue Hills WSA. Continued management of WSAs under the IMP would limit surface-disturbing actions that could adversely impact relevant and important values. WSAs are closed to oil and gas leasing, precluding any impact from oil and gas development, and they are managed as VRM Class I, which further restricts surface-disturbing activities.

Areas of Critical Environmental Concern

The Gilbert Badlands ACEC is also a research natural area, a pre-FLPMA administrative designation that was elected to be carried forward. The ACEC is managed to protect its relevant and important geomorphology (Mancos Shale badlands). The area would continue to be managed for the protection of its relevant and important value.

Alternative A

Impacts from Visual Resources

Under this alternative, the area would be designated as VRM Class I due to its location within the Mount Ellen—Blue Hills WSA. This would preserve the existing character of the landscape by restricting surface-disturbing activities, and it would provide protection to the shale badlands.

Impacts from Livestock Grazing

Impacts would be the same as those described under Alternative N.

Impacts from Travel Management

Motorized travel in the Gilbert Badlands area would be designated as limited to designated routes under this alternative. However, due to the topographic isolation of the area, rough nature of the badlands, and location within the Mount Ellen—Blue Hills WSA, it is unlikely that routes would be designated across the badlands. Only ways identified within the WSA inventories would be available for designation. If motorized vehicles were to drive across the badlands, damage to the geologic features could occur.

Impacts from Lands and Realty

Under this alternative, the area would not be recommended for mineral withdrawal, and there would be no ACEC management decision for the acquisition of non-Federal inholdings. However, because of the location of this potential ACEC within the Mount Ellen/Blue Hills WSA, lands actions such as mineral withdrawal, acquisition of non-Federal inholdings and ROW exclusion would continue to be managed as identified under the IMP. Within the WSA, acquisition of non-Federal inholdings would be pursued. Continued management of the WSA under the IMP would provide protection from surface disturbing actions.

Impacts from Minerals and Energy

Impacts would be similar to those described under Alternative N, except that the area would not be recommended for mineral withdrawal, so surface-disturbing activities associated with locatable mineral development (and impacts to the relevant and important value of the area) could occur. The WSA would continue to provide protection but would not prevent surface disturbing activities associated with locatable mineral development. The IMP allows for locatable mining claims and assessment work within WSAs subject to the non-impairment clause. Minimal surface disturbance that could be reclaimed immediately or within 48 hours could occur, but the potential to impact the overall badlands geology would be minimal.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Areas of Critical Environmental Concern

The Gilbert Badlands ACEC would not be designated under this alternative, and no special management prescriptions would be implemented to specifically protect the relevant and important values of the area. However, because this area is entirely within the Mount Ellen—Blue Hills WSA, the area would be managed pursuant to the IMP, which would provide adequate protection for the area's relevant and important values.

Proposed RMP

Impacts from Visual Resources

Under the Proposed RMP, the Gilbert Badlands would not be designated as an ACEC. The potential ACEC is located within the Mount Ellen—Blue Hills WSA which would be designated as VRM Class I Although scenery is not a relevant and important value of this potential ACEC, management as VRM Class would preserve the existing character of the landscape by restricting surface-disturbing activities, and it would provide indirect protection to the shale badlands geology relevant and important value for this area.

Impacts from Livestock Grazing

The potential ACEC would continue to be available for grazing. However, there is little-to-no threat to the Gilbert Badlands ACEC badlands geology relevant and important value from livestock grazing. The area is topographically isolated and lack sufficient vegetation and water within the Mancos Shale badlands to support livestock.

Impacts from Travel Management

The potential Gilbert Badlands ACEC is closed to OHV use under the Proposed RMP, eliminating potential impacts to the badlands geology relevant and important value from motorized use.

Impacts from Lands and Realty

Under the Proposed RMP, the area would not be recommended for mineral withdrawal, and there would be no ACEC management decision for the acquisition of non-Federal inholdings. However, because of the location of this potential ACEC within the Mount Ellen-Blue Hills WSA, lands actions such as mineral withdrawal, acquisition of non-Federal inholdings and ROW exclusion would continue to be managed as identified under the IMP. Within the WSA, acquisition of non-Federal inholdings would be pursued. Continued management of the WSA under the IMP would provide adequate protection for the badlands geology relevant and important value of this potential ACEC.

Impacts from Minerals and Energy

Impacts would be similar to those described under Alternative N, except that the area would not be recommended for mineral withdrawal, so surface-disturbing activities associated with locatable mineral development (and impacts to the relevant and important value of the area) could occur. The WSA would continue to provide protection but would not prevent surface disturbing activities associated with locatable mineral development. The IMP allows for locatable mining claims and assessment work within WSAs subject to the non-impairment clause. Only minimal surface disturbance that could be reclaimed immediately or within 48 hours could occur. Therefore, the potential to impact the overall badlands geology relevant and important value would be minimal.

Impacts from Special Designations

Wilderness Study Areas

Gilbert Badlands ACEC is within the Mount Ellen—Blue Hills WSA. Continued management of WSAs under the IMP would limit surface-disturbing actions that could adversely impact the badlands geology relevant and important value. WSAs are closed to oil and gas leasing, precluding any impact from oil and gas development, and they are managed as VRM Class I, which further restricts surface-disturbing activities.

Areas of Critical Environmental Concern

The Gilbert Badlands ACEC would not be designated under the Proposed RMP, and no special management prescriptions would be implemented to specifically protect the relevant and important value of the area. However, because this area is entirely within the Mount Ellen—Blue Hills WSA, the area would be managed pursuant to the IMP, which would provide adequate protection for the area's badlands geology relevant and important value.

Alternatives C and D

Impacts from Visual Resources

Impacts would be similar to those described under Alternative N. The existing Gilbert Badlands ACEC would be included in the larger potential Badlands ACEC, which includes additional management prescriptions for the protection of its relevant and important values.

Impacts from Livestock Grazing

Impacts would be similar to those described under Alternative N.

Impacts from Travel Management

Impacts would be similar to those described under Alternative N.

Impacts from Lands and Realty

Impacts would be similar to those described under Alternative N.

Impacts from Minerals and Energy

Impacts would be similar to those described under Alternative N.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Areas of Critical Environmental Concern

Impacts would be similar to those described under Alternative N.

4.5.3.2 Potential ACECs

Badlands Potential RNA ACEC

The Badlands Potential RNA ACEC encompasses 88,900 acres of public lands in the Caineville area of eastern Wayne County and includes the existing North and South Caineville Mesa ACECs and Factory Butte. Forty-six percent of the area is within the Mount Ellen—Blue Hills WSA. The relevant and important values of the area are scenic, special status plant species, natural processes (wind erosion), riparian, and relict vegetation values.

The SSS (notably Wright fishhook cactus and Winkler pincushion cactus) and scenic relevant and important values could be threatened with irreparable damage by ground disturbance associated with cross-country OHV use under some alternatives. The natural process (wind erosion) value, per se, would not be affected by OHV use. However, preliminary research suggests that the soil erosion increases in badlands areas heavily used by OHVs, which could have indirect effects on the natural process. Long-term studies are necessary to verify and quantify the preliminary findings.

The riparian value would not be threatened with irreparable harm due to protective management, such as surface disturbance protection in riparian areas, in each alternative.

The relict vegetation relevant and important values (North and South Caineville Mesas) could be threatened with irreparable damage if these areas were made available for livestock grazing, although topography, access, and lack of water make it difficult to graze livestock on the mesa tops. Historically,

limited grazing may have occurred in these areas during wet winter seasons. Making the mesas available for grazing would present some risk to the relict vegetation under those alternatives.

Impacts to the relevant and important value of this ACEC could occur from the following resource management programs:

- Visual Resources
- Special Status Species
- Non-WSA Lands with Wilderness Characteristics
- Livestock Grazing
- Recreation
- Travel Management
- Lands and Realty
- Minerals and Energy
- Special Designations.

Other programs were determined to have little or no impact on the relevant and important values of this potential ACEC.

Alternative N: No Action

Impacts from Visual Resources

Visual resource management classes within the potential ACEC vary by alternative, as shown in Table 4-60. The higher VRM Classes (I and II) would better protect the scenic values and, by limiting surface-disturbing activities, also benefit other relevant and important values.

Class A scenery is identified as a relevant and important value of this ACEC. Class A scenery occurs within the Mount Ellen—Blue Hills WSA, an area north of Highway 24 encompassing North Caineville Mesa, Factory Butte, and the Fremont River Corridor. Although none of the lands within this potential ACEC are classified as VRM Class I, the portion within the Mount Ellen—Blue Hills WSA (40,400 acres) would be managed to meet VRM Class I objectives. This would preserve the existing character of the landscape by restricting surface-disturbing activities, and it would provide protection to the area. VRM Class II would protect scenic values within 77% of the area. In the remaining 23% of the area (which is managed as either VRM Class III or Class IV), activities that could adversely impact relevant and important values would be allowed.

Table 4-60. VRM Class Designations within Badlands Potential ACEC

		Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
Class I	Acres	0*	40,400	40,400	40,400	75,800
	% ACEC	0%	46%	46%	46%	85%
Class II	Acres	68,300	0	23,200	28,400	7,700
	% ACEC	77%*	0%	26%	32%	9%
Class III	Acres	4,000	400	3,700	4,000	500
	% ACEC	4%	0%	4%	4%	1%

		Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
Class IV	Acres	16,600	48,100	21,600	16,100	5,000
	% ACEC	19%	55%	24%	18%	5%

* By BLM policy, the portion of the potential ACEC within the Mount Ellen—Blue Hills WSA would be managed to meet VRM Class I objectives. The lands within the WSA were inventoried as VRM Class II and are represented as such in this table.

Impacts from Special Status Species

Under all alternatives, management actions—such as prohibiting the destruction, adverse modification, or fragmentation of listed species habitat; maintaining the integrity of SSS habitat; and habitat improvements—would benefit SSS. In the Proposed RMP, Alternatives A, C, and D, additional strategies (such as utilizing seasonal and spatial buffers for surface-disturbing activities and complying with raptor protection guidelines for powerline construction) would be employed to protect raptors and their habitat. These actions would minimize or eliminate impacts to the SSS relevant and important values.

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness characteristics on lands outside of WSAs are proposed under this alternative, resulting in no additional protection for relevant and important values.

Impacts from Livestock Grazing

The North and South Caineville Mesas would continue to be unavailable for grazing, which would continue to provide protection to the relict vegetation on the mesa tops. Relict vegetation was not identified as a relevant and important value within the remainder of the potential ACEC. Grazing in the remainder of the area would be managed in accordance with the *Fundamentals of Rangeland Health* and *Standards and Guidelines for Grazing Administration*, which would minimize impacts to the relevant and important values. There would be little-to-no threat to the Gilbert Badlands from livestock grazing because of topographic isolation and lack of vegetation and water within the Mancos Shale badlands to support livestock. This would continue to provide protection to the relevant values of the area.

Impacts from Recreation

Under Alternative N, no SRMAs are proposed, so there would be no impacts to relevant and important values. However, visitor use is expected to increase throughout the RFO. Under this alternative, the entire RFO (with the exception of Yuba Reservoir, which is managed by the Fillmore FO) is identified and managed as an ERMA. Management of recreation in ERMAs is restricted to custodial actions only, with no special prescriptions identified that would limit or control recreational activities. Thus, intensively used recreation sites (such as Factory Butte) could experience impacts to vegetation and other resources. Potential for these impacts would be most likely to occur within the 46% of the area that would be open to OHV use with no specific management emphasis. These activities could result in loss of vegetation cover and soil compaction, as well as a decrease in riparian ecological condition as cross-country activities increase in vegetated areas or spread into the riparian zones. Thus, impacts to relevant and important values of this potential ACEC from recreation could continue under this alternative—or even increase as visitor use increases.

Impacts from Travel Management

OHV area designations vary by alternative, as shown in Table 4-61.

Table 4-61. OHV Area Designations within Badlands Potential ACEC

		Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
Open	Acres	40,800	40,400	8,000	0	0
	% Area	46%	45%	9%	0%	0%
Limited	Acres	1,800	48,500	36,400	6,000	4,100
	% Area	2%	55%	41%	7%	5%
Closed	Acres	46,300	0	44,500	82,900	84,800
	% Area	52%	0%	50%	93%	95%

The greatest impacts to relevant and important values from cross-country OHV use could occur under Alternative N. Forty-six percent of the area would be designated as open to OHVs, and relevant and important values would continue to be adversely impacted by vehicles running over vegetation and compacting soil. Two percent of the area would be limited, and 52% would be closed to OHV use, protecting relevant and important values from ground disturbance caused by cross-country OHV use within those areas.

Impacts from Lands and Realty

Withdrawing land from mineral entry would benefit all relevant and important values by protecting them from ground-disturbing activities associated with the exploration and development of locatable minerals. Under Alternative N, the proposal to withdraw North Caineville Mesa (2,200 acres) would benefit the relict vegetation value on the mesa by protecting it from ground disturbance caused by exploration and development of mineral resources. Alternative N would also propose to withdraw South Caineville Mesa (4,100 acres) and Gilbert Badlands (3,680 acres).

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Lands open to oil and gas leasing vary by alternative, as shown in Table 4-62. There would be no impacts to relevant and important values within the WSA, which is closed to oil and gas leasing. The WSA represents 46% of the potential ACEC. An additional 3% of the potential ACEC is open to leasing subject to major constraints (NSO), which would result in minimal impacts to the relevant and important values, and 23% would be open to leasing with minor constraints. In the remainder of the area, impacts to relevant and important values from oil and gas leasing could occur due to surface-disturbing activities.

Protection is also provided by laws, rules, and regulations for other resources. Adherence to VRM Class II standards would provide protection for the Class A scenic values. SSS values would receive protection by the ESA. In addition, the potential ACEC is in a portion of the RFO identified as having low potential for oil and gas development. Few wells are expected to be drilled in this area in the next 15 to 20 years.

Table 4-62. Leasing Stipulations within Badlands Potential ACEC

		Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
Standard	Acres	25,100	47,300	37,000	0	0

		Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
Lease Terms	**% Area**	28%	53%	42%	0%	0%
Controlled Surface Use or Timing Stipulations	**Acres**	20,000	1,200	6,800	0	0
	% Area	23%	1%	8%	0%	0%
No Surface Occupancy	**Acres**	3,400	0	4,700	0	0
	% Area	3%	0%	5%	0%	0%
Closed	**Acres**	40,400	40,400	40,400	88,900	88,900
	% Area	46%	46%	45%	100%	100%

Leasable Minerals—Coal

There are limited coal resources within the ACEC. Under this alternative, the 2,200-acre North Caineville Mesa ACEC and the 4,100-acre South Caineville Mesa ACEC would be identified as withdrawn from consideration for leasing for surface coal mining. The remainder of the potential ACEC would be available for consideration for leasing for surface coal mining, which would cause irreparable harm to the relevant and important values in the area where surface mining occurred. The 46% of the ACEC within the WSA would be managed pursuant to the IMP, which would provide protection from these activities.

Locatable Minerals

There is potential for uranium, vanadium, and copper mineralization within the area. Under Alternative N, 36% of the potential ACEC (the area outside the WSA) could be impacted by mineral exploration and development. Locatable mineral exploration and development would be allowed under the General Mining Law in these areas. FLPMA requires BLM to regulate mining activities to prevent undue and unnecessary environmental degradation to resources. This would minimize impacts from mining activities to relevant and important values. Difficulty of access due to location makes development unlikely within the next 15 years. Additionally, within a designated ACEC, federal regulations (43 CFR 3809.11 (c) (3)) require that a plan of operations be submitted for any operation causing surface disturbance greater than casual use. This regulation would mitigate the impacts of mining exploration and development on relevant and important values within the North Caineville Mesa ACEC.

Impacts from Special Designations

Wilderness Study Areas

The potential ACEC encompasses 40,400 acres of the Mount Ellen—Blue Hills WSA. Within this area (46% of the potential ACEC), continued management of the WSA under the IMP would limit surface-disturbing actions that could adversely impact relevant and important values. WSAs are closed to oil and gas leasing, precluding any impact from oil and gas development, and they are managed as VRM Class I, which further restricts surface-disturbing activities.

Wild and Scenic Rivers

The Fremont River between Capitol Reef National Park and the Caineville Ditch diversion was determined to be an eligible WSR. Under this alternative, managing to protect its outstandingly remarkable values would also benefit the scenic and riparian relevant and important values within the river corridor.

Areas of Critical Environmental Concern

The North and South Caineville Mesas and Gilbert Badlands ACECs (9,980 combined acres) would be continued under Alternative N, which represents 11% of the Badlands Potential ACEC. Management of these ACECs would allow no uses that would cause irreparable damage to relevant and important values. In addition, because much of the potential ACEC (46%) is within the Mount Ellen—Blue Hills WSA, that portion of the potential ACEC would be managed pursuant to the IMP, which would protect the relevant and important values in that area. Potential impacts could occur under this alternative within the remainder of the potential ACEC.

Alternative A

Impacts from Visual Resources

Under this alternative, the portion of the potential ACEC located within the Mount Ellen—Blue Hills WSA (40,400 acres) would be designated as VRM Class I. This would preserve the existing character of the landscape by restricting surface-disturbing activities, and it would provide protection to the relevant and important values. The remaining 54% of the area would be designated VRM Classes III and IV. Scenic values could be adversely impacted because the objectives for these VRM classes allow actions that can result in moderate-to-major landscape modification and therefore greater surface disturbance. Among all of the alternatives, Alternative A would allow the greatest impacts to scenic resources.

Impacts from Special Status Species

Impacts would be the same as those described under Alternative N.

Impacts from Non-WSA Lands with Wilderness Characteristics

Impacts would be the same as those described under Alternative N.

Impacts from Livestock Grazing

Under this alternative, North and South Caineville Mesas would be available for livestock grazing, which could adversely impact the relict vegetation value. However, because access and water are extremely limited on the mesas, the potential for such use is low. Relict vegetation was not identified as a relevant and important value within the remainder of the potential ACEC. There would be little-to-no threat to Gilbert Badlands from livestock grazing because of topographic isolation and lack of vegetation and water within the Mancos Shale badlands to support livestock. In addition, grazing would be managed in accordance with the *Fundamentals of Rangeland Health* and *Standards and Guidelines for Grazing Administration*, which would minimize impacts to the relevant and important values of the area.

Impacts from Recreation

Under this alternative, the Factory Butte SRMA would include much of the proposed Badlands ACEC that is outside of the WSA. Cross-country OHV use would adversely impact several relevant and important values by vehicles running over vegetation, compacting soil, and possibly causing increased erosion.

Impacts from Travel Management

Forty-five percent of the area would be designated open to OHVs under Alternative A, so relevant and important values could be adversely impacted by cross-country vehicle use. Fifty-five percent of the area would be limited to OHV use, protecting relevant and important values from ground disturbance caused by cross-country OHV use within that portion of the potential ACEC.

Impacts from Lands and Realty

Under this alternative, the area would not be recommended for mineral withdrawal. Thus, the relevant and important value of the area would not receive additional protection from land and realty actions.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Lands open to oil and gas leasing are shown in Table 4-62. There would be no impacts to relevant and important values within the WSA, which is closed to oil and gas leasing. The WSA represents 46% of the potential ACEC. In the remainder of the area, impacts to relevant and important values from oil and gas leasing and development could occur due to surface-disturbing activities. However, the potential ACEC is in a portion of the RFO identified as having low development potential for oil and gas development. Therefore, few wells are expected to be drilled in this area in the next 15 to 20 years. Thus, it is unlikely that surface-disturbing activities from oil and gas development would occur that would impact the relevant and important values of this area.

Leasable Minerals—Coal

There are limited coal resources within the ACEC. Under this alternative, the potential ACEC would be available for consideration for leasing for surface coal mining, which would cause irreparable harm to the relevant and important values in the area where surface mining occurred. The 46% of the ACEC within the WSA would be managed pursuant to the IMP, which would provide protection from these activities.

Locatable Minerals

Impacts would be the same as those described under Alternative N.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Under this alternative, the Fremont River between Capitol Reef National Park and the Caineville Ditch diversion would not be recommended as suitable, with no special management to protect its outstandingly remarkable values and free-flowing nature. This would provide no additional protection to the area's relevant and important values.

Areas of Critical Environmental Concern

The potential Badlands ACEC would not be designated under this alternative, and no special management prescriptions would be implemented to specifically protect the relevant and important values of the area. However, because much of the potential ACEC (46%) is within the Mount Ellen—Blue Hills WSA, that portion of the potential ACEC would be managed pursuant to the IMP, which would protect the relevant and important values in that area. This alternative would present the greatest threat to relevant and important values of the potential ACEC.

Proposed RMP

Impacts from Visual Resources

VRM Classes I and II would protect scenic values within 72% of the area, the majority of the Class A scenery. This would preserve or retain the existing character of the landscape by restricting surface-disturbing activities, and it would provide protection to the scenic relevant and important value.

Restricting surface-disturbing activities for visual resources would also provide indirect protection for the remaining relevant and important values of special status plants, natural processes, riparian and relict vegetation.

The remaining 28% would be designated as either VRM Class III or Class IV, but only a small portion of this area was identified as having scenic values. Although these VRM classes allow actions that can result in moderate-to-major landscape modification, the potential to impact the overall scenic relevant and important value of the potential Badlands ACEC would be minimal.

Impacts from Special Status Species

Under all alternatives, management actions—such as prohibiting the destruction, adverse modification, or fragmentation of listed species habitat; maintaining the integrity of SSS habitat; and habitat improvements—would benefit SSS. In the Proposed RMP, as well as Alternatives A, C, and D, additional strategies (such as utilizing seasonal and spatial buffers for surface-disturbing activities and complying with raptor protection guidelines for powerline construction) would be employed to protect raptors and their habitat. These actions would minimize or eliminate impacts to the SSS relevant and important values.

Impacts from Non-WSA Lands with Wilderness Characteristics

Under the Proposed RMP, portions of the Mount Ellen—Blue Hills non-WSA lands with wilderness characteristics area (3,900 acres).which would be managed to protect, preserve and maintain their wilderness characteristics, overlap the potential Badlands ACEC. Management prescriptions to protect, preserve and maintain wilderness characteristics would protect scenic values, reduce or eliminate surface disturbance, and retain public lands in federal ownership. Approximately 810 acres (less than 1% of the potential ACEC) overlap with the managed wilderness characteristic lands, providing indirect protection for all the relevant and important values that occur within that area.

Impacts from Livestock Grazing

Under the Proposed RMP, the North Caineville Mesa ACEC (which is located wholly within the potential Badlands ACEC) would be designated and would continue to be unavailable for grazing, which would continue to provide protection to the relict vegetation relevant and important value located on North Caineville Mesa. The South Caineville Mesa would be available for livestock grazing, which could adversely impact the relict vegetation relevant and important value. However, because access and water are extremely limited on the mesa, the potential for such use is low. Relict vegetation was not identified as a relevant and important value within the remainder of the potential ACEC.

There would be little to no threat to the relevant and important natural processes value of the Gilbert Badlands or the potential Badlands ACEC as a whole from livestock grazing because of lack of vegetation and water within the Mancos shale badlands to support livestock. In addition, grazing would be managed in accordance with the *Fundamentals of Rangeland Health and Standards and Guidelines for Grazing Administration*, which would minimize impacts to the relevant and important value of natural processes within the potential Badlands ACEC.

Impacts from Recreation

Under the Proposed RMP, 24,400 acres north of Highway 24 would be included in the Factory Butte SRMA. This SRMA would provide special management attention for the cross-country OHV use area, while providing information to visitors regarding the other resources within the area and restricting use in sensitive areas such as the, North Caineville Mesa ACEC, Factory Butte, SSS habitat areas, and the riparian zones located within the ACEC. The OHV open area is an area with little-to-no vegetation.

Studies would continue regarding the long-term effects of OHV use on the Mancos Shale soils (natural processes relevant and important value) at this location.

The portion of the potential Badlands ACEC south of Highway 24 is included in the Henry Mountains SRMA. This SRMA would be managed for a combination of semi-primitive non-motorized and motorized recreation. Managing recreation use would help protect all the relevant and important values that occur within that area (scenic, SSS habitat areas, natural processes and relict vegetation from ground-disturbing activities associated with recreation.

Impacts from Travel Management

Nine percent of the potential Badlands ACEC would be designated open to OHVs under the Proposed RMP. The relevant and important values that are present within the OHV open area are scenic and natural processes (wind erosion) values. A small portion of the area remaining open to cross-country OHV use was identified as having Class A scenery. However, this area has been receiving extensive cross-country use since before completion of the 1982 Henry Mountains MFP and the potential to impact the overall scenic relevant and important value of the potential Badlands ACEC from continuing OHV use in this small area would be minimal. The VRM Class for this area would be adjusted for consistency with the OHV activities that have and would continue to occur there. Studies would continue regarding the long-term effects of OHV use on the Mancos Shale soils at this location, and thus on the natural processes. No SSS, riparian, or relict vegetation values have been identified within the OHV open area.

Forty-one percent of the area would limit OHV use to designated routes, protecting all relevant and important values from ground disturbance caused by cross-country OHV use; 50% of the area would be closed to OHV use, which would result in no impacts from motorized vehicles. Proposed OHV designations under this alternative would reduce or eliminate impacts to all the identified relevant and important values from OHV use within the 91% of the potential ACEC.

Impacts from Lands and Realty

Under the Proposed RMP, the recommendation to withdraw North Caineville Mesa (2,200 acres) would benefit the relict vegetation value on the mesa by protecting it from ground disturbance caused by exploration and development of mineral resources. The remainder of the potential Badlands ACEC would not be recommended for mineral withdrawal. Thus, the relevant and important values of the area would not receive additional protection from land and realty actions.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Impacts would be similar to those described under Alternative N. There would be no impacts to relevant and important values within the WSA, which is closed to oil and gas leasing. The WSA represents 45% of the potential ACEC. An additional 5% of the potential ACEC is open to leasing subject to major constraints (NSO), which would result in minimal impacts to the relevant and important values, and 8% would be open to leasing with moderate constraints. In the remainder of the area (42%), impacts to relevant and important values from oil and gas leasing could occur due to surface-disturbing activities.

Protection is also provided by laws, rules, and regulations for other resources. Adherence to VRM Class II standards would provide protection for the Class A scenic values. SSS values would receive protection by the ESA, riparian protection zones would provide adequate protection for the riparian values and the relict vegetation values are located within areas of the potential ACEC that would require NSO or closed. In addition, the potential ACEC is in a portion of the RFO identified as having low potential for oil and gas development. Few wells are expected to be drilled in this area in the next 15 to 20 years. Therefore, the potential for impacts to relevant and important values from oil and gas are minimal.

Leasable Minerals—Coal

There are limited coal resources within the potential Badlands ACEC. Under this alternative, the 2,200-acre North Caineville Mesa ACEC would be identified as withdrawn from consideration for leasing for surface coal mining. The remainder of the potential ACEC would be available for consideration for leasing for surface coal mining, which would cause irreparable harm to the relevant and important values if they were present in the area where surface mining occurred. The 46% of the ACEC within the WSA would be managed pursuant to the IMP, which would provide protection from these activities.

Locatable Minerals

Impacts would be the same as those described under Alternative N. There is potential for uranium, vanadium, and copper mineralization within the area. The 36% of the potential ACEC (the area outside the WSA) could be impacted by mineral exploration and development. Locatable mineral exploration and development would be allowed under the General Mining Law in these areas. FLPMA requires BLM to regulate mining activities to prevent undue and unnecessary environmental degradation to resources. This would minimize impacts from mining activities to all relevant and important values. Difficulty of access due to location makes development unlikely within the next 15 years. Additionally, within a designated ACEC, federal regulations (43 CFR 3809.11 (c) (3)) require that a plan of operations be submitted for any operation causing surface disturbance greater than casual use. This regulation would mitigate the impacts of mining exploration and development on relevant and important values within the North Caineville Mesa ACEC which is located within the potential Badlands ACEC.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N. The potential ACEC encompasses 40,400 acres of the Mount Ellen—Blue Hills WSA. Within this area (45% of the potential ACEC), continued management of the WSA under the IMP would limit surface-disturbing actions that could adversely impact relevant and important values. WSAs are closed to oil and gas leasing, precluding any impact from oil and gas development, and they are managed as VRM Class I, which further restricts surface-disturbing activities and would provide protection to all the relevant and important values located within the WSA.

Wild and Scenic Rivers

Impacts would be the same as those described under Alternative A. Under the Proposed RMP, the Fremont River between Capitol Reef National Park and the Caineville Ditch diversion would not be recommended as suitable, with no special management to protect its outstandingly remarkable values and free-flowing nature. This would provide no additional protection to the potential Badlands ACEC's relevant and important values.

Areas of Critical Environmental Concern

Under the Proposed RMP, the potential Badlands ACEC would not be designated, and no special management prescriptions would be implemented to specifically protect the relevant and important values of that area. The existing North Caineville Mesa ACEC (2,200 acres) would continue to be designated to protect the relict vegetation relevant and important value. The portion of the potential Badlands ACEC located within the Mount Ellen—Blue Hills WSA would continue to receive adequate protection for all relevant and important values located within that area under the IMP. Resource decisions related to riparian protection zones, SSS, and restricting OHV use to designated routes and a small, managed open area provide protection to the relevant and important values. The potential for impacts associated with cross-country OHV use would be reduced significantly under this alternative when compared with Alternatives N and A.

Alternative C

Impacts from Visual Resources

Impacts would be similar to those described under the Proposed RMP. As shown in Table 4-60, the VRM class designations between the two alternatives are very similar, the main difference being that Alternative C designates all Class A scenery outside of the WSA as VRM Class II and designates fewer VRM Class IV areas, which would provide more protection to relevant and important values by allowing less surface-disturbing activities.

Impacts from Special Status Species

Impacts would be the same as those described under Alternative N.

Impacts from Non-WSA Lands with Wilderness Characteristics

Impacts would be the same as those described under Alternative N.

Impacts from Livestock Grazing

Impacts would be the same as those described under Alternative N.

Impacts from Recreation

Under this alternative, the portion of the potential ACEC south of Highway 24 is included in the Henry Mountains SRMA. This SRMA would be managed for a combination of semi-primitive and motorized recreation. Managing recreation use would help protect relevant and important values from ground-disturbing activities associated with recreation.

Impacts from Travel Management

Alternative C would close 93% of the area to OHVs (including the mesa tops) and would limit OHVs to designated routes in the remaining 7% of the area. This would protect relevant and important values from ground disturbances caused by this activity.

Impacts from Lands and Realty

Impacts would be similar to those described under Alternative N, except that substantially more acres would be recommended for withdrawal under Alternative C. Under Alternative C, 27,800 acres would be recommended for withdrawal from mineral entry, which would protect scenic values as well as other values, by precluding those areas from surface-disturbing activities associated with locatable mineral development.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Under this alternative, the entire ACEC would be closed to oil and gas leasing, precluding any impacts from this type of activity.

Leasable Minerals—Coal

Under this alternative, the potential Badlands ACEC would be closed to leasing for coal resources, precluding any impacts from this type of activity.

Locatable Minerals

There is potential for uranium, vanadium, and copper mineralization within the area. Under Alternative C, 13% of the potential ACEC could be impacted by mineral exploration and development. However, difficulty of access makes development unlikely within the next 15 years. Additionally, within a

designated ACEC, federal regulations (43 CFR 3809.11 (c) (3)) require that a plan of operations be submitted for any operation causing surface disturbance greater than casual use. This regulation would mitigate the impacts of mining exploration and development on relevant and important values.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

The Fremont River between Capitol Reef National Park and the Caineville Ditch diversion (4 miles) was determined to be an eligible WSR and recommended as suitable under this alternative. Managing to protect the river's outstandingly remarkable values would also benefit the scenic and riparian relevant and important values within the river corridor portion of the potential Badlands ACEC.

Areas of Critical Environmental Concern

Under Alternative C, the Badlands ACEC and RNA would be designated on 88,900 acres of public land to protect and provide special management for the relevant and important values. In addition to the management direction associated with Alternative C related to other resource programs (described above), designating the ACEC would allow no uses that would cause irreparable damage to relevant and important values.

Alternative D

Impacts from Visual Resources

This alternative provides the most protection to scenic resources of all the alternatives. Ninety-four percent of the potential ACEC would be designated as either VRM Class I or II, which would preserve or retain the existing character of the landscape by restricting surface-disturbing activities. The remaining 6% of the area, which does not contain Class A scenery, would be designated as either VRM Class III or IV. Scenic values in these areas could be adversely impacted because the objectives for these VRM classes allow actions that can result in moderate-to-major landscape modification and therefore greater surface disturbance.

Impacts from Special Status Species

Impacts would be the same as those described under Alternative N.

Impacts from Non-WSA Lands with Wilderness Characteristics

Portions of the Mount Ellen—Blue Hills (6,200 acres), Muddy Creek/Crack Canyon (17,700 acres), Red Desert (830 acres), and Wild Horse Mesa (10,600 acres) non-WSA lands with wilderness characteristics lie within the 88,900-acre potential Badlands ACEC. Under Alternative D, protecting the non-WSA lands with wilderness characteristics within the Badlands ACEC would provide protection for relevant and important values on 35,330 acres. Specifics are disclosed in the visual resource management, travel management, lands and realty, and minerals discussions in this section.

Impacts from Livestock Grazing

Impacts would be the same as those described under Alternative N.

Impacts from Recreation

Under Alternative D, portions of the Badlands Potential RNA ACEC would be included in the Capitol Reef Gateway, Henry Mountains, and San Rafael Swell SRMAs. The proposed management direction of

these SRMAs, with its emphasis on primitive and semi-primitive recreation, would help protect relevant and important values from ground-disturbing activities associated with some types of motorized recreation.

Impacts from Travel Management

Alternative D would best protect relevant and important values from cross-country OHV use among the alternatives. Ninety-five percent of the area would be closed to OHVs and 5% of the ACEC would limit OHVs to designated routes, protecting relevant and important values from ground disturbances caused by this activity.

Impacts from Lands and Realty

Impacts would be similar to those described under Alternative C, except that a much larger area (42,700 acres) would be recommended for withdrawal under Alternative D to protect scenic values. This alternative would best protect the relevant and important values from the ground-disturbing activities associated with mining exploration and development.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Impacts would be the same as those described under Alternative C.

Leasable Minerals—Coal

Impacts would be the same as those described under Alternative C.

Locatable Minerals

There is potential for uranium, vanadium, and copper mineralization within the area. Under Alternative D, 6% of the potential ACEC (the area outside the WSA) could be impacted by mineral exploration and development. However, difficulty of access due to location of the WSA makes development unlikely within the next 15 years. Additionally, within a designated ACEC, federal regulations (43 CFR 3809.11 (c) (3)) require that a plan of operations be submitted for any operation causing surface disturbance greater than casual use. This regulation would mitigate the impacts of mining exploration and development on relevant and important values.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Impacts would be the same as those described under Alternative C.

Areas of Critical Environmental Concern

Impacts would be the same as those described under Alternative C.

Bull Creek Potential ACEC

The Bull Creek Potential ACEC encompasses 4,800 acres of public lands located in Wayne County several miles south of Hanksville. The relevant and important value is cultural resources (archaeological). None of the proposed decisions would threaten archaeological values with irreparable harm, and the archaeological values could be protected without designating the area as an ACEC. However, designating

the as an ACEC would enhance those values. Impacts to the relevant and important value of this ACEC could occur from the following resource management programs:

- Cultural Resources
- Travel Management
- Minerals and Energy
- Special Designations.

Other programs were determined to have little or no impact on the archaeological values of this potential ACEC.

Alternative N: No Action

Impacts from Cultural Resources

Under Alternative N, management of the Bull Creek Archaeological District would be consistent with properties listed on the National Register of Historic Places, which would protect the values for which the district was nominated. Under all alternatives, no surface-disturbing activities would be authorized in the Bull Creek Archaeological District other than archaeological research.

Impacts from Travel Management

Under Alternative N, continuing to limit vehicles to designated routes would protect the cultural resources from surface disturbance caused by cross-country motor vehicle travel.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Under Alternative N, the Bull Creek Archaeological District would continue to be open to leasing subject to major constraints (NSO), precluding surface disturbances.

Locatable Minerals

Under Alternative N, locatable mineral exploration and development would be allowed under the General Mining Law. FLPMA requires BLM to regulate mining activities to prevent undue and unnecessary environmental degradation to resources, including cultural values. This would minimize impacts of mining activities on cultural resources. Mining activities have not occurred within the area and are not expected in the future.

Impacts from Special Designations

Areas of Critical Environmental Concern

The potential Bull Creek ACEC would not be designated under this alternative, and no special management prescriptions would be implemented to specifically protect the relevant and important values of the area. Existing laws, rules, and regulations, as well as management decisions for cultural and travel management would adequately protect the relevant and important cultural values.

Alternative A

Impacts from Cultural Resources

Impacts would be the same as those described under Alternative N.

Impacts from Travel Management

Under this alternative, motorized use within the potential ACEC and surrounding area would be limited to designated routes. This would protect the cultural resources from potential surface disturbance associated with cross-country motor vehicle travel.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Impacts would be the same as those described under Alternative N.

Locatable Minerals

Impacts would be the same as those described under Alternative N.

Impacts from Special Designations

Areas of Critical Environmental Concern

Impacts would be the same as those described under Alternative N.

Proposed RMP

Impacts from Cultural Resources

Under the Proposed RMP, motorized use within the potential Bull Creek Archaeological ACEC and surrounding area would be limited to designated routes. This would protect the relevant and important cultural values from potential surface disturbance associated with cross-country motor vehicle travel.

Impacts from Travel Management

Under the Proposed RMP, motorized use within the potential ACEC and surrounding area would be limited to designated routes. This would protect the relevant and important cultural values from potential surface disturbance associated with cross-country motor vehicle travel.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Under the Proposed RMP, the potential Bull Creek Archaeological District would continue to be open to leasing subject to major constraints (NSO), precluding surface disturbances which would provide adequate protection to the relevant and important cultural value.

Locatable Minerals

Under the Proposed RMP, locatable mineral exploration and development would be allowed under the General Mining Law. FLPMA requires BLM to regulate mining activities to prevent undue and unnecessary environmental degradation to resources, including cultural values. This would minimize impacts of mining activities on cultural resources. Mining activities have not occurred within the area and are not expected in the future.

Impacts from Special Designations

Areas of Critical Environmental Concern

The potential Bull Creek Archaeological ACEC would not be designated under the Proposed RMP, and no special management prescriptions would be implemented to specifically protect the relevant and important cultural value of the area. Existing laws, rules, and regulations, as well as management decisions for cultural, travel and minerals and energy management would adequately protect the relevant and important cultural value.

Alternative C

Impacts from Cultural Resources

Under Alternative C, special management for the ACEC would include the following prescriptions: increase public awareness of cultural resource values; increase law enforcement presence; and, if necessary, install fencing or other direct protection of important sites. These prescriptions would provide added protection for the archaeological district.

Impacts from Travel Management

Impacts would be the same as those described under Alternative A.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Impacts would be the same as those described under Alternative N.

Locatable Minerals

Impacts would be similar as those described under Alternative N. Additionally, designating the area as an ACEC under this alternative would require the filing of a plan of operation and analyzing impacts with a site-specific environmental assessment (EA) before mineral development would be allowed.

Impacts from Special Designations

Areas of Critical Environmental Concern

Under Alternative C, designating the Bull Creek ACEC would provide increased management emphasis for protecting cultural resources. Special management for the ACEC would include the following prescriptions: increase public awareness of cultural resource values; increase law enforcement presence; and, if necessary, install fencing or other direct protection of important sites.

Alternative D

Impacts from Cultural Resources

Special management under Alternative D would increase public awareness of cultural resource values and increase law enforcement presence, but no fencing would be allowed in non-WSA lands with wilderness characteristics, which may not protect the archaeological district as much as Alternative C.

Impacts from Travel Management

In Alternative D, the 320 acres of the potential Bull Creek Archaeological District ACEC overlapping non-WSA lands with wilderness characteristics would be closed to OHV use, providing additional protection to cultural resources.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Impacts would be the same as those described under Alternative N.

Locatable Minerals

Impacts would be the same as those described under Alternative C.

Impacts from Special Designations

Areas of Critical Environmental Concern

Under Alternative D, designating the Bull Creek ACEC would provide increased management emphasis for protecting cultural resources but to a lesser extent than Alternative C. Special management under Alternative D would increase public awareness of cultural resource values and increase law enforcement presence, but no fencing would be allowed in non-WSA lands with wilderness characteristics.

Dirty Devil/North Wash Potential ACEC

The Dirty Devil/North Wash Potential ACEC includes the Dirty Devil River and side canyons and totals 205,300 acres. It is located southeast of Hanksville in Wayne and Garfield counties. Sixty-four percent of the potential ACEC is within WSAs, where management under the IMP would protect all relevant and important values from surface-disturbing activities. The potential ACEC includes the existing Beaver Wash ACEC; the Dirty Devil, French Spring/Happy Canyon, and Fiddler Butte Wilderness Study Areas; and the Dirty Devil River, Beaver Wash Canyon, Larry Canyon, No Mans Canyon, Robbers Roost Canyon, Sams Mesa Box Canyon, and Twin Corral Box Canyon eligible WSRs. Relevant and important values include scenic, cultural, paleontological, wildlife (bighorn sheep), and SSS (plant species and the Mexican spotted owl).

OHV use could adversely impact the scenic, cultural, wildlife, and SSS values if OHVs travel where these values are present. Plants could be crushed, damaged, or destroyed; cultural resources could be damaged or destroyed; and new trails could be established in scenic areas. OHV use could also disturb Desert bighorn sheep and special status animal species. Impacts to the relevant and important value of this ACEC could occur from the following resource management programs:

- Vegetation
- Cultural Resources
- Visual Resources
- Special Status Species
- Fish and Wildlife
- Fire and Fuels Management
- Non-WSA Lands with Wilderness Characteristics
- Livestock Grazing
- Recreation
- Travel Management
- Lands and Realty
- Minerals and Energy
- Special Designations.

Other programs were determined to have little or no impact on the relevant and important values of this potential ACEC.

Alternative N: No Action

Impacts from Vegetation

Under Alternative N, no surface-disturbing activities would be allowed within 500 feet of riparian areas unless it could be shown that there are no practical alternatives, all long-term impacts could be fully mitigated, and the activity would benefit and enhance the riparian area. This would protect the desert

riparian ecosystem from surface-disturbing activities, but it could restrict potentially beneficial actions such as riparian area restoration and vegetation treatment.

Impacts from Cultural Resources

Under Alternative N, no special management prescriptions for cultural resources (other than that already afforded by existing laws) would be provided.

Impacts from Visual Resources

Visual resource management classes within the potential ACEC vary by alternative, as shown in Table 4-63. The higher VRM Classes (I and II) would better protect the scenic values and, by limiting surface-disturbing activities, also benefit other relevant and important values. Scenic relevant and important values were found to be present within 60% of the potential ACEC, generally the canyons. Under Alternative N, 74% of the ACEC is designated as VRM Class II. Per BLM policy, the 64% of the ACEC within WSAs would continue to be managed as VRM Class I. VRM Class I and II management would provide adequate protection to the Class A scenery occurring within the ACEC.

Table 4-63. VRM Class Designations within Dirty Devil/North Wash Potential ACEC

		Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
Class I	Acres	0	130,700	130,700	130,700	203,900
	% ACEC	0%	64%	64%	64%	99%
Class II	Acres	151,300	0	46,300	47,600	900
	% ACEC	74%	0%	22%	23%	<1%
Class III	Acres	22,000	64,800	5,700	5,400	100
	% ACEC	11%	31%	3%	3%	<1%
Class IV	Acres	32,000	9,800	22,600	21,600	400
	% ACEC	15%	5%	11%	10%	<1%

Impacts from Special Status Species

Under Alternative N, management actions such as prohibiting the destruction, adverse modification, or fragmentation of listed species habitat; maintaining the integrity of SSS habitat; and habitat improvements would benefit SSS.

Impacts from Fish and Wildlife

Managing Desert bighorn sheep in accordance with the existing habitat management plan (HMP) would benefit this relevant and important value. The HMP was specifically prepared to direct and provide for management of this wildlife species. Prohibiting the changing in class of livestock from cattle to sheep would protect the Desert bighorn sheep from diseases that could be contracted from domestic sheep. Under this alternative, implementing less seasonal or spatial restrictions on human presence or surface-disturbing activity could result in greater impacts to Desert bighorn sheep during critical periods, such as lambing.

Impacts from Fire and Fuels Management

Although unlikely due to vegetation within Mexican spotted owl habitats, decisions under this alternative would allow for habitat manipulations to improve habitat condition for this species. Any fuels activities would be required to adhere to the Endangered Species Act and, for portions of the potential ACEC within WSAs, the IMP.

Impacts from Non-WSA Lands with Wilderness Characteristics

Portions of the Dirty Devil/French Spring (58,100 acres), Fiddler Butte (12,000 acres), Flat Tops (10 acres), and Little Rockies (3,200 acres) non-WSA lands with wilderness characteristics lie within the 205,300-acre potential Dirty Devil/North Wash ACEC. No actions to maintain wilderness characteristics on lands outside of WSAs are proposed under Alternative N, resulting in no additional protection for relevant and important values.

Impacts from Livestock Grazing

Under Alternative N, the majority of the potential ACEC would be available for livestock grazing. The Big Ridge would continue to be unavailable for grazing. The North Wash drainage and Beaver Wash Canyon would continue to be unavailable for grazing, which would provide additional protection of the desert riparian ecosystem. Grazing would be managed in accordance with the *Fundamentals of Rangeland Health* and *Standards and Guidelines for Grazing Administration*, which would minimize impacts to the relevant and important values of the area.

Impacts from Recreation

Under Alternative N, no SRMAs are proposed, so there would be no impacts to relevant and important values. However, visitor use is expected to increase throughout the RFO. Under this alternative, the entire RFO (with the exception of Yuba Reservoir, which is managed by the Fillmore FO) is identified and managed as an ERMA. Management of recreation in ERMAs is restricted to custodial actions only, with no special prescriptions identified that would limit or control recreational activities. As recreation uses increase and new types of recreational activities develop, having no SRMA management plan in place to manage that use could result in impacts to relevant and important values. The remoteness of the area and 64% of the potential ACEC being located within WSAs would continue to provide protection from recreational uses, such as cross-country motorized travel, within those portions of the ACEC.

Impacts from Travel Management

OHV area designations vary by alternative, as shown in Table 4-64. Alternative N would continue to allow cross-country vehicle travel within 31% of the potential ACEC, which could adversely impact the scenic, cultural, wildlife, and special status plant species values if the OHVs traveled where these values were present. Plants could be crushed, damaged, or destroyed; cultural resources could be damaged or destroyed; and new trails could be established in scenic areas. OHV use could also disturb Desert bighorn sheep and special status animal species. Thirty percent of the area would limit OHV use to designated routes, protecting relevant and important values from ground disturbance caused by cross-country OHV use; 39% of the area would be closed to OHV use, which would result in no impacts from motorized vehicles.

Table 4-64. OHV Area Designations within Dirty Devil/North Wash Potential ACEC

		Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
Open	**Acres**	64,100	0	0	0	0

		Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
	% Area	31%	0%	0%	0%	0%
Limited	Acres	61,500	205,300	99,600	600	500
	% Area	30%	100%	49%	<1%	<1%
Closed	Acres	79,700	0	105,700	204,700	204,800
	% Area	39%	0%	51%	100%	100%

Impacts from Lands and Realty

Under this alternative, the portion of the potential ACEC outside WSAs would not be recommended for mineral withdrawal. Thus, the relevant and important value of the area would not receive additional protection from land and realty actions.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Lands open to oil and gas leasing vary by alternative, as shown in Table 4-65. Under all alternatives, there would be no impacts to relevant and important values within the WSAs, which are closed to oil and gas leasing by law. WSAs represent 64% of the potential ACEC. Under Alternative N, 29% of the potential ACEC would be open to oil and gas leasing under standard terms, and 7% would be open under controlled surface use or timing stipulations. The seasonal restriction would prohibit exploration and development from April 15 through June 15 to reduce impacts to bighorn sheep during the lambing season. Among the alternatives, Alternative N would have the greatest potential of impacting relevant and important values. However, the potential ACEC is in a portion of the lands managed by the RFO identified as having low development potential for oil and gas leasing. Few, if any, wells are expected to be drilled in this area in the next 15 to 20 years. Thus, it is unlikely that surface-disturbing activities from oil and gas development would occur that would impact the relevant and important values of this potential ACEC.

Table 4-65. Leasing Stipulations within Dirty Devil/North Wash Potential ACEC

		Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
Standard Lease Terms	Acres	59,200	5,800	3,600	400	200
	% Area	29%	3%	2%	<1%	<1%
Controlled Surface Use or Timing Stipulations	Acres	15,300	68,800	21,800	7,200	100
	% Area	7%	33%	11%	4%	<1%
No Surface Occupancy	Acres	100	0	49,300	32,200	700
	% Area	<1%	0%	24%	16%	<1%
Closed	Acres	130,700	130,700	130,600	165,500	204,300
	% Area	64%	64%	64%	80%	100%

Locatable Minerals

Under Alternative N, 36% of the potential ACEC (the area outside the WSAs) could be impacted by mineral exploration and development. There is potential for uranium, vanadium, and copper mineralization within the area. There has been increasing interest in uranium adjacent to the Dirty Devil River corridor in the vicinity of Poison Spring and North Hatch Canyons, which could result in increased mineral-related activities within the potential ACEC. Locatable mineral exploration and development would be allowed under the General Mining Law. FLPMA requires BLM to regulate mining activities to prevent undue and unnecessary environmental degradation to resources. Mitigation such as minimizing visual impacts and avoiding sensitive seasons or areas for SSS would be addressed in site-specific analysis as proposals are reviewed. These mitigation measures would reduce, but would not eliminate, impacts to relevant and important values.

Salable Minerals

Under all alternatives, there would be no impacts to relevant and important values within the WSAs, which would be managed under the IMP. Under Alternative N, the effects of mineral material sales on relevant and important values would be determined on a case-by-case basis. Impacts to relevant and important values would be analyzed within site-specific NEPA and minimization measures identified as necessary.

Impacts from Special Designations

Wilderness Study Areas

The potential ACEC encompasses 130,700 acres of wilderness study areas, including all of the Dirty Devil and French Spring/Happy Canyon WSAs and part of the Fiddler Butte WSA. Within the WSAs, which represent 64% of the potential ACEC, relevant and important values would be protected from ground-disturbing activities by management under the IMP to protect the wilderness characteristics of the area.

Wild and Scenic Rivers

WSR designations, by alternative, are shown in Table 4-66. Seven eligible WSRs are within the potential ACEC and recommended suitable under Alternatives C and D: Dirty Devil River, Beaver Wash Canyon, Larry Canyon, No Mans Canyon, Robbers Roost Canyon, Sams Mesa Box Canyon, and Twin Corral Box Canyon. Protecting the river-related outstandingly remarkable values of all segments under Alternative N would also protect relevant and important values within about 19% of the potential ACEC. However, most of these river segments are within WSAs, so management to protect the river values would add little or no additional protection for the ACEC values over what is afforded by WSA management direction.

Table 4-66. Eligible/Suitable Wild and Scenic Rivers within Dirty Devil/North Wash Potential ACEC

		Eligible	Suitable		
Eligible/ Suitable Rivers		**Alternative N (No Action)**	**Alternative A**	**Proposed RMP**	**Alternatives C and D**
Eligible/ Suitable Rivers	**# of Segments**	7	0	0	7
	River Miles	121	0	0	121
	Acres	38,400	0	0	38,400

		Eligible	Suitable		
Eligible/ Suitable Rivers		Alternative N (No Action)	Alternative A	Proposed RMP	Alternatives C and D
	% Potential ACEC	19%	0%	0%	19%

Areas of Critical Environmental Concern

Under Alternative N, the existing Beaver Wash ACEC (4,800 acres) would continue to be designated to protect its unique desert riparian ecosystem. Management according to the IMP within the 64% of the potential ACEC within the WSAs and management of the eligible WSR corridors would provide protection of the relevant and important values within those areas.

Alternative A

Impacts from Vegetation

Under Alternative A, no surface-disturbing activities would be allowed within 330 feet on each side of the stream or the 100-year floodplain, whichever is greater, unless it could be shown that there are no practical alternatives, all long-term impacts could be fully mitigated, and the activity would benefit and enhance the riparian area. Although the buffer zone is smaller than in Alternatives N, C, and D, it would still protect the desert riparian ecosystem from surface-disturbing activities. This decision could restrict potentially beneficial actions such as riparian area restoration and vegetation treatment.

Impacts from Cultural Resources

Impacts would be the same as those described under Alternative N.

Impacts from Visual Resources

Alternative A would provide less protection for the scenic values of the potential ACEC than the other alternatives. The 64% of the ACEC within WSAs would be designated as VRM Class I, which would prevent surface-disturbing activities that would result in changes to the landscape, thus providing protection to the scenic relevant and important values. The remainder of the ACEC, including some areas having Class A scenery, would be designated as VRM Classes III and IV, which would allow activities to take place that could impact the scenic values.

Impacts from Special Status Species

As with Alternative N, in Alternative A, management actions such as prohibiting the destruction, adverse modification, or fragmentation of listed species habitat; maintaining the integrity of SSS habitat; and habitat improvements would benefit SSS. Under this alternative, additional strategies (such as utilizing seasonal and spatial buffers for surface-disturbing activities and complying with raptor protection guidelines for powerline construction) would be employed to protect raptors and their habitat. These actions would minimize or eliminate impacts to the SSS relevant and important value.

Impacts from Fish and Wildlife

Impacts would be the same as those described under Alternative N.

Impacts from Fire and Fuels Management

Impacts would be the same as those described under Alternative N.

Impacts from Non-WSA Lands with Wilderness Characteristics

Impacts would be the same as those described under Alternative N.

Impacts from Livestock Grazing

As per the fish and wildlife management decisions, the change in kind of livestock from cattle to domestic sheep would be prohibited in those allotments with bighorn sheep habitat identified in the BLM Desert Bighorn Sheep HMP. This would provide protection for the desert bighorn sheep relevant and important value. Under Alternative A, the majority of the potential ACEC would be available for livestock grazing. The North Wash drainage and the Big Ridge would continue to be unavailable for grazing. Grazing would be managed in accordance with the *Fundamentals of Rangeland Health* and *Standards and Guidelines for Grazing Administration* which would minimize impacts to the relevant and important values of the area.

Impacts from Recreation

Under Alternative A, the Dirty Devil SRMA (290,000 acres) would encompass the northern two-thirds of the Dirty Devil/North Wash Potential ACEC. The Dirty Devil SRMA management emphasis on primitive and semi-primitive recreation would complement the relevant and important values by focusing recreational use and limiting development.

Impacts from Travel Management

Under all action alternatives, adverse impacts from cross-country motorized travel would be virtually eliminated. Under Alternative A, vehicles would be limited to designated routes within the entire potential ACEC. Limiting OHV use would reduce the impacts to relevant and important values because use would be confined to designated routes, although there could be some impacts if relevant and important values were located on or adjacent to open routes.

Impacts from Lands and Realty

Impacts would be the same as those described under Alternative N.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Impacts would be similar to those described under Alternative N, except that fewer acres would be open with standard leasing terms. Under Alternative A, 3% of the potential ACEC would be open to oil and gas leasing under standard terms, and 33% would be open under controlled surface use or timing stipulations. Compared with Alternative N, Alternative A would reduce potential impacts to bighorn sheep by placing more land under seasonal restrictions.

Locatable Minerals

Impacts would be the same as those described under Alternative N.

Salable Minerals

Impacts would be the same as those described under Alternative N.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Under this alternative, the seven eligible WSRs within the potential ACEC would not be recommended as suitable, with no special management to protect their outstandingly remarkable values and free-flowing nature. This would provide no additional protection to the areas' relevant and important values. However, most of these river segments are within WSAs, so management to protect the river values would add little or no additional protection for the ACEC values over what is afforded by WSA management direction.

Areas of Critical Environmental Concern

Under Alternative A, no ACEC would be designated. Management according to the IMP within the 64% of the potential ACEC within the WSAs would provide protection of the relevant and important values within those areas.

Proposed RMP

Impacts from Vegetation

Under the Proposed RMP, no surface-disturbing activities would be allowed within 330 feet on each side of the stream or the 100-year floodplain, whichever is greater, unless it could be shown that there are no practical alternatives, all long-term impacts could be fully mitigated, and the activity would benefit and enhance the riparian area. Although the buffer zone is smaller than in Alternatives N, C, and D, it would still protect the riparian resources from surface-disturbing activities which indirectly benefits the wildlife and SSS relevant and important values of the potential ACEC. This decision could restrict potentially beneficial actions such as riparian area restoration and vegetation treatment.

Impacts from Cultural Resources

Impacts would be the same as those described under Alternative N. Under the Proposed RMP, no special management prescriptions for cultural resources (other than that already afforded by existing laws) would be provided.

Impacts from Visual Resources

Under the Proposed RMP, 86% of the potential ACEC would be designated as VRM Classes I or II. These designations would adequately protect the scenic relevant and important values by limiting surface-disturbing activities within the majority of the ACEC, including the canyons identified for Class A scenery.

Impacts from Special Status Species

As with Alternatives N and A, management actions identified within the Proposed RMP, such as prohibiting the destruction, adverse modification, or fragmentation of listed species habitat; maintaining the integrity of SSS habitat; and habitat improvements would benefit SSS. Under the Proposed RMP, additional strategies (such as utilizing seasonal and spatial buffers for surface-disturbing activities and complying with raptor protection guidelines for powerline construction) would be employed to protect raptors and their habitat. These actions would minimize or eliminate impacts to the SSS relevant and important value within the potential ACEC.

Impacts from Fish and Wildlife

Management according to the IMP within the 64% of the potential ACEC within the WSAs would provide protection of the wildlife (bighorn sheep) relevant and important values within those areas. In addition, managing desert bighorn sheep in accordance with the existing habitat management plan (HMP) would benefit and provide protection for the wildlife (bighorn sheep) relevant and important value of the Dirty Devil/North Wash ACEC. The potential Dirty Devil/North Wash ACEC was defined by Class A Scenery, Mexican spotted owl suitable habitat and the desert bighorn crucial yearlong habitat within the

nominated areas. The desert bighorn sheep HMP includes all of the desert bighorn crucial yearlong habitat identified for relevant and important values, plus additional acres of the potential ACEC. The HMP was specifically prepared to direct and provide for management of this wildlife species. Prohibiting the change in class of livestock from cattle to sheep would protect the Desert bighorn sheep from diseases that could be contracted from domestic sheep. Under this alternative, greater seasonal and spatial restrictions on human presence or surface-disturbing activities could result in benefits to Desert bighorn sheep because they would be afforded protection from disturbances during critical periods. Other SSS could also benefit if they were in the same areas as the Desert bighorn sheep.

Impacts from Fire and Fuels Management

Impacts would be the same as those described under Alternative N. Although unlikely due to vegetation within Mexican spotted owl habitats, decisions under the Proposed RMP would allow for habitat manipulations to improve habitat condition for this species. Any fuels activities would be required to adhere to the Endangered Species Act and, for portions of the potential ACEC within WSAs, the IMP which would provide adequate protection for the SSS relevant and important value of the potential Dirty Devil ACEC.

Impacts from Non-WSA Lands with Wilderness Characteristics

Under the Proposed RMP, portions of the Dirty Devil/French Spring (6,000 acres) non-WSA lands with wilderness characteristics would be managed for wilderness characteristics. Management prescriptions would protect scenic values, reduce or eliminate surface disturbance, and retain public lands in federal ownership. Approximately 550 acres of the Dirty Devil/French Springs non-WSA lands managed for wilderness characteristics would overlap with the potential Dirty Devil/North Wash ACEC (less than 1% of the potential ACEC) which would provide additional protection for relevant and important values within those areas.

Impacts from Livestock Grazing

Impacts would be similar to those described under Alternative A. In addition, no domestic sheep and goat grazing east of Capitol Reef National Park, subject to existing livestock grazing permits would be allowed, providing additional protection for the wildlife (bighorn sheep) relevant and important value of the potential Dirty Devil/North Wash ACEC.

Impacts from Recreation

Under the Proposed RMP, the Dirty Devil SRMA (290,000 acres) would encompass the northern two-thirds of the Dirty Devil/North Wash Potential ACEC. The Dirty Devil SRMA management emphasis on primitive and semi-primitive recreation would complement the relevant and important values of the potential ACEC by focusing recreational use and limiting development.

Impacts from Travel Management

Under the Proposed RMP, vehicles would be limited to designated routes within 49% of the potential ACEC, and the remaining 51% would be closed to motor vehicles. Limiting OHV use would reduce the impacts to all relevant and important values because use would be confined to designated routes. Although there could be some surface disturbance and associated impacts to relevant and important values located on or adjacent to open routes, the potential would be minimized. In closed areas, impacts to relevant and important values from OHV use would be eliminated.

Impacts from Lands and Realty

Impacts would be the same as those described under Alternative N. Under the Proposed RMP, the portion of the potential ACEC outside WSAs (46%) would not be recommended for mineral withdrawal. Thus,

the relevant and important values of the area would not receive additional protection from land and realty actions.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Impacts would be similar to those described under Alternatives N and A, except that fewer acres would be open to leasing subject to standard terms and conditions and more acres would be open to leasing subject to major constraints (NSO) or closed to leasing. Under the Proposed RMP, only 2% of the potential ACEC would be open to oil and gas leasing subject to standard terms and conditions, 11% open to leasing subject to moderate constraints (timing limitation, CSU), 24% open to leasing subject to major constraints (NSO), and 64% closed to leasing. Compared with Alternatives N and A, the Proposed RMP would reduce potential impacts to all relevant and important values.

Locatable Minerals

Under the Proposed RMP, 46% of the potential ACEC (the area outside the WSAs) could be impacted by mineral exploration and development. There is potential for uranium, vanadium, and copper mineralization within the area. There has been increasing interest in uranium adjacent to the Dirty Devil River corridor in the vicinity of Poison Spring and North Hatch Canyons, which could result in increased mineral-related activities within the potential ACEC. Locatable mineral exploration and development would be allowed under the General Mining Law. FLPMA requires BLM to regulate mining activities to prevent undue and unnecessary environmental degradation to resources. Mitigation such as minimizing visual impacts and avoiding sensitive seasons or areas for SSS would be addressed in site-specific analysis as proposals are reviewed. These mitigation measures would reduce, but would not eliminate, impacts to relevant and important values.

Salable Minerals

Under the Proposed RMP, impacts would be similar to those described under Alternative N, except that no material sales would be allowed in Class A scenery areas, resulting in no surface disturbance and no impact to the relevant and important scenic values.

Impacts from Special Designations

Wilderness Study Areas

The potential ACEC encompasses 130,700 acres of wilderness study areas, including all of the Dirty Devil and French Spring/Happy Canyon WSAs and part of the Fiddler Butte WSA. Within the WSAs, which represent 64% of the potential ACEC, all relevant and important values would be protected from ground-disturbing activities by management under the IMP to protect the wilderness characteristics of the area.

Wild and Scenic Rivers

Under the Proposed RMP, the seven eligible WSRs within the potential Dirty Devil/North Wash ACEC would not be recommended as suitable, with no special management to protect their outstandingly remarkable values and free-flowing nature. This would provide no additional protection to the areas' relevant and important values. However, most of these river segments are within WSAs, so management to protect the river values would add little or no additional protection for the ACEC values over what is afforded by WSA management direction.

Areas of Critical Environmental Concern

Under the Proposed RMP, the potential Dirty Devil/North Wash ACEC would not be designated, and no special management prescriptions would be implemented to specifically protect the relevant and important values of that area. Management according to the IMP within the 64% of the potential ACEC within the WSAs and management prescriptions for the Dirty Devil/French Spring non-WSA lands within the potential ACEC would provide protection for all the relevant and important values within those areas. Existing laws, rules, and regulations, as well as other resource decisions within this alternative for VRM, SSS, fish and wildlife, travel, and minerals management would adequately protect or mitigate potential impacts to the scenic, cultural, paleontological, wildlife and SSS relevant and important values of the potential ACEC.

Alternative C

Impacts from Vegetation

Under Alternative C, no surface-disturbing activities would be allowed within 660 feet of riparian areas unless it could be shown that there are no practical alternatives, all long-term impacts could be fully mitigated, and the activity would benefit and enhance the riparian area. This would protect the desert riparian ecosystem from surface-disturbing activities, but it could restrict potentially beneficial actions such as riparian area restoration and vegetation treatment.

Impacts from Cultural Resources

Under Alternative C, special management for the ACEC would include the following prescriptions: increase public awareness of cultural resource values; increase law enforcement presence; and if necessary, install fencing or other direct protection of important sites. These prescriptions would provide added protection for cultural resources in the area.

Impacts from Visual Resources

Impacts would be similar to those described under the Proposed RMP, except that an additional 1% of the ACEC, 87% total, would be protected by VRM Class I and II designations.

Impacts from Special Status Species

Impacts would be the same as those described under Alternative A.

Impacts from Fish and Wildlife

Impacts would be the same as those described under the Proposed RMP.

Impacts from Fire and Fuels Management

Special management prescriptions associated with the ACEC (designated under Alternatives C and D) would allow no prescribed or wildland fire use in Mexican spotted owl core and nest protection areas. In addition, all wildland fires that threaten Mexican spotted owl core areas and nest protection areas would be suppressed. While these actions would minimize short-term loss of habitat from fire, these decisions would preclude habitat manipulations to improve habitat condition, which could impact the Mexican spotted owl in the long term. However, habitat manipulation projects would be limited within the area due to vegetation types and WSAs.

Impacts from Non-WSA Lands with Wilderness Characteristics

Impacts would be the same as those described under Alternative N.

Impacts from Livestock Grazing

Impacts would be the same as those described under Alternative N.

Impacts from Recreation

Under Alternative C, an expanded Dirty Devil SRMA would encompass all of the potential ACEC. The Dirty Devil SRMA management emphasis on primitive and semi-primitive recreation would complement the relevant and important values by focusing recreational use and limiting development. Because the SRMA under Alternatives C and D encompasses the entire potential ACEC, it would best protect relevant and important values from the impacts of recreation use.

Impacts from Travel Management

Under Alternatives C and D, the entire potential ACEC would be closed to OHVs. In closed areas, impacts to relevant and important values from OHV use would be eliminated.

Impacts from Lands and Realty

Withdrawing land from mineral entry would benefit all relevant and important values by protecting them from ground-disturbing activities associated with the exploration and development of locatable minerals. A withdrawal of 47,400 acres (23% of the potential ACEC) to protect Class A scenery outside the WSAs is proposed in Alternative C as part of the ACEC designation.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Under Alternative C, 96% of the potential ACEC would either be closed to leasing or open to leasing subject to major constraints (NSO). The remaining 4% would be open to leasing subject to moderate constraints (timing limitation, CSU). Given these restrictions, there would be virtually no impacts to relevant and important values.

Locatable Minerals

Impacts would be similar to those described under Alternative N, except that the portion of the potential ACEC available for locatable minerals exploration and development would be less than Alternatives N, A, and the Proposed RMP. Under Alternative C, 13% of the potential ACEC (the area outside the WSAs and outside proposed withdrawals) could be impacted. In addition, within a designated ACEC, federal regulations (43 CFR 3809.11 (c) (3)) require that a plan of operation be submitted for any operation causing surface disturbance greater than casual use. This regulation would mitigate, but not eliminate, the impacts of mining exploration and development on relevant and important values in Alternatives C and D.

Salable Minerals

Impacts would be the same as those described under the Proposed RMP.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

The seven eligible WSRs within the potential ACEC would be recommended as suitable under Alternative C. Protecting the river-related outstandingly remarkable values of all segments under Alternative C would also protect relevant and important values within about 19% of the potential ACEC. However, most of these river segments are within WSAs, so management to protect the river values

would add little or no additional protection for the ACEC values over what is afforded by WSA management direction.

Areas of Critical Environmental Concern

Under Alternative C, the Dirty Devil/North Wash ACEC would be designated on 205,300 acres of public land to protect and provide special management for the relevant and important values. In addition to management direction associated with Alternative C described above, designating the ACEC would allow no uses that would cause irreparable damage to relevant and important values.

Alternative D

Impacts from Vegetation

Impacts would be the same as those described under Alternative C.

Impacts from Cultural Resources

Special management under Alternative D would increase public awareness of cultural resource values and increase law enforcement presence, but no fencing would be allowed in non-WSA lands with wilderness characteristics, which may not protect the cultural resources in the area as much as Alternative C.

Impacts from Visual Resources

Under Alternative D, 99% of the potential ACEC would be designated as VRM Class I, providing the best protection to the scenic values of the ACEC, even in areas not identified for Class A scenery.

Impacts from Special Status Species

Impacts would be the same as those described under Alternative A.

Impacts from Fish and Wildlife

Impacts would be the same as those described under the Proposed RMP.

Impacts from Fire and Fuels Management

Impacts would be the same as those described under Alternative C.

Impacts from Non-WSA Lands with Wilderness Characteristics

Portions of the Dirty Devil/French Spring (58,100 acres), Fiddler Butte (12,000 acres), Flat Tops (10 acres), and Little Rockies (3,200 acres) non-WSA lands with wilderness characteristics lie within the 205,300-acre potential Dirty Devil/North Wash ACEC. Under Alternative D, protecting the non-WSA lands with wilderness characteristics within the Dirty Devil/North Wash ACEC would provide protection for relevant and important values on 73,310 acres. Specifics are disclosed in the visual resource management, travel management, fluid minerals, and mineral withdrawal discussions in this section.

Impacts from Livestock Grazing

Impacts would be the same as those described under Alternative N.

Impacts from Recreation

Impacts would be the same as those described under Alternative C.

Impacts from Travel Management

Impacts would be the same as those described under Alternative C.

Impacts from Lands and Realty

Impacts would be similar to those described under Alternative C, except that more of the potential ACEC would be recommended for withdrawal. A withdrawal of 100,500 acres (49% of the potential ACEC) is proposed under Alternative D to protect non-WSA lands with wilderness characteristics located within the ACEC.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Under Alternative D, virtually all of the potential ACEC would be closed to leasing, precluding any impacts to relevant and important values.

Locatable Minerals

Impacts would be the same as those described under Alternative C.

Salable Minerals

Under Alternative D, no mineral material sales would be allowed within the ACEC, therefore eliminating any potential impacts to relevant and important values.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Impacts would be the same as those described under Alternative C.

Areas of Critical Environmental Concern

Impacts would be the same as those described under Alternative C.

Fremont Gorge/Cockscomb Potential ACEC

The Fremont Gorge/Cockscomb Potential ACEC is located on public lands west of Capitol Reef National Park in the Torrey–Teasdale–Grover area of central Wayne County. The potential ACEC totals 34,300 acres and includes the Fremont Gorge WSA and Fremont Gorge and Fish Creek eligible WSRs. Relevant and important values are cultural, scenic, riparian, plant, and wildlife (mule deer).

Some vegetation manipulation activities, which would benefit the mule deer, could be restricted by vegetation (riparian) decisions, and VRM Class I and II management objectives. Designation of areas as open to OHVs would threaten all relevant and important values, possibly with irreparable damage.

Impacts to the relevant and important values of this ACEC could occur from the following resource management programs:

- Vegetation (Riparian)
- Visual Resources
- Non-WSA Lands with Wilderness Characteristics
- Recreation
- Travel Management

- Lands and Realty
- Minerals and Energy
- Special Designations.

Other programs were determined to have little or no impact on the relevant and important values of this potential ACEC.

Alternative N: No Action

Impacts from Vegetation

Under all alternatives, no surface-disturbing activities would be allowed within identified distances (which vary by alternative) from riparian areas unless it could be shown that there are no practical alternatives, all long-term impacts could be fully mitigated, and the activity would benefit and enhance the riparian area. This would protect the riparian relevant and important values from surface-disturbing activities, but it could restrict potentially beneficial actions such as riparian area restoration and vegetation treatment. Under Alternative N, no surface-disturbing activities would be allowed within 500 feet of riparian areas.

Impacts from Visual Resources

Visual resource management classes within the potential ACEC, by alternative, are shown in Table 4-67. The higher VRM classes (I and II) would best protect the scenic values and, by limiting surface-disturbing activities, also benefit the cultural and riparian values. Per BLM policy, the 8% of the ACEC within the Fremont Gorge WSA would continue to be managed as VRM Class I. Scenic relevant and important values were found to be present within 9% of the potential ACEC outside of the WSA. Under Alternative N, all portions of the ACEC outside of the WSA would be designated as VRM Class III or IV, which could result in impacts to the 9% of Class A scenery located outside of the WSA.

Table 4-67. VRM Class Designations within Fremont Gorge/Cockscomb Potential ACEC

		Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
Class I	**Acres**	0	2,800	2,800	2,800	18,700
	% ACEC	0%	8%	8%	8%	55%
Class II	**Acres**	2,800	0	2,900	4,700	1,300
	% ACEC	8%	0%	9%	14%	4%
Class III	**Acres**	11,400	15,700	9,000	26,800	14,200
	% ACEC	33%	46%	26%	78%	41%
Class IV	**Acres**	20,100	15,800	19,600	0	0
	% ACEC	59%	46%	57%	0%	0%

Impacts from Non-WSA Lands with Wilderness Characteristics

Portions of the Fremont Gorge (16,000 acres) non-WSA lands with wilderness characteristics lie within the 34,300-acre potential Fremont Gorge/Cockscomb ACEC. No actions to maintain wilderness characteristics on lands outside of WSAs are proposed under Alternative N, resulting in no additional protection for relevant and important values.

Impacts from Recreation

SRMAs within the potential ACEC vary by alternative. No SRMAs are proposed within the potential ACEC in Alternative N, hence there would be no impacts to relevant and important values from SRMA identification under this alternative.

Impacts from Travel Management

OHV area designations within the potential ACEC vary by alternative, as shown in Table 4-68. The ground disturbance caused by cross-country vehicle travel within open areas would adversely impact all relevant and important values. Additionally, vehicle travel cross-country would harass mule deer. Adverse impacts would be the greatest in Alternative N, which designates 85% of the potential ACEC as open to cross-country vehicle use. Adverse impacts would be reduced in the 8% of the ACEC limited to designated routes and would be eliminated in the 7% of the area closed to OHV use.

Table 4-68. OHV Area Designations within Fremont Gorge/Cockscomb Potential ACEC

		Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
Open	Acres	29,200	14,700	0	0	0
	% Area	85%	43%	0%	0%	0%
Limited	Acres	2,800	19,600	32,800	11,100	13,900
	% Area	8%	57%	96%	32%	41%
Closed	Acres	2,300	0	1,500	23,200	20,400
	% Area	7%	0%	4%	68%	59%

Impacts from Lands and Realty

No lands within the potential ACEC are identified as available for sale and no withdrawals are proposed under Alternative N. Therefore, there would be no impacts to relevant and important values from lands and realty decisions.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Lands open to oil and gas leasing vary by alternative, as shown in Table 4-69. Alternative N would provide the least protection to relevant and important values by leaving 48% open to oil and gas leasing subject to the standard terms and conditions. Leasing would be open and subject to major constraints (NSO) within 10% of the potential ACEC and closed within 8% of the area, which would eliminate impacts to relevant and important values within those areas. It is important to note that the potential ACEC is within a portion of the lands managed by the RFO identified as having low potential for oil and gas development, so the likelihood of any impact from these activities on any relevant and important value would be small.

Table 4-69. Oil and Gas Leasing Stipulations within Fremont Gorge/Cockscomb Potential ACEC

		Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
Standard Lease Terms	Acres	16,400	0	0	0	0
	% Area	48%	0%	0%	0%	0%
Controlled surface use or timing stipulations	Acres	11,600	31,500	29,900	26,700	13,800
	% Area	34%	92%	87%	78%	40%
No Surface Occupancy	Acres	3,500	0	0	3,100	1,600
	% Area	10%	0%	0%	9%	5%
Closed	Acres	2,800	2,800	4,400	4,500	18,900
	% Area	8%	8%	13%	13%	55%

Impacts from Special Designations

Wilderness Study Areas

Managing the Fremont Gorge WSA (8% of the potential ACEC) to protect its wilderness characteristics under the IMP would generally benefit all relevant and important values by limiting ground-disturbing activities.

Wild and Scenic Rivers

WSR designations vary by alternative, as shown in Table 4-70. Two eligible WSR segments are within the potential ACEC: Fremont Gorge (5 miles) and Fish Creek (one-quarter mile). Managing to protect the river-related outstandingly remarkable values of both segments under Alternative N would also protect the relevant and important values within about 5% of the potential ACEC.

Table 4-70. Eligible/Suitable Wild and Scenic Rivers within Fremont Gorge/Cockscomb Potential ACEC

		Eligible	Suitable		
		Alternative N (No Action)	Alternative A	Proposed RMP	Alternatives C and D
Eligible/Suitable Rivers	# of Segments	2	0	1	2
	River Miles	5.25	0	5	5.25
	Acres	1680	0	1600	1680
	% Area	5%	0%	5%	5%

Areas of Critical Environmental Concern

Under Alternative N, no ACEC would be designated. Management according to the IMP within the 8% of the potential ACEC within the Fremont Gorge WSA, and management of the Fremont Gorge and Fish Creek eligible WSRs would provide protection of the relevant and important values within those areas.

Alternative A

Impacts from Vegetation

Under Alternative A, no surface-disturbing activities would be allowed within 330 feet on each side of the stream or the 100-year floodplain, whichever is greater, unless it could be shown that there are no practical alternatives, all long-term impacts could be fully mitigated, and the activity would benefit and enhance the riparian area. This would protect the riparian relevant and important values from surface-disturbing activities, but it could restrict potentially beneficial actions such as riparian area restoration and vegetation treatment.

Impacts from Visual Resources

Impacts would be similar to those described under Alternative N. The 8% of the potential ACEC within the Fremont Gorge WSA would be designated as VRM Class I. The 9% of the potential ACEC found to have Class A scenery outside of the WSA would be designated as VRM Class III or IV.

Impacts from Non-WSA Lands with Wilderness Characteristics

Impacts would be the same as those described under Alternative N.

Impacts from Recreation

Impacts would be the same as those described under Alternative N.

Impacts from Travel Management

Under Alternative A, 43% of the potential ACEC would be open to cross-country vehicle use, continuing to allow for adverse impacts to relevant and important values within that portion of the area. The remaining 57% of the ACEC would be limited to designated routes, which would provide protection to the relevant and important values.

Impacts from Lands and Realty

Lands identified as available for sale under FLPMA Section 203 vary by alternative. Under Alternative A, 2,300 acres (7% of the potential ACEC) are identified as available for possible sale. Impacts to relevant and important values would be as follows:

- **Cultural and Riparian.** Impacts to these values would be assessed in a site-specific environmental analysis conducted prior to the sale of any parcel. Lands with high-value cultural or riparian values would likely not be offered for sale.
- **Scenery.** The lands identified for sale include no Class A scenery, so sales of land would have no impact on the scenic relevant and important value.
- **Mule Deer.** All lands within the potential ACEC are identified as crucial mule deer habitat. Any sale of land within the potential ACEC would result in a loss of habitat in federal ownership and would be considered in site-specific analysis prior to offering the land for sale. Actual impacts to mule deer populations and habitat would depend upon the acreage sold and how the land is used and developed after it leaves federal ownership.

No withdrawals from mineral entry are proposed under Alternative A. Therefore, there would be no impacts to relevant and important values.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Alternative A would protect the mule deer relevant and important value from being impacted by oil and gas leasing by placing seasonal restrictions on 92% of the potential ACEC. The remainder of the potential ACEC, would be closed to leasing, which would eliminate impacts to relevant and important values within those areas. It is important to note that the potential ACEC is within a portion of the lands managed by the RFO identified as having low potential for oil and gas development, so the likelihood of any impact from these activities on any relevant and important value would be small.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Under this alternative, no suitable WSRs are proposed and there would be no special management to protect the outstandingly remarkable values and free-flowing nature. This would provide no additional protection to the area's relevant and important values.

Areas of Critical Environmental Concern

Under Alternative A, no ACEC would be designated. Management according to the IMP within the 8% of the potential ACEC within the Fremont Gorge WSA would provide protection of the relevant and important values within those areas.

Proposed RMP

Impacts from Vegetation

Under the Proposed RMP, no surface-disturbing activities would be allowed within 330 feet on each side of the stream or the 100-year floodplain, whichever is greater, unless it could be shown that there are no practical alternatives, all long-term impacts could be fully mitigated, and the activity would benefit and enhance the riparian area. This would protect the riparian relevant and important value of the potential Fremont Gorge ACEC from surface-disturbing activities, but it could restrict potentially beneficial actions such as riparian area restoration and vegetation treatment.

Impacts from Visual Resources

Under the Proposed RMP, 17% of the potential ACEC would be designated as VRM Classes I and II, 8% of the potential ACEC within the WSA would be designated as VRM Class I, and the remaining 9% of the ACEC with Class A scenery would be designated as VRM Class II. This would provide protection for all of the Class A scenic relevant and important value of the area.

Impacts from Non-WSA Lands with Wilderness Characteristics

Portions of the Fremont Gorge (16,000 acres) non-WSA lands with wilderness characteristics lie within the 34,300-acre potential Fremont Gorge/Cockscomb ACEC. No actions to maintain wilderness characteristics within the Fremont Gorge non-WSA lands are proposed under the Proposed RMP, resulting in no additional protection for relevant and important values.

Impacts from Recreation

In the Proposed RMP, the Capitol Reef Gateway SRMA would overlap 37% (12,800 acres) of the potential ACEC east of Highway 12 and west of Capitol Reef National Park. Identifying the SRMA for primitive and semi-primitive motorized and non-motorized recreation would, in and of itself, have no

impact on the relevant and important values. However, the management of recreation uses associated with the SRMA could help protect all the relevant and important values located in those portions of the potential ACEC.

Impacts from Travel Management

Under the Proposed RMP, no areas would be designated as open to cross-country vehicle use, thus eliminating the threats to relevant and important values from cross-country activities. The potential for adverse impacts would be reduced in the 95% of the ACEC limited to designated routes and eliminated in the 5% of the area closed to OHV use.

Impacts from Lands and Realty

Lands identified as available for sale under FLPMA Section 203 vary by alternative. Under the Proposed RMP, 2,300 acres (7% of the potential ACEC) are identified as available for possible sale. Impacts to relevant and important values would be as follows:

- **Cultural and Riparian.** Impacts to these values would be assessed in a site-specific environmental analysis conducted prior to the sale of any parcel. Lands with high-value cultural or riparian values would likely not be offered for sale.
- **Scenery.** The lands identified for sale include no Class A scenery, so sales of land would have no impact on the scenic relevant and important value.
- **Mule Deer.** All lands within the potential ACEC are identified as crucial mule deer habitat. Any sale of land within the potential ACEC would result in a loss of habitat in federal ownership and would be considered in site-specific analysis prior to offering the land for sale. Actual impacts to mule deer populations and habitat would depend upon the acreage sold and how the land is used and developed after it leaves federal ownership.

No withdrawals from mineral entry are proposed under the Proposed RMP for the potential ACEC. Therefore, there would be no impacts to relevant and important values.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

The Proposed RMP would protect the mule deer relevant and important value from being impacted by oil and gas leasing by placing seasonal restrictions on 87% of the potential ACEC. The remainder of the potential ACEC would be closed to leasing (13%), which would eliminate impacts to all of the relevant and important values within those areas. It is important to note that the potential ACEC is within a portion of the lands managed by the RFO identified as having low potential for oil and gas development, so the likelihood of any impact from these activities on any relevant and important value would be small.

Impacts from Special Designations

Wilderness Study Areas

Managing the Fremont Gorge WSA (8% of the potential ACEC) to protect its wilderness characteristics under the IMP would generally benefit all relevant and important values by limiting ground-disturbing activities.

Wild and Scenic Rivers

Under the Proposed RMP, the Fremont Gorge segment of the Fremont River which is located within the potential Fremont Gorge ACEC would be recommended suitable, tentatively classified as wild, and managed to protect the river related outstandingly remarkable values of that segment. This would also

protect the relevant and important values of cultural, scenic, riparian, and plants from surface disturbing activities within this portion of the potential ACEC.

Areas of Critical Environmental Concern

Under the Proposed RMP, no ACEC would be designated. Management according to the IMP within the 8% of the potential ACEC within the Fremont Gorge WSA and management of the Fremont Gorge suitable WSR would provide protection of the relevant and important values within those areas. Existing laws, rules, and regulations, as well as other resource decisions within this alternative—such as VRM designations, protection of crucial deer habitat from cross-country OHV use, and surface disturbance—would provide protection for relevant and important values, reducing or eliminating potential impacts to the potential Fremont Gorge/Cockscomb ACEC.

Alternative C

Impacts from Vegetation

Under Alternative C, no surface-disturbing activities would be allowed within 660 feet of riparian areas unless it could be shown that there are no practical alternatives, all long-term impacts could be fully mitigated, and the activity would benefit and enhance the riparian area. This would protect the riparian relevant and important values from surface-disturbing activities, but it could restrict potentially beneficial actions such as riparian area restoration and vegetation treatment. Alternatives C and D provide for the greatest protection of riparian values.

Impacts from Visual Resources

Impacts would be similar to those described under the Proposed RMP, except that Alternative C would designate 22% of the potential ACEC as VRM Class I or II.

Impacts from Non-WSA Lands with Wilderness Characteristics

Impacts would be the same as those described under Alternative N.

Impacts from Recreation

Impacts would be the same as those described under the Proposed RMP.

Impacts from Travel Management

Under Alternative C, no areas would be designated as open to cross-country vehicle use, thus eliminating the threats to relevant and important values from cross-country activities. The potential for adverse impacts would be reduced in the 32% of the ACEC limited to designated routes and would be eliminated in the 68% of the area closed to OHV use.

Impacts from Lands and Realty

Under Alternative C, no lands within the potential ACEC are identified as available for sale. Therefore, there would be no impacts to relevant and important values from proposed sales.

Withdrawing land from mineral entry would benefit all relevant and important values by protecting them from ground-disturbing activities associated with the exploration and development of locatable minerals. Alternative C proposes withdrawing 4,500 acres (14% of the potential ACEC).

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Alternative C would protect the mule deer relevant and important value from being impacted by oil and gas leasing by placing seasonal restrictions on 78% of the potential ACEC. The remainder of the potential ACEC would be open to leasing subject to major constraints (NSO) (9%) or closed to leasing (13%), which would eliminate impacts to relevant and important values within those areas. It is important to note that the potential ACEC is within a portion of the lands managed by the RFO identified as having low potential for oil and gas development, so the likelihood of any impact from these activities on any relevant and important value would be small.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Under Alternative C, the two eligible WSR segments within the potential ACEC would be recommended as suitable and managed to protect the river-related outstandingly remarkable values of those segments. This would also protect the relevant and important values within about 5% of the potential ACEC.

Areas of Critical Environmental Concern

Under Alternative C, Fremont Gorge/Cockscomb ACEC would be designated on 34,300 acres of public land in Wayne County. In addition to management direction for other resource programs associated with Alternative C (described above), designating the ACEC would allow no uses that would cause irreparable damage to relevant and important values.

Alternative D

Impacts from Vegetation

Impacts would be the same as those described under Alternative C.

Impacts from Visual Resources

Alternative D would provide the most protection of scenic values by designating 59% of the potential ACEC as VRM Class I or II.

Impacts from Non-WSA Lands with Wilderness Characteristics

Under Alternative D, protecting the non-WSA lands with wilderness characteristics within the Fremont Gorge/Cockscomb ACEC would provide protection for relevant and important values on 16,000 acres. Specifics are disclosed in the visual resource management, travel, lands and realty, and minerals discussions in this section. However, some of the prescriptions associated with protecting wilderness characteristics could limit opportunities for managing vegetation for the mule deer relevant and important value.

Impacts from Recreation

Impacts would be the same as those described under the Proposed RMP.

Impacts from Travel Management

Under Alternative D, no areas would be designated as open to cross-country vehicle use, thus eliminating the threats to relevant and important values from cross-country activities. The potential for adverse

impacts would be reduced in the 41% of the ACEC limited to designated routes and would be eliminated in the 59% of the area closed to OHV use.

Impacts from Lands and Realty

Under Alternative C, no lands within the potential ACEC are identified as available for sale. Therefore, there would be no impacts to relevant and important values from proposed sales.

Withdrawing land from mineral entry would benefit all relevant and important values by protecting them from ground-disturbing activities associated with the exploration and development of locatable minerals. Alternative D proposes withdrawing 17,300 acres (50% of the potential ACEC).

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

This alternative would protect the mule deer relevant and important value from being impacted by oil and gas on 40% of the potential ACEC by opening it to leasing subject to moderate constraints (timing limitation, CSU). Alternative D would best protect scenic, cultural, and riparian relevant and important values from ground disturbance caused by oil and gas exploration and development within 60% of the potential ACEC by closing it to leasing or opening it to leasing subject to major constraints (NSO).

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Impacts would be the same as those described under Alternative C.

Areas of Critical Environmental Concern

Impacts would be the same as those described under Alternative C.

Henry Mountains Potential ACEC

The Henry Mountains Potential ACEC is located in the Henry Mountains south of Hanksville and totals 288,200 acres. Forty-five percent of the potential ACEC is within the Mount Hillers, Mount Pennell, and Bull Mountain WSAs, and the southern portion of the Mount Ellen—Blue Hills WSA. Relevant and important values are scenic, wildlife (bison and mule deer), SSS (Townsend's big-eared bat, ferruginous hawk, burrowing owl, hole-in-the-rock prairie clover, Dana's milkvetch, Barneby milkvetch), and ecological values (riparian areas and relict vegetation).

The portion of the potential ACEC that is within WSAs would be managed under the IMP, which would protect the relevant and important values from surface-disturbing activities. Impacts to the relevant and important values of this ACEC could occur from the following resource management programs:

- Vegetation and Fire and Fuels Management
- Visual Resources
- Special Status Species
- Fish and Wildlife
- Non-WSA Lands with Wilderness Characteristics
- Forestry and Woodland Products

- Livestock Grazing
- Recreation
- Travel Management
- Lands and Realty
- Minerals and Energy
- Special Designations.

Other programs were determined to have little or no impact on the relevant and important values of this potential ACEC.

Alternative N: No Action

Impacts from Vegetation and Fire and Fuels Management

Managing vegetation and fire and fuels could enhance bison and mule deer habitat and riparian values, and could adversely impact scenic, cultural, and SSS values. Under Alternative N, managing vegetation with a full range of tools—mechanical, biological, manual, fire, and chemical—would have beneficial impacts on mule deer and bison habitat but could have adverse impacts on scenic values if treatments occurred in areas having Class A scenery.

Vegetation and fire and fuels treatments could have indirect impacts on cultural resources from increased erosion and displacement and destruction of surface artifacts and, in some cases, destruction of surface and buried structures and features. Overall impacts from vegetation management would result in direct and indirect impacts to cultural resources, which could be partially mitigated during compliance with NEPA and Section 106 of NHPA. Projects would be redesigned to avoid historic properties or those eligible for or listed on the NRHP, thus mitigating some of the direct and indirect impacts.

Vegetation treatment methods include mechanical, prescribed fire, and chemical treatments. Surface-disturbing activities, such as the use of heavy equipment, cause crushing and mortality of individual plants and alter habitat. The use of herbicides or pesticides in occupied habitat could render the habitat unsuitable by some species. Chemical weed controls could also affect potential pollinators of special status plant species by eliminating their habitat.

Removing vegetation with heavy equipment could temporarily reduce potential breeding and nesting habitats. Human disturbance and noise associated with the use of heavy equipment could also temporarily displace special status bird species from foraging and nesting habitats. For example, the Southwestern willow flycatcher and the yellow-billed cuckoo have been known to nest in tamarisk and Russian olive. Vegetation treatments to remove these invasive plant species could result in habitat loss and disrupt nesting and foraging behavior. Overall impacts from vegetation management to SSS are discussed in more detail in Section 4.3.8 of this document. Analysis of impacts to SSS would occur during project-specific NEPA and adjustments would be made in the project if impacts to SSS were identified. Any vegetation or fuels projects would be required to adhere to the Endangered Species Act, and, for portions of the potential ACEC within WSAs, the IMP. In the long term, special status animal species would benefit from most vegetation treatments through an increase in vegetation productivity, which would provide additional forage, cover, and prey base.

Under all alternatives, no surface-disturbing activities would be allowed within identified distances (which vary by alternative) from riparian areas unless it could be shown that there are no practical alternatives, all long-term impacts could be fully mitigated, and the activity would benefit and enhance the riparian area. Under Alternative N, the protection zone for riparian areas would be 500 feet. This would protect the riparian relevant and important values from surface-disturbing activities, but it could restrict potentially beneficial actions such as riparian area restoration and vegetation treatment.

Impacts from Visual Resources

Visual resource management classes within the potential ACEC, by alternative, are shown in Table 4-71. The higher VRM classes (I and II) would better protect the scenic values and, by limiting surface-disturbing activities, also benefit other values. Under Alternative N, all Class A scenery would be managed as VRM Classes I and II, providing protection to the scenic relevant and important values. Conversely, the lower VRM classes (III and IV) would permit greater flexibility in vegetation management, a benefit to the mule deer and bison value. The remaining 56% of the potential ACEC would be designated as VRM Class III or IV, which would least restrict vegetation management activities.

Table 4-71. VRM Class Designations within Henry Mountains Potential ACEC

		Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
Class I	**Acres**	0	130,000	130,000	130,000	222,500
	% ACEC	0%	45%	45%	45%	78%
Class II	**Acres**	127,600	0	43,900	54,200	23,200
	% ACEC	44%	0%	15%	19%	8%
Class III	**Acres**	43,300	34,700	0	24,600	15,100
	% ACEC	15%	12%	0%	8%	5%
Class IV	**Acres**	117,300	123,500	114,300	79,400	27,400
	% ACEC	41%	43%	40%	28%	9%

Impacts from Special Status Species

Under all alternatives, management actions such as prohibiting the destruction, adverse modification, or fragmentation of listed species habitat; maintaining the integrity of SSS habitat; and habitat improvements would benefit SSS.

Impacts from Fish and Wildlife

Management actions for the benefit of bison and mule deer would benefit those relevant and important values. These management prescriptions and seasonal and spatial restrictions on activities within the potential ACEC vary by alternative. Alternative N would provide no special management for the Henry Mountains bison or mule deer. Current seasonal closures to OHV use on Swap Mesa and Cave Flat and restrictions of oil and gas activities in crucial bison and mule deer habitat during sensitive seasons would benefit the relevant and important values of bison and mule deer. These seasonal restrictions would protect fewer acres and for a shorter time frame than the Proposed RMP and Alternatives C and D.

Impacts from Non-WSA Lands with Wilderness Characteristics

All of Mount Hillers (1,800 acres) and portions of the Bull Mountain (2,800 acres), Mount Ellen—Blue Hills (17,800 acres), Mount Pennell (45,700 acres), and Ragged Mountain (24,400 acres) non-WSA lands with wilderness characteristics lie within the 288,200-acre potential Henry Mountains ACEC. No actions to maintain wilderness characteristics on lands outside of WSAs are proposed under Alternative N, resulting in no additional protection for relevant and important values.

Impacts from Forestry and Woodland Products

Allowing for the harvest of forest and woodland products in the Henry Mountains outside the WSAs could have an adverse impact on Class A scenery due to potential changes in the landscape character. These potential impacts would be greater with commercial harvest of timber and woodland products than with smaller-scale, non-commercial harvesting of woodland products for personal use. There could be short-term impacts to riparian and other relevant and important values from surface disturbances associated with harvesting activities. Effects would be determined in site-specific environmental analysis, and mitigating measures would likely be developed. Proposed decisions for areas open to forest and woodland products harvest vary by alternative. Under Alternative N, no commercial timber harvesting would be allowed within the Henry Mountains. Non-commercial use of woodlands products outside WSAs by permit would continue. Demand for these products has been low and mostly occurs within seeding areas in which continued harvest of woodland products is beneficial to maintenance of these areas for wildlife. Potential impacts to the relevant and important values would be low.

Impacts from Livestock Grazing

Under all alternatives, implementing the *Fundamentals of Rangeland Health* and *Standards and Guidelines for Grazing Administration* and maintaining or improving rangeland productivity would be beneficial to mule deer, bison, and riparian relevant and important values.

Impacts from Recreation

The establishment of SRMAs would vary by alternative. No SRMA is proposed in Alternative N, so there would be no impact to relevant and important values.

Impacts from Travel Management

OHV area designations, by alternative, are shown in Table 4-72. Cross-country OHV use could adversely impact the scenic, riparian, and special status plant species values if OHVs traveled where these values were present. Plants could be crushed, damaged, or destroyed; cultural resources could be damaged or destroyed; and new trails could be established in scenic areas. OHV use could also disturb bison and mule deer. Under Alternative N, 54% of the potential ACEC would continue to be open to cross-country motorized travel, adversely impacting scenic, wildlife (bison and mule deer), SSS, and ecological values if the OHVs traveled in the areas in which these values are present. Plants could be crushed and damaged or destroyed, and new trails could be established in areas containing Class A scenery. In closed areas (12%), relevant and important values would benefit because OHV use and associated surface disturbances and human-caused disruptions would be essentially eliminated. Seasonal OHV closures on Cave Flat and Swap Mesa would continue to benefit bison by reducing human disturbances during the critical winter period.

Table 4-72. OHV Area Designations within Henry Mountains Potential ACEC

		Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
Open	Acres	155,800	0	0	0	0
	% Area	54%	0%	0%	0%	0%
Limited	Acres	98,000	288,200	288,200	81,000	57,800
	% Area	34%	100%	100%	28%	20%
Closed	Acres	34,400	0	0	207,200	230,400
	% Area	12%	0%	0%	72%	80%

Impacts from Lands and Realty

Withdrawing land from mineral entry would benefit all relevant and important values by protecting them from ground-disturbing activities associated with the exploration and development of locatable minerals. No withdrawals from mineral entry are proposed under Alternative N. Therefore, there would be no impacts to relevant and important values.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Lands open to oil and gas leasing vary by alternative, as shown in Table 4-73. Under all alternatives, there would be no impacts to relevant and important values within the WSAs, which are closed to oil and gas leasing by law. WSAs represent 45% of the potential ACEC. Under Alternative N, 37% of the potential ACEC would be open to oil and gas leasing subject to the standard terms and conditions, and 18% would be open to leasing subject to moderate constraints (timing limitation, CSU), where exploration and development activities would be restricted in portions of the mule deer and bison range during the winter and spring. Among the alternatives, Alternative N would have the greatest potential to impact all relevant and important values. In addition, the potential ACEC is in a portion of the lands managed by the RFO identified as having low development potential for oil and gas leasing. Few, if any, wells are expected to be drilled in this area in the next 15 to 20 years.

Table 4-73. Leasing Stipulations within Henry Mountains Potential ACEC

		Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
Standard Lease Terms	Acres	105,700	200	0	0	0
	% Area	37%	<1%	0%	0%	0%
Controlled Surface Use or Timing Stipulations (Seasonal)	Acres	51,700	158,000	142,100	106,200	43,500
	% Area	18%	55%	49%	37%	15%
No Surface Occupancy	Acres	800	0	16,100	17,200	5,200
	% Area	<1%	0%	6%	6%	2%
Closed	Acres	130,000	130,000	130,000	164,800	239,500
	% Area	45%	45%	45%	57%	83%

Leasable Minerals—Coal

Development of coal resources, particularly surface mining, could adversely impact all relevant and important values. In the Henry Mountains coal field, some of the 8,134 acres of coal resources acceptable for leasing by underground mining methods and 3,013 acres acceptable for surface mining methods are located within the ACEC. Under this alternative, the potential ACEC would be available for consideration for leasing for surface coal mining, which could cause irreparable harm to the relevant and important values in the area where surface mining occurred. Mitigation of such impacts would be addressed during site-specific NEPA prior to development. The 45% of the ACEC within the WSAs would be managed pursuant to the IMP, which would provide protection from these activities.

Locatable Minerals

Exploration and development of locatable minerals could impact relevant and important values sensitive to surface disturbance and harassment, including scenic values. The development of gold and copper (if found in economic quantities in the Henry Mountains) is possible, though probably on a small scale. Development is most likely in the Bromide Basin/Crescent Creek area. There is also potential for uranium development in the southern half of the Henry Mountains. Impacts to relevant and important values through direct ground disturbance and harassment of wildlife would be greatest under Alternatives N and A.

Salable Minerals

Under Alternative N, the effects of mineral material sales on relevant and important values would be determined on a case-by-case basis. Mitigation measures, if necessary to protect relevant and important values, would be developed during site-specific NEPA analysis.

Impacts from Special Designations

Wilderness Study Areas

The potential ACEC encompasses 130,000 acres of WSAs, including all of the Mount Hillers, Mount Pennell, and Bull Mountain WSAs and the southern portion of the Mount Ellen—Blue Hills WSA. Within the WSAs, which represent 45% of the potential ACEC, relevant and important values would be protected from ground-disturbing activities by management under the IMP, which requires BLM to protect these areas' suitability for wilderness.

Wild and Scenic Rivers

The only eligible WSR within the potential ACEC is a portion of Maidenwater Creek. Due to the small portion of the potential ACEC encompassed by Maidenwater Creek, neither recommending nor not recommending it as a suitable WSR would have any perceptible impact on any relevant and important values.

Areas of Critical Environmental Concern

Under Alternative N, no ACEC would be designated. Management according to the IMP within the 45% of the potential ACEC within the WSAs would provide protection of the relevant and important values within that portion of the potential ACEC.

Alternative A

Impacts from Vegetation and Fire and Fuels Management

Impacts would be similar to those described under Alternative N for vegetation and fire and fuels treatments. Under Alternative A, no surface-disturbing activities would be allowed within 330 feet on each side of the stream or the 100-year floodplain, whichever is greater, unless it could be shown that there are no practical alternatives, all long-term impacts could be fully mitigated, and the activity would benefit and enhance the riparian area. This would protect the riparian relevant and important values from surface-disturbing activities, but it could restrict potentially beneficial actions such as riparian area restoration and vegetation treatment.

Impacts from Visual Resources

Impacts would be similar to those described under Alternative N. Alternative A would designate 45% of the potential ACEC as VRM Class I, providing protection to the scenic values. The remainder of the area would be designated as VRM Classes III and IV, allowing greater flexibility in vegetation management, a benefit to the mule deer and bison relevant and important value.

Impacts from Special Status Species

Under all alternatives, management actions such as prohibiting the destruction, adverse modification, or fragmentation of listed species habitat; maintaining the integrity of SSS habitat; and habitat improvements would benefit SSS. In Alternative A, additional strategies (such as utilizing seasonal and spatial buffers for surface-disturbing activities and complying with raptor protection guidelines for powerline construction) would be employed to protect raptors and their habitat. These actions would minimize or eliminate impacts to the SSS relevant and important values.

Impacts from Fish and Wildlife

Management actions for the benefit of bison and mule deer would benefit those relevant and important values. Alternative A would implement the fewest specific management prescriptions and seasonal or spatial restrictions on human presence or surface-disturbing activities, which could result in greater impacts to mule deer and bison during critical periods. There would be no special management for Henry Mountains bison or mule deer. Seasonal or spatial restrictions on surface-disturbing activity could be added as mitigation but would not be required. However, limiting OHV use to designated routes in crucial bison habitat and allowing the use of prescriptive grazing to favor forage production for big game crucial winter range would benefit habitats and the relevant and important values of bison and mule deer.

Impacts from Non-WSA Lands with Wilderness Characteristics

Impacts would be the same as those described under Alternative N.

Impacts from Forestry and Woodland Products

Allowing for the harvest of forest and woodland products in the Henry Mountains outside the WSAs could have an adverse impact on scenery (Class A) due to potential changes in the landscape character. These potential impacts would be greater with the commercial harvest of timber and woodland products than with smaller-scale, non-commercial harvesting of woodland products for personal use. There could be short-term impacts to riparian and other relevant and important values from surface disturbances associated with harvesting activities. Effects would be determined in site-specific environmental analysis and mitigating measures developed if impacts were anticipated. Under Alternative A, commercial and non-commercial harvesting of forest and woodland products would be allowed (outside WSAs) where feasible, sustainable, and compatible with restoring, maintaining, or improving forest health. This could indirectly benefit wildlife species by improving habitat conditions. If demands for products increase, potential impacts to scenic values would be greatest under this alternative.

Impacts from Livestock Grazing

Impacts would be the same as those described under Alternative N.

Impacts from Recreation

Impacts would be the same as those described under Alternative N.

Impacts from Travel Management

Under Alternative A, OHVs would be limited to designated routes within the entire potential ACEC. No areas would be open to cross-country OHV use, which would reduce impacts on relevant and important values compared with Alternative N.

Impacts from Lands and Realty

Impacts would be the same as those described under Alternative N.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Under Alternative A, 55% of the potential ACEC would be open to oil and gas leasing subject to moderate constraints (timing limitation, CSU) where exploration and development activities would be restricted in the mule deer and bison range during the winter and spring. The 45% of the potential ACEC within the WSAs would be closed to oil and gas leasing. Compared with Alternative N, Alternative A would reduce impacts to bison and mule deer by placing more land under seasonal restrictions. In addition, the potential ACEC is in a portion of the lands managed by the RFO identified as having low development potential for oil and gas leasing. Few, if any, wells are expected to be drilled in this area in the next 15 to 20 years.

Leasable Minerals—Coal

Impacts would be the same as those described under Alternative N.

Locatable Minerals

Impacts would be the same as those described under Alternative N.

Salable Minerals

Impacts would be the same as those described under Alternative N.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Impacts would be the same as those described under Alternative N.

Areas of Critical Environmental Concern

Under Alternative A, no ACEC would be designated. Management according to the IMP within the 45% of the potential ACEC within the WSAs would provide protection of the relevant and important values within that portion of the potential ACEC.

Proposed RMP

Impacts from Vegetation and Fire and Fuels Management

Impacts associated with vegetation and fire and fuels management would be similar to those described under Alternative N. Under the Proposed RMP, a full-range of tools would be permitted and more of the potential ACEC would be designated as VRM Class II, providing beneficial impacts to wildlife relevant and important value while protecting the scenic relevant and important value. Impacts associated with riparian protection zones would be the same as Alternative A. Under the Proposed RMP, no surface-disturbing activities would be allowed within 330 feet on each side of the stream or the 100-year floodplain, whichever is greater, unless it could be shown that there are no practical alternatives, all long-term impacts could be fully mitigated, and the activity would benefit and enhance the riparian area. This would protect the riparian relevant and important values from surface-disturbing activities, but it could restrict potentially beneficial actions such as riparian area restoration and vegetation treatment.

Impacts from Visual Resources

The Proposed RMP would designate 45% of the potential ACEC as VRM Class I and 15% as VRM Class II, providing protection to the scenic relevant and important values. The remainder of the area would be designated as VRM Classes III and IV, allowing greater flexibility in vegetation management, a benefit to the mule deer and bison value.

Impacts from Special Status Species

Under the Proposed RMP, management actions such as prohibiting the destruction, adverse modification, or fragmentation of listed species habitat; maintaining the integrity of SSS habitat; and habitat improvements would benefit SSS. Additional strategies (such as utilizing seasonal and spatial buffers for surface-disturbing activities and complying with raptor protection guidelines for powerline construction) would be employed to protect raptors and their habitat. These actions would minimize or eliminate impacts to the SSS relevant and important values.

Impacts from Fish and Wildlife

Management actions for the benefit of bison and mule deer would benefit the wildlife relevant and important values. The Proposed RMP would provide more specific management prescriptions and seasonal or spatial restrictions on human presence or surface-disturbing activities than Alternatives N and A, but less than Alternatives C and D. A habitat management plan for bison, mule deer, and other big game species within the Henry Mountains area would be developed and prescriptive grazing would be used to favor forage production for big game high-priority and crucial winter range. OHV use would be limited to designated routes in mule deer and bison crucial habitat, and seasonal restrictions of surface-disturbing activities would be required in crucial bison and mule deer habitats. These management actions would provide adequate protection for the wildlife relevant and important value of the potential Henry Mountains ACEC.

Impacts from Non-WSA Lands with Wilderness Characteristics

Under the Proposed RMP, the Mount Ellen—Blue Hills (3,900 acres), Mount Pennell (4,700 acres), and Ragged Mountain (7,900 acres) non-WSA lands with wilderness characteristics would be managed for wilderness characteristics. Management prescriptions would protect scenic values, reduce or eliminate surface disturbance, and retain public lands in federal ownership. Combined, approximately 15,890 acres (6% of the potential Henry Mountains ACEC) would be overlapped by non-WSA areas managed to maintain their wilderness characteristics, providing indirect protection for relevant and important values within those areas.

Impacts from Forestry and Woodland Products

Impacts would be similar to those described under Alternative A, except that the potential for impacts to the scenic values from woodland products harvest would be reduced. All Class A scenery (44% of the potential Henry Mountain ACEC) would be managed as VRM Classes I (29% of the potential Henry Mountain ACEC) and VRM Class II (15% of the potential Henry Mountain ACEC), providing protection for that relevant and important value.

Impacts from Livestock Grazing

Under all alternatives, including the Proposed RMP, implementing the *Fundamentals of Rangeland Health* and *Standards and Guidelines for Grazing Administration* and maintaining or improving rangeland productivity would be beneficial to the wildlife (mule deer, bison) and riparian relevant and important values.

Impacts from Recreation

Under the Proposed RMP, the Henry Mountains SRMA (532,600 acres) would encompass all of the Henry Mountains Potential ACEC. Management emphasis on primitive and semi-primitive motorized and non-motorized recreation would complement the relevant and important values by focusing recreational use and limiting development and surface-disturbing activities.

Impacts from Travel Management

Impacts would be the same as those described under Alternative A. Under the Proposed RMP, OHVs would be limited to designated routes within the entire potential ACEC. No areas would be open to cross-country OHV use, which would reduce impacts on all relevant and important values within the potential ACEC, compared with Alternative N.

Impacts from Lands and Realty

Withdrawing land from mineral entry would benefit all relevant and important values by protecting them from ground-disturbing activities associated with the exploration and development of locatable minerals. No withdrawals from mineral entry are proposed under within the potential Henry Mountains ACEC in the Proposed RMP. Therefore, there would be no beneficial impacts to relevant and important values.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Under the Proposed RMP, 49% of the potential ACEC would be open to oil and gas leasing subject to moderate constraints (timing limitation, CSU), 6% open to leasing subject to major constraints (NSO), and the 45% within the WSAs would be closed to leasing. No areas would be available for oil and gas development under standard stipulations. These oil and gas leasing restriction in the Proposed RMP would reduce or eliminate potential impacts to all relevant and important values within the potential ACEC. In addition, the potential ACEC is in a portion of the lands managed by the RFO identified as having low development potential for oil and gas leasing. Few, if any, wells are expected to be drilled in this area in the next 15 to 20 years.

Leasable Minerals—Coal

Development of coal resources, particularly surface mining, could adversely impact all relevant and important values. In the Henry Mountains coal field, some of the 8,134 acres of coal resources acceptable for leasing by underground mining methods and 3,013 acres acceptable for surface mining methods are located within the potential ACEC. Under the Proposed RMP, the potential ACEC would be available for consideration for leasing for surface coal mining, which could cause irreparable harm to the relevant and important values in the area where surface mining occurred. Mitigation of such impacts would be addressed during site-specific NEPA prior to development. The 45% of the ACEC within the WSAs would be managed pursuant to the IMP, which would provide protection to all the relevant and important values from these activities within those areas.

Locatable Minerals

Exploration and development of locatable minerals could impact relevant and important values sensitive to surface disturbance and harassment, including scenic values. The development of gold and copper (if found in economic quantities in the Henry Mountains) is possible, though probably on a small scale. Development is most likely in the Bromide Basin/Crescent Creek area. There is also potential for uranium development in the southern half of the Henry Mountains. Locatable mineral exploration and development would be allowed under the General Mining Law. FLPMA requires BLM to regulate mining activities to prevent undue and unnecessary environmental degradation to resources. Mitigation such as minimizing visual impacts and avoiding sensitive seasons or areas for wildlife and SSS would be

addressed in site-specific analysis as proposals are reviewed. These mitigation measures would reduce, but would not eliminate, impacts to relevant and important values.

Salable Minerals

Under the Proposed RMP, no material sales would be allowed in Class A scenery areas, resulting in no surface disturbance and no impact to the relevant and important scenic value. The effects of mineral material sales on relevant and important values outside the Class A scenery would be similar to those described under Alternative N. Material sales would be analyzed on a case-by-case basis and mitigation measures, if necessary to protect relevant and important values, would be developed during site-specific NEPA analysis.

Impacts from Special Designations

Wilderness Study Areas

The potential ACEC encompasses 130,000 acres of WSAs, including all of the Mount Hillers, Mount Pennell, and Bull Mountain WSAs and the southern portion of the Mount Ellen—Blue Hills WSA. Within the WSAs, which represent 45% of the potential ACEC, all relevant and important values would be protected from ground-disturbing activities by management under the IMP, which requires BLM to protect these areas' suitability for wilderness. This management would provide indirect protection for all relevant and important values of this portion of the potential Henry Mountains ACEC.

Wild and Scenic Rivers

The only eligible WSR within the potential ACEC is a portion of Maidenwater Creek. Due to the small portion of the potential ACEC encompassed by Maidenwater Creek, neither recommending nor not recommending it as a suitable WSR would have any perceptible impact on any relevant and important values.

Areas of Critical Environmental Concern

Under the Proposed RMP, no ACEC would be designated. Management according to the IMP within the 45% of the potential ACEC within the WSAs would provide protection of the relevant and important values within those areas. Other resource decisions under this alternative such as VRM Classes I and II, limiting OHV use to designated routes, and seasonal/spatial restrictions would provide adequate protection for the relevant and important values of the potential ACEC.

Alternative C

Impacts from Vegetation and Fire and Fuels Management

Under Alternative C, utilizing only natural processes to treat vegetation could limit the success of treatments, adversely impacting bison and mule deer relevant and important values.

Under Alternative C, no surface-disturbing activities would be allowed within 660 feet from riparian areas unless it could be shown that there are no practical alternatives, all long-term impacts could be fully mitigated, and the activity would benefit and enhance the riparian area. This would protect the riparian relevant and important values from surface-disturbing activities, but it could restrict potentially beneficial actions such as riparian area restoration and vegetation treatment.

Impacts from Visual Resources

Impacts would be similar to those described under the Proposed RMP, except that Alternative C would designate 64% of the potential ACEC as VRM Class I or II and the remaining as VRM Class III or IV.

Impacts from Special Status Species

Impacts would be the same as those described under Alternative A.

Impacts from Fish and Wildlife

Alternative C would implement additional management prescriptions in support of the potential ACEC and greater seasonal and spatial restrictions on human presence or surface-disturbing activities, which could result in benefits to the relevant and important values of mule deer and bison. Under Alternative C, prescriptive grazing would be used to favor forage production for big game ranges. Manipulation of habitat and range improvements would be allowed to benefit wildlife. An HMP would be developed for bison and mule deer within the ACEC. OHV use in mule deer crucial winter range and crucial bison habitat would be limited to designated routes or closed. Seasonal restrictions would apply to surface-disturbing activities in crucial bison habitat and crucial and high-value mule deer habitat.

Impacts from Non-WSA Lands with Wilderness Characteristics

Impacts would be the same as those described under Alternative N.

Impacts from Forestry and Woodland Products

Impacts would be similar to those described under Alternative N. No commercial timber harvest would be allowed. Commercial and non-commercial use of forest and woodland products would continue outside WSAs, where feasible, sustainable, and compatible with restoring, maintaining, or improving forest health.

Impacts from Livestock Grazing

Impacts would be similar to Alternative N.

Impacts from Recreation

Impacts would be the same as those described under the Proposed RMP.

Impacts from Travel Management

Under Alternative C, OHVs would be limited to designated routes within 28% of the potential ACEC. Seventy-two percent of the area would be closed to OHV use, which would reduce impacts on relevant and important values compared to Alternatives N, and A and the Proposed RMP.

Impacts from Lands and Realty

Withdrawing land from mineral entry would benefit all relevant and important values by protecting them from ground-disturbing activities associated with the exploration and development of locatable minerals. A withdrawal of 53,400 acres (19% of the potential ACEC) to protect Class A scenery outside the WSAs is proposed in Alternative C as part of the ACEC designation, which would provide additional protection of the relevant and important values.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Under Alternative C, 37% of the potential ACEC would be open to oil and gas leasing subject to moderate constraints (timing limitation, CSU). The remainder of the potential ACEC would either be open to leasing subject to major constraints (NSO) (6%) or closed to leasing (57%; 12% in addition to WSAs), reducing or eliminating impacts to relevant and important values. In addition, the potential ACEC is in a portion of the lands managed by the RFO identified as having low development potential for oil and gas leasing. Few, if any, wells are expected to be drilled in this area in the next 15 to 20 years.

Leasable Minerals—Coal

Under Alternative C, the Henry Mountains coal field, 8,134 acres of coal resources acceptable for leasing by underground mining methods, and 3,013 acres acceptable for surface mining methods would be closed to leasing due to the management of the Henry Mountains and Badlands ACECs. Closing these public lands to coal leasing would preclude exploration and development of coal resources within those portions of the ACECs, thus eliminating the potential for impacts to relevant and important values.

Locatable Minerals

Impacts would be less than those described under Alternative N. Under Alternative C, 19% of the potential ACEC is proposed for withdrawal from mineral entry, which would provide additional protection for relevant and important values within a larger portion of the potential ACEC.

Salable Minerals

Impacts would be the same as those described under the Proposed RMP.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Impacts would be the same as those described under Alternative N.

Areas of Critical Environmental Concern

Under Alternative C, the Henry Mountains ACEC would be designated on 288,200 acres of public land to protect and provide special management for the relevant and important values. In addition to management direction associated with Alternative C described above, designating the ACEC would allow no uses that would cause irreparable damage to relevant and important values.

Alternative D

Impacts from Vegetation and Fire and Fuels Management

Impacts would be the same as those described under Alternative C.

Impacts from Visual Resources

Alternative D would best protect the scenic values by designating 86% of the potential ACEC as VRM Class I or II. However, designating only 14% of the potential ACEC as VRM Classes III and IV would restrict vegetation management activities, resulting in fewer benefits to the mule deer and bison relevant and important values.

Impacts from Special Status Species

Impacts would be the same as those described under Alternative A.

Impacts from Fish and Wildlife

Impacts would be similar to those described under Alternative C. Manipulation of habitat and range improvement outside of WSAs and non-WSA lands with wilderness characteristics would be allowed to benefit wildlife. This would restrict vegetation manipulations and result in reduced benefits to wildlife. OHV use in mule deer crucial winter range and crucial bison habitat would be limited to designated routes or closed, with the largest acres closed to OHV use in Alternative D. Alternative D would provide

the greatest protection from surface disturbances and the greatest restriction of vegetation enhancement to benefit the mule deer and bison values.

Impacts from Non-WSA Lands with Wilderness Characteristics

All of the Mount Hillers (1,800 acres) and portions of the Bull Mountain (2,800 acres), Mount Ellen—Blue Hills (17,800 acres), Mount Pennell (45,700 acres), and Ragged Mountain (24,400 acres) non-WSA lands with wilderness characteristics lie within the 288,200-acre potential Henry Mountains ACEC. Under Alternative D, protecting the non-WSA lands with wilderness characteristics within the Henry Mountains ACEC would provide protection for relevant and important values on 92,500 acres. Specifics are disclosed in the vegetation, visual resource management, travel, lands and realty (withdrawals), and minerals discussions in this section.

Impacts from Forestry and Woodland Products

Under Alternative D, prohibiting commercial and non-commercial use of forest and woodland products (including timber harvesting in the Henry Mountains) would result in no impacts to relevant and important values caused by this activity, but would preclude any wildlife habitat improvements that could result from harvest.

Impacts from Livestock Grazing

Impacts would be similar to Alternative N.

Impacts from Recreation

Impacts would be the same as those described under the Proposed RMP.

Impacts from Travel Management

Under Alternative D, OHVs would be limited to designated routes within 20% of the potential ACEC. Eighty percent of the area would be closed to OHV use. Among the alternatives, Alternative D would best protect relevant and important values from ground disturbance and harassment caused by OHVs.

Impacts from Lands and Realty

Impacts would be similar to those described under Alternative C, except that additional acres are proposed for withdrawal (115,400 acres, 40% of the potential ACEC) in Alternative D to protect the non-WSA lands with wilderness characteristics.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Under Alternative D, 83% of the potential ACEC would be closed to oil and gas leasing. Among the alternatives, Alternative D would best protect the relevant and important values from surface disturbance and harassment caused by oil and gas exploration and development.

Leasable Minerals—Coal

Impacts would be the same as those described under Alternative C.

Locatable Minerals

The potential for impacts would be the least under Alternative D. Under this alternative, 40% of the potential ACEC is proposed for withdrawal from mineral entry, which would provide additional protection for relevant and important values.

Salable Minerals

Impacts would be the same as those described under the Proposed RMP.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Impacts would be the same as those described under Alternative N.

Areas of Critical Environmental Concern

Impacts would be the same as those described under Alternative C.

Horseshoe Canyon Potential ACEC

The Horseshoe Canyon Potential ACEC includes Horseshoe Canyon, a tributary to the Green River, and totals 40,900 acres. It is located in northeastern Wayne County. It includes portions of the Horseshoe Canyon North and Horseshoe Canyon South WSAs. Relevant and important values are scenic, cultural (Cowboy Cave), SSS (Townsend's big-eared bat), and riparian. Ninety-two percent of the potential ACEC is within WSAs, where management under the IMP would protect all relevant and important values from surface-disturbing activities. Impacts to the relevant and important values of this ACEC could occur from the following resource management programs:

- Vegetation (Riparian)
- Visual Resources
- Special Status Species
- Non-WSA Lands with Wilderness Characteristics
- Recreation
- Travel Management
- Lands and Realty
- Minerals and Energy
- Special Designations.

Other programs were determined to have little or no impact on the relevant and important values of this potential ACEC.

Alternative N: No Action

Impacts from Vegetation

Under all alternatives, no surface-disturbing activities would be allowed within identified distances (which vary by alternative) from riparian areas unless it could be shown that there are no practical alternatives, all long-term impacts can be fully mitigated, and the activity would benefit and enhance the riparian area. This would protect the riparian relevant and important values from surface-disturbing activities, but it could restrict potentially beneficial actions such as riparian area restoration and vegetation treatment. Under Alternative N, no surface-disturbing activities would be allowed within 500 feet from riparian areas, providing protection of the riparian relevant and important values.

Impacts from Visual Resources

Visual resource management classes within the potential ACEC, by alternative, are shown in Table 4-74. The higher VRM classes (I and II) would better protect the scenic values and, by limiting surface-disturbing activities, also benefit other relevant and important values. Under Alternative N, 99% of the potential ACEC would be managed for VRM Classes I and II, providing adequate protection of the scenic relevant and important value.

Table 4-74. VRM Class Designations within the Horseshoe Canyon Potential ACEC

		Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
Class I	Acres	0	37,800	37,800	37,800	40,800
	% ACEC	0%	92%	92%	92%	100%
Class II	Acres	40,400	0	2,900	2,900	100
	% ACEC	99%	0%	7%	7%	<1%
Class III	Acres	500	3,100	200	200	0
	% ACEC	1%	8%	<1%	<1%	0%
Class IV	Acres	0	0	0	0	0
	% ACEC	0%	0%	0%	0%	0%

Impacts from Special Status Species

Under all alternatives, management actions such as prohibiting the destruction, adverse modification, or fragmentation of listed species habitat; maintaining the integrity of SSS habitat; and habitat improvements would benefit SSS.

Impacts from Non-WSA Lands with Wilderness Characteristics

A portion of the Horseshoe Canyon South (2,900 acres) and Labyrinth Canyon (1 acre) non-WSA lands with wilderness characteristics lie within the 40,900-acre (RFO portion only) potential Horseshoe Canyon ACEC. No actions to maintain wilderness characteristics on lands outside of WSAs are proposed under Alternative N, resulting in no additional protection for relevant and important values.

Impacts from Recreation

No SRMA is proposed in Alternative N, so there would be no impact to relevant and important values.

Impacts from Travel Management

OHV use would not threaten relevant and important values under any of the alternatives for several reasons. First, no OHV open areas are proposed under any of the alternatives, precluding impacts from cross-country OHV use. Second, only 7 miles of open motorized routes were inventoried, a nominal amount in such a large area. These routes would remain open under Alternatives N, and A and the Proposed RMP. Third, much of the terrain within the potential ACEC is too rugged to be accessible to vehicles in any case. OHV area designations by alternative are shown in Table 4-75.

Table 4-75. OHV Area Designations within the Horseshoe Canyon Potential ACEC

		Alternative N (No Action)	Alternative A	Proposed RMP	Alternatives C and D
Open	Acres	0	0	0	0
	% area	0%	0%	0%	0%
Limited	Acres	40,900	40,900	32,800	100
	% area	100%	100%	80%	<1%
Closed	Acres	0	0	8,100	40,800
	% area	0%	0%	20%	>99%

Impacts from Lands and Realty

Under Alternative N, proposed decisions for land tenure adjustments could maintain, increase, or decrease the land in federal ownership, having a beneficial or adverse impact on relevant and important values that would be determined in site-specific environmental analysis.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Under Alternative N, 92% of the potential ACEC (the portion within the WSA) would be closed to oil and gas leasing, precluding any impacts from oil and gas exploration or development activities. Oil and gas stipulations in the area outside the WSA vary by alternative, as shown in Table 4-76 below. Alternative N would allow oil and gas exploration and development with standard lease terms and conditions within 8% of the potential ACEC, which could impact relevant and important values.

Table 4-76. Leasing Stipulations within the Horseshoe Canyon Potential ACEC

		Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
Standard Lease Terms	Acres	3,100	0	0	0	0
	% Area	8%	0%	0%	0%	0%
Controlled Surface Use or Timing Stipulations	Acres	0	3,100	200	0	0
	% Area	0%	8%	1%	0%	0%
No Surface Occupancy	Acres	0	0	2,900	3,100	100
	% Area	0%	0%	7%	8%	Negligible
Closed	Acres	37,800	37,800	37,800	37,800	40,800
	% Area	92%	92%	92%	92%	100%

Locatable Minerals

Under all alternatives, only 8% of the potential ACEC could be impacted by mineral exploration and development (because the remainder is within the WSA). Due to the remoteness and low mineral

potential within the area, it would be unlikely that mining activity would impact the relevant and important values.

Impacts from Special Designations

Wilderness Study Areas

The potential ACEC encompasses 37,800 acres of the Horseshoe Canyon WSA. Within the WSA, which represents 92% of the potential ACEC, relevant and important values would be protected from ground-disturbing activities by management under the IMP.

Areas of Critical Environmental Concern

Under Alternative N, no ACEC would be designated. Management according to the IMP within the 92% of the potential ACEC within the WSAs would provide protection of the relevant and important values.

Alternative A

Impacts from Vegetation

Under Alternative A, no surface-disturbing activities would be allowed within 330 feet on each side of the stream or the 100-year floodplain, whichever is greater, providing protection of the riparian relevant and important values.

Impacts from Visual Resources

Impacts would be similar to those described under Alternative N, except that slightly fewer acres would be designated as VRM Classes I and II (92%), providing less protection to scenic relevant and important values.

Impacts from Special Status Species

As in Alternative N, management actions such as prohibiting the destruction, adverse modification, or fragmentation of listed species habitat; maintaining the integrity of SSS habitat; and habitat improvements would benefit SSS. In Alternative A, additional strategies (such as utilizing seasonal and spatial buffers for surface-disturbing activities and complying with raptor protection guidelines for powerline construction) would be employed to protect raptors and their habitat. These actions would minimize or eliminate impacts to the SSS relevant and important value.

Impacts from Non-WSA Lands with Wilderness Characteristics

Impacts would be the same as those described under Alternative N.

Impacts from Recreation

Under Alternative A, the Dirty Devil SRMA would encompass the Horseshoe Canyon Potential ACEC. The Dirty Devil SRMA management emphasis on primitive and semi-primitive recreation would complement the relevant and important values by focusing recreational use and limiting development.

Impacts from Travel Management

Impacts would be the same as those described under Alternative N.

Impacts from Lands and Realty

Impacts would be the same as those described under Alternative N.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Under Alternative A, 92% of the potential ACEC (the portion within the WSA) would be closed to oil and gas leasing, precluding any impacts from oil and gas exploration or development activities. Oil and gas stipulations in the area outside the WSA vary by alternative, as shown in Table 4-76 below. Alternative A would allow oil and gas exploration subject to moderate constraints (timing limitation, CSU) within 8% of the potential ACEC, which would reduce the potential for impacts to relevant and important values.

Locatable Minerals

Impacts would be the same as those described under Alternative N.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Areas of Critical Environmental Concern

Impacts would be the same as those described under Alternative N.

Proposed RMP

Impacts from Vegetation

Under the Proposed RMP, no surface-disturbing activities would be allowed within 330 feet on each side of the stream or the 100-year floodplain, whichever is greater, providing protection of the riparian relevant and important values.

Impacts from Visual Resources

Visual resource management classes within the potential ACEC, by alternative, are shown in Table 4-74. The higher VRM classes (I and II) would better protect the scenic values and, by limiting surface-disturbing activities, also benefit other relevant and important values. Under the Proposed RMP, 99% of the potential ACEC would be managed for VRM Classes I and II, providing adequate protection of the scenic relevant and important value.

Impacts from Special Status Species

As in Alternative N, management actions under the Proposed RMP such as prohibiting the destruction, adverse modification, or fragmentation of listed species habitat; maintaining the integrity of SSS habitat; and habitat improvements would benefit SSS. Additional strategies (such as utilizing seasonal and spatial buffers for surface-disturbing activities and complying with raptor protection guidelines for powerline construction) would be employed to protect raptors and their habitat. These actions would minimize or eliminate impacts to the SSS relevant and important value.

Impacts from Non-WSA Lands with Wilderness Characteristics

Under the Proposed RMP, 12,200 acres of the Horseshoe Canyon South non-WSA lands with wilderness characteristics would be managed to maintain their wilderness characteristics. Management prescriptions would protect scenic values, reduce or eliminate surface disturbance, and retain public lands in federal ownership. Approximately 1,780 acres of the Horseshoe Canyon South non-WSA lands would overlap with the potential Horseshoe Canyon ACEC, providing indirect protection for relevant and important values within those areas.

Impacts from Recreation

Under the Proposed RMP, the Dirty Devil SRMA would encompass the Horseshoe Canyon Potential ACEC. The Dirty Devil SRMA management emphasis on primitive and semi-primitive recreation would complement the relevant and important values by focusing recreational use and limiting development.

Impacts from Travel Management

OHV use would not threaten relevant and important values under any of the alternatives, including the Proposed RMP, for several reasons. First, no OHV open areas are proposed, precluding impacts from cross-country OHV use. Second, motorized use would be limited to designated routes with only 7 miles of routes inventoried and identified for designation, a nominal amount in such a large area. These routes would remain open under Alternatives N, A, and the Proposed RMP. Third, much of the terrain within the potential ACEC is too rugged to be accessible to vehicles in any case. Therefore, there would be no impact to relevant and important values of the potential Horseshoe Canyon ACEC from motorized use.

Impacts from Lands and Realty

Under the Proposed RMP, proposed decisions for land tenure adjustments could maintain, increase, or decrease the land in federal ownership, having a beneficial or adverse impact on relevant and important values that would be determined in site-specific environmental analysis. With 92% of the potential ACEC being located within the WSA, it would be most likely that land tenure adjustments, if any, would benefit the relevant and important values of the area.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Under the Proposed RMP, 92% of the proposed ACEC (the portion within the WSA) would be closed to oil and gas leasing, precluding any impacts from oil and gas exploration or development activities. The portion of the proposed ACEC outside of the WSA would be open to leasing with minor constraints (1%) or open with NSO (7%). The potential for impacts to relevant and important values from oil and gas exploration or development activities would be unlikely.

Locatable Minerals

Under all alternatives, including the Proposed RMP, only 8% of the potential ACEC could be impacted by mineral exploration and development (because the remainder is within the WSA). Due to the remoteness and low mineral potential within the area, it would be unlikely that mining activity would impact the relevant and important values.

Impacts from Special Designations

Wilderness Study Areas

The potential Horseshoe Canyon ACEC encompasses 37,800 acres of the Horseshoe Canyon WSA. Within the WSA, which represents 92% of the potential ACEC, relevant and important values would be protected from ground-disturbing activities by management under the IMP.

Areas of Critical Environmental Concern

Under the Proposed RMP, no Horseshoe Canyon ACEC would be designated. WSA management and other resource decisions under this alternative for visual resource, travel, and minerals management would provide adequate protection for all the relevant and important values identified within this potential ACEC.

Alternative C

Impacts from Vegetation

Under Alternative C, no surface-disturbing activities would be allowed within 660 feet from riparian areas, providing protection of the riparian relevant and important values.

Impacts from Visual Resources

Impacts would be the same as those described under Alternative N.

Impacts from Special Status Species

Impacts would be the same as those described under Alternative A.

Impacts from Non-WSA Lands with Wilderness Characteristics

Impacts would be the same as those described under Alternative N.

Impacts from Recreation

Impacts would be the same as those described under Alternative A.

Impacts from Travel Management

Impacts would be similar to those described under Alternative N, except that the designated routes would be reduced to 2 miles of open routes under Alternative C.

Impacts from Lands and Realty

Under Alternative C, proposed decisions for land tenure adjustments would benefit all relevant and important values by keeping the land in federal ownership and protecting it from development.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Impacts would be the same as those described under Alternative C.

Locatable Minerals

Impacts would be the same as those described under Alternative N.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Areas of Critical Environmental Concern

Under Alternative C, the Horseshoe Canyon ACEC would be designated on 40,900 acres of public land to protect and provide special management for the relevant and important values. In addition to management direction associated with Alternative C described above, designating the ACEC would allow no uses that would cause irreparable damage to relevant and important values.

Alternative D

Impacts from Vegetation

Impacts would be the same as those described under Alternative C.

Impacts from Visual Resources

Impacts would be similar to those described under Alternative N, except that the entire potential ACEC would be designated as VRM Class I, eliminating any impact to scenic relevant and important values.

Impacts from Special Status Species

Impacts would be the same as those described under Alternative A.

Impacts from Non-WSA Lands with Wilderness Characteristics

A portion of the Horseshoe Canyon South (2,900 acres) and Labyrinth Canyon (1 acre) non-WSA lands with wilderness characteristics lie within the 40,900-acre (RFO portion only) potential Horseshoe Canyon ACEC. Under Alternative D, protecting the non-WSA lands with wilderness characteristics within the Horseshoe Canyon potential ACEC would provide indirect protection for relevant and important values on 2,901 acres. Specifics are disclosed in the visual resources, travel management, minerals and energy, and lands and realty discussions in this section.

Impacts from Recreation

Impacts would be the same as those described under Alternative A.

Impacts from Travel Management

Impacts would be the same as those described under Alternative C.

Impacts from Lands and Realty

Impacts would be similar to those described under Alternative C. Also under Alternative D, proposed withdrawal from mineral entry of the 2,900 acres outside the WSA (to protect the non-WSA lands with wilderness characteristics) would protect relevant and important values from surface disturbance caused by mineral exploration and development.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Impacts from oil and gas leasing would be precluded under Alternative D, which closes all but a small portion of the potential ACEC to oil and gas leasing.

Locatable Minerals

Impacts would be similar to those described under Alternative N. In addition, under Alternative D, 2,900 acres outside the WSA would be proposed for withdrawal from mineral entry to protect non-WSA lands with wilderness characteristics, which would also protect relevant and important values.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Areas of Critical Environmental Concern

Impacts would be the same as those described under Alternative C.

Kingston Canyon Potential ACEC

The Kingston Canyon Potential ACEC encompasses 22,100 total acres of public lands located in the side canyons north and south of the Sevier River between the towns of Kingston and Antimony in Sevier County. Relevant and important values are mule deer, mule deer habitat, and riparian areas.

Impacts to the relevant and important values of this ACEC could occur from the following resource management programs:

- Vegetation
- Fish and Wildlife
- Fire and Fuels Management
- Non-WSA Lands with Wilderness Characteristics
- Travel Management
- Lands and Realty
- Special Designations.

Other programs were determined to have little or no impact on the relevant and important values of this potential ACEC.

Alternative N: No Action

Impacts from Vegetation

Under all alternatives, no surface-disturbing activities would be allowed within identified distances (which vary by alternative) from riparian areas unless it could be shown that there are no practical alternatives, all long-term impacts could be fully mitigated, and the activity would benefit and enhance the riparian area. This would protect the riparian relevant and important values from surface-disturbing activities, but it could restrict potentially beneficial actions such as riparian area restoration and vegetation treatment. Under Alternative N, no surface-disturbing activities would be allowed within 500 feet of riparian areas.

Impacts from Fish and Wildlife

Fish and wildlife management actions for the benefit of mule deer and their habitat would benefit those relevant and important values. These management prescriptions and seasonal and spatial restrictions on activities with the potential ACEC vary by alternative. Under Alternative N, a seasonal restriction on oil and gas exploration and development would be required in crucial and high-value mule deer habitat during sensitive seasons, such as fawning. These seasonal restrictions would provide greater protection for the mule deer and habitat relevant and important values than Alternative A, but less than under the Proposed RMP and Alternatives C and D.

Impacts from Fire and Fuels Management

Under Alternative N, unwanted wildfire in crucial mule deer habitats could result in impacts to crucial mule deer habitats. However, this alternative includes stabilization and rehabilitation efforts as needed for every wildland fire. Stabilization and rehabilitation efforts would benefit fish and wildlife species over the long term by decreasing erosion and restoring or improving habitat conditions following a fire event.

Impacts from Non-WSA Lands with Wilderness Characteristics

All of the Phonolite Hill (7,900 acres) and portions of the Kingston Ridge (2,100 acres) and Rocky Ford (6,400 acres) non-WSA lands with wilderness characteristics lie within the 22,100-acre potential

Kingston Canyon ACEC. No actions to maintain wilderness characteristics on lands outside of WSAs are proposed under Alternative N, resulting in no impacts to relevant and important values.

Impacts from Travel Management

Proposed OHV area designations, by alternative, are shown in Table 4-77. Under Alternative N, continuing to manage the area as open to OHV use would cause the greatest adverse impacts to mule deer and riparian values by allowing harassment of mule deer, crushing and removal of riparian vegetation, and loss of habitat.

Table 4-77. OHV Area Designations within the Kingston Canyon Potential ACEC

		Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
Open	Acres	22,100	18,800	0	0	0
	% Area	100%	85%	0%	0%	0%
Limited	Acres	0	3,300	22,100	22,100	5,700
	% Area	0%	15%	100%	100%	26%
Closed	Acres	0	0	0	0	16,400
	% Area	0%	0%	0%	0%	74%

Impacts from Lands and Realty

No lands within the Kingston Canyon Potential ACEC have been identified as available for FLPMA Section 203 sales. Under Alternative N, proposed decisions for land tenure adjustments could maintain, increase, or decrease the land in federal ownership, having a beneficial or adverse impact on relevant and important values that would be determined in site-specific environmental analysis.

Impacts from Special Designations

Areas of Critical Environmental Concern

Under Alternative N, no ACEC would be designated and no special management prescriptions would be implemented to specifically protect the relevant and important values of the area.

Alternative A

Impacts from Vegetation

Impacts would be similar to those described under Alternative N, except that no surface-disturbing activities would be allowed within 330 feet on each side of the stream or the 100-year floodplain, whichever is greater.

Impacts from Fish and Wildlife

Under Alternative A, no seasonal or spatial restrictions of human presence or surface-disturbing activities would be required, which could result in greater impacts to mule deer and habitats during critical periods. This alternative would provide the least protection to mule deer and their habitat.

Impacts from Fire and Fuels Management

Impacts would be the same as those described under Alternative N.

Impacts from Non-WSA Lands with Wilderness Characteristics

Impacts would be the same as those described under Alternative N.

Impacts from Travel Management

Under Alternative A, managing the potential ACEC as open and limited would continue most of the impacts in the open areas and reduce impacts in limited use areas. Adverse impacts under Alternative A would be slightly less than Alternative N.

Impacts from Lands and Realty

Impacts would be the same as those described under Alternative N.

Impacts from Special Designations

Areas of Critical Environmental Concern

Under Alternative A, no ACEC would be designated and no special management prescriptions would be implemented to specifically protect the relevant and important values of the area.

Proposed RMP

Impacts from Vegetation

Under all alternatives, no surface-disturbing activities would be allowed within identified distances (which vary by alternative) from riparian areas unless it could be shown that there are no practical alternatives, all long-term impacts could be fully mitigated, and the activity would benefit and enhance the riparian area. This would protect the riparian relevant and important values from surface-disturbing activities, but it could restrict potentially beneficial actions such as riparian area restoration and vegetation treatment. Under the Proposed RMP no surface-disturbing activities would be allowed within 330 feet on each side of the stream or the 100-year floodplain, whichever is greater. Although the protection area is smaller than Alternatives N, C and D, it would provide adequate protection to the riparian relevant and important values of the potential Kingston Canyon ACEC.

Impacts from Fish and Wildlife

Seasonal or spatial restriction of human presence or surface-disturbing activities under this alternative could provide greater benefits to the mule deer and mule deer habitat relevant and important values than Alternatives N and A, but less than Alternatives C and D. Prescriptive grazing would be used to favor forage production for big game high-priority and crucial winter range. OHV use would be limited to designated routes in mule deer crucial habitat, and seasonal restrictions of surface-disturbing activities would be required in crucial mule deer habitats.

Impacts from Fire and Fuels Management

Impacts would be similar to those described under Alternative N, except that the Proposed RMP would include stabilization efforts to sustain ecosystems, improve public health, improve safety, and help communities protect infrastructure. Priority would be given to areas that pose a threat to life and property and areas with a potential for invasive weeds. Stabilization efforts would have the potential to benefit the mule deer and mule deer habitat relevant and important values in the long term.

Impacts from Non-WSA Lands with Wilderness Characteristics

All of the Phonolite Hill (7,900 acres) and portions of the Kingston Ridge (2,100 acres) and Rocky Ford (6,400 acres) non-WSA lands with wilderness characteristics lie within the 22,100-acre potential Kingston Canyon ACEC. These areas would not be managed to for wilderness characteristics in the Proposed RMP, resulting in no impacts to relevant and important values.

Impacts from Travel Management

Under the Proposed RMP, limiting vehicles to designated routes would reduce adverse impacts to mule deer habitat and harassment to the mule deer populations caused by cross-country vehicle use, as compared with Alternatives N and A. By limiting motorized use to designated routes, the impacts of crushing and removal of riparian vegetation, and loss of habitat associated with motorized activities would be eliminated or reduced to areas adjacent to the routes. Therefore, the Proposed RMP would provide protection to the mule deer and mule deer habitat relevant and important values of the potential Kingston Canyon ACEC.

Impacts from Lands and Realty

No lands within the Kingston Canyon Potential ACEC have been identified as available for FLPMA Section 203 sales. Proposed decisions for land tenure adjustments could maintain, increase, or decrease the land in federal ownership, having a beneficial or adverse impact on relevant and important values that would be determined in site-specific environmental analysis. Lands with riparian values would likely not be offered for disposal, thus not impacting the riparian relevant and important value. Any sale of land within the potential ACEC would result in a loss of mule deer habitat in federal ownership and would be considered in site-specific analysis prior to offering the land for sale. Actual impacts to the mule deer and mule deer habitat relevant and important values would depend upon the acreage sold and how the land is used and developed after it leaves federal ownership.

Impacts from Special Designations

Areas of Critical Environmental Concern

Under the Proposed RMP, the potential Kingston Canyon ACEC would not be designated and no special management prescriptions would be implemented to specifically protect the relevant and important values of the area. Existing laws, rules, and regulations, as well as management decisions for riparian protection zones, seasonal/spatial restrictions on surface disturbances, and travel management would adequately protect the relevant and important riparian, mule deer and mule habitat values of the potential ACEC. The UDWR purchased and set aside a 319 acre wildlife management area in Kingston Canyon and would provide additional protection for the ACEC's relevant and important values (mule deer, mule deer habitat, and riparian areas).

Alternative C

Impacts from Vegetation

Impacts would be similar to those described under Alternative N, except that no surface-disturbing activities would be allowed within 660 feet of riparian areas.

Impacts from Fish and Wildlife

Under Alternative C, prescriptive grazing would be used to favor forage production for big game ranges. OHV use in mule deer crucial winter range would be limited to designated routes or closed. Seasonal restrictions would apply to surface-disturbing activities in crucial and high-value mule deer habitats. Alternatives C and D would provide the greatest protection for the relevant and important values of mule deer and mule deer habitat.

Impacts from Fire and Fuels Management

Under Alternative C, the proposed decision to suppress unwanted wildfire in crucial mule deer habitats would benefit the mule deer by protecting the browse species that could otherwise be damaged by wildland fire and subsequently out-competed by undesirable species.

Impacts from Non-WSA Lands with Wilderness Characteristics

Impacts would be the same as those described under Alternative N.

Impacts from Travel Management

Impacts would be the same as those described under the Proposed RMP.

Impacts from Lands and Realty

No lands within the Kingston Canyon Potential ACEC have been identified as available for FLPMA Section 203 sales. Under Alternative C, proposed decisions for land tenure adjustments benefit all relevant and important values by keeping the land in federal ownership and protecting it from development.

Impacts from Special Designations

Areas of Critical Environmental Concern

Under Alternative C, Kingston Canyon ACEC would be designated on 22,100 acres of public land to protect and provide special management for the mule deer (e.g., mule deer habitat) and riparian relevant and important values. In addition to management direction associated with Alternative C described above, designating the ACEC would allow no uses that would cause irreparable damage to relevant and important values.

Alternative D

Impacts from Vegetation

Impacts would be the same as those described under Alternative C.

Impacts from Fish and Wildlife

Impacts would be similar to those described under Alternative C, except that additional acres would be closed to OHV use in Alternative D. Alternatives C and D would provide the greatest protection for the relevant and important values of mule deer and mule deer habitat.

Impacts from Fire and Fuels Management

Impacts would be the same as those described under Alternative C.

Impacts from Non-WSA Lands with Wilderness Characteristics

All of the Phonolite Hill (7,900 acres) and portions of the Kingston Ridge (2,100 acres) and Rocky Ford (6,400 acres) non-WSA lands with wilderness characteristics lie within the 22,100-acre potential Kingston Canyon ACEC. Under Alternative D, protecting the non-WSA lands with wilderness characteristics within the Kingston Canyon ACEC would provide indirect protection for relevant and important mule deer value on 16,400 acres, but it could limit options for managing mule deer habitat.

Impacts from Travel Management

Closing 74% of the potential ACEC to vehicle use would reduce adverse impacts to deer habitat and harassment to the deer populations caused by cross-country vehicle use, as compared with all other alternatives.

Impacts from Lands and Realty

Impacts would be the same as those described under Alternative C.

Impacts from Special Designations

Areas of Critical Environmental Concern

Under Alternative D, Kingston Canyon ACEC would be designated on 22,100 acres of public land to protect and provide special management for the mule deer (e.g., mule deer habitat) and riparian relevant and important values. In addition to management direction associated with Alternative D described above, designating the ACEC would allow no uses that would cause irreparable damage to relevant and important values.

Little Rockies Potential ACEC

The Little Rockies Potential ACEC totals 49,200 acres located in the southeast corner of Garfield County. It includes the entire Little Rockies National Natural Landmark—an NPS designation. Seventy-six percent of the potential ACEC is within the Little Rockies WSA. Relevant and important values are scenic, wildlife (Desert bighorn sheep), SSS (Townsend's big-eared bat and hole-in-the-rock prairie clover), and ecological (riparian) values.

Impacts to the relevant and important values of this ACEC could occur from the following resource management programs:

- Vegetation
- Visual Resources
- Special Status Species
- Fish and Wildlife
- Non-WSA Lands with Wilderness Characteristics
- Travel Management
- Lands and Realty
- Minerals and Energy
- Special Designations.

Other programs were determined to have little or no impact on the relevant and important values of this potential ACEC.

Alternative N: No Action

Impacts from Vegetation

Under all alternatives, no surface-disturbing activities would be allowed within identified distances (which vary by alternative) from riparian areas unless it could be shown that there are no practical alternatives, all long-term impacts could be fully mitigated, and the activity would benefit and enhance the riparian area. This would protect the riparian relevant and important value from surface-disturbing activities, but it could restrict potentially beneficial actions such as riparian area restoration and vegetation treatment. Under Alternative N, no surface-disturbing activities would be allowed within 500 feet of riparian areas.

Impacts from Visual Resources

Visual resource management classes within the potential ACEC, by alternative, are shown in Table 4-78. Under Alternative N, all lands within the potential ACEC would be designated as VRM Class I or II, protecting scenic values.

Table 4-78. VRM Class Designations within Little Rockies Potential ACEC

		Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
Class I	Acres	0	37,400	37,400	37,400	46,300
	% ACEC	0%	76%	76%	76%	94%
Class II	Acres	49,200	0	11,800	11,800	2,900
	% ACEC	100%	0%	24%	24%	6%
Class III	Acres	0	0	0	0	0
	% ACEC	0%	0%	0%	0%	0%
Class IV	Acres	0	11,800	0	0	0
	% ACEC	0%	24%	0%	0%	0%

Impacts from Special Status Species

Under all alternatives, management actions such as prohibiting the destruction, adverse modification, or fragmentation of listed species habitat; maintaining the integrity of SSS habitat; and habitat improvements would benefit SSS.

Impacts from Fish and Wildlife

Under all alternatives, proposed decisions prohibiting the conversion of classification of livestock from cattle to sheep would benefit the Desert bighorn sheep value by eliminating the threat of disease spread by domestic sheep. The proposed decision to allow Desert bighorn sheep reintroductions would have a beneficial impact by augmenting the herd to provide for genetic diversity, which would increase the health of the population. The proposed decision to limit surface-disturbing activities near springs would have a beneficial impact on riparian vegetation, Desert bighorn sheep, and other riparian species. Proposed decisions for limiting ground-disturbing activities in Desert bighorn sheep habitat vary by alternative. Under Alternative N, not limiting activities in Desert bighorn sheep habitat during lambing and other sensitive seasons could adversely affect the Desert bighorn sheep by allowing disturbance and harassment during critical periods.

Impacts from Non-WSA Lands with Wilderness Characteristics

A portion of the Little Rockies (8,700 acres) non-WSA lands with wilderness characteristics lies within the 49,200-acre potential Little Rockies ACEC. No actions to maintain wilderness characteristics on lands outside of WSAs are proposed under Alternative N, resulting in no impacts to relevant and important values.

Impacts from Travel Management

OHV area designations, by alternative, are shown in Table 4-79. Under Alternative N, continuing to allow cross-country travel in 19% of the potential ACEC would threaten relevant and important values in that area with ground disturbance or harassment.

Table 4-79. OHV Area Designations within Little Rockies Potential ACEC

		Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
Open	Acres	9,200	0	0	0	0 ac
	% Area	19%	0%	0%	0%	0%
Limited	Acres	2,500	49,200	11,800	10,800	2,300
	% Area	5%	100%	24%	22%	5%
Closed	Acres	37,500	0	37,400	38,400	46,900
	% Area	76%	0%	76%	78%	95%

Impacts from Lands and Realty

Withdrawing land from mineral entry would benefit all relevant and important values by protecting them from ground-disturbing activities associated with the exploration and development of locatable minerals. No withdrawals from mineral entry are proposed under Alternative N. Therefore, there would be no impacts to relevant and important values.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Lands open to oil and gas leasing, by alternative, are shown in Table 4-80. Under all alternatives, there would be no impacts to relevant and important values within the WSA, which is closed to oil and gas leasing. The Little Rockies WSA represents 76% of the potential ACEC. Under Alternative N, 11% of the potential ACEC would be available for leasing with standard terms, which could result in impacts to relevant and important values. However, the potential ACEC is in a portion of the lands managed by the RFO identified as having low development potential for oil and gas leasing. Few, if any, wells are expected to be drilled in this area in the next 15 to 20 years.

Table 4-80. Leasing Stipulations within Little Rockies Potential ACEC

		Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
Standard Lease Terms	Acres	5,400	11,800	4,000	0	0
	% Area	11%	24%	8%	0%	0%
Controlled Surface Use or Timing Stipulations (Seasonal)	Acres	0	0	2,200	0	0
	% Area	0%	0%	4%	0%	0%
No Surface Occupancy	Acres	0	0	5,400	11,800	2,300
	% Area	0%	0%	11%	24%	5%
Closed	Acres	43,800	37,400	37,600	37,400	46,900
	% Area	89%	76%	76%	76%	95%

Locatable Minerals

Under Alternative N, 24% of the potential ACEC (the area outside the WSA) could be impacted by mineral exploration and development. There is potential for mineral exploration within the area. Mitigation such as minimizing visual impacts and avoiding sensitive seasons or areas for SSS would be addressed in site-specific analysis as proposals are reviewed. These mitigation measures would reduce but may not eliminate impacts to relevant and important values.

Salable Minerals

In Alternative N, the effects of salable mineral disposal on relevant and important values would be considered on a case-by-case basis outside the WSA. Disposal of salable minerals would not be allowed within the WSA. Mitigation measures would likely be developed if potential impacts were identified for relevant and important values.

Impacts from Special Designations

Wilderness Study Areas

The potential ACEC encompasses 37,400 acres of the Little Rockies WSA. Within the WSA, relevant and important values would be protected from ground-disturbing activities by management under the IMP.

Wild and Scenic Rivers

The only eligible WSR within the potential ACEC is a portion of Maidenwater Creek. Due to the small portion of the potential ACEC encompassed by Maidenwater Creek, neither recommending nor not recommending it as a suitable WSR would have any perceptible impact on any relevant and important value.

Areas of Critical Environmental Concern

Under Alternative N, no ACEC would be designated. Management according to the IMP within the 76% of the potential ACEC within the Little Rockies WSA would provide protection of the relevant and important values within that portion of the potential ACEC.

Alternative A

Impacts from Vegetation

Under Alternative A, no surface-disturbing activities would be allowed within 330 feet on each side of the stream or the 100-year floodplain, whichever is greater, unless it could be shown that there are no practical alternatives, all long-term impacts could be fully mitigated, and the activity would benefit and enhance the riparian area. This would protect the riparian relevant and important value from surface-disturbing activities, but it could restrict potentially beneficial actions such as riparian area restoration and vegetation treatment.

Impacts from Visual Resources

Under Alternative A, lands outside the WSA would be designated as VRM Class IV, which could allow activities that would adversely impact the scenic values within 24% of the potential ACEC.

Impacts from Special Status Species

Under Alternative A, management actions such as prohibiting the destruction, adverse modification, or fragmentation of listed species habitat; maintaining the integrity of SSS habitat; and habitat improvements would benefit SSS. Additional strategies (such as utilizing seasonal and spatial buffers for surface-disturbing activities and complying with raptor protection guidelines for powerline construction) would

be employed to protect raptors and their habitat. These actions would minimize or eliminate impacts to the SSS relevant and important values.

Impacts from Fish and Wildlife

Impacts would be the same as those described under Alternative N.

Impacts from Non-WSA Lands with Wilderness Characteristics

Impacts would be the same as those described under Alternative N.

Impacts from Travel Management

Under Alternative A, limiting OHV use to designated routes throughout the potential ACEC would reduce vehicle impacts to relevant and important values, as compared with Alternative N.

Impacts from Lands and Realty

Impacts would be the same as those described under Alternative N.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Alternative A would allow leasing subject to standard terms and conditions for all lands within the potential ACEC outside the WSA. This alternative would result in the greatest potential for impacts. However, the potential ACEC is in a portion of the lands managed by the RFO identified as having low development potential for oil and gas leasing. Few, if any, wells are expected to be drilled in this area in the next 15 to 20 years.

Locatable Minerals

Impacts would be the same as those described under Alternative N.

Salable Minerals

Impacts would be the same as those described under Alternative N.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Impacts would be the same as those described under Alternative N.

Areas of Critical Environmental Concern

Impacts would be the same as those described under Alternative N.

Proposed RMP

Impacts from Vegetation

Under the Proposed RMP, no surface-disturbing activities would be allowed within 330 feet on each side of the stream or the 100-year floodplain, whichever is greater, unless it could be shown that there are no practical alternatives, all long-term impacts could be fully mitigated, and the activity would benefit and enhance the riparian area. This would protect the riparian relevant and important value from surface-

disturbing activities, but it could restrict potentially beneficial actions such as riparian area restoration and vegetation treatment.

Impacts from Visual Resources

Under the Proposed RMP, all lands within the potential ACEC would be designated as VRM Class I (76%) or II (24%), protecting scenic relevant and important values of the potential Little Rockies ACEC.

Impacts from Special Status Species

Management actions such as prohibiting the destruction, adverse modification, or fragmentation of listed species habitat; maintaining the integrity of SSS habitat; and habitat improvements would benefit SSS. Additional strategies (such as utilizing seasonal and spatial buffers for surface-disturbing activities and complying with raptor protection guidelines for powerline construction) would be employed to protect raptors and their habitat. These actions would minimize or eliminate impacts to the SSS relevant and important values.

Impacts from Fish and Wildlife

The proposed decisions prohibiting the conversion of classification of livestock from cattle to sheep would benefit the Desert bighorn sheep relevant and important value by eliminating the threat of disease spread by domestic sheep. The proposed decision to allow Desert bighorn sheep reintroductions would have a beneficial impact by augmenting the herd to provide for genetic diversity, which would increase the health of the population. The proposed decision to limit surface-disturbing activities near springs would have a beneficial impact on the riparian, Desert bighorn sheep, and wildlife relevant and important values. Proposed decisions for limiting ground-disturbing activities in Desert bighorn sheep habitat vary by alternative. Under the Proposed RMP, limiting activities in Desert bighorn sheep habitat during lambing and other sensitive seasons would benefit Desert bighorn sheep by minimizing disturbance and harassment during critical periods, providing additional benefits to this relevant and important value.

Impacts from Non-WSA Lands with Wilderness Characteristics

Under the Proposed RMP, 9,500 acres of the Little Rockies non-WSA lands with wilderness characteristics would be managed to maintain their wilderness characteristics. Management prescriptions would protect scenic values, reduce or eliminate surface disturbance, and retain public lands in federal ownership. Approximately 5,480 acres (11% of the Little Rockies non-WSA lands) would overlap with the potential Little Rockies ACEC, providing indirect protection for all the relevant and important values within those areas.

Impacts from Travel Management

Under the Proposed RMP, the WSA would be closed to OHVs (76% of the potential ACEC) and the remaining portion of the potential ACEC would restrict OHVs to designated routes. This would reduce or eliminate vehicle impacts to the relevant and important values of the potential Little Rockies ACEC.

Impacts from Lands and Realty

Withdrawing land from mineral entry would benefit all relevant and important values by protecting them from ground-disturbing activities associated with the exploration and development of locatable minerals. However, no withdrawals from mineral entry are proposed under the Proposed RMP, resulting in no impacts to relevant and important values.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Under the Proposed RMP, only 8% of the potential ACEC would be open to oil and gas leasing subject to standard terms and conditions, 4% would be leased subject to moderate constraints (timing limitation, CSU), 11% would be subject to major constraints (NSO) and the 76% within the WSA would be closed to leasing. The potential for impacts would be reduced or eliminated compared with Alternatives N and A. In addition, the potential ACEC is in a portion of the lands managed by the RFO identified as having low development potential for oil and gas leasing. Few, if any, wells are expected to be drilled in this area in the next 15 to 20 years.

Locatable Minerals

Impacts would be the same as those described under Alternative N. Under the Proposed RMP, 24% of the potential ACEC (the area outside the WSA) could be impacted by mineral exploration and development. There is potential for mineral exploration within the area. Locatable mineral exploration and development would be allowed under the General Mining Law. FLPMA requires BLM to regulate mining activities to prevent undue and unnecessary environmental degradation to resources. Mitigation such as minimizing visual impacts and avoiding sensitive seasons or areas for SSS would be addressed in site-specific analysis as proposals are reviewed. These mitigation measures would reduce but may not eliminate impacts to relevant and important values.

Salable Minerals

Impacts would be the same as those described under Alternative N. The effects of salable mineral disposal on relevant and important values would be considered on a case-by-case basis outside the WSA. Disposal of salable minerals would not be allowed within the WSA. Management for visual resources, riparian protection zones, and SSS and wildlife habitats provide protection from surface disturbing activities such as mineral material sales. Mitigation measures would be developed or the action denied if potential impacts were identified for the scenic, riparian, SSS and wildlife relevant and important values of the potential Little Rockies ACEC.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N. The potential ACEC encompasses 37,400 acres of the Little Rockies WSA. Within the WSA, relevant and important values would be protected from ground-disturbing activities by management under the IMP.

Wild and Scenic Rivers

The only eligible WSR within the potential ACEC is a portion of Maidenwater Creek. Due to the small portion of the potential ACEC encompassed by Maidenwater Creek, neither recommending nor not recommending it as a suitable WSR would have any perceptible impact on any relevant and important value.

Areas of Critical Environmental Concern

Under the Proposed RMP, no ACEC would be designated. Management according to the IMP within the 76% of the potential ACEC within the Little Rockies WSA would provide protection of the relevant and important values within that portion of the potential ACEC. Existing laws, rules, and regulations, as well as management decisions for riparian protection zones, VRM, seasonal/spatial restrictions on surface disturbances, non-WSA lands with wilderness characteristics, and travel management would adequately protect all the relevant and important values of the potential Little Rockies ACEC.

Alternative C

Impacts from Vegetation

Under Alternative C, no surface-disturbing activities would be allowed within 660 feet from riparian areas unless it could be shown that there are no practical alternatives, all long-term impacts could be fully mitigated, and the activity would benefit and enhance the riparian area. This would protect the riparian relevant and important value from surface-disturbing activities, but it could restrict potentially beneficial actions such as riparian area restoration and vegetation treatment.

Impacts from Visual Resources

Impacts would be the same as those described under Alternative N.

Impacts from Special Status Species

Impacts would be the same as those described under Alternative A.

Impacts from Fish and Wildlife

Impacts would be the same as those described under the Proposed RMP.

Impacts from Non-WSA Lands with Wilderness Characteristics

Impacts would be the same as those described under Alternative N.

Impacts from Travel Management

Impacts would be similar to those described under the Proposed RMP, except that Desert bighorn sheep habitat outside the WSA would also be closed to OHVs, providing additional protection for that relevant and important value.

Impacts from Lands and Realty

In Alternative C, the potential ACEC outside the WSA is proposed to be withdrawn from mineral entry, precluding locatable mineral development, which would protect the relevant and important values from ground disturbance caused by mineral exploration and development. If the area is not withdrawn but an ACEC is designated, a plan of operations would be required that would address the effects on relevant and important values and other resource concerns.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Under Alternative C, 24% of the potential lands would be leased subject to major constraints (NSO), with the remaining 76% within the WSA closed to leasing. This would eliminate the potential for impacts to relevant and important values.

Locatable Minerals

Under Alternative C, the area outside the WSA would be proposed for withdrawal from mineral entry, protecting the relevant and important values from disturbances associated with mining exploration and development. Additionally, within a designated ACEC, federal regulations (43 CFR 3809.11 (c)(3)) require that a plan of operation be submitted for any operation causing surface disturbance greater than casual use. This regulation would mitigate the impacts of mining exploration and development on relevant and important values.

Salable Minerals

Under Alternative C, no disposal of salable minerals would be allowed in the ACEC, resulting in no surface disturbance and no impact to the relevant and important values.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Impacts would be the same as those described under Alternative N.

Areas of Critical Environmental Concern

Under Alternative C, Little Rockies ACEC would be designated on 49,200 acres of public land to protect and provide special management for the relevant and important values. In addition to management direction associated with Alternative C described above, designating the ACEC would allow no uses that would cause irreparable damage to relevant and important values.

Alternative D

Impacts from Vegetation

Impacts would be the same as those described under Alternative C.

Impacts from Visual Resources

Impacts would be similar to those described under Alternative N. Scenic values would be best protected under Alternative D, which would designate 94% of the potential ACEC as VRM Class I to protect the existing character of the landscape.

Impacts from Special Status Species

Impacts would be the same as those described under Alternative A.

Impacts from Fish and Wildlife

Impacts would be the same as those described under the Proposed RMP.

Impacts from Non-WSA Lands with Wilderness Characteristics

A portion of the Little Rockies (8,700 acres) non-WSA lands with wilderness characteristics lies within the 49,200-acre potential Little Rockies ACEC. Under Alternative D, protecting the non-WSA lands with wilderness characteristics within the Little Rockies ACEC would provide indirect protection for relevant and important values on 8,700 acres. Specifics are disclosed in the visual resource management, travel, fluid minerals, and lands and realty (withdrawals) discussions in this section.

Impacts from Travel Management

Under Alternative D, closing the WSA and the non-WSA lands with wilderness characteristics to OHVs (95% of the potential ACEC) would best protect relevant and important values from vehicle impacts.

Impacts from Lands and Realty

Impacts would be the same as those described under Alternative C.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Alternative D would best protect relevant and important values from ground-disturbing activities associated with oil and gas exploration and development by closing 95% of the potential ACEC to oil and gas leasing and allowing leases subject to major constraints (NSO) in the remaining 5%.

Locatable Minerals

Impacts would be the same as those described under Alternative C.

Salable Minerals

Impacts would be the same as those described under Alternative C.

Impacts from Special Designations

Wilderness Study Areas

Impacts would be the same as those described under Alternative N.

Wild and Scenic Rivers

Impacts would be the same as those described under Alternative N.

Areas of Critical Environmental Concern

Impacts would be the same as those described under Alternative C.

Lower Muddy Creek Potential ACEC

The Lower Muddy Creek Potential ACEC, located along Muddy Creek north of Hanksville, totals 16,200 acres of the RFO, with additional acreage to the north in the lands managed by the Price Field Office. The discussion here is limited to the RFO portion. Relevant and important values of this potential ACEC are scenic, SSS (Wright fishhook cactus and Heil's beavertail cactus), and riparian.

Impacts to the relevant and important values of this ACEC could occur from the following resource management programs:

- Vegetation
- Visual Resources
- Special Status Species
- Non-WSA Lands with Wilderness Characteristics
- Travel Management
- Minerals and Energy
- Special Designations.

Other programs were determined to have little or no impact on the relevant and important values of this potential ACEC.

Alternative N: No Action

Impacts from Vegetation

Under all alternatives, no surface-disturbing activities would be allowed within identified distances (which vary by alternative) from riparian areas unless it could be shown that there are no practical

alternatives, all long-term impacts could be fully mitigated, and the activity would benefit and enhance the riparian area. This would protect the riparian relevant and important values from surface-disturbing activities, but it could restrict potentially beneficial actions such as riparian area restoration and vegetation treatment. Under Alternative N, no surface-disturbing activities would be allowed within 500 feet of riparian areas.

Impacts from Visual Resources

VRM class designations, by alternative, are shown in Table 4-81. The higher VRM classes (I and II) would better protect the scenic values and, by limiting surface-disturbing activities, also benefit other relevant and important values. Under Alternative N, 97% of the potential ACEC would be managed as VRM Class II, which would protect the scenic relevant and important values.

Table 4-81. VRM Class Designations within Lower Muddy Creek Potential ACEC

		Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
Class I	Acres	0	0	0	0	15,800
	% ACEC	0%	0%	0%	0%	98%
Class II	Acres	15,600	0	15,600	16,200	400
	% ACEC	97%	0%	97%	100%	2%
Class III	Acres	400	0	400	0	0
	% ACEC	2%	0%	2%	0%	0%
Class IV	Acres	200	16,200	200	0	0
	% ACEC	1%	100%	1%	0%	0%

Impacts from Special Status Species

Under all alternatives, management actions such as prohibiting the destruction, adverse modification, or fragmentation of listed species habitat; maintaining the integrity of SSS habitat; and habitat improvements would benefit SSS.

Impacts from Non-WSA Lands with Wilderness Characteristics

A portion of the Wild Horse Mesa (15,800 acres) non-WSA lands with wilderness characteristics lies within the 16,200-acre (RFO portion only) potential Lower Muddy Creek ACEC. No actions to maintain wilderness characteristics on lands outside of WSAs are proposed under Alternative N, resulting in no additional protection for relevant and important values.

Impacts from Travel Management

OHV area designations, by alternative, are shown in Table 4-82. Alternative N would continue to allow cross-country vehicle travel within all of the potential ACEC, which would adversely impact the scenic, riparian, and special status plant species values if the OHVs travel where these values are present. Plants could be crushed, damaged, or destroyed; riparian areas disrupted; and new trails established in scenic areas.

Table 4-82. OHV Area Designations within Lower Muddy Creek Potential ACEC

		Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
Open	Acres	16,200	16,200	0	0	0
	% Area	100%	100%	0%	0%	0%
Limited	Acres	0	0	16,200	1,600	300
	% Area	0%	0%	100%	10%	2%
Closed	Acres	0	0	0	14,600	15,900
	% Area	0%	0%	0%	90%	98%

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Lands open to oil and gas leasing, by alternative, are shown in Table 4-83. Under Alternative N, all of the potential ACEC would be open to oil and gas leasing under standard terms and conditions. Among the alternatives, this proposed decision would pose the greatest risk to relevant and important values from surface disturbance caused by oil and gas exploration. However, the potential ACEC is in a portion of land managed by the RFO identified as having low development potential for oil and gas leasing. Few, if any, wells are expected to be drilled in this area in the next 15 to 20 years.

Table 4-83. Lease Stipulations within Lower Muddy Creek Potential ACEC

		Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
Standard Lease Terms	Acres	16,200	16,200	7,500	0	0
	% Area	100%	100%	46%	0%	0%
Controlled Surface Use or Timing Stipulations	Acres	0	0	200	0	0
	% Area	0%	0%	1%	0%	0%
No Surface Occupancy	Acres	0	0	8,500	0	0
	% Area	0%	0%	52%	0%	0%
Closed	Acres	0	0	0	16,200	16,200
	% Area	0%	0%	0%	100%	100%

Locatable Minerals

Under Alternative N, exploration and development of locatable minerals could impact relevant and important values sensitive to surface disturbance. Locatable mineral exploration and development would be allowed under the General Mining Law. FLPMA requires BLM to regulate mining activities to prevent undue and unnecessary environmental degradation to resources. SSS would be protected by law and BLM policy. This would minimize impacts of mining activities on relevant and important values of the potential ACEC.

Impacts from Special Designations

Areas of Critical Environmental Concern

Under Alternative N, no ACEC would be designated and no special management prescriptions would be implemented to specifically protect the relevant and important values of the area. There would be a potential for impacts to relevant and important values from continued cross-country OHV use under this alternative.

Alternative A

Impacts from Vegetation

Under Alternative A, no surface-disturbing activities would be allowed within 330 feet on each side of the stream or the 100-year floodplain, whichever is greater, unless it could be shown that there are no practical alternatives, all long-term impacts could be fully mitigated, and the activity would benefit and enhance the riparian area. This would protect the riparian relevant and important value from surface-disturbing activities, but it could restrict potentially beneficial actions such as riparian area restoration and vegetation treatment.

Impacts from Visual Resources

The higher VRM classes (I and II) would better protect the scenic values and, by limiting surface-disturbing activities, also benefit other relevant and important values. Conversely, areas designated as VRM Class III or IV would be subject to actions that allow for greater landscape modification and therefore greater surface disturbance. Alternative A would provide no protection for scenic values by designating all of the potential ACEC as VRM Class IV.

Impacts from Special Status Species

Under Alternative A, management actions such as prohibiting the destruction, adverse modification, or fragmentation of listed species habitat; maintaining the integrity of SSS habitat; and habitat improvements would benefit SSS. Additional strategies (such as utilizing seasonal and spatial buffers for surface-disturbing activities and complying with raptor protection guidelines for powerline construction) would be employed to protect raptors and their habitat. These actions would minimize or eliminate impacts to the SSS relevant and important values.

Impacts from Non-WSA Lands with Wilderness Characteristics

Impacts would be the same as those described under Alternative N.

Impacts from Travel Management

Impacts would be the same as those described under Alternative N.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Impacts would be the same as those described under Alternative N.

Locatable Minerals

Impacts would be the same as those described under Alternative N.

Impacts from Special Designations

Areas of Critical Environmental Concern

Under Alternative A, no ACEC would be designated and no special management prescriptions would be implemented to specifically protect the relevant and important values of the area. This alternative would result in the greatest potential for impacts to relevant and important values due to resource decisions for visual resource and travel management.

Proposed RMP

Impacts from Vegetation

Under the Proposed RMP, no surface-disturbing activities would be allowed within 330 feet on each side of the stream or the 100-year floodplain, whichever is greater, unless it could be shown that there are no practical alternatives, all long-term impacts could be fully mitigated, and the activity would benefit and enhance the riparian area. This would protect the riparian relevant and important value from surface-disturbing activities, but it could restrict potentially beneficial actions such as riparian area restoration and vegetation treatment.

Impacts from Visual Resources

Impacts would be the same as those described under Alternative N. VRM class designations, by alternative, are shown in Table 4-81. The higher VRM classes (I and II) would better protect the scenic values and, by limiting surface-disturbing activities, also benefit other relevant and important values. Under the Proposed RMP, 97% of the potential ACEC would be managed as VRM Class II, limiting surface disturbing activities which would protect the scenic relevant and important values. This management would also indirectly benefit the SSS and riparian relevant and important values of the potential Lower Muddy Creek ACEC.

Impacts from Special Status Species

Under the Proposed RMP, management actions such as prohibiting the destruction, adverse modification, or fragmentation of listed species habitat; maintaining the integrity of SSS habitat; and habitat improvements would benefit SSS. Additional strategies (such as utilizing seasonal and spatial buffers for surface-disturbing activities and complying with raptor protection guidelines for powerline construction) would be employed to protect raptors and their habitat. These actions would minimize or eliminate impacts to the SSS relevant and important values.

Impacts from Non-WSA Lands with Wilderness Characteristics

Under the Proposed RMP, management prescriptions to maintain wilderness characteristics on 8,700 acres of the Wild Horse Mesa non-WSA lands with wilderness characteristics area that overlap the Lower Muddy Creek ACEC would provide an indirect protection for relevant and important values within that portion of the potential ACEC. Management prescriptions would protect scenic values, reduce or eliminate surface disturbance, and retain public lands in federal ownership.

Impacts from Travel Management

Under the Proposed RMP, no areas within the potential ACEC would be open to cross-country travel. Motorized use would be limited to designated routes. Limiting OHV use would reduce the impacts to relevant and important values because use would be confined to designated routes, although there could be some impacts if relevant and important values were located on or adjacent to open routes. The potential for impacts to relevant and important values from cross-country OHV use would be eliminated within this alternative.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Under the Proposed RMP, 52% of the potential ACEC would be open to oil and gas leasing subject to major constraints (NSO) which would protect the relevant and important values from surface disturbances caused by oil and gas exploration and development within most of the area. In addition, the potential ACEC is in a portion of land managed by the RFO identified as having low development potential for oil and gas leasing. Few, if any, wells are expected to be drilled in this area in the next 15 to 20 years.

Locatable Minerals

Impacts would be the same as those described under Alternative N. Under the Proposed RMP, exploration and development of locatable minerals could impact relevant and important values sensitive to surface disturbance. Locatable mineral exploration and development would be allowed under the General Mining Law. FLPMA requires BLM to regulate mining activities to prevent undue and unnecessary environmental degradation to resources. SSS would be protected by law and BLM policy. This would minimize impacts of mining activities on relevant and important values of the potential ACEC.

Impacts from Special Designations

Areas of Critical Environmental Concern

Under the Proposed RMP, no ACEC would be designated and no special management prescriptions would be implemented to specifically protect the relevant and important values of the area. Existing laws, rules, and regulations, as well as resource decisions within the Proposed RMP that limit surface disturbance (i.e., managing the Wild Horse Mesa non-WSA lands for wilderness characteristics), would provide adequate protection to all the relevant and important values of the potential ACEC.

Alternative C

Impacts from Vegetation

Under Alternative C, no surface-disturbing activities would be allowed within 660 feet from riparian areas unless it could be shown that there are no practical alternatives, all long-term impacts could be fully mitigated, and the activity would benefit and enhance the riparian area. This would protect the riparian relevant and important value from surface-disturbing activities, but it could restrict potentially beneficial actions such as riparian area restoration and vegetation treatment.

Impacts from Visual Resources

Under Alternative C, the potential ACEC would be designated as VRM Class II, which would eliminate the potential for impacts to the relevant and important values.

Impacts from Special Status Species

Impacts would be the same as those described under Alternative A.

Impacts from Non-WSA Lands with Wilderness Characteristics

Impacts would be the same as those described under Alternative N.

Impacts from Travel Management

Under Alternative C, no areas would be open to cross-country use, vehicles would be limited to designated routes within 10% of the potential ACEC, and the remaining 90% would be closed to motor vehicles. Although there could be some impacts if relevant and important values were located on or adjacent to designated routes, this alternative would reduce or eliminate potential impacts by eliminating cross-country use.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Under Alternative C, all of the potential ACEC would be closed to leasing, precluding any impacts to relevant and important values from oil and gas leasing.

Locatable Minerals

Under Alternative C, within a designated ACEC, federal regulations (43 CFR 3809.11 (c)(3)) require that a plan of operation be submitted for any operation causing surface disturbance greater than casual use. This regulation would mitigate the impacts of mining exploration and development on relevant and important values.

Impacts from Special Designations

Areas of Critical Environmental Concern

Under Alternative C, Lower Muddy Creek ACEC would be designated on 16,200 acres of public land to protect and provide special management for the relevant and important values. In addition to management direction associated with Alternative C described above, designating the ACEC would allow no uses that would cause irreparable damage to relevant and important values.

Alternative D

Impacts from Vegetation

Impacts would be the same as those described under Alternative C.

Impacts from Visual Resources

Alternative D would best protect the scenic values by designating most of the potential ACEC as VRM Class I, with the remaining area designated as VRM Class II.

Impacts from Special Status Species

Impacts would be the same as those described under Alternative A.

Impacts from Non-WSA Lands with Wilderness Characteristics

A portion of the Wild Horse Mesa (15,800 acres) non-WSA lands with wilderness characteristics lies within the 16,200-acre (RFO portion only) potential Lower Muddy Creek ACEC. Under Alternative D, protecting the non-WSA lands with wilderness characteristics within the Lower Muddy Creek ACEC would provide indirect protection for relevant and important values on 15,800 acres (98% of the potential ACEC). Specifics are described in the visual resources, travel management, minerals and energy, and lands and realty discussions in this section.

Impacts from Travel Management

Under Alternative D, 98% of the potential ACEC would be closed to motor vehicles. Consequently, Alternative D would best protect the relevant and important values from motorized vehicle use.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Impacts would be the same as those described under Alternative C.

Locatable Minerals

Impacts would be similar to those described under Alternative C. Additionally, under Alternative D, 15,800 acres (98% of the potential ACEC) would be proposed for withdrawal from mineral entry, precluding impacts to relevant and important values from mining exploration and development.

Impacts from Special Designations

Areas of Critical Environmental Concern

Impacts would be the same as those described under Alternative C.

Old Woman Front Potential ACEC

The Old Woman Front RNA Potential ACEC is located in eastern Sevier County, adjacent to the Old Woman Plateau RNA on the Fishlake National Forest. It encompasses 330 acres. Designating this area as an ACEC would complement the adjacent Forest Service RNA and provide a logical topographical boundary for the area. The relevant and important value of the area is its relict vegetation.

Impacts to the relevant and important value of this ACEC could occur from the following resource management programs:

- Fish and Wildlife
- Fire and Fuels Management
- Forest and Woodland Products
- Livestock Grazing
- Recreation
- Travel Management
- Lands and Realty
- Minerals and Energy
- Special Designations.

Other programs were determined to have little or no impact on the relevant and important values of this potential ACEC.

Alternative N: No Action

Impacts from Fish and Wildlife

Under Alternative N, vegetation treatments to meet terrestrial, aquatic, and riparian habitat objectives could pose risks to relict vegetation.

Impacts from Fire and Fuels Management

Alternative N would allow fire and fuels management and suppression activities that could crush or remove relict vegetation.

Impacts from Forest and Woodland Products

Alternative N would allow the harvest of forest and woodland products. However, due to the remote location and lack of access, the potential of harvest and the associated impacts to relict vegetation would both be low.

Impacts from Livestock Grazing

Under Alternative N, the Old Woman Front potential ACEC would be available for livestock grazing, so the relict vegetation could be grazed by domestic livestock. Management of livestock grazing in accordance with the *Fundamentals of Rangeland Health* and *Standards and Guidelines for Grazing Administration* would minimize impacts to the relict plant community, but these alternatives would pose some risks to the relevant and important value of relict vegetation.

Impacts from Recreation

Management in Alternative N could allow SRPs to be issued within the potential ACEC. There has been little-to-no demand for SRPs within this area. Prior to issuance of an SRP, site-specific analysis would be required and could provide mitigation for relict vegetation.

Impacts from Travel Management

Under Alternative N, the Old Woman Front is open to OHV use (including cross-country travel), which presents the greatest risk to relict vegetation from motorized vehicles.

Impacts from Lands and Realty

The potential ACEC is not recommended for withdrawal under Alternative N, which would allow mineral activities to be proposed within the area, possibly resulting in vegetation loss.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Under Alternative N, all of the potential ACEC would be open to oil and gas leasing subject to standard lease terms and conditions or with open to oil and gas leasing subject to moderate constraints (TL, CSU) restrictions. Among the alternatives, this proposed decision would pose the greatest risk to relevant and important relict vegetation values from surface disturbance caused by oil and gas exploration.

Locatable Minerals

Under Alternative N, exploration and development of locatable minerals could impact relevant and important relict vegetation values that are sensitive to surface disturbance. Locatable mineral exploration and development would be allowed under the General Mining Law. FLPMA requires BLM to regulate mining activities to prevent undue and unnecessary environmental degradation to resources.

Impacts from Special Designations

Areas of Critical Environmental Concern

Under Alternative N, no ACEC would be designated and no special management prescriptions would be implemented to specifically protect the relevant and important relict vegetation of the area. There would be a potential for impacts to relevant and important relict vegetation from resource decisions under this alternative.

Alternative A

Impacts from Fish and Wildlife

Impacts would be the same as those described under Alternative N.

Impacts from Fire and Fuels Management

Impacts would be the same as those described under Alternative N.

Impacts from Forest and Woodland Products

Impacts would be the same as those described under Alternative N.

Impacts from Livestock Grazing

Impacts would be the same as those described under Alternative N.

Impacts from Recreation

Impacts would be the same as those described under Alternative N.

Impacts from Travel Management

Under Alternative A, OHV use would be limited to designated routes within the potential ACEC, reducing the risks greatly over Alternative N. No routes are currently identified within this area. If routes were designated, this motorized activity could pose some risk to relevant and important relict vegetation by potential disturbance adjacent to these routes.

Impacts from Lands and Realty

Impacts would be the same as those described under Alternative N.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Impacts would be the same as those described under Alternative N.

Locatable Minerals

Impacts would be the same as those described under Alternative N.

Impacts from Special Designations

Areas of Critical Environmental Concern

Impacts would be the same as those described under Alternative N.

Proposed RMP

Impacts from Fish and Wildlife

Under the Proposed RMP, no wildlife habitat manipulation would be allowed, thus eliminating the risks to relevant and important relict vegetation from these types of treatments.

Impacts from Fire and Fuels Management

Under the Proposed RMP, requirements to use fire to accomplish the objectives of the area, use "light on the land" techniques (which minimize disturbance), and avoid the use of heavy equipment would best protect the relevant and important value of relict vegetation.

Impacts from Forest and Woodland Products

Under the Proposed RMP, the harvest of forest and woodland products would not be allowed, providing the best protection of the relevant and important value.

Impacts from Livestock Grazing

Under the Proposed RMP, the potential ACEC would be unavailable to grazing, eliminating the risks from livestock grazing to the relevant and important relict vegetation value.

Impacts from Recreation

Management actions under the Proposed RMP would preclude issuance of SRPs and would allow no impacts from this type of activity.

Impacts from Travel Management

Under the Proposed RMP, the potential ACEC would be closed to OHV use, eliminating any impacts to the relict vegetation from motorized use.

Impacts from Lands and Realty

Under the Proposed RMP, the potential ACEC is proposed to be withdrawn from mineral entry, precluding locatable mineral development, which would protect the relevant and important relict vegetation values from ground disturbance caused by mineral exploration and development. If the area is not withdrawn but an ACEC is designated, a plan of operations would be required that would address the effects on relevant and important values and other resource concerns.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Under the Proposed RMP, all of the potential ACEC would be open to leasing subject to major constraints (NSO), precluding any impacts to relevant and important values from oil and gas leasing.

Locatable Minerals

Under the Proposed RMP, within a designated ACEC, federal regulations (43 CFR 3809.11 (c)(3)) require that a plan of operation be submitted for any operation causing surface disturbance greater than casual use. This regulation would mitigate the impacts of mining exploration and development on the relict vegetation relevant and important values.

Impacts from Special Designations

Areas of Critical Environmental Concern

Under the Proposed RMP, Old Woman Front RNA ACEC would be designated on 330 acres of public land in eastern Sevier County, adjacent to the Old Woman Plateau RNA on the Fishlake National Forest. Management actions for the Old Woman Front RNA ACEC associated with the Proposed RMP (i.e., protection of relict vegetation, closing the ACEC to OHV use) described above, designating the ACEC would allow no uses that would cause irreparable damage to relevant and important values.

Alternative C

Impacts from Fish and Wildlife

Impacts would be the same as those described under the Proposed RMP.

Impacts from Fire and Fuels Management

Impacts would be the same as those described under the Proposed RMP.

Impacts from Forest and Woodland Products

Impacts would be the same as those described under the Proposed RMP.

Impacts from Livestock Grazing

Impacts would be the same as those described under the Proposed RMP.

Impacts from Recreation

Impacts would be the same as those described under the Proposed RMP.

Impacts from Travel Management

Impacts would be the same as those described under the Proposed RMP.

Impacts from Lands and Realty

Impacts would be the same as those described under the Proposed RMP.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Impacts would be the same as those described under the Proposed RMP.

Locatable Minerals

Impacts would be the same as those described under the Proposed RMP.

Impacts from Special Designations

Areas of Critical Environmental Concern

Impacts would be the same as those described under the Proposed RMP.

Alternative D

Impacts from Fish and Wildlife

Impacts would be the same as those described under the Proposed RMP.

Impacts from Fire and Fuels Management

Impacts would be the same as those described under the Proposed RMP.

Impacts from Forest and Woodland Products

Impacts would be the same as those described under the Proposed RMP.

Impacts from Livestock Grazing

Impacts would be the same as those described under the Proposed RMP.

Impacts from Recreation

Impacts would be the same as those described under the Proposed RMP.

Impacts from Travel Management

Impacts would be the same as those described under the Proposed RMP.

Impacts from Lands and Realty

Impacts would be the same as those described under the Proposed RMP.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Impacts would be the same as those described under the Proposed RMP.

Locatable Minerals

Impacts would be the same as those described under the Proposed RMP.

Impacts from Special Designations

Areas of Critical Environmental Concern

Impacts would be the same as those described under the Proposed RMP.

Parker Mountain Potential ACEC

The Parker Mountain Potential ACEC is located in western Wayne County on the Awapa Plateau. The area totals 107,900 acres. Relevant and important values are sagebrush-steppe habitat and SSS (Greater sage-grouse, Utah prairie dog, and pygmy rabbit).

Impacts to the relevant and important values of this ACEC could occur from the following resource management programs:

- Special Status Species
- Fish and Wildlife
- Travel Management
- Minerals and Energy
- Special Designations.

Other programs were determined to have little or no impact on the relevant and important values of this potential ACEC.

Alternative N: No Action

Impacts from Special Status Species

Under all alternatives, management actions such as prohibiting the destruction, adverse modification, or fragmentation of listed species habitat; maintaining the integrity of SSS habitat; and habitat improvements would benefit SSS. Proposed decisions to manage surface-disturbing activities within wildlife habitat could affect the sage-grouse, prairie dog, and pygmy rabbit values. Under Alternative N, the proposed decision to prohibit surface-disturbing activities from March 1 through July 15 near Greater sage-grouse leks and from April 1 through June 15 within sage-grouse brooding/nesting habitat would have beneficial impacts to sage-grouse, prairie dogs, and pygmy rabbits during those times of the year when the restrictions are in place.

Impacts from Fish and Wildlife

Under this alternative, restricting oil and gas activities in crucial pronghorn antelope habitat from December 1 through April 30 would have beneficial impacts to the Parker Mountain antelope herd and other wildlife inhabiting the area.

Impacts from Travel Management

OHV area designations within the potential ACEC, by alternative, are shown in Table 4-84. Under Alternative N, continuing to allow cross-country OHV use within 97% of the potential ACEC would adversely impact wildlife habitat due to ground disturbance and would also adversely impact wildlife itself due to harassment and displacement.

Table 4-84. OHV Area Designations within Parker Mountain Potential ACEC

		Alternative N (No Action)	Alternative A	Proposed RMP	Alternative C	Alternative D
Open	Acres	104,500	9,300	90	0	0
	% Area	97%	9%	<1%	0%	0%
Limited	Acres	3,400	98,600	107,810	107,900	107,900
	% Area	3%	91%	>99%	100%	100%
Closed	Acres	0	0	0	0	0
	% Area	0%	0%	0%	0%	0%

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Lands open to oil and gas leasing vary by alternative, as shown in Table 4-85. Under Alternative N, 23% of the potential ACEC would be open to leasing under standard terms and conditions. Among the alternatives, this proposed decision would pose the greatest risk to relevant and important relict vegetation values from surface disturbance caused by oil and gas exploration.

Table 4-85. Oil and Gas Leasing Stipulations within Parker Mountain Potential ACEC

		Alternative N (No Action)	Proposed RMP	Alternatives A, C and D
Standard Lease Terms	Acres	24,400	0	0
	% Area	23%	0%	0%
Controlled Surface Use or Timing Stipulations	Acres	77,400	104,200	107,900
	% Area	72%	97%	100%
No Surface Occupancy	Acres	6,100	3,700	0
	% Area	5%	3%	0%
Closed	Acres	0	0	0
	% Area	0%	0%	0%

Impacts from Special Designations

Areas of Critical Environmental Concern

Under Alternative N, no ACEC would be designated and no special management prescriptions would be implemented to specifically protect the relevant and important values of the area. There would be a potential for impacts to relevant and important values from travel and leasable mineral decisions under this alternative.

Alternative A

Impacts from Special Status Species

Under Alternative A, management actions such as prohibiting the destruction, adverse modification or fragmentation of listed species habitat, maintaining the integrity of SSS habitat, and habitat improvements would benefit SSS. Additional strategies (such as utilizing seasonal and spatial buffers for surface-disturbing activities and complying with raptor protection guidelines for powerline construction) would be employed to protect raptors and their habitat. These actions would minimize or eliminate impacts to the SSS relevant and important values. Under this alternative, the proposed decision to prohibit surface-disturbing activities within one-quarter mile of sage-grouse leks from March 15 through June 1 would have beneficial impacts to sage-grouse, prairie dogs, and pygmy rabbits during those times of the year when the restrictions are in place. However, this alternative has no surface disturbance restrictions for sage-grouse brooding/nesting habitat, thus posing a greater risk to relevant and important values than the other alternatives.

Impacts from Fish and Wildlife

Under Alternative A, having no surface disturbance restrictions for crucial pronghorn antelope habitat poses a greater risk to relevant and important values than the other alternatives.

Impacts from Travel Management

Under Alternative A, limiting vehicles to designated routes within 91% of the potential ACEC would greatly reduce these impacts. Continuing to allow cross-country OHV use within 9% of the potential ACEC could result in impacts to wildlife habitat due to ground disturbance, and wildlife itself due to harassment and displacement within that portion of the ACEC. The portion of the ACEC remaining open to OHVs is composed of large boulders, and the SSS of this potential ACEC have not been identified within this area. Portions of the open OHV area have been receiving continuous use from community-based recreational activities for many years.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Under Alternative A, oil and gas leasing throughout the potential ACEC would be subject to moderate constraints (timing limitation, CSU). This would protect the wildlife relevant and important values by restricting use during sensitive seasons.

Impacts from Special Designations

Areas of Critical Environmental Concern

Under Alternative A, no ACEC would be designated and no special management prescriptions would be implemented to specifically protect the relevant and important values of the area. Existing laws, rules, and regulations, as well as management decisions for travel and leasable minerals management, would adequately protect the relevant and important values of the potential ACEC.

Proposed RMP

Impacts from Special Status Species

Under the Proposed RMP, management actions such as prohibiting the destruction, adverse modification or fragmentation of listed species habitat, maintaining the integrity of SSS habitat, and habitat improvements would benefit SSS. Additional strategies (such as utilizing seasonal and spatial buffers for surface-disturbing activities and complying with raptor protection guidelines for powerline construction) would be employed to protect raptors and their habitat. These actions would minimize or eliminate impacts to the SSS relevant and important values.

The decision to limit surface-disturbing activities in sage-grouse habitat would benefit sage-grouse, prairie dogs, and pygmy rabbits during those times of the year when the restrictions are in place. Restrictions include managing the area as open to oil and gas leasing subject to major constraints (NSO) within ½ mile of Greater sage-grouse leks and prohibiting surface disturbing or otherwise disruptive activities within 2 miles of a lek from March 15 through July 15, and within sage-grouse winter habitat from December 15 through March 14 (see Appendix 11 for exceptions, waivers, and modifications).

Impacts from Fish and Wildlife

Restricting surface-disturbing activities in crucial pronghorn antelope habitat from May 15 through June 15 would provide additional benefits to sage-grouse, prairie dogs, and pygmy rabbits over Alternatives N and A.

Impacts from Travel Management

Limiting vehicles to designated routes within 99% of the potential ACEC under the Proposed RMP would greatly reduce the potential for impacts to relevant and important values associated with cross-country OHV use. A 90-acre managed open area would be located within the potential ACEC. The portion of the ACEC remaining open to OHVs is composed of large boulders, and the SSS of this potential ACEC have not been identified within this area. Extensive OHV use has been occurring within this area, and continuing that use would maintain the current condition, not resulting in any change to relevant and important values.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Under the Proposed RMP, oil and gas leasing on 97% of the potential ACEC would be subject to moderate constraints (timing limitation, CSU), and leasing on the remaining 3% would be subject to major constraints (NSO). This would protect the SSS relevant and important values by restricting use during sensitive seasons.

Impacts from Special Designations

Areas of Critical Environmental Concern

Under the Proposed RMP, the potential Parker Mountain ACEC would not be designated and no special management prescriptions would be implemented to specifically protect the relevant and important values of the area. Existing laws, rules, and regulations, as well as management decisions for SSS, fish and wildlife, travel, and leasable minerals management would adequately protect all the relevant and important values of the potential ACEC.

Alternative C

Impacts from Special Status Species

Impacts would be similar to those described under the Proposed RMP, however Alternative C has fewer restrictions on surface disturbing activities within Greater sage-grouse habitat.

Impacts from Fish and Wildlife

Impacts would be the same as those described under the Proposed RMP.

Impacts from Travel Management

The greatest beneficial impacts from travel management would be under Alternatives C and D, where no areas are open to cross-country motorized vehicle travel, thus eliminating the potential for impacts to relevant and important values.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Impacts would be the same as those described under Alternative A.

Impacts from Special Designations

Areas of Critical Environmental Concern

Under Alternative C, Parker Mountain ACEC would be designated on 107,900 acres of public land in Wayne County. In addition to management direction associated with Alternative C, described above, designating the ACEC would allow no uses that would cause irreparable damage to relevant and important values.

Alternative D

Impacts from Special Status Species

Impacts would be the same as those described under Alternative C.

Impacts from Fish and Wildlife

Impacts would be the same as those described under the Proposed RMP.

Impacts from Travel Management

Impacts would be the same as those described under Alternative C.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Impacts would be the same as those described under Alternative A.

Impacts from Special Designations

Areas of Critical Environmental Concern

Impacts would be the same as those described under Alternative C.

Quitchupah Potential ACEC

The Quitchupah Potential ACEC is located in eastern Sevier County along Quitchupah Creek and totals 180 acres. The potential ACEC boundary includes the riparian corridors and associated cultural resource sites and areas that have spiritual value to Native Americans. Relevant and important values are cultural resources and riparian values. Impacts to the relevant and important values of this ACEC could occur from the following resource management programs:

- Vegetation
- Cultural Resources
- Non-WSA Lands with Wilderness Characteristics
- Travel Management
- Special Designations.

Other programs were determined to have little or no impact on the relevant and important values of this potential ACEC.

Alternative N: No Action

Impacts from Vegetation

Under all alternatives, no surface-disturbing activities would be allowed within identified distances (which vary by alternative) from riparian areas unless it could be shown that there are no practical alternatives, all long-term impacts could be fully mitigated, and the activity would benefit and enhance the riparian area. This would protect the riparian relevant and important values from surface-disturbing activities, but it could restrict potentially beneficial actions such as riparian area restoration and vegetation treatment. Under Alternative N, no surface-disturbing activities would be allowed within 500 feet of riparian areas.

Impacts from Cultural Resources

Under Alternative N, management of cultural resources within the potential ACEC would be in accordance with existing cultural resource laws, which would protect this relevant and important value.

Impacts from Non-WSA Lands with Wilderness Characteristics

A portion of the Wildcat Knolls (30 acres) non-WSA lands with wilderness characteristics lies within the 180-acre potential Quitchupah ACEC. No actions to maintain wilderness characteristics on lands outside of WSAs are proposed under Alternative N, resulting in no additional protection for relevant and important values.

Impacts from Travel Management

Proposed OHV area designations vary by alternative. Under Alternative N, Trough Hollow is closed to OHV use (54 acres, or 30% of the ACEC), which would protect the relevant and important values. For Quitchupah Creek, Link Canyon, and Water Hollow (121 acres, 67% of the ACEC), unrestricted OHV use would continue to pose a threat to cultural resources, Native American concerns, and riparian values.

Impacts from Special Designations

Wild and Scenic Rivers

Under Alternative N, managing Quitchupah Creek as an eligible WSR to protect its free-flowing nature and cultural outstandingly remarkable values would protect and enhance the cultural and riparian relevant and important values.

Areas of Critical Environmental Concern

Under Alternative N, no ACEC would be designated and no special management prescriptions would be implemented to specifically protect the relevant and important values of the area. There would be a potential for impacts to relevant and important values from travel management decisions under this alternative.

Alternative A

Impacts from Vegetation

Under Alternative A, no surface-disturbing activities would be allowed within 330 feet on each side of the stream or the 100-year floodplain, whichever is greater, unless it could be shown that there are no practical alternatives, all long-term impacts could be fully mitigated, and the activity would benefit and enhance the riparian area. This would protect the riparian relevant and important value from surface-disturbing activities, but it could restrict potentially beneficial actions such as riparian area restoration and vegetation treatment.

Impacts from Cultural Resources

Impacts would be the same as those described under Alternative N.

Impacts from Non-WSA Lands with Wilderness Characteristics

Impacts would be the same as those described under Alternative N.

Impacts from Travel Management

Under Alternative A, limiting vehicles to designated routes within the potential ACEC would protect the cultural resources, Native American concerns, and riparian values from disturbance.

Impacts from Special Designations

Wild and Scenic Rivers

There would be no additional protective management for Quitchupah Creek because it is not designated as a suitable WSR under Alternative A.

Areas of Critical Environmental Concern

Under Alternative A, no ACEC would be designated and no special management prescriptions would be implemented to specifically protect the relevant and important values of the area. Existing laws, rules, and regulations, as well as management decisions for this alternative, would adequately protect the relevant and important values of the potential ACEC.

Proposed RMP

Impacts from Vegetation

Under the Proposed RMP, no surface-disturbing activities would be allowed within 330 feet on each side of the stream or the 100-year floodplain, whichever is greater, unless it could be shown that there are no practical alternatives, all long-term impacts could be fully mitigated, and the activity would benefit and enhance the riparian area. This would protect the riparian relevant and important value from surface-disturbing activities, but it could restrict potentially beneficial actions such as riparian area restoration and vegetation treatment. Management to reduce surface-disturbing activities would also indirectly benefit the cultural relevant and important value of the potential Quitchupah ACEC.

Impacts from Cultural Resources

Impacts under the Proposed RMP would be the same as those described under Alternative N. Management of cultural resources within the potential ACEC would be in accordance with existing cultural resource laws, which would protect the cultural relevant and important value.

Impacts from Non-WSA Lands with Wilderness Characteristics

A portion of the Wildcat Knolls (30 acres) non-WSA lands with wilderness characteristics lies within the 180-acre potential Quitchupah ACEC. This non-WSA area would not be managed for wilderness characteristics within the Proposed RMP, resulting in no additional protection for relevant and important values.

Impacts from Travel Management

Impacts would be the same as those described under Alternative A. Under the Proposed RMP, limiting vehicles to designated routes within the potential ACEC would protect the cultural resources, Native American concerns, and riparian relevant and important values from disturbance.

Impacts from Special Designations

Wild and Scenic Rivers

There would be no additional protective management for Quitchupah Creek because it is not designated as a suitable WSR under the Proposed RMP.

Areas of Critical Environmental Concern

Under the Proposed RMP, the potential Quitchupah ACEC would not be designated and no special management prescriptions would be implemented to specifically protect the relevant and important values of the area. Existing laws, rules, and regulations, as well as management decisions within the Proposed RMP for riparian protection (no surface-disturbing activities within 330 feet on each side of the stream or the 100-year floodplain) and travel management (limiting vehicles to designated routes), would adequately protect the riparian and cultural relevant and important values of the potential ACEC.

Alternative C

Impacts from Vegetation

Under Alternative C, no surface-disturbing activities would be allowed within 660 feet from riparian areas unless it could be shown that there are no practical alternatives, all long-term impacts could be fully mitigated, and the activity would benefit and enhance the riparian area. This would protect the riparian relevant and important value from surface-disturbing activities, but it could restrict potentially beneficial actions such as riparian area restoration and vegetation treatment.

Impacts from Cultural Resources

Under Alternative C, special management for the ACEC would include an increase in public awareness of cultural resource values; an increase in law enforcement presence; and if necessary, installing fencing or other direct protection of important sites. These prescriptions would provide added protection for the cultural resources in the area.

Impacts from Non-WSA Lands with Wilderness Characteristics

Impacts would be the same as those described under Alternative N.

Impacts from Travel Management

Under Alternative C, closing portions of the area to OHV use (90 acres), with the remaining acres limited to designated routes, would protect the cultural resources, Native American concerns, and riparian values from disturbance.

Impacts from Special Designations

Wild and Scenic Rivers

Under Alternative C, designating Quitchupah Creek as a suitable WSR to protect its free-flowing nature and cultural outstandingly remarkable values would protect and enhance the cultural and riparian relevant and important values of the potential ACEC.

Areas of Critical Environmental Concern

Under Alternative C, designating the Quitchupah Archaeological ACEC to protect relevant and important archaeological, riparian, and Native American concerns would provide increased management emphasis for protecting these relevant and important values.

Alternative D

Impacts from Vegetation

Impacts would be the same as those described under Alternative C.

Impacts from Cultural Resources

Impacts would be similar to those described under Alternative C, except that special management under Alternative D would allow no fencing in non-WSA lands with wilderness characteristics, which may not protect the cultural resources as much as Alternative C.

Impacts from Non-WSA Lands with Wilderness Characteristics

A portion of the Wildcat Knolls (30 acres) non-WSA lands with wilderness characteristics lies within the 180-acre potential Quitchupah ACEC. Under Alternative D, protecting the non-WSA lands with wilderness characteristics within the Quitchupah ACEC would provide indirect protection for relevant and important values on 30 acres (17% of the potential ACEC). Specifics are described in the travel management discussion in this section.

Impacts from Travel Management

Impacts would be similar to those described under Alternative D, except that within Alternative D, 110 acres would be closed to OHV use. This alternative would provide the greatest level of protection for the relevant and important values of the potential ACEC.

Impacts from Special Designations

Wild and Scenic Rivers

Impacts would be the same as those described under Alternative C.

Areas of Critical Environmental Concern

Impacts would be the same as those described under Alternative C.

Rainbow Hills Potential ACEC

The Rainbow Hills Potential ACEC is located just east of Richfield and encompasses the colorful Arapien Shale outcropping. It totals 4,000 acres of public lands. Relevant and important values are mule deer, mule deer habitat, special status plants (Utah phacelia, Arapien stickleaf, Wards penstemon, rainbow rabbitbrush, Sigurd townsendia, and Glenwood milkvetch), and the naturally functioning ecosystem. Impacts to the relevant and important values of this ACEC could occur from the following resource management programs:

- Special Status Species
- Fish and Wildlife
- Fire and Fuels Management
- Travel Management
- Lands and Realty
- Minerals and Energy
- Special Designations.

Other programs were determined to have little or no impact on the relevant and important values of this potential ACEC.

Alternative N: No Action

Impacts from Special Status Species

Under all alternatives, management actions such as prohibiting the destruction, adverse modification, or fragmentation of listed species habitat; maintaining the integrity of SSS habitat; and habitat improvements would benefit SSS.

Impacts from Fish and Wildlife

Fish and wildlife management actions for the benefit of mule deer and their habitat would benefit those relevant and important values. These management prescriptions and seasonal and spatial restrictions on activities within the potential ACEC vary by alternative. Under Alternative N, a seasonal restriction on oil and gas exploration and development would be required in crucial and high-value mule deer habitat during sensitive seasons, such as fawning. These seasonal restrictions would provide greater protection for the mule deer and habitat relevant and important values than Alternative A, but less than under the Proposed RMP and Alternatives C and D.

Impacts from Fire and Fuels Management

Under Alternative N, unwanted wildfire in crucial mule deer habitats could result in impacts to crucial mule deer habitats. However, this alternative includes stabilization and rehabilitation efforts as needed for every wildland fire. Stabilization and rehabilitation efforts would benefit fish and wildlife species over the long term by decreasing erosion and restoring or improving habitat conditions following a fire event.

Impacts from Travel Management

Proposed OHV area designations, by alternative, are shown in Table 4-86. Under Alternative N, continuing to manage Rainbow Hills as an open OHV area could have adverse impacts on the relevant and important values because cross-country travel could disrupt wildlife use patterns and habitat. SSS would also continue to be impacted by vehicle travel, resulting in vegetation disturbance.

Table 4-86. OHV Area Designations within Rainbow Hills Potential ACEC

		Alternative N (No Action	Alternative A	Proposed RMP	Alternatives C and D
Open	**Acres**	4,000	3,800	700	0
	% Area	100%	95%	17%	0%
Limited	**Acres**	0	200	3,300	0
	% Area	0%	5%	83%	0%
Closed	**Acres**	0	0	0	4,000
	% Area	0%	0%	0%	100%

Impacts from Lands and Realty

Under Alternative N, proposed decisions for land tenure adjustments could maintain, increase, or decrease the land in federal ownership, having a beneficial or adverse impact on relevant and important values that would be determined in site-specific environmental analysis.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

The Rainbow Hills area is within the Covenant Oil Field, presently encompassed by authorized oil and gas leases, and the producing oil field in this RFD area overlaps this potential ACEC. Under Alternative N, exploration and development activities could affect relevant and important values due to surface and human-caused disturbances if they occur within the potential ACEC. The existing leases are a valid existing right and would have priority over the ACEC designation. The effects of any proposals on relevant and important values would be analyzed in site-specific analysis.

Locatable Minerals

Locatable mineral exploration and development would be allowed under the General Mining Law. FLPMA requires BLM to regulate mining activities to prevent undue and unnecessary environmental degradation to resources. SSS would be protected by law and BLM policy. This would minimize impacts of mining activities on relevant and important values of the potential ACEC. In addition, there is a low-to-moderate potential for occurrence of locatable mineral resources within the area. Currently, there is little interest in development. Impacts to relevant and important values from future exploration and development are expected to be low.

Impacts from Special Designations

Areas of Critical Environmental Concern

Under Alternative N, no ACEC would be designated and no special management prescriptions would be implemented to specifically protect the relevant and important values of the area. There would be a potential for impacts to relevant and important values from resource management decisions under this alternative.

Alternative A

Impacts from Special Status Species

Under Alternative A, management actions such as prohibiting the destruction, adverse modification, or fragmentation of listed species habitat; maintaining the integrity of SSS habitat; and habitat improvements would benefit SSS. Additional strategies (such as utilizing seasonal and spatial buffers for surface-disturbing activities and complying with raptor protection guidelines for powerline construction) would be employed to protect raptors and their habitat. These actions would minimize or eliminate impacts to the SSS relevant and important values.

Impacts from Fish and Wildlife

Under Alternative A, no seasonal or spatial restrictions of human presence or surface-disturbing activities would be required, which could result in greater impacts to mule deer and habitats during critical periods. This alternative would provide the least protection for the relevant and important values of mule deer and mule deer habitat.

Impacts from Fire and Fuels Management

Impacts would be the same as those described under Alternative N.

Impacts from Travel Management

Impacts would be similar to those described under Alternative N. Under Alternative A, 95% of the potential ACEC would continue to be open to cross-country OHV travel.

Impacts from Lands and Realty

Impacts would be the same as those described under Alternative N.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Impacts would be the same as those described under Alternative N.

Locatable Minerals

Impacts would be the same as those described under Alternative N.

Impacts from Special Designations

Areas of Critical Environmental Concern

Under Alternative A, no ACEC would be designated and no special management prescriptions would be implemented to specifically protect the relevant and important values of the area. There would be a potential for impacts to relevant and important values from resource management decisions under this alternative.

Proposed RMP

Impacts from Special Status Species

Under the Proposed RMP, management actions such as prohibiting the destruction, adverse modification, or fragmentation of listed species habitat; maintaining the integrity of SSS habitat; and habitat improvements would benefit SSS. Additional strategies (such as utilizing seasonal and spatial buffers for surface-disturbing activities and complying with raptor protection guidelines for powerline construction) would be employed to protect raptors and their habitat. These actions would minimize or eliminate impacts to the SSS relevant and important values and indirectly benefit the mule deer, mule deer habitat and naturally functioning ecosystem relevant and important values of the potential Rainbow Hills ACEC.

Impacts from Fish and Wildlife

Under the Proposed RMP, seasonal or spatial restriction of human presence or surface-disturbing activities could provide greater benefits to mule deer and habitats than Alternatives N and A, but less than Alternatives C and D. Prescriptive grazing would be used to favor forage production for big game high-priority and crucial winter range. OHV use would be limited to designated routes in mule deer crucial habitat, and seasonal restrictions of surface-disturbing activities would be required in crucial mule deer habitats. These management prescriptions would provide adequate protection of the mule deer and mule deer habitat relevant and important values.

Impacts from Fire and Fuels Management

Impacts would be similar to those described under Alternative N, except that the Proposed RMP would include stabilization efforts to sustain ecosystems, improve public health, improve safety, and to help communities protect infrastructure. Priority would be given to areas that pose a threat to life and property and areas with a potential for invasive weeds. Stabilization efforts would have the potential to benefit mule deer and the mule deer habitat relevant and important values in the long term.

Impacts from Travel Management

Under the Proposed RMP, open OHV use would occur on 700 acres within the potential Rainbow Hills ACEC. Boundaries of the open area have been adjusted to eliminate the potential for impacts to the SSS relevant and important value of the potential ACEC. Limiting OHVs to designated routes within the remainder of the area would reduce the impacts created by cross-country use. Vehicle travel on

designated routes could temporarily disrupt mule deer if these routes are near feeding and other occupied areas. Few routes have been identified for designation within this area, reducing the potential for impacts to all the relevant and important values.

Impacts from Lands and Realty

Under the Proposed RMP, proposed decisions for land tenure adjustments could maintain, increase, or decrease the land in federal ownership, having a beneficial or adverse impact on relevant and important values that would be determined in site-specific environmental analysis. Lands with SSS populations would likely not be offered for disposal, thus not impacting the SSS relevant and important value. Any sale of land within the potential ACEC would result in a loss of mule deer habitat in federal ownership and would be considered in site-specific analysis prior to offering the land for sale. Actual impacts to the mule deer and mule deer habitat relevant and important values would depend upon the acreage sold and how the land is used and developed after it leaves federal ownership.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

The Rainbow Hills area is within the Covenant Oil Field, presently encompassed by authorized oil and gas leases, and the producing oil field in this RFD area overlaps this potential ACEC. Under the Proposed RMP, exploration and development activities could affect relevant and important values due to surface and human-caused disturbances if they occur within the potential ACEC. The existing leases are a valid existing right and would have priority over the ACEC designation. The effects of any proposals on relevant and important values would be analyzed in site-specific analysis.

Locatable Minerals

Locatable mineral exploration and development would be allowed under the General Mining Law. FLPMA requires BLM to regulate mining activities to prevent undue and unnecessary environmental degradation to resources. SSS would be protected by law and BLM policy. This would minimize impacts of mining activities on all the relevant and important values of the potential ACEC. In addition, there is a low-to-moderate potential for occurrence of locatable mineral resources within the area. Currently, there is little interest in development. Impacts to relevant and important values from future exploration and development are expected to be low.

Impacts from Special Designations

Areas of Critical Environmental Concern

Under the Proposed RMP, the potential Rainbow Hills ACEC would not be designated and no special management prescriptions would be implemented to specifically protect the relevant and important values of the area. A small portion of the potential ACEC would remain open for OHV use, while providing protection to SSS relevant and important value. Existing laws, rules, and regulations, as well as management decisions within the Proposed RMP for fish and wildlife (crucial habitats), fire and fuels, travel, lands and realty and locatable minerals, would provide protection for the relevant and important values of the potential ACEC.

Alternative C

Impacts from Special Status Species

Impacts would be the same as those described under Alternative A.

Impacts from Fish and Wildlife

Under Alternative C, prescriptive grazing would be used to favor forage production for big game ranges. OHV use in mule deer crucial winter range would be limited to designated routes or closed. Seasonal restrictions would apply to surface-disturbing activities in crucial and high-value mule deer habitats.

Impacts from Fire and Fuels Management

Under Alternative C, the proposed decision to suppress unwanted wildfire in crucial mule deer habitats would benefit the mule deer by protecting the browse species that could otherwise be damaged by wildland fire and subsequently out-competed by undesirable species.

Impacts from Travel Management

Under Alternative C, closing the Rainbow Hills to OHV use would eliminate the potential impacts from motorized travel described above.

Impacts from Lands and Realty

Under Alternative C, proposed decisions for land tenure adjustments would benefit all relevant and important values by keeping the land in federal ownership and protecting it from development. In addition, proposed withdrawal from mineral entry would protect relevant and important values from surface disturbance caused by mineral exploration and development.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

The Rainbow Hills area is within the Covenant Oil Field, presently encompassed by authorized oil and gas leases, and the producing oil field in this RFD area overlaps this potential ACEC. Under Alternative C, management prescriptions would allow leasing with NSO to protect special status and endemic plants and the naturally functioning system relevant and important values. However, the existing leases are a valid existing right and would have priority over the ACEC designation, and those leases are not subject to NSO. Surface-disturbing activities from these existing leases could continue to pose risks to the relevant and important values. The effects of any proposals on relevant and important values would be analyzed in site-specific analysis.

Locatable Minerals

Under Alternative C, withdrawing the area from locatable mineral entry would protect relevant and important values from disturbances caused by mining activities.

Impacts from Special Designations

Areas of Critical Environmental Concern

Under Alternative C, Rainbow Hills ACEC would be designated on 4,000 acres of public land to protect and provide special management for the mule deer, mule deer habitat, special status plants, and the naturally functioning ecosystem relevant and important values. Under Alternative C, the proposed decision to designate a Rainbow Hills ACEC would (1) allow no uses that would cause irreparable damage to relevant and important values and (2) prescribe management to protect and enhance all relevant and important values.

Alternative D

Impacts from Special Status Species

Impacts would be the same as those described under Alternative A.

Impacts from Fish and Wildlife

Impacts would be similar to those described under Alternative C.

Impacts from Fire and Fuels Management

Impacts would be the same as those described under Alternative C.

Impacts from Travel Management

Impacts would be the same as those described under Alternative C.

Impacts from Lands and Realty

Impacts would be the same as those described under Alternative C.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Impacts would be the same as those described under Alternative C.

Locatable Minerals

Impacts would be the same as those described under Alternative C.

Impacts from Special Designations

Areas of Critical Environmental Concern

Impacts would be the same as those described under Alternative C.

Sevier Canyon Potential ACEC

The Sevier Canyon Potential ACEC encompasses the gorge bordering the Sevier River located between the towns of Marysvale and Sevier and totals 8,900 acres of public land. Relevant and important values are mule deer, mule deer habitat, SSS, and riparian areas.

Impacts to the relevant and important values of this ACEC could occur from the following resource management programs:

- Vegetation
- Special Status Species
- Fire and Fuels Management
- Travel Management
- Lands and Realty
- Special Designations.

Other programs were determined to have little or no impact on the relevant and important values of this potential ACEC.

Alternative N: No Action

Impacts from Vegetation

Under all alternatives, no surface-disturbing activities would be allowed within identified distances (which vary by alternative) from riparian areas unless it could be shown that there are no practical alternatives, all long-term impacts could be fully mitigated, and the activity would benefit and enhance

the riparian area. This would protect the riparian relevant and important values from surface-disturbing activities, but it could restrict potentially beneficial actions such as riparian area restoration and vegetation treatment. Under Alternative N, no surface-disturbing activities would be allowed within 500 feet of riparian areas.

Impacts from Special Status Species

Under all alternatives, management actions such as prohibiting the destruction, adverse modification, or fragmentation of listed species habitat; maintaining the integrity of SSS habitat; and habitat improvements would benefit SSS.

Impacts from Fire and Fuels Management

Under Alternative N, unwanted wildfire in crucial mule deer habitats could result in impacts to crucial mule deer habitats. However, this alternative includes stabilization and rehabilitation efforts as needed for every wildland fire. Stabilization and rehabilitation efforts would benefit fish and wildlife species over the long term by decreasing erosion and restoring or improving habitat conditions following a fire event.

Impacts from Travel Management

Proposed OHV area designations, by alternative, are shown in Table 4-87. Under Alternative N, continuing to manage the area as open to cross-country OHV use could adversely impact mule deer, SSS, and riparian values by allowing disruption, crushing, and removal of vegetation and loss of habitat.

Table 4-87. OHV Area Designations within Sevier Canyon Potential ACEC

		Alternatives N and A	The Proposed RMP and Alternatives C and D
Open	Acres	8,900	0
	% Area	100%	0%
Limited	Acres	0	8,900
	% Area	0%	100%

Impacts from Lands and Realty

Under Alternative N, proposed decisions for land tenure adjustments could maintain, increase, or decrease the land in federal ownership, having a beneficial or adverse impact on relevant and important values that would be determined in site-specific environmental analysis.

Impacts from Special Designations

Areas of Critical Environmental Concern

Under Alternative N, no ACEC would be designated and no special management prescriptions would be implemented to specifically protect the relevant and important values of the area. There would be a potential for impacts to relevant and important values from resource management decisions under this alternative.

Alternative A

Impacts from Vegetation

Under Alternative A, no surface-disturbing activities would be allowed within 330 feet on each side of the stream, unless it could be shown that there are no practical alternatives, all long-term impacts could be

fully mitigated, and the activity would benefit and enhance the riparian area. This would protect the riparian relevant and important value from surface-disturbing activities, but it could restrict potentially beneficial actions such as riparian area restoration and vegetation treatment.

Impacts from Special Status Species

Under Alternative A, management actions such as prohibiting the destruction, adverse modification, or fragmentation of listed species habitat; maintaining the integrity of SSS habitat; and habitat improvements would benefit SSS. Additional strategies (such as utilizing seasonal and spatial buffers for surface-disturbing activities and complying with raptor protection guidelines for powerline construction) would be employed to protect raptors and their habitat. These actions would minimize or eliminate impacts to the SSS relevant and important values.

Impacts from Fire and Fuels Management

Impacts would be the same as those described under Alternative N.

Impacts from Travel Management

Impacts would be the same as those described under Alternative N.

Impacts from Lands and Realty

Impacts would be the same as those described under Alternative N.

Impacts from Special Designations

Areas of Critical Environmental Concern

Impacts would be the same as those described under Alternative N.

Proposed RMP

Impacts from Vegetation

Impacts would be similar to those described under Alternative A, except within the Proposed RMP the buffer zone would be equal to the 100-year floodplain or 330 feet on either side from the centerline, whichever is greater. This would provide protection for the riparian relevant and important value of the potential Sevier Canyon ACEC

Impacts from Special Status Species

Management actions such as prohibiting the destruction, adverse modification, or fragmentation of listed species habitat; maintaining the integrity of SSS habitat; and habitat improvements would benefit SSS. Additional strategies (such as utilizing seasonal and spatial buffers for surface-disturbing activities and complying with raptor protection guidelines for powerline construction) would be employed to protect raptors and their habitat. These actions would minimize or eliminate impacts to the SSS relevant and important values.

Impacts from Fire and Fuels Management

Impacts would be similar to those described under Alternative N, except that the Proposed RMP would include stabilization efforts to sustain ecosystems, improve public health, improve safety, and help communities protect infrastructure. Priority would be given to areas that pose a threat to life and property and areas with a potential for invasive weeds. Stabilization efforts would have the potential to benefit mule deer and mule deer habitat relevant and important values in the long term.

Impacts from Travel Management

Under the Proposed RMP, limiting vehicles to designated routes would reduce adverse impacts to riparian areas and mule deer habitat and reduce the potential for harassment of mule deer and SSS, providing protection to all the relevant and important values of the potential ACEC. Impacts would be less than Alternatives N and A, and the same as Alternatives C and D.

Impacts from Lands and Realty

Under the Proposed RMP, proposed decisions for land tenure adjustments could maintain, increase, or decrease the land in federal ownership, having a beneficial or adverse impact on relevant and important values that would be determined in site-specific environmental analysis. Lands with riparian values and SSS populations would likely not be offered for disposal, thus not impacting the riparian and SSS relevant and important value. Any sale of land within the potential ACEC would result in a loss of mule deer habitat in federal ownership and would be considered in site-specific analysis prior to offering the land for sale. Actual impacts to the mule deer and mule deer habitat relevant and important values would depend upon the acreage sold and how the land is used and developed after it leaves federal ownership.

Impacts from Special Designations

Areas of Critical Environmental Concern

Under the Proposed RMP, the potential Sevier Canyon ACEC would not be designated and no special management prescriptions would be implemented to specifically protect the relevant and important values of the area. Existing laws, rules, and regulations, as well as management decisions for riparian protection zones, SSS, fire and fuels, and travel management under the Proposed RMP would provide protection for all the relevant and important values of the potential ACEC.

Alternative C

Impacts from Vegetation

Under Alternative C, no surface-disturbing activities would be allowed within 660 feet from riparian areas unless it could be shown that there are no practical alternatives, all long-term impacts could be fully mitigated, and the activity would benefit and enhance the riparian area. This would protect the riparian relevant and important value from surface-disturbing activities, but it could restrict potentially beneficial actions such as riparian area restoration and vegetation treatment.

Impacts from Special Status Species

Impacts would be the same as those described under Alternative A.

Impacts from Fire and Fuels Management

Under Alternative C, the proposed decision to suppress unwanted wildfire in crucial mule deer habitats would benefit the mule deer by protecting the browse species that could otherwise be damaged by wildland fire and subsequently out-competed by undesirable species.

Impacts from Travel Management

Impacts would be the same as those described under the Proposed RMP.

Impacts from Lands and Realty

Under Alternative C, proposed decisions for land tenure adjustments would benefit all relevant and important values by keeping the land in federal ownership and protecting it from development.

Impacts from Special Designations

Areas of Critical Environmental Concern

Under Alternative C, Sevier Canyon ACEC would be designated on 8,900 acres of public land to protect and provide special management for the mule deer and riparian relevant and important values. In addition to management direction associated with Alternative C described above, designating the ACEC would allow no uses that would cause irreparable damage to relevant and important values.

Alternative D

Impacts from Vegetation

Impacts would be the same as those described under Alternative C.

Impacts from Special Status Species

Impacts would be the same as those described under Alternative A.

Impacts from Fire and Fuels Management

Impacts would be the same as those described under Alternative C.

Impacts from Travel Management

Impacts would be the same as those described under the Proposed RMP.

Impacts from Lands and Realty

Impacts would be the same as those described under Alternative C.

Impacts from Special Designations

Areas of Critical Environmental Concern

Impacts would be the same as those described under Alternative C.

Special Status Species Potential ACEC

The Special Status Species Potential ACEC encompasses documented locations of SSS identified in the evaluations of the various ACEC proposals. In total, this represents 15,100 acres of public lands. Relevant and important values are the following SSS: Winkler pincushion cactus, Wright fishhook cactus, last chance townsendia, Rabbit Valley gilia, Cronquist wild buckwheat, Creutzfeldt flower, Wards penstemon, Basalt milkvetch, Bicknell milkvetch, hole-in-the-rock prairie clover, Dana's milkvetch, Barneby milkvetch, Psoralea globemallow, Heil's beavertail, Jane's globemallow, flat-top wild buckwheat, Townsend's big eared bat, Allen's big eared bat, big free-tailed bat, fringed miotis, ferruginous hawk, bald eagle, burrowing owl, long-billed curlew, southwestern willow flycatcher, Greater sage-grouse, bluehead sucker, flannelmouth sucker, round-tail sucker, leatherside chub, and desert night lizard.

Impacts to the relevant and important values of this ACEC could occur from the following resource management programs:

- Vegetation
- Special Status Species
- Travel Management
- Lands and Realty
- Minerals and Energy

- Special Designations.

Other programs were determined to have little or no impact on the SSS of this potential ACEC.

Alternative N: No Action

Impacts from Vegetation

Under all alternatives, no surface-disturbing activities would be allowed within identified distances (which vary by alternative) from riparian areas unless it could be shown that there are no practical alternatives, all long-term impacts could be fully mitigated, and the activity would benefit and enhance the riparian area. This would protect the riparian relevant and important values from surface-disturbing activities, but it could restrict potentially beneficial actions such as riparian area restoration and vegetation treatment. Under Alternative N, no surface-disturbing activities would be allowed within 500 feet of riparian areas.

Impacts from Special Status Species

Under all alternatives, management actions such as prohibiting the destruction, adverse modification, or fragmentation of listed species habitat; maintaining the integrity of SSS habitat; and habitat improvements would benefit SSS.

Impacts from Travel Management

Proposed decisions for OHV open areas under Alternative N would pose the threat of irreparable damage to some of the special status plant species. If cross-country OHV use occurred within areas occupied by special status plants, they could be crushed, damaged, or destroyed.

Impacts from Lands and Realty

Under Alternative N, proposed decisions for land tenure adjustments could maintain, increase, or decrease the land in federal ownership, having a beneficial or adverse impact on relevant and important values that would be determined in site-specific environmental analysis.

Impacts from Minerals and Energy

Potential impacts of energy and mineral development to special status plant species include direct mortality from construction equipment and vehicles in occupied habitats. Also, habitat could be lost or modified by constructing well pads, pipelines, and associated facilities in occupied and suitable habitats and by disturbing habitat of the species' pollinators. Potential impacts of energy and mineral development to special status animal species include disturbance and harassment, which could interrupt/affect animals during critical activities (such as breeding or foraging), which could impact survival. SSS are scattered in various locations throughout the RFO, which could involve areas open to oil and gas, areas suitable for coal exploration and development, locatable minerals development, and mineral material disposal.

Leasable Minerals—Oil and Gas

SSS that are located in open areas or areas open to leasing subject to moderate constraints (timing limitation, CSU) are at greatest risk from oil and gas activities. Under Alternative N, 58% of the RFO would be open to leasing subject to standard terms and conditions and 19% would be open to leasing subject to moderate constraints (timing limitation, CSU). Lease notices informing potential lessees of restrictions and requirements that could be necessary for the protection of SSS would be attached to oil and gas leases offered in the State. The lease notices and accompanying consultation memoranda are found in Appendix 11. Application of the measures resulted in a "may affect, not likely to adversely affect" determination for the oil and gas leasing program.

Leasable Minerals—Coal

Any direct impacts of coal development on listed plant and animal species would be precluded by Coal Unsuitability Criterion 9, which states that, "federally designated habitat for listed threatened or endangered plant and animal species or species proposed for listing…shall be considered unsuitable."

Locatable Minerals

SSS could be adversely affected by surface-disturbing activities resulting from locatable minerals development. Closing or withdrawing areas from mineral operations would prevent impacts to SSS if they occur within those areas. Alternative N would recommend the fewest acres for withdrawal (169,480 acres). Locatable mineral exploration and development would be allowed under the General Mining Law. FLPMA requires BLM to regulate mining activities to prevent undue and unnecessary environmental degradation to resources. SSS would be protected by law and BLM policy. This would minimize impacts of mining activities on relevant and important values of the potential ACEC.

Salable Minerals

Existing areas of salable mineral disposals have already been substantially impacted. Therefore, it is likely that SSS do not occur in these areas. Authorization of new sites would be subject to NEPA review and consultation with USFWS, which would protect SSS.

Impacts from Special Designations

Areas of Critical Environmental Concern

Under Alternative N, no ACEC would be designated and no special management prescriptions would be implemented to specifically protect the relevant and important values of the area. There would be a potential for impacts to relevant and important values from resource management decisions under this alternative.

Alternative A

Impacts from Vegetation

Under Alternative A, no surface-disturbing activities would be allowed within 330 feet on each side of the stream, unless it could be shown that there are no practical alternatives, all long-term impacts could be fully mitigated, and the activity would benefit and enhance the riparian area. This would protect the riparian relevant and important value from surface-disturbing activities, but it could restrict potentially beneficial actions such as riparian area restoration and vegetation treatment.

Impacts from Special Status Species

Under Alternative A, management actions such as prohibiting the destruction, adverse modification, or fragmentation of listed species habitat; maintaining the integrity of SSS habitat; and habitat improvements would benefit SSS. Additional strategies (such as utilizing seasonal and spatial buffers for surface-disturbing activities and complying with raptor protection guidelines for powerline construction) would be employed to protect raptors and their habitat. These actions would minimize or eliminate impacts to the SSS relevant and important values.

Impacts from Travel Management

Impacts would be the same as those described under Alternative N.

Impacts from Lands and Realty

Impacts would be the same as those described under Alternative N.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Impacts would be similar to those described under Alternative N, except with fewer acres open to oil and gas leasing with standard stipulations. Under Alternative A, 40% of the RFO would be open to leasing subject to standard terms and conditions, and 39% would be open to leasing subject to moderate constraints (timing limitation, CSU).

Leasable Minerals—Coal

Impacts would be the same as those described under Alternative N.

Locatable Minerals

Impacts would be similar to those described under Alternative N, except that fewer acres (154,700) would be recommended for withdrawal from mineral entry.

Salable Minerals

Impacts would be the same as those described under Alternative N.

Impacts from Special Designations

Areas of Critical Environmental Concern

Impacts would be the same as those described under Alternative N.

Proposed RMP

Impacts from Vegetation

Impacts would be similar to those described under Alternative A, except within the Proposed RMP the buffer zone would be equal to the 100-year floodplain or 330 feet on either side from the centerline, whichever is greater. This protection of riparian resources would indirectly benefit any special status species located or dependant on those areas, and thus provide benefit to the SSS relevant and important value of the potential ACEC.

Impacts from Special Status Species

As in Alternative A, under the Proposed RMP, management actions such as prohibiting the destruction, adverse modification, or fragmentation of listed species habitat; maintaining the integrity of SSS habitat; and habitat improvements would benefit SSS. Additional strategies (such as utilizing seasonal and spatial buffers for surface-disturbing activities and complying with raptor protection guidelines for powerline construction) would be employed to protect raptors and their habitat. These actions would minimize or eliminate impacts to the SSS relevant and important values.

Impacts from Travel Management

Proposed decisions for OHV open areas under Alternatives N and A would pose the threat of irreparable damage to some of the special status plant species. The threat would be much reduced under the Proposed RMP where less than 1% of the lands managed by the RFO are designated as open. The boundaries of these small, managed open areas were developed to avoid SSS and thus protect this relevant and important value.

Impacts from Lands and Realty

Under the Proposed RMP, proposed decisions for land tenure adjustments could maintain, increase, or decrease the land in federal ownership, having a beneficial or adverse impact on relevant and important

values that would be determined in site-specific environmental analysis. Lands with SSS populations would likely not be offered for disposal, thus not impacting the SSS relevant and important value.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

The Proposed RMP would reduce the potential threat to SSS by having only 29% of the RFO open to leasing subject to standard terms and conditions. There would be 43% of the RFO open to leasing subject to moderate constraints (timing limitation, CSU), and the remaining 28% would be open to leasing subject to major constraints (NSO) or closed to leasing. Oil and gas leasing would be subject to species-specific buffers and seasonal, temporal and spatial restrictions identified within Appendix 11 and 14 to conserve habitat for SSS. These mitigation measures would provide protection to the SSS relevant and important values of the potential ACEC.

Leasable Minerals—Coal

Any direct impacts of coal development on listed plant and animal species would be precluded by Coal Unsuitability Criterion 9, which states that, "federally designated habitat for listed threatened or endangered plant and animal species or species proposed for listing…shall be considered unsuitable."

Locatable Minerals

Impacts would be similar to those described under Alternative N, except that additional acres (176,200) would be recommended for withdrawal from mineral entry over Alternatives N and A, providing additional protection to SSS species and the relevant and important values, if SSS are located within those areas.

Salable Minerals

Existing areas of salable mineral disposals have already been substantially impacted. Therefore, it is likely that SSS do not occur in these areas. Authorization of new sites would be subject to NEPA review and consultation with USFWS, which would protect SSS relevant and important values.

Impacts from Special Designations

Areas of Critical Environmental Concern

Under the Proposed RMP, the potential Special Status Species ACEC would not be designated and no special management prescriptions would be implemented to specifically protect the relevant and important values of the area. Resource decisions under the Proposed RMP have greatly reduced the potential for impacts to SSS. Existing laws, rules, and regulations, as well as the management decisions for SSS (maintaining the integrity of SSS habitats), travel, and minerals management (oil and gas leasing stipulations) would provide protection for the relevant and important SSS values of the potential ACEC.

Alternative C

Impacts from Vegetation

Under Alternative C, no surface-disturbing activities would be allowed within 660 feet from riparian areas unless it could be shown that there are no practical alternatives, all long-term impacts could be fully mitigated, and the activity would benefit and enhance the riparian area. This would protect the riparian relevant and important value from surface-disturbing activities, but it could restrict potentially beneficial actions such as riparian area restoration and vegetation treatment.

Impacts from Special Status Species

Impacts would be the same as those described under Alternative A.

Impacts from Travel Management

The potential for impacts to SSS from travel management was virtually eliminated under this alternative, which designated no open areas.

Impacts from Lands and Realty

Under Alternative C, proposed decisions for land tenure adjustments would benefit SSS by keeping the land in federal ownership and pursuing acquisition of non-federal lands from willing sellers where determined necessary for SSS. Also under this alternative, ROWs and other land use authorizations would be avoided if they would impact SSS or their habitats.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

In Alternative C, 2% less of the RFO would be open to leasing subject to standard terms and conditions, and 9% more of the area would be open to leasing subject to major constraints (NSO) or closed to leasing. This alternative would reduce risks to SSS compared to Alternatives N and A and the Proposed RMP.

Leasable Minerals—Coal

Impacts would be the same as those described under Alternative N.

Locatable Minerals

Impacts would be similar to those described under Alternative N, except that additional acres (331,100) would be recommended for withdrawal from mineral entry, providing additional protection to SSS.

Salable Minerals

Alternative C would provide additional protection for SSS by managing disposal subject to controlled surface use or timing limitations.

Impacts from Special Designations

Areas of Critical Environmental Concern

Under Alternative C, the Special Status Species ACEC would be designated (15,100 acres of public land) to protect and provide special management for SSS values within the potential ACEC by protecting them from ground-disturbing activities.

Alternative D

Impacts from Vegetation

Impacts would be the same as those described under Alternative C.

Impacts from Special Status Species

Impacts would be the same as those described under Alternative A.

Impacts from Travel Management

Impacts would be the same as those described under Alternative C.

Impacts from Lands and Realty

Impacts would be the same as those described under Alternative C.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Potential for impacts would be least under this alternative, which would allow leasing with standard stipulations on only 14% of the RFO. The remainder of the area would be open to leasing subject to moderate constraints (TL, CSU), subject to major constraints (NSO), or closed to leasing, which would minimize or eliminate the potential for impacts to SSS.

Leasable Minerals—Coal

Impacts would be the same as those described under Alternative N.

Locatable Minerals

Alternative D would provide the greatest protection to SSS by recommending 903,900 acres for withdrawal from mineral entry.

Salable Minerals

Impacts would be the same as those described under Alternative C.

Impacts from Special Designations

Areas of Critical Environmental Concern

Impacts would be the same as those described under Alternative C.

Thousand Lakes Bench Potential ACEC

The Thousand Lakes Bench ACEC is located in southeastern Sevier County, south of Interstate 70 and east of Thousand Lake Mountain. It is 500 acres, located in several small areas. Relevant and important values are cultural resources, SSS (bald eagle, last chance townsendia, and Wright fishhook cactus), and riparian areas. Impacts to the relevant and important values of this ACEC could occur from the following resource management programs:

- Vegetation
- Cultural Resources
- Special Status Species
- Non-WSA Lands with Wilderness Characteristics
- Travel Management
- Special Designations.

Other programs were determined to have little or no impact on the relevant and important values of this potential ACEC.

Alternative N: No Action

Impacts from Vegetation

Under all alternatives, no surface-disturbing activities would be allowed within identified distances (which vary by alternative) from riparian areas unless it could be shown that there are no practical alternatives, all long-term impacts could be fully mitigated, and the activity would benefit and enhance the riparian area. This would protect the riparian relevant and important values from surface-disturbing activities, but it could restrict potentially beneficial actions such as riparian area restoration and

vegetation treatment. Under Alternative N, no surface-disturbing activities would be allowed within 500 feet of riparian areas.

Impacts from Cultural Resources

Under Alternative N, management of cultural resources within the potential ACEC would be in accordance with existing cultural resource laws, which would protect this relevant and important value.

Impacts from Special Status Species

Under all alternatives, management actions such as prohibiting the destruction, adverse modification, or fragmentation of listed species habitat; maintaining the integrity of SSS habitat; and habitat improvements would benefit SSS.

Impacts from Non-WSA Lands with Wilderness Characteristics

A portion of the Jones Bench (40 acres) and Limestone Cliffs (390 acres) non-WSA lands with wilderness characteristics lie within the 500-acre potential Thousand Lakes Bench ACEC. No actions to maintain wilderness characteristics on lands outside of WSAs are proposed under Alternative N, resulting in no additional protection for relevant and important values.

Impacts from Travel Management

OHV area designations, by alternative, are shown in Table 4-88. Under Alternative N, continuing to manage the area as open to cross-country OHV use would leave relevant and important values vulnerable to direct impacts from cross-country vehicle use.

Table 4-88. OHV Area Designations within Thousand Lakes Bench Potential ACEC

		Alternative N (No Action)	Alternatives A and the Proposed RMP	Alternatives C and D
Open	Acres	500	0	0
	% Area	100%	0%	0%
Limited	Acres	0	500	0
	% Area	0%	100%	0%
Closed	Acres	0	0	500
	% Area	0%	0%	100%

Impacts from Special Designations

Areas of Critical Environmental Concern

Under Alternative N, no ACEC would be designated and no special management prescriptions would be implemented to specifically protect the relevant and important values of the area. There would be a potential for impacts to relevant and important values from travel management decisions under this alternative.

Alternative A

Impacts from Vegetation

Under Alternative A, no surface-disturbing activities would be allowed within 330 feet on each side of the stream, unless it could be shown that there are no practical alternatives, all long-term impacts could be fully mitigated, and the activity would benefit and enhance the riparian area. This would protect the riparian relevant and important value from surface-disturbing activities, but it could restrict potentially beneficial actions such as riparian area restoration and vegetation treatment.

Impacts from Cultural Resources

Impacts would be the same as those described under Alternative N.

Impacts from Special Status Species

Under Alternative A, management actions such as prohibiting the destruction, adverse modification, or fragmentation of listed species habitat; maintaining the integrity of SSS habitat; and habitat improvements would benefit SSS. Additional strategies (such as utilizing seasonal and spatial buffers for surface-disturbing activities and complying with raptor protection guidelines for powerline construction) would be employed to protect raptors and their habitat. These actions would minimize or eliminate impacts to the SSS relevant and important values.

Impacts from Non-WSA Lands with Wilderness Characteristics

Impacts would be the same as those described under Alternative N.

Impacts from Travel Management

Under Alternative A, limiting vehicles to designated routes would reduce direct impacts to cultural, special status plant species, and riparian areas and would reduce the disturbance to bald eagles.

Impacts from Special Designations

Areas of Critical Environmental Concern

Under Alternative A, no ACEC would be designated and no special management prescriptions would be implemented to specifically protect the relevant and important values of the area. Existing laws, rules, and regulations, as well as other resource decisions for riparian protection zones and travel management under this alternative, would provide protection for the relevant and important values of the potential ACEC.

Proposed RMP

Impacts from Vegetation

Impacts would be similar to those described under Alternative A, except within the Proposed RMP the buffer zone would be equal to the 100-year floodplain or 330 feet on either side from the centerline, whichever is greater. This would provide protection for the riparian relevant and important value of the potential Thousand Lakes Bench ACEC

Impacts from Cultural Resources

Impacts would be the same as those described under Alternative N. Under the Proposed RMP, management of cultural resources within the potential ACEC would be in accordance with existing cultural resource laws, which would protect this relevant and important value.

Impacts from Special Status Species

Under the Proposed RMP, as in Alternative A, management actions such as prohibiting the destruction, adverse modification, or fragmentation of listed species habitat; maintaining the integrity of SSS habitat;

and habitat improvements would benefit SSS. Additional strategies (such as utilizing seasonal and spatial buffers for surface-disturbing activities and complying with raptor protection guidelines for powerline construction) would be employed to protect raptors and their habitat. These actions would minimize or eliminate impacts to the SSS relevant and important values.

Impacts from Non-WSA Lands with Wilderness Characteristics

Under the Proposed RMP, management prescriptions to maintain wilderness characteristics on 2,600 acres of the Jones Bench non-WSA lands with wilderness characteristics area would provide indirect protection for relevant and important values within the 50 acres located within the potential Thousand Lakes Bench ACEC. Management prescriptions would protect scenic values, reduce or eliminate surface disturbance, and retain public lands in federal ownership.

Impacts from Travel Management

Impacts would be the same as those described under Alternative A. Under the Proposed RMP, limiting vehicles to designated routes would reduce direct impacts to cultural, special status plant species, and riparian areas and would reduce the disturbance to bald eagles, thus providing protection for all relevant and important values of the potential ACEC.

Impacts from Special Designations

Areas of Critical Environmental Concern

Under the Proposed RMP, the Thousand Lakes Bench ACEC would not be designated and no special management prescriptions would be implemented to specifically protect the relevant and important values of the area. Existing laws, rules, and regulations, as well as other resource decisions for riparian protection zones (not allowing surface disturbing activities within the 100-year floodplain or 330 feet on either side from the centerline), SSS (maintaining the integrity of the SSS habitats), non-WSA lands with wilderness characteristics and travel management (limiting vehicles to designated routes) under the Proposed RMP, would provide protection for all the relevant and important values of the potential ACEC.

Alternative C

Impacts from Vegetation

Under Alternative C, no surface-disturbing activities would be allowed within 660 feet from riparian areas unless it could be shown that there are no practical alternatives, all long-term impacts could be fully mitigated, and the activity would benefit and enhance the riparian area. This would protect the riparian relevant and important value from surface-disturbing activities, but it could restrict potentially beneficial actions such as riparian area restoration and vegetation treatment.

Impacts from Cultural Resources

Under Alternative C, special management for the ACEC would include increasing public awareness of cultural resource values, increasing law enforcement presence, and, if necessary, installing fencing or other direct protection of important sites. These prescriptions would provide added protection for the cultural resources in the area.

Impacts from Special Status Species

In addition to the management strategies described under Alternative A, Alternative C prescribes increasing law enforcement presence in order to deter unauthorized collection of Wright fishhook cactus. This would provide added protection for this SSS within the potential ACEC.

Impacts from Non-WSA Lands with Wilderness Characteristics

Impacts would be the same as those described under Alternative N.

Impacts from Travel Management

Alternative C would close the potential ACEC to OHV use, thus eliminating the risks associated with motorized use and protecting the relevant and important values.

Impacts from Special Designations

Areas of Critical Environmental Concern

Under Alternative C, Thousand Lakes Bench ACEC would be designated (500 acres of public land) to protect and provide special management for the SSS, cultural resources, and riparian area values within the potential ACEC by protecting them from ground-disturbing activities.

Alternative D

Impacts from Vegetation

Impacts would be the same as those described under Alternative C.

Impacts from Cultural Resources

Special management under Alternative D would increase public awareness of cultural resource values and increase law enforcement presence, but no fencing would be allowed in non-WSA lands with wilderness characteristics, which may not protect the cultural resources as much as Alternative C.

Impacts from Special Status Species

Impacts would be the same as those described under Alternative C.

Impacts from Non-WSA Lands with Wilderness Characteristics

A portion of the Jones Bench (50 acres) and Limestone Cliffs (390 acres) non-WSA lands with wilderness characteristics lie within the 500-acre potential Thousand Lakes Bench ACEC. Under Alternative D, protecting the non-WSA lands with wilderness characteristics within the Thousand Lakes Bench ACEC would provide indirect protection for relevant and important values on 440 acres (88% of the potential ACEC). Specifics are described in the travel management discussion in this section.

Impacts from Travel Management

Impacts would be the same as those described under Alternative C.

Impacts from Special Designations

Areas of Critical Environmental Concern

Impacts would be the same as those described under Alternative C.

4.6 IMPACTS TO THE SOCIAL AND ECONOMIC ENVIRONMENT

This section is subdivided into three general areas:

- Impacts to social and economic conditions
- Impacts to environmental justice
- Impacts to public safety.

4.6.1 Social and Economic Conditions

This section discusses impacts to the social and economic conditions of the five-county socioeconomic study area from management actions contained within the various RMP alternatives and the Proposed RMP. Such impacts may result from specific individual management actions but also often reflect the collective effect of a number of actions under a particular alternative. Thus, this section presents impacts *from* the specific management actions of various resource programs and alternatives, in terms of impacts *to* the local economy, population, community services, public finance, and social customs and culture. Environmental justice is also addressed.

Potential *economic impacts* include changes in employment, income, business costs, and tax revenue to local, State, and Federal Government entities. Changes in employment and income can then cause indirect socioeconomic impacts, such as changes in population, which can lead to community impacts on housing, infrastructure, and other government services. These economic impacts may then produce *social impacts*, such as changes in community structure as new people move in to take new jobs. Changes in management of resources under the Proposed RMP and all alternatives can also have direct social impacts for residents and visitors, affecting livelihoods, lifestyles, attitudes, opinions, quality of life, and social structures.

The socioeconomic impact analysis and conclusions are based on BLM knowledge of resource uses in the socioeconomic study area; review of existing literature; and information provided by BLM specialists, local and State cooperating entities, and industry contacts. Impacts are quantified when possible and described in qualitative terms in the absence of reliable quantitative data. The analysis of socioeconomic impacts is intended to capture the most notable, overall socioeconomic impacts under each alternative, and cannot address all potential impacts.

Methods and Assumptions

This analysis was based on the following socioeconomic assumption:

- Baseline population growth in the planning area would follow projections made by the Governor of Utah's Office of Planning and Budget, Demographic and Economic Analysis Section, as shown in Table 4-89. (Deviations from these baseline projections due to management alternatives were noted, if any.)

Table 4-89. Population Projections in the Five-County Area

County	1990 Population	2000 Population	2010 Projected Population	2020 Projected Population	2030 Projected Population	Percent Change 2000–2030
Garfield*	3,980	4,763	4,955	5,973	6,747	42%

County	1990 Population	2000 Population	2010 Projected Population	2020 Projected Population	2030 Projected Population	Percent Change 2000–2030
Piute	1,277	1,436	1,503	1,790	1,797	25%
Sanpete	16,259	22,846	27,904	32,902	35,181	54%
Sevier	15,431	18,938	21,038	24,855	26,892	42%
Wayne	2,177	2,515	2,764	3,469	3,943	57%
Socioeconomic Study Area Totals	**39,124**	**50,498**	**58,164**	**68,989**	**74,560**	**48%**
Utah Totals	**1,722,850**	**2,246,553**	**2,833,337**	**3,486,218**	**4,086,319**	**82%**

Source: U.S. Census Bureau 2005, Utah Governor's Office of Planning and Budget 2005.
*Most of Garfield County's population lives outside the portion of the county within the RFO boundary.

Additional assumptions related to particular resource programs are important to the analysis of socioeconomic impacts. These are noted in the analyses below as needed.

Estimation of employment and income impacts required an economic model and a series of inputs specific to the RFO socioeconomic study area. Current uses of public lands and how these uses could change under each alternative provided quantitative input necessary for the economic impact analysis (e.g., number of gas wells, AUMs). Quantitative measures were only possible for some resource uses, specifically, livestock grazing, fuels management, recreation, and minerals (coal and fluid minerals). The estimates of annual employment and income generated in this study represent *only* the economic activity *directly attributable to activities on BLM-administered lands within the planning area*, based on the data and assumptions described in the methodology sections for each specific resource use. Economic activity that does not result from use of the RFO, such as jobs and income derived from livestock forage outside of BLM-administered lands, is not reported in this analysis.

It should be noted that for each resource use, future economic activity is dependent on a variety of factors beyond the control of BLM. For instance, the extent, pace, and timing of energy development activities depend on national and international energy demand and prices, production factors within each industry, and business strategies of operators. Because the pace of energy development in the planning area is unknown, a constant rate of production is assumed in this analysis for both coal production and oil and gas drilling and production. Likewise, utilization of livestock AUMs is assumed to be constant throughout the study period, based on the AUM allocations for each alternative. Actual economic impacts may vary if the rate of production in any of these industries changes over the study period.

Environmental Consequences

Impacts to socioeconomics would likely result from actions proposed under the following resource programs:

- Vegetation
- Visual Resources
- Fire and Fuels Management
- Non-WSA Lands with Wilderness Characteristics

- Forestry and Woodland Products
- Livestock Grazing
- Recreation
- Travel Management
- Lands and Realty
- Minerals and Energy
- Special Designations.

Other programs were determined to have little or no impact on socioeconomic conditions. There are no WSA decisions that would impact socioeconomic conditions.

Alternative N: No Action

Impacts from Vegetation

Vegetation treatments (including weed control and pest control) could provide some benefits to economic uses of BLM rangelands (e.g., livestock grazing and harvesting of forest and woodland products) and could result in inflows of dollars and provide contracts, income, and employment in the five-county study area. Insufficient information exists to quantify these benefits, but differences between the alternatives are discussed qualitatively.

Impacts from Visual Resources

VRM decisions represent a collection of restrictions placed on various resource programs, depending on the class of scenery identified through visual resource inventories. The VRM class itself does not represent a restriction; restrictions result from management decisions for other resources that potentially affect scenic qualities. The socioeconomic impacts of management decisions result from those separate resource decisions for the specific acreages within each VRM class designation. As with other resources, these decisions vary by alternative.

Impacts on socioeconomics from VRM decisions would most likely result from actions proposed under vegetation, fire and fuels management, non-WSA lands with wilderness characteristics, livestock grazing, recreation, travel management, lands and realty, minerals and energy, and special designations.

It must be re-emphasized that restrictions within these *other* resources provide the tools that BLM can use in managing scenic resources.

Alternative N contains no acreage in VRM Class I and is thus potentially the least restrictive of the alternatives. This is somewhat misleading in that Alternative N does not include WSA acreage as VRM Class I, as do the Proposed RMP and Alternatives A, C, and D. By policy, all WSAs must be managed under IMP. The prescriptions of IMP, which bar almost all forms of development or surface-disturbing activities, have the same net impact as managing as VRM Class I. The impacts to socioeconomics would be similar to the impacts discussed for other resources in this alternative that directly affect scenic quality. The lower degree of protection of scenic resources under this alternative has the potential to adversely impact those businesses and individuals whose livelihood depends, all or in part, on local recreation spending by those visitors who place a high value on the scenic qualities of the planning area.

Impacts from Fire and Fuels Management

Wildland fires pose significant threats to human life and property. Personal, social, and economic losses from wildland fires, particularly in the Wildland Urban Interface, can be substantial. Strains on the resources of communities to fight fires can also be considerable. The wildland fire risk management and fire-fighting policies and programs of the alternatives would reduce risks and eventual losses. Fire

suppression activities within the RFO are managed by the Richfield Interagency Fire Center (RIFC), which is located in central Utah. Its jurisdictional boundaries cover seven counties, including Piute, Sanpete, Sevier, and Wayne counties. RIFC employed local personnel that participated on 468 on-and-off district assignments in 2005 (RIFC 2005). In the same year, BLM administered two exclusive use contracts for a Type-3 helicopter and one air-attack/reconnaissance fixed-wing aircraft, both stationed at Richfield airport. BLM also acquired two Single Engine Airtankers on Call When Needed contracts that were stationed at Fillmore and Nephi (ibid). From 1996 through 2005, 336,392 acres burned on BLM's Richfield and Fillmore Field offices combined, with an annual average of 82 fires burning an annual average of 33,639 acres (ibid). In the Richfield area, the cost of fire suppression ranges from $169 for fires one-quarter of an acre to 10 acres down to $34 per acre for fires larger than 1,000 acres (BLM RFO 2008). Assuming the entire cost for fire suppression stays within the socioeconomic study area, the average fire is about 410 acres, and cost of fire suppression for a fire between 300 acres and 1,000 acres remains at $47 per acre over the life of the plan, a rough estimate of the annual revenue contributed to the local economy from fire suppression activities can be estimated. This results in about $1,580,000 annually to the local economy over the life of the plan. The estimate overstates the total economic contribution to the local economy because it uses the average annual acreage for fires in both the Richfield and Fillmore Field Offices. Post-fire stabilization and rehabilitation costs could result in inflows of dollars to the socioeconomic study area and provide opportunities for contracts, income, and employment in the study area. However, the resulting economic activity from suppression activities cannot be quantified or differentiated between the alternatives due to unpredictability in the locations and intensities of wildfire and rehabilitation requirements.

For fuels treatments, however, it is possible to quantify expenditures and their impact on the local economy. In the Richfield Fire District (of which the BLM is a partner), approximately 10,000 acres per year have been mechanically treated in recent years. In the Richfield area, the cost of this treatment is about $100 per acre, with about 70% of that amount going to a local contractor (conversation between Bill Stevens, Moab Field Office and Stan Anderson, United States Forest Service (USFS), Richfield Interagency Fire Center, June 29, 2007). This has resulted in at least $70,000 per year being put into the local economy from mechanical fuels treatments. Contracts for such services are awarded competitively, so there is no assurance that such contracts will continue to be locally awarded. This analysis, however, makes that assumption.

The extent of socioeconomic impacts of fire suppression cannot be projected given the unpredictability in the locations and intensities of wildfire. However, under Alternative N and based on assumptions discussed above, on average, approximately 33,639 acres are suppressed annually, contributing an estimated $1,580,000 to the local economy. Alternative N is not specific as to acres treated per year, as decisions are made on a case-by-case basis. In recent years, as noted above, approximately 10,000 acres have been treated annually, contributing an estimated $700,000 to the local economy.

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness characteristics on lands outside of WSAs are proposed under this alternative, resulting in no additional impacts on socioeconomics.

Impacts from Forestry and Woodland Products

Insufficient information on current harvests and harvest potential (e.g., areas suitable for timber harvest) is available to quantify the economic value, jobs, and income produced from forest and woodland products on public lands.

Commercial timber harvesting on public land in the RFO has historically been very limited. At present, commercial harvests are prohibited east of Capitol Reef National Park, including the Henry Mountains, which have commercially harvestable species. Public lands are also used for commercial seed and live

plant collection. These operations are believed to support jobs and income in the socioeconomic study area. Non-commercial harvests of Christmas trees, posts and poles, and fuelwood also have economic, social, and cultural significance to local residents. Under this alternative, forest and woodland product harvests, and any resulting jobs and significance to local custom and culture, would continue to follow recent patterns.

Impacts from Livestock Grazing

Grazing decisions were analyzed as follows. First, historical grazing use (licensed AUMs per year) within the RFO was obtained from BLM records. This data is provided in Chapter 3. Next, the average values of AUMs in Utah for cattle and sheep were estimated, which is also discussed in Chapter 3.

Grazing use of public lands would continue to provide income and jobs in the socioeconomic study area. According to a statewide social survey conducted by Utah State University (USU) in 2007, provided in Appendix 17, a minority group of the residents in each of the five counties within the socioeconomic study area relies on permitted use of BLM lands for a portion of their household income. The highest percentage of respondents that indicated some portion of their household income comes from permit-based grazing activities on BLM lands was for Garfield County (20% of respondents), and the lowest percentage was for Sanpete County (4.5% of respondents).

Levels of grazing would likely continue at recent levels. Use of public lands in the Richfield planning area averaged 50,827 cattle AUMs and 9,756 sheep AUMs over the 10-year period from 1994 to 2003. This base period includes a number of good, average, and low grazing years, ranging from 76,591 total AUMs in 2001 to 39,921 total AUMs in 2003. Based on this average use and average Utah production values per AUM, the annual value of livestock production from AUMs on public lands is $2,319,000. This represents 1.5% of the $154,189,000 annual value of cash receipts from livestock and livestock products for the entire five-county socioeconomic study area.

Ranching on public lands also represents an important aspect of the local culture. A decrease in the number of acres available for grazing has the potential to adversely impact the lifestyle of ranchers in the community. Losses in grazing opportunities could result in lost income and consequently a decline in social well-being for affected ranchers and their families. The inability for the ranchers to continue with traditional practices could potentially impact the overall character and way of life for residents of the planning area. Reductions in ranching-based income could make it difficult for families to earn a living on ranching alone. Family members may have to get second jobs or work off of the ranch to bring in additional income. If ranchers are unable to continue operations, impacts to local communities could include loss of business activity or the businesses themselves and a decline in population if individuals have to relocate to earn a living.

Impacts from Recreation

Recreational activity has important socioeconomic value, both in terms of satisfaction provided to local residents and visitors and the economic activity generated for the local economy. Recreation-related expenditures in the socioeconomic study area by visitors from other regions infuse new money into the local economy. These expenditures and re-spending of this money between sectors within the local economy generate income and support jobs.

Data on recreational use for various activities on public lands managed by the RFO is available from RMIS (Recreation Management Information System), a database maintained by the BLM. RMIS data for fiscal years (FYs) 2001–2004 is summarized in Chapter 3. Unfortunately, neither RMIS nor any other source provides data on the proportion of visitor days accounted for by individuals living outside the socioeconomic study area. According to a state-commissioned study by D.K. Shifflet & Associates (2006), non-resident travel within Utah has consistently been about double that of resident tourism,

measured in terms of visitor days. In 2005, for example, the study found that non-resident visitor days accounted for 66.2% of statewide visitor days. Not all visitors, of course, are recreation visitors (e.g., business, visiting family), nor are all recreation visitors using BLM lands. Given the lack of other data sources, this figure seems reasonable for the purpose of estimating visitor spending in that non-resident visitors typically spend more per day than resident visitors. It is likely that this figure (66.2%) is too high for some activities and too low for others[1].

Data on expenditures per local (defined as Utah resident) and non-local visitor day was obtained from the above source. That study estimated non-resident visitor spending statewide at $103 per day, with resident spending statewide averaging $61 per day. A large part of the difference was due to spending on lodging, implying that many resident visitors are not on overnight trips, which may be representative of the planning area.

Due to insufficient data, economic differences between the alternatives could not be quantified. Differences are discussed qualitatively.

The economic contributions of recreation to the local economy were quantified for Alternative N based on current levels of recreation. Recreational visitor days on BLM land were based on a 4-year average of RMIS data for fiscal years 2001 to 2004. Total visitor days were 374,594. Non-local visitor days were assumed to be 66.2% of that figure. Total expenditures in the socioeconomic study area by non-local recreationists using public lands were estimated to be $25,542,000 in 2005 dollars. Spending by Utah residents (not all of whom would reside in the planning area) added another $7,723,000, based on the assumptions outlined above.

Factors outside the planning area are expected to increase demand for recreational activities within the RFO. While there have been reductions in visitation numbers over recent years, these contradict regional and national recreation trends and are expected to reverse and grow over time (BLM 2003b). For instance, increasing populations along the Wasatch Front and the western slope of Colorado are expected to result in increasing demand for recreational activities throughout Utah, and likely for the RFO. No projections for increased visitation to RFO lands over the planning period are available, but expenditures, income, and jobs related to recreation on public lands are likely to increase over the planning period. According to the 2007 USU social survey, with summary results provided in Appendix 17, the percentage of survey respondents who operate or work at a business linked to recreation or tourism activities influenced by public lands and resources was highest in Wayne County (51.3%), Garfield County (40.3%), and Piute County (33.3%) and substantially lower in Sevier County (8.1%) and Sanpete County (5.3%).

Recreation management decisions could impact the lifestyle or quality of life of individuals utilizing or living near public lands. In particular, decisions that alter the classification of certain areas within the RFO relative to different types of recreation experiences (e.g., primitive, motorized, developed sites) would affect the availability and quality of different recreational experiences. This could impact individuals with expectations or desires that differ from those provided by the management decisions. Under Alternative N, existing conflicts caused by differing visitor expectations and desires for certain types of recreational experiences could continue and intensify with time. This alternative does not address these types of conflicts.

[1] *A comprehensive visitation use study conducted for the Moab, Utah, BLM Field Office found that 18% of recreation visitors were locals, defined as living within 50 miles of the interview site (USFS 2007).*

Impacts from Travel Management

Demand for OHV recreation use is likely to increase over time in the RFO, although these increases are not quantifiable with existing data. The employment and income impacts of current levels of OHV recreation use are captured in the recreation analysis.

Under this alternative, most of the RFO (1,636,400 acres, 77%) would be open to OHV recreation use without limitation. This would provide for high quantity and quality of experience for users seeking an unconfined OHV recreation use experience, but it would impact the quality of experience for other recreationists interested in non-motorized recreational environments. There could also be adverse impacts to that segment of OHV users for whom a key part of their recreation experience is interaction with and enjoyment of scenic values. Unrestricted OHV use has the potential to detract from such values, and thus the desired experience of this subset of users.

Impacts from Lands and Realty

Land tenure adjustments potentially impact local government finances. Disposal of public lands to private ownership could reduce Payments In Lieu of Taxes (PILT) by the Federal Government to local government, but would also result in payments of property taxes to local government by the new private property owner(s). Land exchange to other governments could also impact PILT payments. Acquisition of private land by the BLM would reduce property taxes paid to local government but would increase PILT payments. The net impact on local government finances cannot be determined without detailed information on the specific property or properties in question and the tax rates and other financial figures for the particular local government(s).

Disposal of public lands to local governments or private parties could further the economic development of communities within the RFO or serve other important social purposes such as provision of special recreational areas. Neither the increased economic activity nor other social benefits or costs can be predicted within the framework of the RMP process because these impacts depend on the location and timing of the specific land tenure adjustments. Analysis of these impacts would properly be conducted at the implementation level.

ROWs, leases, and permits produce revenue for the BLM and play important roles in the economy within, and in some cases beyond, the RFO. Management direction established in the RMP might support or deny ROWs, leases, and permits, but actual impacts would depend on the specific location and proposal. The socioeconomic impacts cannot be estimated at the RMP level.

Under Alternative N, only a few parcels (280 acres) identified in current land use plans that have not sold to date would be available for FLPMA Section 203 sales. Thus, impacts from sales under this program would be low, resulting in foregone opportunities to bolster local economic development. However, other land tenure adjustments (exchanges, R&PP patents, etc.) could still be approved. These other land tenure adjustments are considered on a case-by-case basis and are hard to predict.

Under Alternative N, certain areas are managed as avoidance or exclusion areas for ROWs, including utility corridors and communication sites:

- WSAs
- ACECs
- Eligible WSR corridors
- Areas closed to oil and gas leasing
- Areas open to oil and gas leasing subject to major constraints (NSO).

To the extent that areas are excluded for ROWs, there could be an adverse impact on certain types of economic development that require such use of the public lands. To the extent that such areas are avoidance areas, additional costs could be imposed on those entities desiring ROWs. Without knowing the quantity of ROWs foregone by this alternative, the economic impacts cannot be quantified.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

The economic impact of oil and gas operations was analyzed in two phases:

- Phase I: Exploration and Development
- Phase II: Production.

Phase I considered how many exploratory and development wells would be drilled in the RFO under each alternative and how many would be completed as producing wells. The average number of wells expected to be drilled under each alternative for four sub-areas of the RFO was taken from the RFD scenario (Appendix 12) prepared by BLM for this Proposed RMP. A number of additional assumptions were necessary for this analysis, which are summarized in Table 4-90.

Table 4-90. Assumptions for Oil and Gas Economic Impact Analysis

Item		RFD Area			Source
		1 and 2	3	4	
Number of Wells Drilled per Year on BLM		3	0	11	RFD Table 1 figures as adjusted for land ownership, divided by 15-year period
Type of Well	Oil	50%	0	100%	RFD, and Utah BLM state office minerals staff professional judgment
	Conventional Gas	50%	0	0	
	Coalbed Methane	0	100%	0	
Average Success Rates, All Well Types		12.50%	12.50%	50%	Utah BLM state office mineral staff professional judgment—12.5% is the national average for exploration; a higher rate is expected in Area 4 due to known field development
Average Cost of Drilling and Completion to Producing Well	Oil	$2.25 million			Utah BLM state office mineral staff, based on costs in recent "Paying Well Determination" submittals for wells similar to those expected in the RFO
	Conventional Gas	$2.25 million			
	Coalbed Methane	$1 million			
Average Cost of Drilling and Completion to Dry Hole	Oil	$1.35 million			Utah BLM state office mineral staff professional judgment
	Conventional Gas	$1.35 million			
	Coalbed Methane	$0.6 million			

Item		RFD Area			Source
		1 and 2	3	4	
Average Annual Operating Costs	Oil	$60,000			Utah BLM state office mineral staff, based on costs in recent "Paying Well Determination" submittals for wells similar to those expected in the RFO
Average Annual Operating Costs	Conventional Gas	$60,000			
	Coalbed Methane	$30,000			

With regard to exploration and development, the assumptions in Table 4-90 result in figures of $22 million for annual oil and gas well drilling and completion costs. (RFD Area 3 includes 49 projected wells located in a play on the eastern side of Sanpete and Sevier counties. Because RFD Area 3 has the least amount of BLM or other public land, any fluid mineral development precluded on public lands would likely be made up on other lands. This is why no wells are projected on BLM lands in RFD Area 3.) Not all of these expenditures benefit the socioeconomic study area because the oil and gas industry within the socioeconomic study area is quite small due to the low level of development in this area. It was therefore assumed for this analysis that all of the drilling operators would originate from areas outside of the study area. Investment in oil and gas drilling would have less of an economic impact on the area because most of the direct expenditures (labor costs in particular) would not be recirculated back into the local economy. However, some businesses that would support drilling activities indirectly are located in the study area; for instance, hotels and restaurants used by the drilling crews. A study of impacts of gas drilling in Carbon and Emery counties concluded that only 40% of the direct expenditures for new wells would be local. This result was used for oil and gas exploration and development activities in the RFO.

Historically, the RFO has seen limited oil and gas exploration and very little development. Interest has recently increased with the advent of a producing well field. The RFD predicts that approximately 207 wells (including coalbed methane wells) would be drilled on BLM lands in the planning area over the 15-year planning period. This is an average rate of about 14 wells per year.

Using recent data from the State of Utah for the Uintah Basin and Uintah County and making two additional assumptions: 1) oil and gas development and production in the RFO socioeconomic study area are similar to the Uintah Basin and Uintah County and 2) average wages for oil and gas employment and average wages for all other employment in the RFO socioeconomic study area are also similar to the Uintah Basin and Uintah County, it is possible to project the numbers of jobs likely to be created by drilling and completing a well in the RFO. A study done by the Utah Energy Office (UEO 2004) estimated the number of jobs in all sectors that drilling and completing a single well in the Uintah Basin would create at 14.8 jobs. The study cautions that the projection is for a single well; additional wells would likely use most of these same employees. Table 4-91 confirms this likelihood. As of 2006, for example (the most recent year for which complete data is available), the number of employees per well in Uintah County was 0.67. For the 5 years prior to this, the ratio varied from a low of 0.463 to the 0.67 reported for 2006. Similarly, one can compute the number of additional employees in the industry in Uintah County in relationship to the number of new wells drilled. Although the numbers vary somewhat from year to year, Table 4-91 shows that the highest multiple was in 2006 at 1.267 additional employees per new producing well brought online; the average for all positive years was 1.03. This data is not inconsistent with the UEO study, which estimated that most of the new job creation would be in the services, retail, and wholesale trades, with only 1.7 of the 14.8 projected new jobs in the oil and gas industry. The recent lower numbers are likely due to economies of scale resulting from large-scale

development. If all wells, including dry holes, were included, the ratio would be less. These results should not be surprising, in that the industry can quickly relocate crews to new drilling platforms as wells are drilled and completed. Once completed, it takes relatively few employees to oversee the operation of numerous wells and associated infrastructure.

As stated above, the UEO study projected the additional non-oil and gas jobs that a single well would create at 13.1 jobs (14.8 total minus 1.7 specific to oil and gas). The information from UEO assumes that employment for 14.8 individuals is required for one well, and it would require 14.8 employees for each well thereafter. The numbers used from the report do not take into account that one employee may be able to complete the tasks required for numerous wells, for example, a clerk in a retail store could accommodate the needs of several oil and gas employees. In other words, one cannot assume a strictly multiplicative increase for additional wells. This is borne out by recent studies done for the State of Utah by the University of Utah[2]. This study estimated total employment in the Uintah Basin at 19,852 employees. Of this total, the study estimates that 9,835 jobs were directly or indirectly related to the oil and gas industry, with direct employment of 3,959. This suggests a multiplier effect of 2.48 (9835/3959). Although a significant economic impact in itself, this is considerably less than the multiplier suggested by the earlier UEO study. Once again, this can be explained by the fact that the UEO study estimated the impact of a single well, which misses the economies of scale that result from large-scale development of the type currently experienced in the Uintah Basin. Given this recent State-provided data, subsequent analysis in this section will assume 1.26 direct and 2.48 indirect jobs created per additional well drilled over the life of the plan (2006 data). Wage data are derived from the same study: average wages for employees in the oil and gas industry in the Uintah Basin were $65,482 in 2006 and average wages for all other jobs were $30,607. Combining this data, the analysis that follows will assume that each new well could create 3.74 jobs, generating $158,412 in wage income annually. These numbers are based on producing wells, rather than wells drilled. Given that not all exploration efforts are successful, the actual economic impact per well drilled, based on the RFD, will probably be lower.

Table 4-91. Producing Wells and Employment in the Oil and Gas Industry—Uintah County, 2001–2006

Year	Producing Wells[1]	Employment[2]	Oil and Gas Employment per Well	Change in Well Numbers	Change in Employment	Ratio of Change in Employment to Change in Wells
2001	2,650	1,376	0.519			
2002	2,867	1,327	0.463	217	-49	-0.226
2003	3,119	1,564	0.501	252	237	0.940
2004	3,471	1,830	0.527	352	266	0.756
2005	3,875	2,254	0.582	404	424	1.050
2006	4,452	2,985	0.670	577	731	1.267

[2] *Source:* The Structure and Economic Impact of Utah's Oil and Gas Exploration and Production Industry Phase I—The Uinta Basin, *Bureau of Economic and Business Research, University of Utah, November, 2007)*

Under Alternative N, 459,700 acres would be closed to oil and gas leasing and 22,600 acres would be open to leasing subject to major constraints (NSO). Remaining lands would be open to leasing subject to standard terms and conditions (1,236,500 acres) or subject to moderate constraints (timing limitation, CSU) (409,200 acres). The closures and stipulations on leasing under this alternative are not expected to significantly affect oil and gas development. Nearly 80% of the wells projected in the RFD are located in a play along the west side of the planning area where public lands are either open to leasing subject to standard terms and conditions or open to leasing subject to moderate constraints (timing limitation, CSU).

Leasable Minerals—Coal

Coal mining has historically been an important activity within the RFO, and it is expected that this importance would continue in the future. Currently, only one mine is operating within the planning area. This is the Southern Utah Fuel Company (SUFCO) mine in eastern Sevier County, which is Utah's single most productive coal mine. This operation includes both Forest Service and BLM land. While its current activity focuses on Forest Service land, BLM land is also part of the "logical mining unit" and, therefore, the production of this mine is included in its entirety for this socioeconomic impact analysis. As described in Chapter 2, the coal region of which the SUFCO mine is a part includes 73,952 acres of federal mineral estate.

Economic contributions associated with coal mining within the RFO were analyzed by first considering coal resources and annual production for Sevier County, which is the location of the SUFCO mine. This information was obtained from the Utah Geological Survey (2004). A 5-year production average, as summarized in Table 4-92, was used as a basis for future potential coal production during the study period. Coal resources in the vicinity of the SUFCO mine are adequate to support this level of production (Tabet 2003, pages 1 and 41).

Table 4-92. Total Annual Coal Production for Sevier County, Utah

Year	Production (Thousand Short Tons)
2000	5,906
2001	7,001
2002	7,600
2003	7,126
2004[a]	7,400
5-yr Average	**7,007**

[a] Forecast
Source: UGS 2004.

The value of coal production within the RFO was then estimated by applying an annual price forecast per short ton to the 5-year average annual production rate listed in Table 4-92. The average forecasted price was obtained from the U.S. Energy Information Administration (2004) and represents the average forecasted 9-month price for the U.S. over the period 2004–2018.

Coal mining under current conditions has a notable impact on the local economy, supporting nearly 700 full- and part-time jobs and nearly $22 million in labor income within the socioeconomic study area. Based on management actions under Alternative N, current trends in coal production are expected to continue and, therefore, the future economic role of coal mining in the socioeconomic study area would be much the same as today. Adequate accessible coal resources exist to allow continuation of current

production trends (Tabet 2003). No policies are in place that would substantially affect those trends. Rather, significant decreases or increases in coal production depend on energy prices and the relative economics of coal production in the RFO versus other regions. New coal development also depends strongly on site-specific environmental review.

In addition to the SUFCO mining area on the Wasatch Plateau, the Richfield RFD scenario identifies an additional area in the Henry Mountains with potential for subsurface coal leasing, totaling 107,414 acres of federal mineral estate. Although no current production exists, development of this resource has the potential to generate beneficial socioeconomic impacts under Alternative N. Under this alternative, the entire acreage would be available for lease, with the exception of WSA acreage.

Locatable and Salable Minerals

Insufficient information was available to quantify the generation of employment and income from mining of locatable minerals (e.g., gypsum and metals such as gold) or salable minerals such as sand and gravel, stone, humate, and clay. Differences between the alternatives with regard to these mining activities are discussed qualitatively. According to the assumptions of this study, significant development of oil shale, tar sands, or geothermal resources is considered unlikely within the planning horizon.

Under Alternative N, present locatable mineral and mineral material exploration and development would be able to continue, with levels of activity depending on market conditions. Opportunities for individuals and companies to prospect for and develop mineral deposits would be maintained, thus preserving a culture of historic and social significance in the region.

Impacts from Special Designations

For the RFO, areas of special designation include ACECs and WSRs. As is the case with VRM and non-WSA lands with wilderness characteristics, ACECs and WSRs are not resource management tools in themselves but rely on prescriptions for other resource programs to achieve management goals. Alternative N continues to designate four existing ACECs totaling 14,780 acres and manages in a protective manner 12 eligible WSR segments totaling 135 miles.

Wild and Scenic Rivers

Alternative N requires BLM to manage all eligible streams to protect their outstandingly remarkable values, free-flowing nature, and tentative classification to the degree that BLM has authority (e.g., BLM lands within the corridor) and within the parameters of decisions made in the previous planning documents, until such time as suitability determinations are made. Under Alternative N, no suitability determinations would be made for any of the eligible WSR segments. However, the 12 eligible river segments would continue to be managed in a manner that would not impair their WSR suitability. Social and economic impacts resulting from this management action would be similar to current conditions.

Areas of Critical Environmental Concern

The management prescriptions for the four existing ACECs are described in detail in Chapter 2. The prescriptions include restrictions on oil and gas leasing (either closed to leasing or subject to major constraints), restrictions on grazing in three of the ACECs, managed as closed to OHV use, closed to surface coal leasing, and recommended for mineral withdrawal. For those people in the planning area who could use these restricted resources for their economic or social benefit, this alternative is potentially harmful. No additional impact to these interests would occur, however, because these areas are currently managed to protect the relevant and important values that led to their creation. For those who derive social well-being from protection of these relevant and important values, this alternative provides such benefits. For all groups, however, socioeconomic impacts likely would be minor, given the small amount of acreage currently managed as ACECs.

Alternative A

Impacts from Vegetation

Additional vegetation treatments and weed control efforts, relative to Alternative N, would likely result in additional inflows of dollars to the RFO, increasing the opportunities for contracts, income, and employment. These additional treatments could also improve forage, economically benefiting ranchers who graze cattle on public lands. This alternative would provide the greatest economic stimulus in the form of contracts, income, and employment related to vegetation treatments, weed control, and pest control. This stimulus would be very small relative to the total socioeconomic study area economy.

Impacts from Visual Resources

Alternative A designates 446,900 acres as VRM Class I. This acreage is within WSAs and is managed in Alternative N to protect scenic quality under IMP. The impacts to socioeconomics would be similar to the impacts from Alternative N decisions for those resources that directly impact scenic quality.

Impacts from Fire and Fuels Management

Assuming the 73,600 acres for treatment annually in this alternative are funded and implemented, the number of fires could diminish relative to Alternatives N, C, or D, thus lowering the economic activity resulting from fire suppression. The economic activity resulting from hazardous fuel reduction treatments could be greater than in Alternatives N, C, or D, because Alternative A could provide the greatest economic stimulus in the form of contracts, income, and employment related to hazardous fuel reduction treatments. If, for example, the full acreage was mechanically treated and past contract patterns continued, over $5,000,000 could be contributed to the local economy. Such a scenario, however, is unlikely in that funding on such a scale is improbable. The acreage maximum may be achieved through a variety of means, including naturally caused wildfires or selective thinning (often done by out-of-area contractors). It is also unclear whether local contractors would have the capacity to operate on such a scale, even for the type of work now being done. A more realistic scenario would be continued treatment at the 10,000-acre annual level, resulting in economic impacts similar to Alternative N. Any increase up to the prescribed maximum could generate more economic benefits to the local economy.

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness characteristics on lands outside of WSAs are proposed under this alternative, resulting in no additional impacts on socioeconomics.

Impacts from Forestry and Woodland Products

Opening additional areas to commercial harvesting in this alternative potentially could result in additional income and jobs relative to Alternative N; however, the value of timber available for harvest in this alternative is unknown. No impacts are anticipated to commercial seed and live plant harvesting and non-commercial harvesting of woodland products relative to Alternative N. This alternative could provide the greatest economic stimulus in the form of contracts, income, and employment related to forestry and woodland products. The level of economic stimulus would be very small relative to the total socioeconomic study area economy.

Impacts from Livestock Grazing

Impacts would be the same as described under Alternative N, except that an additional 1,079 AUMs of forage on 36,950 acres would be available for livestock grazing. These additional AUMs would show little overall change from the above-listed figures, representing an increase of only 1% over Alternative N. Construction of necessary range improvements to facilitate the use of the additional forage could inject a small amount of permittee-provided investment into the economy. The limited scope of those improvements and the extended timeframes required for initial investments to be recouped from the small

amount of added production would delay real, derived economic benefit to the ranchers for possibly decades. The small reduction in available AUMs for wildlife would possibly reduce the allotted hunting permits or opportunity in each respective locale for the species concerned (e.g., mule deer, elk, bison, or a combination thereof). This reduction in permit numbers or hunting opportunity would reduce proportionally the income in local service industries, guide businesses, and Utah Division of Wildlife Resources (UDWR) coffers. The impact would be greatest on bison-related activities with 249 AUMs becoming unavailable in Dry Lakes and Sawmill Basin allotments for bison, reducing their yearlong herd number by 20 animals. This alternative would also forfeit the investment the UDWR or their agents have made in purchasing these AUMs from livestock permit holders for the purpose of increasing available forage for wildlife.

Impacts from Recreation

The emphasis of Alternative A on motorized access, commodity production, and resource extraction impacts recreation. Management actions under this alternative could reduce the quality of the recreational experience for certain recreationists, particularly those seeking primitive and semi-primitive experiences. However, these impacts would be relatively localized, as the commercial potential for operations with substantial impacts on recreation (e.g., mining or timber harvesting) is relatively limited in the planning area and resource development would likely be focused in small areas.

Recreation management impacts to lifestyle and quality of life under Alternative A could be locally significant (for particular sites) or significant in aggregate, depending on the degree to which the decisions match individual and societal preferences for the wide array of recreational uses provided by public lands. Under Alternative A, a number of SRMAs would be established. Plans for these areas include both recreational facility development and primitive area preservation (the latter most notably for the Dirty Devil/Robbers Roost area), and emphasizes motorized and non-motorized uses to greater or lesser degrees. Recreationists seeking a wide variety of experiences would be able to find areas in which their preferences are emphasized. This could improve the quality of experiences and resulting quality of life of many recreationists and reduce conflicts relative to Alternative N.

Establishment and management of the Dirty Devil/Robbers Roost SRMA to provide for recreational experiences complementary with the remote and scenic nature and other resource values of this area would help protect the quality of those experiences and could draw additional visitors to the area from outside the socioeconomic study area. (The Dirty Devil Canyon area provides the type of primitive and semi-primitive recreation experiences and opportunities for challenge and solitude that are in substantial demand across the West.) This could result in increased economic activity in communities near the Dirty Devil area. To the extent that visitors rely on local permittees as guides or outfitters, these activities would directly benefit businesses and individuals engaged in such activities.

Impacts from Travel Management

Management actions under this alternative would provide some areas open to OHV recreation use without limitation (449,000 acres), but they would place limitations on OHV recreation use in a very large portion of the RFO (1,679,000 acres). This would reduce the quantity and quality of experience for OHV recreation users seeking unconfined experiences. However, the lessened impacts on the scenery that could result from these restrictions could enhance the recreational experience of those OHV users whose primary interest is in enjoying the scenic qualities of the area. All areas closed to OHV recreation use in Alternative N (214,000 acres) would be limited under Alternative A, providing new areas for OHV recreation use. Designation of a large number of open play areas could draw additional riders from outside the RFO, resulting in economic stimulus to the socioeconomic study area. However, increased concentration of OHV recreation users in certain locations could cause increased conflicts among OHV recreation users or decreased quality of experience. The quality of experience for other recreationists

seeking non-motorized recreational environments would be enhanced in those areas being placed in a limited category under this alternative.

Under Alternative A, 252 fewer miles of routes are open for motorized travel than under Alternative N; use on 249 additional miles is restricted; and 3 additional miles are closed. The effects on the local economy from these differences should be minor to negligible, given that 4,312 miles of routes would remain open to motorized travel.

Impacts from Lands and Realty

Under Alternative A, approximately 13,400 acres of BLM-administered public lands would be considered for FLPMA Section 203 sales, much more than would be considered under Alternative N. Benefits to community development and taxes, assuming more land disposals, would likely be greater than under Alternative N. An offset to this economic gain to local counties would be a loss of PILT payments for any lands so disposed. A potential adverse social impact to disposals under this alternative would be the probable loss of public access to these parcels, although many of them are small, isolated parcels surrounded by non-federal land where access is already restricted. Opportunities for other land tenure adjustments would be the same as for Alternative N.

Under Alternative A, certain areas are managed as avoidance or exclusion areas for ROWs, including utility corridors:

- WSAs
- Areas closed to oil and gas leasing.

The acreage avoided or excluded is less than for all other alternatives. To the extent that areas are excluded for ROWs, there could be an adverse impact on certain types of economic development that require such access. To the extent that such areas are avoidance areas, additional costs could be imposed on those entities desiring ROW access. Without knowing the quantity of ROWs foregone by this alternative, the economic impacts cannot be quantified, but they would likely be less than under any other alternative.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Impacts from management actions under this alternative are similar to Alternative N. Under Alternative A, 446,900 acres would be closed to oil and gas leasing. Remaining lands would be open to leasing subject to standard terms and conditions (860,600 acres) or subject to moderate constraints (timing limitation, CSU) (820,500 acres). The closures and stipulations on leasing under this alternative are not expected to significantly alter oil and gas development, for the same reasons noted for Alternative N.

Leasable Minerals—Coal

Under Alternative A, the coal unsuitability reports prepared for this Proposed RMP would be used to determine lands acceptable for further consideration for leasing (Appendix 8). The acreage of lands available for leasing is considerably less in this alternative (and the Proposed RMP and Alternatives C and D) than in Alternative N. However, the unsuitability analysis indicates 41,842 acres in the Henry Mountains coal field are suitable for underground mining (82% of the total underground minable coal resource acreage) and 14,719 acres are suitable for surface mining (40% of the corresponding acreage). In the Emery and Wasatch fields, 31,838 acres are suitable for underground mining (100%) and no acres are suitable for surface mining (0% of the 683 total acres of surface-minable coal resource). In short, the unsuitability analyses indicate ample acreages are available for continued and perhaps expanded coal mining operations. This alternative includes policies and decisions that are designed to support extractive

industries such as coal mining. However, as in Alternative N, whether additional coal development takes place depends upon energy prices, the relative economics of coal production in the RFO versus other regions, and site-specific environmental review.

Locatable and Salable Minerals

Impacts would be similar to those described under Alternative N, except that this alternative would have fewer restrictions on disposal of mineral materials. The lessened restrictions could provide additional opportunities for those wishing to obtain salable minerals.

Impacts from Special Designations

Wild and Scenic Rivers

Alternative A would not recommend rivers within the RFO for WSR designation. This would create some opportunities for businesses and individuals currently impacted by managing the eligible river segments to protect their outstandingly remarkable values, free-flowing nature, and tentative classification under Alternative N. Individuals whose social well-being is enhanced by the values currently protected could be adversely impacted by this alternative, relative to Alternative N.

Areas of Critical Environmental Concern

Alternative A would designate no ACECs. This would create some opportunities for businesses and individuals currently impacted by restrictions on the existing ACECs under Alternative N. Individuals whose social well-being is enhanced by the relevant and important values currently protected could be adversely impacted by this alternative, relative to Alternative N. For all groups, however, socioeconomic impacts likely would be minor, given the small amount of acreage currently designated as ACECs.

Proposed RMP

Impacts from Vegetation

Impacts from management actions under the Proposed RMP are the same as for Alternative A. In addition, management actions under the Proposed RMP would apply an economic threshold to the application of pest control programs. This would probably result in fewer pest control programs and reduce attendant contracts, income, and employment opportunities compared to Alternative A.

Impacts from Visual Resources

The Proposed RMP designates the same acreage as VRM Class I as Alternative A, but adds 249,800 acres as VRM Class II. The VRM Class II will pose additional costs on certain activities, particularly minerals. A corresponding socio-economic benefit, however, will be a net increase in scenic vistas. Our recreation data indicates “driving for pleasure” as the number one recreation activity in the RFO. The socioeconomic impacts of resource decisions to protect scenic qualities of VRM Class II areas are described further in those specific resource discussions. Resource decisions most affected by the Proposed RMP include non-WSA lands with wilderness characteristics, recreation, minerals, and travel management.

Impacts from Fire and Fuels Management

Impacts would be the same as described under Alternative A.

Impacts from Non-WSA Lands with Wilderness Characteristics

The Proposed RMP manages 78,600 acres of non-WSA lands with wilderness characteristics to maintain the qualities of naturalness, outstanding opportunities for primitive and unconfined recreation or solitude, and supplemental values where present. As with visual resources, this resource itself is not a management tool but relies on restrictions of other resource programs to achieve its management goals. The tools used

include restrictions on forestry and woodland products, travel management, minerals and energy, lands and realty, and recreation. These restrictions are identical to the restrictions discussed for each of the resources described throughout chapter 4 under the Proposed RMP, and the socioeconomic impacts are similar for each of these resources so restricted. The socioeconomic impacts of these restrictions resulting from managing 78,600 acres to protect wilderness characteristics are summarized in this section under the specific resource decision, and in the following paragraph.

To help protect, preserve and maintain wilderness characteristics in the 78,600 acres being so managed, the Proposed RMP does the following. Motorized use would be limited to 25.6 miles of designated routes, typically in areas now open to cross-country OHV travel. This decision will benefit those desiring a more non-motorized recreation experience, but negatively impact those OHV recreationists who desire a less restricted environment. All acres of those being protected would be subject to major constraints (NSO). To the extent that such mineral resources are present in the affected areas, there is a potential negative impact to those individuals and firms relying on minerals extraction for their livelihood. All 78,600 acres would be rights-of-way avoidance areas, which could have minor impacts on those needing such provisions. All 78,600 acres would remain in federal ownership, although this would likely have only minor to minimal impacts on future land exchanges or disposals. Woodland harvest would be prohibited, which could cause some harm to those currently relying on the area for such harvest. All 78,600 acres would be in VRM Class II. This has the potential to increase costs for certain types of activities such as minerals; given that all 78,600 acres would be NSO category, however, the additional restrictions posed by VRM class would not likely have an additional negative impact. As with visual resources, the restrictions on development under this alternative have the greatest potential to restrict economic opportunities for those whose livelihood depends, all or in part, on the restricted activities. This would be particularly true in the case of minerals development and motorized recreation. Conversely, those whose livelihood or sense of well-being depends on values associated with wilderness characteristics and primitive recreation would perceive a benefit under the Proposed RMP. This alternative could benefit those businesses that rely on those recreation visitors who value wilderness qualities.

It is not possible to predict whether the potential socioeconomic gains described above would outweigh the socioeconomic losses that could result from this alternative. Managing lands for wilderness characteristics may have some benefits to the local economy above and beyond benefits to individual users of these areas. There is extensive literature that argues that protecting lands as wilderness provides local, regional, and even national economic benefits. Other research suggests that areas with protected lands are more likely to attract higher income individuals, as well as businesses, who value the types of recreation activities provided by protected areas. Still other research argues that certain types of high-dollar recreation, such as hunting, are enhanced by wilderness protection. While most of these studies have focused on the benefits accruing from *designated* wilderness, it is possible that the same arguments may be applicable to non-WSA lands with wilderness characteristics[3].

Impacts from Forestry and Woodland Products

Impacts would be similar to those described under Alternative A, with two exceptions. The 78,600 acres of non-WSA lands with wilderness characteristics being managed to protect, preserve and maintain wilderness characteristics in the Proposed RMP would be closed to woodland harvest, live plant and seed collection (except as allowed under the Healthy Lands Initiative), potentially affecting those individuals relying in whole or part on these areas for this activity. Live plant and seed collection would only be allowed in areas outside WSAs, the 78,600 acres of non-WSA lands with wilderness characteristics being carried forward and suitable WSR corridors.

[3] A good source with an extensive literature review is: "The net economic value of wilderness", Bowker, J.M.; Harvard, J.E.,III; Bergstrom, John C.; Cordell, H. Ken; English, Donald B.K.; Loomis, John B., in *The Multiple Values of Wilderness*, pp. 161–181, USFS, Southern Research Station, 2005.

Impacts from Livestock Grazing

Impacts would be the same as described under Alternative N.

Impacts from Recreation

Management actions under the Proposed RMP attempt to balance needs to provide for production of food, fiber, and minerals with needs to protect, restore, and enhance natural values and to provide quality recreational experiences. There could be less impact on recreation due to resource development and extraction than under Alternative A and, therefore, less impact on the lifestyle and quality of life of recreational users of the lands managed by the RFO.

Management of the SRMAs and non-WSA lands with wilderness characteristics would emphasize primitive and semi-primitive experiences to a greater extent than under Alternative A (most notably for the Capitol Reef Gateway and Henry Mountains). This could draw additional visitors to the area from outside the planning area who seek such experiences, potentially resulting in increased economic activity in communities near these SRMAs.

Establishing an SRMA for motorized recreation in the Factory Butte area could provide positive social benefits to those individuals and groups who value a less restricted recreation experience. The management actions in the SRMA, especially facilities and marked trails, have the potential to attract additional visitation to the area, possibly benefiting local businesses. Conversely, those businesses and individuals who cater to non-motorized recreation may be negatively impacted by this decision.

Impacts from Travel Management

The Proposed RMP has 9,890 acres open to OHV use and fewer designated open play areas than Alternative A. This could result in a diminished recreational experience for some OHV users and may impact the area's ability to draw new OHV users, and their associated expenditures, to the socioeconomic study area. OHV use on the majority of the RFO (1,908,210 acres) would be limited to designated routes. The total acreage closed to OHV use in the Proposed RMP (209,900 acres) is also similar to that for Alternative N (214,000 acres). While OHV users seeking unconfined experiences would be impacted, overall OHV recreation use would likely be similar to Alternative N. Thus the economic impact of OHV recreation use under this alternative would likely be similar to the impact under Alternative N.

Under the Proposed RMP, designated routes total 4,277 miles, 538 miles of which have timing or vehicle size restrictions. The reduced miles available for motorized travel could adversely impact some local users, to the degree that their perceived needs for access are affected. For those desiring a more backcountry recreation experience, the reduced miles of available motorized routes could be perceived as beneficial. The overall differences between Alternatives N and A might not be substantial enough to produce other than minor socioeconomic impacts.

Impacts from Lands and Realty

The types of impacts from lands and realty under the Proposed RMP are similar to those for Alternative A. In addition, the Proposed RMP considers withdrawing a relatively small amount of land from mineral entry; however, this would have minor impacts on mineral development relative to Alternative N, given current rates of such development and directional drilling technologies. Significant acreages would also not be available for ROWs for wind and solar energy exploration and development, but this would likely have minimal impacts as the potential for such uses is small.

Under the Proposed RMP, certain areas would be avoidance or exclusion areas for ROWs, including utility corridors and communication sites:

- WSAs
- ACECs
- Suitable WSR corridors
- Areas closed to oil and gas leasing
- Areas open to oil and gas leasing subject to major constraints (NSO).

The *categories* of these ROW avoidance/exclusion areas are similar to Alternative N, except for the inclusion in the Proposed RMP of 78,600 acres of non-WSA lands with wilderness characteristics as ROW avoidance areas. This addition results in differing acreages due to differences between the alternatives within these land categories, primarily due to the inclusion of 78,600 acres of non-WSA lands with wilderness characteristics being managed to protect, preserve and maintain the wilderness characteristics. The Proposed RMP places greater restrictions on ROWs than does Alternative N because an additional 79,100 acres fall into the closed or subject to major constraints (NSO) oil and gas leasing categories. This is somewhat offset by the management of 12,250 fewer acres as ACECs under the Proposed RMP. In addition, although the Proposed RMP recommends one eligible river segment (5 miles) as suitable (while no suitability determination is made in Alternative N), all eligible river segments are managed to protect their outstandingly remarkable values, free-flowing nature, and tentative classification under Alternative N. To the extent that areas are excluded for ROWs, there could be an adverse impact on certain types of economic development that require such development. To the extent that such areas are avoidance areas, additional costs could be imposed on those entities desiring ROWs. Without knowing the quantity of ROWs foregone by this alternative, the economic impacts cannot be quantified.

As discussed earlier, the Proposed RMP retains lands in public ownership for 78,600 acres being managed to protect, preserve and maintain wilderness characteristics. Although expected to be minor, this decision could potentially affect community expansion opportunities and any resultant economic benefits. Retaining these lands in public ownership will result in continued PILT payments to local governments.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Impacts from management actions under the Proposed RMP are similar to Alternative A. Although the total number of acres closed to oil and gas leasing (447,300 acres) or open to leasing subject to major constraints (NSO) (154,500 acres) is greater than under Alternatives N or A, this would not likely have substantial effects on oil and gas activity for the reasons noted for Alternative N. These reasons include the relatively lower minerals potential in the areas closed or NSO. Additionally, 446,900 acres of the 447,300 acres closed to leasing are located in WSA's, which are outside the scope of the plan.

Leasable Minerals—Coal

Impacts from management actions under the Proposed RMP on coal production and its impact on the local economy likely would be similar to Alternative A. The Wasatch and Emery coal fields would remain largely available. The Proposed RMP includes policies and decisions that are designed to balance extractive industries, such as coal mining, with needs to protect, restore, and enhance natural values. As in Alternative A, whether additional coal development takes place largely depends upon energy prices, the relative economics of coal production in the RFO versus other regions, and site-specific environmental review.

Locatable and Salable Minerals

The Proposed RMP recommends withdrawing an additional 21,500 acres from mineral entry relative to Alternative A. This could have minor-to-negligible effects on the local economy. The Proposed RMP

closes an additional 400 acres to disposal of salable minerals. These areas are largely devoid of potential or at uneconomic distances from users (e.g., sand and gravel deposits located at a distance from significant construction activity), rendering socioeconomic impacts similar to Alternative A.

Impacts from Special Designations

Wild and Scenic Rivers

The Proposed RMP recommends one river segment (5 miles) as suitable for inclusion into the wild and scenic rivers system, tentative classification of wild. Restrictions under the Proposed RMP include closing the area to OHV use, oil and gas leasing with NSO, and recommending for withdrawal from mineral entry. These restrictions could potentially adversely impact individuals or businesses in the planning area that rely on these resources. The acreage affected, however, is small, and these effects would likely be minor. The OHV restrictions in particular would have negligible-to-minor impacts, as the segments in question receive little if any motorized use due to topography or current OHV management. The designation of WSRs under the Proposed RMP could potentially lead to an increase in tourism revenue to local communities, thus having long-term beneficial impact on the local economies. The designation of rivers or river segments could attract more people to the area who enjoy the type of recreation that often accompanies these designations (including high scenic qualities and opportunities for solitude).

Areas of Critical Environmental Concern

The Proposed RMP would designate two ACECs totaling 2,530 acres (which is less than under Alternative N but more than under Alternative A). This would create additional opportunities for businesses and individuals currently impacted by restrictions within ACECs under Alternative N, but less opportunities than under Alternative A. Individuals whose social well-being is enhanced by the relevant and important values currently protected could be adversely impacted by the Proposed RMP, relative to Alternative N. For all groups, however, socioeconomic impacts likely would be minor, given the small amount of acreage currently designated as ACECs.

Alternative C

Impacts from Vegetation

This alternative would rely on using treatment methods that mimic natural processes, including prescribed fire for vegetation treatments and weed control. A maximum of 26,000 acres per year would be so treated, less than the 73,600 acres per year allowed under Alternative A and the Proposed RMP. Fewer opportunities for contracts, income, and employment would be available than under Alternative A or the Proposed RMP. No pest control measures would be implemented; thus, opportunities for contracts, income, and employment available under Alternative A and the Proposed RMP for pest control would not be available under this alternative. Impacts on forage, and thereby on grazing economics, cannot be predicted.

Impacts from Visual Resources

VRM designations for Alternative C are very similar to the Proposed RMP; therefore, socioeconomic impacts would be similar.

Impacts from Fire and Fuels Management

Fire suppression efforts and hazardous fuel reduction treatments could generate economic activity from contracts and result in income and employment gained by those providing the suppression and treatments, plus indirect and induced effects. This activity would be less than under Alternative A or the Proposed RMP because the annual treatments are limited to 26,000 acres per year. The fire suppression efforts could be greater than under Alternative A or the Proposed RMP because the annual fuel treatments

acreage could be less per year. As noted in the discussion for Alternative A, however, a more likely scenario is continued treatment of about 10,000 acres annually, with an economic impact similar to Alternatives N and A and the Proposed RMP.

Impacts from Non-WSA Lands with Wilderness Characteristics

No actions to maintain wilderness characteristics on lands outside of WSAs are proposed under this alternative, resulting in no additional impacts on socioeconomics.

Impacts from Forestry and Woodland Products

Relative to Alternative N, there could be some loss of income and jobs due to this alternative's prohibitions on commercial timber harvesting and commercial collection of seeds and live plants. Such losses are likely to be very small relative to the total socioeconomic study area economy. However, these prohibitions might have important local impacts and could reduce opportunities to maintain aspects of local culture based on harvesting natural resources. Prohibiting commercial seed harvesting would shift this activity to other areas outside of the RFO. Non-commercial harvesting of woodland products would not change relative to Alternative N.

Impacts from Livestock Grazing

Impacts would be the same as described under Alternative N.

Impacts from Recreation

Management actions under this alternative place the emphasis on protection of natural systems. This alternative could produce less of an impact on recreation arising from resource development and extraction than Alternatives N and A or the Proposed RMP.

Management of SRMAs would have a stronger emphasis on primitive, semi-primitive, and non-motorized uses than under Alternatives N and A or the Proposed RMP. Fewer recreational facilities would be developed. Expenditures by individuals who desire developed facilities might decline relative to those alternatives. These expenditure reductions could cause a loss of income and jobs in the socioeconomic study area. Whether these expenditures would be offset by spending from recreationists desiring more primitive recreation experiences cannot be quantified without knowing how numbers would shift (if at all) under this alternative.

Impacts from Travel Management

Under Alternative C, areas closed to OHV use (683,000 acres) and areas in which OHV use is limited to designated routes (1,445,000 acres) would be greater than Alternatives N and A and the Proposed RMP and less than Alternative D. Under this alternative, no acres would be designated as open. The mileage of closed routes in this alternative would be greater than Alternatives N and A and the Proposed RMP and less than Alternative D. Thus the quality of experience for some OHV recreation users, particularly those desiring an unrestricted OHV environment, could be reduced. Restrictions on OHV recreation use could reduce the draw of OHV recreation users from beyond the RFO, resulting in some reduction of expenditures relative to the other alternatives. However, the lowered impacts on scenery that could result from these restrictions could enhance the recreational experience of those OHV users whose primary interest is enjoying the scenic qualities of the area. Limitations and closures to OHV recreation use would enhance the recreational experiences of individuals seeking non-motorized recreational environments.

Alternative C provides 2,601 miles of designated routes and 591 miles of designated routes with seasonal closures or size width restrictions, and it closes 1,188 miles of routes to motorized travel. This represents an additional closure of 984 miles relative to the Proposed RMP. Although not quantifiable, this alternative has greater potential to adversely impact the local economy, but only to the extent that local

residents use these routes in their economic pursuits. Similarly, to the extent that these routes are used for recreational use or access, the additional closures could adversely affect the experiences and potential expenditures of these users. Conversely, those who desire a more primitive recreation experience would likely find their recreational experiences enhanced under this alternative.

Impacts from Lands and Realty

The type of impacts from lands and realty under this alternative are similar to those described under the Proposed RMP, except that no public lands would be considered for FLPMA Section 203 disposals. Thus, any fiscal or economic development benefits achieved in the other alternatives from disposal of public lands would be foregone.

Under Alternative C, certain areas would be avoidance or exclusion areas for ROWs, including utility corridors and communication sites:

- WSAs
- ACECs
- Suitable WSR corridors
- Areas closed to oil and gas leasing
- Areas open to oil and gas leasing subject to major constraints (NSO).

Although the *categories* of lands are similar to Alternative N and the Proposed RMP, the acreages differ due to differences between the alternatives within these land categories. Alternative C places greater restrictions on ROWs than Alternative N and the Proposed RMP because an additional 173,700 acres fall into the closed or open subject to major constraints (NSO) mineral leasing categories. Additionally, Alternative C manages an additional (as compared to the Proposed RMP) 884,280 acres as ACECs. Alternative C also manages an additional 10 segments of WSRs, totaling an additional 76 miles. To the extent that areas are excluded for ROWs, there could be an adverse impact on certain types of economic development that require such development. To the extent that such areas are avoidance areas, additional costs could be imposed on those entities desiring ROWs. Without knowing the quantity of ROWs foregone by this alternative, the economic impacts cannot be quantified.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Impacts from management actions under this alternative are similar to the Proposed RMP. Although the total number of acres closed to fluid mineral leasing (586,300 acres) or open to leasing subject to major constraints (NSO) (148,700 acres) is greater than Alternatives N and A and the Proposed RMP, this would not likely have substantial effects on oil and gas activity for the reasons noted for Alternative N.

Leasable Minerals—Coal

This alternative includes objectives and management actions that are designed to protect, restore, and enhance natural values. Surface and subsurface coal leases would be prohibited in those areas designated as VRM Class I or II; thus this alternative could be more restrictive on coal leasing than the Proposed RMP, which restricts such leasing only in areas designated as VRM Class I. However, as in the Proposed RMP, whether additional coal development takes place largely depends upon energy prices, the relative economics of coal production in the RFO versus other regions, and site-specific environmental review.

Locatable and Salable Minerals

The area proposed for withdrawal from mineral entry is larger, by 154,900 acres, than the Proposed RMP. This has some potential to preclude development of some economically viable deposits, and it could

reduce opportunities for individuals interested in maintaining a mining economy and culture. However, the potential for locatable mineral development in the RFO is at this time assumed to be low. Thus, economic and cultural impacts could also be low.

The area closed to disposal of salable minerals is also larger than in the Proposed RMP, totaling 586,300 acres. These areas are largely devoid of potential, or at uneconomic distances from users (e.g., sand and gravel deposits located at a distance from significant construction activity), rendering socioeconomic impacts similar to the Proposed RMP.

Impacts from Special Designations

Wild and Scenic Rivers

Alternative C recommends 12 river segments (135 miles) as suitable for inclusion into the WSR system. Restrictions under this alternative include closing to OHV use, closing to oil and gas leasing or open to oil and gas leasing subject to major constraints (NSO), and recommending for withdrawal from mineral entry. These restrictions could potentially adversely impact individuals or businesses that rely on these resources. The acreage affected, however, is small and these impacts would likely be minor. Furthermore, nearly three-quarters of the suitable river miles under this alternative are within WSAs, encompassing most of the Dirty Devil River and its side drainages. Thus, the restrictions proposed are already in place under IMP for these particular segments, leading to socioeconomic impacts identical to the current situation. The OHV restrictions in particular would have negligible-to-minor impacts as the segments in question receive little if any motorized use due to topography or current OHV management. The designation of WSRs under Alternative C could potentially lead to an increase in tourism revenue to local communities, thus having long-term beneficial impact on the local economies. The designation of rivers or river segments could attract more people to the area who enjoy the type of recreation that often accompanies these designations (including high scenic qualities and opportunities for solitude).

Areas of Critical Environmental Concern

Alternative C would designate 16 ACECs, totaling 886,810 acres. Table 4-93 summarizes the major management prescriptions for the 16 ACECs under Alternative C that have the potential to impact socioeconomics.

Table 4-93. Management Prescriptions in ACECs Potentially Affecting Socioeconomics—Alternative C

ACEC Name	Acres	Acres within WSAs	OHV Closed Acres	Closed Routes (Miles)	Oil & Gas Closed Acres	VRM Class I Acres
Badlands	88,900	40,400	82,900	12	88,900	40,400
Bull Creek	4,800	0	0	1	0	0
Dirty Devil/North Wash	205,300	130,700	204,700	78	165,500	130,700
Fremont Gorge/Cockscomb	34,300	2,800	23,200	9	4,500	2,800
Henry Mountains	288,200	130,000	207,200	164	164,800	130,000
Horseshoe Canyon	40,900	37,800	40,800	5	37,800	37,800
Kingston Canyon	22,100	0	0	10	0	0
Little Rockies	49,200	37,400	38,400	3	37,400	37,400

ACEC Name	Acres	Acres within WSAs	OHV Closed Acres	Closed Routes (Miles)	Oil & Gas Closed Acres	VRM Class I Acres
Lower Muddy Creek	16,200	0	14,600	17	16,200	0
Old Woman Front	330	0	330	0	0	0
Parker Mountain	107,900	0	0	46	0	0
Quitchupah	180	0	90	0	90	0
Rainbow Hills	4,000	0	4,000	26	0	0
Sevier Canyon	8,900	0	0	3	0	0
Special Status Species	15,100	0	0	0	0	0
Thousand Lakes Bench	500	0	500	0	0	0
Total	**886,810**	**379,100**	**616,720**	**374**	**515,190**	**379,100**

As Table 4-93 indicates, approximately 379,100 acres (42.7%) of the 16 ACECs are partially within WSAs that are managed under IMP. For this acreage, impacts to socioeconomics would be identical to current conditions. For example, the acreage designated as VRM Class I under Alternative C is identical to the WSA acreage, with no additional VRM Class I acreage attributable to ACEC designations. OHV management and oil and gas leasing restrictions, however, encompass additional non-WSA acreage. For the 16 ACECs, 200,100 additional acres (compared to the Proposed RMP) are in the closed OHV category. For oil and gas leasing, an additional 137,400 acres are in the closed to leasing category. These additional restrictions would likely have adverse impacts for OHV enthusiasts and could adversely impact individuals and businesses that rely on mineral resources for all or part of their livelihoods. Individuals whose social well-being is enhanced by the specific relevant and important values protected within these ACECs would be beneficially affected by this alternative, relative to Alternatives N and A and the Proposed RMP.

Alternative D

Impacts from Vegetation

Impacts would be the same as described under Alternative C.

Impacts from Visual Resources

Alternative D places the greatest restrictions on development to protect visual resources. As discussed earlier, the restrictions to protect visual resources are decisions within other resource programs that can impact visual quality. Restrictions under this alternative to protect scenic qualities include restrictions on vegetative treatments and fuels management, travel management, minerals and energy, lands and realty, and recreation. The restrictions on development within VRM Class I and II areas under this alternative have the greatest potential to restrict economic opportunities for those whose livelihood depends, all or in part, on the restricted activities. This would be particularly true in the case of minerals development and motorized recreation. Conversely, the scenic qualities of the RFO that attract visitation would receive the greatest degree of protection under Alternative D. This could benefit those businesses that rely on that type of recreation visitation, including lodging, restaurants, and outfitting.

Impacts from Fire and Fuels Management

Impacts would be the same as described under Alternative C.

Impacts from Non-WSA Lands with Wilderness Characteristics

Alternative D manages 682,600 acres of non-WSA lands with wilderness characteristics in such a manner as to provide protection for the qualities of naturalness, outstanding opportunities for primitive and unconfined recreation or solitude, and supplemental values where present. As with visual resources, this resource itself is not a management tool but relies on restrictions of other resource programs to achieve its management goals. The tools used include restrictions on vegetative and fuels treatments, travel management, minerals and energy, lands and realty, and recreation. These restrictions are identical to the those discussed throughout Chapter 4 for each of these resources under Alternative D, and the socioeconomic impacts are similar for each of these resources so restricted.

As with visual resources, the restrictions on development under this alternative have the greatest potential to restrict economic opportunities for those whose livelihood depends, all or in part, on the restricted activities. This would be particularly true in the case of minerals development and motorized recreation. Conversely, those whose livelihood or sense of well-being depends on values associated with wilderness characteristics and primitive recreation would perceive the greatest benefit under Alternative D. This alternative could benefit those businesses that rely on those recreation visitors who value wilderness qualities.

It is not possible to predict whether the potential socioeconomic gains described above would outweigh the socioeconomic losses that could result from this alternative. Managing lands for wilderness characteristics may have some benefits to the local economy, above and beyond benefits to individual users of these areas. There is extensive literature that argues that protecting lands as wilderness provides local, regional, and even national economic benefits. Other research suggests that areas with protected lands are more likely to attract higher income individuals, as well a businesses, who value the types of recreation activities provided by protected areas. Still other research argues that certain types of high-dollar recreation, such as hunting, are enhanced by wilderness protection. While most of these studies have focused on the benefits accruing from *designated* wilderness, it is possible that the same arguments may be applicable to non-WSA lands with wilderness characteristics[4].

Impacts from Forestry and Woodland Products

Impacts would be similar to those described under Alternative C, with the addition that neither commercial nor non-commercial wood collecting would be allowed in non-WSA lands with wilderness characteristics or in WSR corridors. No live plant or seed collecting would be allowed in these areas. However, these prohibitions could have local social and economic impacts and could reduce opportunities to maintain aspects of local culture based on harvesting natural resources.

Impacts from Livestock Grazing

Impacts would be the same as described under Alternative N.

Impacts from Recreation

Impacts would be similar to those described under Alternative C, except that this alternative would include management prescriptions to protect wilderness characteristics on 682,600 acres of non-WSA lands with wilderness characteristics. The overall management prescriptions associated with this alternative would have a stronger emphasis on primitive, semi-primitive, and non-motorized uses than any of the other alternatives. Fewer recreational facilities would be developed. Expenditures by individuals who desire developed facilities might decline relative to the other alternatives. These

[4] A good source with an extensive literature review is: "The net economic value of wilderness", Bowker, J.M.; Harvard, J.E.,III; Bergstrom, John C.; Cordell, H. Ken; English, Donald B.K.; Loomis, John B., in *The Multiple Values of Wilderness*, pp. 161–181, USFS, Southern Research Station, 2005.

expenditure reductions could cause a loss of income and jobs in the socioeconomic study area. For individuals seeking more primitive and non-motorized recreational experiences, use and resulting expenditures, and related economic activity, as well as experiential satisfaction, would likely be greatest under this alternative.

Impacts from Travel Management

Closure of areas to OHV recreation use (1,155,200 acres) and limiting OHV use to designated routes in other areas (972,800 acres) would be greatest under this alternative. Thus, the quality of experience for some OHV recreation users would be reduced as OHV riding takes place in more limited areas, increasing crowding in some. Restrictions on OHV recreation use could reduce the draw of OHV recreation users from beyond the planning area, resulting in some reduction of expenditures relative to the other alternatives. Limitations and closures to OHV recreation use would enhance the recreational experiences of individuals seeking non-motorized recreational environments.

The miles of routes designated, designated with restrictions, and closed would be similar to Alternative C. The miles of closed routes would be higher by 54 miles, an increase of approximately 5% over Alternative C. The socioeconomic impacts of route designations under Alternative D would thus be similar to Alternative C.

Impacts from Lands and Realty

Socioeconomic impacts from land tenure adjustments would be the same as for Alternative C. Under Alternative D, certain areas would be managed as avoidance or exclusion areas for ROWs, including utility corridors and communication sites:

- WSAs
- ACECs
- Eligible WSR corridors
- Non-WSA lands with wilderness characteristics
- Areas closed to oil and gas leasing
- Areas open to oil and gas leasing subject to major constraints (NSO).

Although the *categories* of lands are similar to Alternatives N and C and the Proposed RMP, the acreages differ due to differences between the alternatives within these land categories. Alternative D includes more areas as ROW exclusion/avoidance areas than does Alternative C because an additional 468,800 acres fall into the closed or NSO mineral lease categories. To the extent that areas are excluded for ROWs, there could be an adverse impact on certain types of economic development that require such development. To the extent that such areas are avoidance areas, additional costs could be imposed on those entities desiring ROWs. Without knowing the quantity of ROWs foregone by this alternative, the economic impacts cannot be quantified.

Impacts from Minerals and Energy

Leasable Minerals—Oil and Gas

Alternative D closes 1,160,500 acres to oil and gas leasing and opens 43,300 acres to leasing subject to major constraints (NSO). As described in detail in the non-WSA lands with wilderness characteristics section, this alternative projects one less well drilled per year in RFD Areas 1 and 2 and projects 13 wells per year fewer in RFD Area 3 (two wells over 15 years). This would result in a reduced spending on Phase 1 exploration and development of $2.87 million (1.13 wells multiplied by $2.25 million to drill and complete one successful well, less if unsuccessful), computed on an average annual basis. As discussed under Alternative N, not all of these expenditures would likely be local.

An additional potential impact to state revenues is the potential loss to SITLA from not being able to lease or develop lands bordered all or in part by non-WSA lands with wilderness characteristics. The value of these lands for oil and gas leasing or development may be reduced if all or portions of public lands bordering these state lands are closed to new oil and gas leasing. This in turn could reduce the monies collected by the state (through SITLA), including royalties and severance taxes. These impacts can be estimated by using current data and incorporating several assumptions. If one assumes that any SITLA land whose perimeter is more than 50% bounded by BLM acreage closed to new oil and gas leasing as a result of implementing Alternative D and would be unavailable for development, and if one uses the projections of the RFD, one can project that slightly more than one well (1.16) would not be drilled over the life of the plan. Using data provided by the State of Utah, royalty payments to wells on SITLA lands averaged $57,065 as of early 2008. Severance taxes averaged $9,335 for all wells, regardless of land ownership. Multiplying these figures by the wells assumed to not be drilled, the fiscal loss to the state would total $66,516 in royalties and $10,881 in severance taxes in any year in which all 1.16 wells would have been in operation. This amount could increase over the life of the plan, as it is likely that some fraction of these wells would be in operation in several (or even all) years of the plan.

Similarly, one can compute potential spending on oil and gas activities (including coalbed methane) lost to the planning area, if these SITLA lands prove undevelopable under Alternative D. Using the assumptions outlined in the Impacts from Minerals and Energy for Alternative N: No Action section, the loss in spending in the local area would be approximately $721,100 in any year in which all 1.16 wells would have been in operation. This amount could increase over the life of the plan, as it is likely that some fraction of these wells would be in operation in several (or even all) years of the plan.

The potential loss to SITLA from not being able to lease or develop lands bordered all or in part by non-WSA lands with wilderness characteristics could also potentially increase school trust land management costs. Restrictive designations could increase the cost of access to school trust lands, impair marketability, and increase expenditures of trust resources in pursuing land exchanges with BLM. It is not possible to estimate the potential increase in school trust land management costs with available data.

Leasable Minerals—Coal

This alternative includes policies and decisions that are designed to protect, restore, and enhance natural values and to protect non-WSA lands with wilderness characteristics. Protecting the non-WSA lands with wilderness characteristics would remove 44,300 acres of identified coal resource land from further consideration for leasing, primarily in the Henry Mountains. But this study assumes this coal field would not be developed within the planning period. Whether additional coal development takes place largely depends upon energy prices, the relative economics of coal production in the RFO versus other regions, and site-specific environmental review.

Locatable and Salable Minerals

Alternative D proposes withdrawing 903,900 acres from development of locatable minerals and closing 1,160,500 acres to salable minerals. This has some potential to preclude development of some economic deposits, and it could reduce opportunities for individuals interested in maintaining a mining economy and culture. However, the potential for both locatable mineral development and disposal of salable minerals in the RFO is, at this time, assumed to be low. Thus, economic and social impacts could also be low.

An additional potential loss to SITLA would be revenues foregone from its inability to lease its lands for other types of minerals. In FY2007, SITLA generated statewide $12 million from leases of coal and other minerals. This amounted to 8% of all SITLA revenues. (In contrast, oil and gas revenues accounted for 40% of SITLA revenues.) To the extent that such minerals are present on SITLA lands that prove to be

undevelopable, there would be a financial loss to SITLA. It is not possible to estimate this potential loss with available data, but the impact is expected to be minor.

Impacts from Special Designations

Wild and Scenic Rivers

Impacts are the same as those described under Alternative C.

Areas of Critical Environmental Concern

Alternative D designates acreage identical to Alternative C, but it offers a higher degree of protection of the relevant and important values. Table 4-94 summarizes those restrictions that could impact socioeconomics.

Table 4-94. Management Prescriptions in ACECs Potentially Affecting Socioeconomics—Alternative D

ACEC Name	Acres	Acreage within WSA	OHV Closed Acres	Closed Routes (Miles)	Oil & Gas Closed Acres	VRM Class I Acres
Badlands	88,900	40400	84,800	10	88,900	75,800
Bull Creek	4,800	0	300	1	0	300
Dirty Devil/North Wash	205,300	130,700	204,800	89	204,300	203,900
Fremont Gorge/Cockscomb	34,300	2,800	20,400	20	18,900	18,700
Henry Mountains	288,200	130,000	230,400	162	239,500	222,500
Horseshoe Canyon	40,900	37,800	40,800	5	40,800	40,800
Kingston Canyon	22,100	0	16,400	20	0	16,500
Little Rockies	49,200	37,400	46,900	4	46,900	46,300
Lower Muddy Creek	16,200	0	15,900	17	16,200	15,800
Old Woman Front	330	0	330	0	0	0
Parker Mountain	107,900	0	0	46	0	0
Quitchupah	180	0	110	0	0	30
Rainbow Hills	4,000	0	4,000	26	0	0
Sevier Canyon	8,900	0	0	3	0	0
Special Status Species	15,100	0	0	0	0	0
Thousand Lakes Bench	500	0	500	1	0	40
Total	**886,810**	**379,100**	**665,640**	**404**	**655,500**	**640,670**

As Table 4-94 indicates, and identical to Alternative C, approximately 379,100 acres (42.7%) of the 16 ACECs are in WSAs currently managed under IMP. For this acreage, impacts to socioeconomics would be identical to current conditions. For example, the acreage designated as VRM Class I under Alternative C is identical to WSA acreage, with no additional acreage attributable to ACEC designations. Additional restrictions on some resources, however, are present in this alternative, above and beyond WSA acreage and the acreage described in Alternative C. These additional acreages in VRM Class I, restrictive oil and

gas lease categories, and closed OHV areas are due almost exclusively to the overlap between the ACECs and non-WSA lands with wilderness characteristics. The increased restrictions on these resources in Alternative D are the result of prescriptions for managing non-WSA lands for wilderness characteristics, rather than prescriptions for protecting the relevant and important values of the ACECs.

These additional restrictions would likely adversely impact OHV enthusiasts and could adversely impact individuals and businesses that rely on mineral resources for all or part of their livelihoods. Individuals whose social well-being is enhanced by the specific relevant and important values protected within these ACECs would be beneficially affected by this alternative relative to the Proposed RMP and Alternatives N, A, and C.

Other Impacts on Socioeconomics

The following section projects impacts on facets of socioeconomics not fully described in the resource decisions discussed above. Specifically, this section discusses the impacts of BLM resource decisions on population, community services, environmental justice, and public health and safety.

4.6.2 Impacts to Population

Any population change that could be associated with implementation of alternatives under consideration in this RMP would likely be linked to employment changes. Activities on public lands in the RFO would continue to support a notable number of jobs in the socioeconomic study area under all alternatives. It is not anticipated that continuing current management actions under Alternative N would significantly affect population trends. Changes in employment in all action alternatives, whether quantified in this RMP or not, are not expected to be substantial relative to Alternative N or to each other. Therefore, population impacts of any of the alternatives would be negligible. Under Alternative A, localized impacts are possible within portions of the socioeconomic study area that are more closely tied to the employment opportunities generated by coal mining and oil and gas development. Under Alternatives C and D, employment could change somewhat in specific locations due to policies that favor resource preservation and passive use over resource development, but any resulting localized impacts to population trends would be minor.

4.6.3 Impacts to Community Services

Activities affected by RMP decisions could cause impacts to local government services in various ways. For instance, changes in demand for local government services could vary with changes in population tied to management actions. Significant changes in population could cause undue strain on infrastructure (e.g., roads, utilities, schools). As discussed above, notable population changes are not expected under any alternative. Therefore, identifiable changes in demand for government services are not expected due to changes in population.

Decisions under the alternatives could also cause impacts to services through changes in tax receipts. All alternatives are expected to continue to generate notable local tax revenues throughout the planning period, with some minor variations. For instance, management actions under Alternative A and the Proposed RMP would provide the greatest potential for community development and increased local tax revenues from land disposals, while management actions under Alternative C would preclude these potential benefits.

Management actions could also affect local government services directly. For instance, increased recreational use of RFO lands, likely under all alternatives due to regional and national trends, would increase the demand for local government services associated with safety, emergency services, and police

protection. While local search-and-rescue operations utilize volunteers, there would be a growing need for training, equipment, and resources. In addition, these operations must be supported by the Sheriff's Office in each county.

Increased government services might also be needed to support other activities such as somewhat greater oil and gas development under Alternative A. This could include emergency, social, and safety services as well as road maintenance and traffic control. However, oil and gas development in this and all alternatives is likely to be fairly limited compared to major oil and gas producing areas in other parts of the West.

4.6.4 Impacts on Public Finance

Management alternatives could affect various revenues collected by the Federal government, state government, and various local governments. The socioeconomic section of the PRMP/FEIS Chapter 3 details a variety of revenue sources that are tied to or related to natural resource management on BLM lands.

Current trends in coal production are expected. The Federal Government would continue to collect mineral rents, royalties, and possibly bonuses from coal mining operations. Fifty percent of these revenues would be retained by the Federal Government, and 50% forwarded to the State of Utah. The State would provide some of these revenues to local governments through a variety of funds, only one of which is directly proportional to the mineral revenues produced by each county. The State has no severance tax on coal. Local governments would continue to receive natural resource property tax revenues from coal mining. Whether changes in coal development take place largely depends upon energy prices, the relative economics of coal production in the RFO versus other regions, and site-specific environmental review. Revenues collected from coal mining operations would be impacted by changes in coal production levels. These revenues cannot be quantified in the PRMP/FEIS, given currently available information.

Oil and gas production expected under all alternatives would produce some new federal and state mineral revenues, and the State would in turn provide some oil and gas revenues to the counties of origin. The State would also obtain new revenues from its oil and gas severance tax, oil and gas conservation fee, and income taxes. Local governments would obtain new revenues from associated natural resource property taxes. Because the amount of oil production is unknown, these impacts cannot be quantified, but they are not expected to vary significantly among between the alternatives because the RFD scenario does not vary significantly among between the alternatives.

Under all alternatives, the BLM would collect revenues through ROW rents, recreation fees, grazing fees, mineral material fees, and other permit fees. Some of these fees would be forwarded to the federal treasury; others would be returned to state and local governments, local grazing boards, or retained and used by the Richfield Field Office.

All alternatives are expected to continue to generate local sales and lodging tax revenues through expenditures of visitors in local establishments. These revenues would increase through the planning period as visitation increases due to regional and national trends and management actions that increase the attractiveness of the decision area to non-local visitors.

Land tenure adjustments under the BLM lands and realty program could potentially impact local government finances. Disposal of BLM lands to private ownership may reduce PILT by the Federal Government to local government, but it would also result in payments of property taxes to local government by the new private property owner(s). Land exchanges to other governments may also impact PILT payments. Acquisition of private land by BLM would reduce property taxes paid to local

government but would increase PILT payments. Differences between the alternatives, as well as the net impact on local government finances, cannot be determined without detailed information on the specific property(ies) in question as well as the tax rates and other financial figures for the particular local government(s).

4.6.5 Environmental Justice

Executive Order 12898, Federal Action to Address Environmental Justice in Minority Populations and Low-Income Populations, requires federal agencies to identify and address disproportionately high and adverse human health and environmental impacts of federal programs, policies, and activities on minority or low-income populations. As noted in the Baseline Socioeconomic Profile (BLM 2003b) and Chapter 3, no socioeconomic study area counties:

- Have minority or low-income populations exceeding 50 percent
- Have minority or low-income populations that are 10 percentage points greater than figures for the State of Utah.

Therefore, for the purposes of this analysis and all management alternatives examined in this Final EIS, there are no environmental justice populations in the socioeconomic study area, and actions required to identify and mitigate impacts to such populations are not required.

4.6.6 Public Health and Safety

An inventory of abandoned mines throughout the RFO has not been completed. Some abandoned mines within the RFO may be considered public safety hazards or suspected to have environmental concerns due to potentially occurring hazardous materials. Through coordination with Utah Department of Oil, Gas, and Mining and subject to funding, abandoned mines will continue to be identified and closed in order of the physical safety hazard priority and availability of funding. None of the management actions would increase public exposure to the risks associated with these abandoned mines. As a result, impacts would be negligible.

Remediation of contaminated and hazardous sites is necessary for compliance with applicable federal and state rules and regulations. No hazardous or solid waste sites are known to occur on public lands within the planning area. Incidental dumping of hazardous materials occurs, but it is rare and concentrated mostly in close proximity to towns and highways primarily within the RFO. None of the management actions proposed by the alternatives would require the handling, storage, or release of hazardous, toxic, or unapproved solid wastes that would cause health and safety concerns. Small amounts of fuels, chemicals, or other vegetation treatment products would be used throughout the RFO, but amounts would be relatively small and mostly applied away from populated areas. As a result, health and safety impacts would be negligible and are not analyzed further.

4.7 CUMULATIVE IMPACTS

Cumulative impacts are the effects on the environment resulting from the impact of implementing the Proposed RMP in combination with other actions outside the scope of this plan, either within the planning area or outside it. As stated in 40 CFR 1508.7 (1997), a "cumulative impact is the impact on the environment that results from the incremental impact of an action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (federal or non-federal) or person undertakes such other actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time."

Resource decisions from this Proposed RMP could combine with other past, present, and reasonably foreseeable future actions to produce cumulative impacts to resources in the planning area or adjacent lands that would be within the influence of the Proposed RMP. In other words, the scope of implementation of the alternatives of this Proposed RMP would include any activities and conditions, either within the RFO boundaries or outside, which would directly or indirectly influence the same resources as analyzed in the Proposed RMP. Planning projects in the region that could contribute to cumulative impacts include any area that would be affected by the decisions of the plan because of their geographic, administrative, or political ties to the Proposed RMP lands, such as adjacent BLM Field Office lands, Forest Service lands, and State-owned lands. Private lands, surrounding communities, and city and county jurisdictions could also produce cumulative impacts where land is developed or projects are constructed adjacent to BLM public lands.

The analysis of cumulative impacts serves to place the projected incremental impacts from the Proposed RMP in the context of past, present, and future impacts. Combining the projected impacts of the Proposed RMP with past, present, and future impacts necessarily involves projections and limited analyses, to the extent possible. Analyses are limited and qualitative in nature due to the inability to isolate the specific contribution of all past and present impacts from non-federal lands; challenges of predicting potential impacts for reasonably foreseeable future actions; the broad programmatic and strategic nature of the Proposed RMP; unknown nature and pace of resource uses and technological changes that could occur; and changing circumstances related to agency priorities, policies, and the economy. It is neither practical nor required to exhaustively analyze all possible cumulative impacts. Instead, CEQ indicates the cumulative impact analysis should focus on meaningful impacts due to the nature of the RMP decisions

4.7.1 Methodology

The cumulative impacts discussion that follows considers the alternatives in the context of the broader human environment and specifically actions that occur outside the scope and geographic area covered by the Proposed RMP. Because of the programmatic, broad-scale nature of this Proposed RMP, this assessment is broad and generalized to address potential effects that could occur from a hypothetical management scenario when combined with other activities or projects. This assessment is primarily qualitative for many resources because of the lack of detailed information that would result from project-level decisions and other activities or projects.

Cumulative impact analysis is limited to important issues of national, regional, or local significance. Therefore, not all issues identified for direct or indirect impact assessment in this Final EIS are analyzed for cumulative effects. Because of the wide geographic scope of a cumulative impact assessment and the variety of activities assessed, cumulative impacts are commonly examined at a more qualitative and less detailed level than are the direct and indirect impacts presented previously in this chapter. This analysis includes discussion of factors that make up the current environment. Factors that could be expected to influence that environment in the future are also considered. Reasonably foreseeable future action

scenarios are projections made only for the prediction of future impacts; they are not actual planning decisions or resource commitments.

Projections, which have been developed for analytical purposes only, are based on current conditions and trends and represent a best professional estimate. Unforeseen changes in such factors as economics, demand, and federal, state, and local laws and policies could result in different outcomes than those projected for this analysis.

The following factors were considered in this cumulative impact assessment:

- Federal, non-federal, and private actions
- The potential for effects to cross political and administrative boundaries
- The characteristics of each affected resource
- The comparative scale of cumulative impacts across alternatives.

4.7.2 Past and Present Actions

4.7.2.1 Population and Settlement

Overall, the RFO is sparsely populated due to its elevation, aridity, and ruggedness. Total population in the five-county, 5,400,000-acre planning area barely exceeds 50,000 residents, and most of this is concentrated in Sevier and Sanpete counties. Piute, Wayne, and Garfield counties are still sparsely populated. All five counties experienced early pioneer settlement dating back to the 1840s. Farms and communities were established along the arable valleys bordering the Sevier and Fremont Rivers and their tributaries. Many of these areas are still used for agriculture-related uses; some have been intensively developed. During the mining heyday, some of the less hospitable areas in the mountains and desert were used for mining ventures, resulting in some residential occupation that still exists. Many of the towns were abandoned when lodes played out or economic conditions changed.

Private land totals 15% of the area. The most evident changes to the natural environment are concentrated in and around the settled areas in which native vegetation and wildlife have been displaced by homes, farms, and other developments.

4.7.2.2 Land Ownership and Management

Most of the RFO remains in public ownership and is managed by the Federal Government or State of Utah. Three federal agencies manage 77% of the land: BLM, 39%; Forest Service, 27%; and National Park Service, 11%. Proposed actions on these lands potentially affecting the environment are analyzed under NEPA, which ensures, among other things, that cumulative impacts are addressed. The State of Utah manages an additional 7% of the land base. Many State land parcels are isolated within large tracts of public land. Impacts from activities on State lands can affect the surrounding federal lands; likewise, impacts from activities on federal land can affect State lands. The National Park Service units, Canyonlands and Capitol Reef National Parks, and Glen Canyon National Recreation Area (NRA) attract large numbers of visitors, which can impact surrounding public lands. Conversely, BLM management decisions for resource uses such as OHVs, oil and gas leasing, and coal leasing can impact national park resources.

4.7.2.3 Water Development

Agriculture in this arid land depends on irrigating crops with water diverted from streams, rivers, and springs. Concentrated along the Sevier and Fremont Rivers and their tributaries is an extensive system of irrigation diversions, canals, pipelines, and ditches. There are 21,000 surface water, groundwater, and point-to-point agricultural water diversions within the RFO. Major water storage facilities include the Gunnison, Rocky Ford, Johnson Valley, Otter Creek, Yuba, Koosharem, and Piute Reservoirs. The water diversions and reservoirs alter the timing of flows, temperature, turbidity, and ecological composition of the rivers and streams, which in turn affects water quality and quantity. Most of the streams within the RFO have been affected by water development. Those few remaining segments that remain relatively unaffected were identified and considered in the WSR analysis.

4.7.2.4 Livestock Grazing

Closely associated with pioneer settlement was livestock grazing on the surrounding public domain, in both the mountains and deserts. The environmental consequences of this early, unregulated grazing led to the establishment of the forest reserves (national forests) and the Forest Service and later, passage of the Taylor Grazing Act and establishment of the Grazing Service, which later became the BLM. Grazing continues today on the public lands and the national forests. Livestock numbers have generally been considerably reduced from what they were in the past, but evidence of past abuses remains on the land.

4.7.2.5 Mineral Development

Locatable mineral exploration and development dominated portions of the RFO in the past, most notably in the Tushar and Henry Mountains and near the towns of Marysvale and Ticaboo. Evidence of past mining activity, such as adits, shafts, roads, old buildings, and machinery remain on the land. Current mineral activity includes the SUFCO coal mine (located north of I-70 in Salina Canyon), gypsum mining (at Sigurd), salt mining (at Redmond), renewed interest in uranium mining (near Ticaboo and Hanksville), sales of various mineral materials (mostly sand and gravel) throughout the RFO, and oil and gas exploration and production in the Sevier and Sanpete Valleys, as discussed under the Reasonably Foreseeable Actions (Section 4.7.3).

4.7.2.6 Industrial Development

The RFO is not heavily industrialized. There are two gypsum plants operating in Sigurd and a gypsum mill in Richfield that use gypsum mined in the San Rafael Swell. There is also a salt mine and plant located in Redmond that produces and markets salt products, and a clay plant in Aurora that also gets clay from the San Rafael Swell.

4.7.2.7 Transportation System

Populated areas within the RFO are served by federal and state highways including Interstate 70, U.S. Highways 89 and 50, and State Highways 12, 24, 28, 62, 72, and 95. The Forest Service and National Park Service maintain networks of road systems within their respective ownerships; the counties maintain roads around communities and on the public lands. Currently there is no rail service within the RFO, but there is a proposal to construct a rail line in Sanpete and Sevier counties in the near future.

4.7.2.8 Off-Highway Vehicles

OHVs, particularly all-terrain vehicles (ATVs), are popular within the planning area for agricultural and recreational use. The Paiute Trail System, a joint effort of federal, state, and local agencies and

communities, is an extensive trail system on the west side of the planning area that links federal- and state-managed public lands with communities. It is a model of OHV management and interagency cooperation and has become an attraction for visitors from outside the area. There are areas of intensive ATV use throughout the area, particularly around some of the communities, where soils, vegetation, and scenic values are being affected.

Overall recreation use within the RFO has grown slightly. Vehicle-based recreation (OHV) use has become popular for a variety of recreational outings, including camping, hunting, and exploring, and OHV-specific activities such as hill climbing and trials riding (rock climbing). As vehicle-based recreation has grown and OHVs adapted for use on rough terrain, areas previously inaccessible for full-sized vehicles have become accessible for ATVs. OHV use has increased on public lands. The trend continues to grow as ATVs become more affordable and popular.

4.7.3 Reasonably Foreseeable Future Actions

4.7.3.1 Population Growth

Over the next 50 years, the population within the planning area is expected to grow by 64% (Table 4-95 and Table 4-96), somewhat less than the population growth in Utah (Table 4-96), which is expected to increase by 140% during the same period.

Table 4-95. Predicted Population Growth in Counties within the Planning Area

	Year	Garfield*	Piute	Sanpete	Sevier	Wayne
Population Projections	2000	4,800	1,400	22,800	18,900	2,500
	2010	5,000	1,500	27,900	21,000	2,800
	2020	6,000	1,800	32,900	24,900	3,500
	2030	6,700	1,800	35,200	26,900	3,900
	2040	7,400	1,900	36,900	28,300	4,300
	2050	8,000	2,000	38,500	29,700	4,600
% Increase	**2000–2050**	**67%**	**43%**	**69%**	**57%**	**84%**

Table 4-96. Growth in the Planning Area and Utah

	Year	Planning Area*	Utah
Population Projections	2000	50,400	2,246,600
	2010	58,200	2,833,300
	2020	69,100	3,486,200
	2030	74,500	4,086,300
	2040	78,800	4,701,400
	2050	82,800	5,368,600
% Increase	**2000–2050**	**64%**	**140%**

Source: Governor's Office of Planning and Budget 2005
*Includes all of Garfield County.

4.7.3.2 Community Growth

Associated with population growth would be the conversion of farmland to residential housing and second homes. Potential impacts from community expansion include wildland-urban interface fire issues, infrastructure demands, water quantity and quality, habitat fragmentation, economic benefits, and social issues. Because most new homes are built on farmland, the loss of farmland is also an issue. Recent trends in the five-county area are shown in Table 4-97. Overall, the number of farms and farmland acreage is decreasing and would likely continue to decrease as farmlands are converted to homes.

Table 4-97. Number and Acreage of Farms in the Planning Area

		Garfield*	Piute	Sanpete	Sevier	Wayne
Number of Farms	1997	312	108	847	530	206
	2002	225	108	759	568	173
Land in Farms	1997	122,536 acres	41,991 acres	361,116 acres	149,774 acres	59,246 acres
	2002	79,879 acres	(Information missing)	357,184 acres	164,817 acres	42,374 acres

Source: USDA 2004b.
*Includes all of Garfield County.

4.7.3.3 Oil and Gas Leasing and Development

Significant portions of public and private lands in the Sevier–Sanpete Valley are currently leased for oil and gas and interest in leasing remains high. Future impacts from oil and gas development would be determined by the outcome of current exploration in the valley. Several producing wells have been drilled and proposals for others are being considered. A RFD scenario for oil and gas within the planning area was developed and is included in Appendix 12. Over the next 15 years, geophysical exploration for oil and gas would directly impact no more than 5,100 acres; and 454 oil and gas wells would be drilled, directly impacting no more than 3,080 acres. Indirect impacts could include impacts to scenic quality, increased traffic on roads and highways, conflicts with wildlife and wildlife habitat, removal of vegetation, and social issues in communities. These numbers reflect expected impacts on private, state, national forest, and public lands.

4.7.3.4 Industrial Development

NEVCO Energy Company is proposing to build a 270-megawatt circulating fluidized bed coal-fired steam electric generating plant near Sigurd. If constructed, the plant would emit nitrogen oxides and sulfur oxides. It would increase demand on water quantity and impact water quality. The project also would increase employment during the plant construction phase and provide a few long-term jobs in the region.

4.7.3.5 Water Development

The Wayne County Water Conservancy District has expressed interest in utilizing remaining unappropriated water in the Fremont River. Dams at sites upstream and downstream from Capitol Reef National Park have been proposed at various times in the past, as have pipelines and land exchanges to bring under cultivation new land along the Fremont River and surrounding areas. No specific proposals or approved plans have been disclosed, and implementation of the project continues to remain uncertain. The coal-fired plant discussed above would require an extraordinary amount of water, which would affect

present uses. Further withdrawals of water could adversely impact outstandingly remarkable values in segments of the Fremont and Dirty Devil Rivers identified as eligible WSRs.

4.7.4 Cumulative Impacts of the Proposed RMP and Draft Alternatives- Cumulative Impacts by Resource Category

Cumulative impacts are discussed only for resources or uses that may experience impacts. The potential for cumulative impacts to the resources and resource uses is discussed below. Cumulative impacts to hazardous materials and public safety are not anticipated; therefore, these topics are not discussed.

Air Quality

Drilling, coal mining, and OHV activities cause emissions of particulate matter, carbon monoxide, nitrogen oxide, sulfur dioxide, and volatile organic compound (VOC) emissions. In the future, these emissions could impact ambient air quality, visibility, and atmospheric deposition. The cumulative impact analysis of air quality within and near the planning area includes major sources such as coal-fired power plants and cogeneration facilities. No other RFD would increase regulated pollutants in the area.

Data provided by RFO staff were used to determine the base year conditions after the development of proposed energy resources was complete. In addition, emissions data were gathered for the area. The most recent Utah Division of Air Quality (UDAQ) Statewide Emissions Inventory Report shows the primary air pollutants in all counties are VOCs and carbon monoxide (CO), followed by PM_{10}, nitrogen oxides (NO_x), $PM_{2.5,}$ and sulfur oxides (SO_x). The only exception is Sevier County where NO_x is higher than PM_{10}. Table 4-98 shows the criteria pollutant levels in tons per year from the Statewide Emissions Inventory. The 2005 emissions from the sources in all counties are 186,241 tons per year (UDAQ 2005). The emissions from future BLM activities for the Proposed RMP and all alternatives range from 2,240 tons to almost 2,271 tons per year (Table 4-11). Emissions from proposed actions from BLM activities in the decision area will contribute approximately $1/10^{th}$ of a percent of the emissions of the State of Utah and approximately 1 percent of the sum of emissions from all counties listed in Table 4-98.

Table 4-98. 2005 Criteria Pollutant Inventory (tons per year)

Area	PM_{10}	$PM_{2.5}$	SO_x	NO_x	VOC	CO	TOTAL
Garfield	**1,544**	**457**	**55**	**634**	**45,336**	**14,930**	62,956
Piute	**240**	**57**	**19**	**138**	**11,703**	**2,935**	15,092
Sanpete	1,231	272	206	1,119	18,874	12,439	34,141
Sevier	1,504	436	262	3,423	19,369	17,047	42,041
Wayne	473	87	79	224	24,591	6,557	32,011
Utah Total	**79,890**	**26,485**	**47,910**	**186,254**	**884,847**	**952,840**	**2,178,226**
Utah Average	**2755**	**913**	**1,652**	**6,423**	**30,512**	**32,857**	**150,222**

Sources: (UDAQ 2005)

Considering that the permitted sources do not calculate emissions from some of the oil and gas sources and that the permitted emissions come from single-point sources, the future anticipated emissions from BLM activities will be low in comparison to existing sources.

Ozone concentrations in both Canyonlands and Zion National Parks have been over 85% of the air quality standard designed to protect public health. The more strict 8-hour ozone NAAQS recently adopted by EPA makes ozone concentrations of critical concern.

Soil and Water Resources

The cumulative analysis boundary for soil resources is the planning area and the fifth order watersheds that intersect the planning area boundary. The BLM management actions combined with other federal, state, local, private and other land incremental impacts to soils and water resources would most likely come from OHV use, mineral exploration and development, livestock grazing, vegetative treatments (including prescribed burning), and wildfires. Historically, these actions have all had cumulatively adverse impacts on soil resources by causing surface disturbance contributing to reduced soil productivity, soil compaction and erosion, and subsequent sedimentation. They have also resulted in the widespread introduction of invasive weeds, which can affect water resources through increased evapotranspiration rates and can affect soil resources through alterations to soil chemistry and productivity. However, BLM-permitted activities would comply with authorizing permit stipulations that would minimize soil erosion and degradation of water quality and are not expected to contribute to the overall cumulative effect to water quantity and quality from past, present, and reasonably foreseeable actions. In addition, fire use and vegetation treatments proposed by BLM under the Proposed RMP would incrementally improve watershed health, which could increase the ability of the watershed to retain moisture. This could increase the volume of water within the watershed.

Reasonably foreseeable future actions in the RFO and on federal, state, local, private, and other lands within and adjacent to the planning area that could have an adverse affect on soils and water resources include an expansion of recreational use (including increased OHV use) and ongoing mineral exploration, development, and production.

Under the Proposed RMP and all DRMP/DEIS alternatives, soils and water resources would benefit from management in accordance with the *Fundamentals of Rangeland Health* and *Standards and Guidelines for Grazing Administration*. Adherence with these standards would reduce many of the adverse impacts from future BLM actions. In general, DRMP/DEIS Alternatives N, and A, would be the least protective of soil and water resources, result in the least beneficial impacts to soils and water resources, and have the least mitigating effect on past impacts to soils and water resources in the RFO. Incremental impacts from DRMP/DEIS Alternatives and A would be the greatest. DRMP/DEIS Alternatives C and D would be the most protective and would provide the least amount of incremental impacts by excluding the most areas from OHV use and other forms of surface disturbance. The Proposed RMP would provide an intermediate level of protection and mitigation of cumulative impacts.

Vegetation

The cumulative impact analysis boundary for vegetation includes the entire planning area. Potential cumulative impacts on vegetation would occur from a combination of BLM and non-BLM activities and land uses occurring within the analysis boundary. Such incremental impacts would result primarily from vegetation treatments, oil, gas, and other minerals development, forage use by livestock and wildlife species, prescribed burning, wildfires, vegetative and increased OHV use. The combined amount of surface-disturbing incremental actions associated with consumptive uses would result in cumulative effects throughout the RFO. Each disturbed area increases the opportunity for weed invasions and disrupts the spatial continuity of vegetation communities, and hence, habitat for plant and animal species. As human access increases, potential cumulative impacts to vegetation and wildlife habitat expand.

Direct impacts would be due to loss of vegetation or habitat from livestock forage use, fires, oil, and gas and other mineral-related development, and vegetative treatments. Indirect impacts would also occur with habitat fragmentation due to development, changes in OHV use due to increased routes and the use of those routes, and revegetation efforts from rehabilitation actions. Changes in land use and ownership could result in the loss of some vegetation used for wildlife habitat. Integrated weed management would reduce the spread and potential for noxious weeds and invasive species establishment.

Past fire suppression has contributed to increasing pinyon-juniper encroachment in the decision area and to a concurrent decrease in aspen and ponderosa pine communities. Fire use and vegetation treatments under the Proposed RMP would generally maintain or improve vegetation communities by removing undesired species, increase species diversity and age class, improve vegetation composition and structure, and increase vegetation cover. In addition, vegetation treatments and range improvements on lands adjacent to the decision area (public and private) would increase available forage and water for wildlife populations and livestock (for use by private operators) in these areas. This also would improve distribution of livestock and wildlife, improving vegetation condition. These incremental impacts would result in healthier vegetation communities that are more capable of retaining moisture and nutrients and resisting disease, non-native species invasion, drought, and other natural disturbances and stressors.

Major contributors to adverse impacts include OHV activities and activities related to mineral development. The potential for adverse cumulative impacts would be greatest under DRMP/DEIS Alternatives N and A, which allow for the most acres open to cross-country OHV use and minerals development. Long-term beneficial impacts to vegetation may not be realized under DRMP/DEIS Alternatives C and D, where vegetation acres and treatment types are limited. The Proposed RMP would provide an intermediate level of protection and mitigation of cumulative impacts. The overall incremental impact of BLM activities proposed for all resource decisions on vegetation is projected to be moderate within the short term. Over the long-term, BLM activities would improve vegetation composition and wildlife habitat through vegetative fire and fuels treatments.

Cultural Resources

Incremental impacts associated with resource decisions from this Proposed RMP, combined with other past, present, and reasonably foreseeable actions including non-BLM lands, could produce cumulative impacts on cultural resources and resources of religious or traditional importance to Native American tribes. The potential for cumulative impacts includes neighboring lands with connected cultural resources, including adjoining BLM Field Offices, other federal lands, state, local and private lands within the RFO. The same general management direction and resource uses occur on all BLM- and Forest Service-managed lands. Surface-disturbing activities such as mineral development taking place across the region can contribute to cumulative impacts of cultural resources. However, these activities would require adherence to cultural resource laws and regulations, resulting in the inventory and identification of cultural sites, avoidance, and, in some cases, data recovery.

Oil and gas development and mineral exploration and development have become factors in parts of the RFO and would continue into the future, both on BLM lands under the Proposed RMP and on state, local, private and other lands. Minerals development will continue to increase the human presence in the general area, thereby increasing the risk to cultural resources from looting, vandalism, and inadvertent impacts. Unregulated uses on BLM-administered lands that could also impact cultural resources include wildfires, dispersed recreation, and cross-country OHV use. However, the cumulative impacts of these activities on cultural resources in the general vicinity of the RFO would likely be less than the potential impacts from the increasing recreational visitation that cultural sites in the region are receiving. Recreational activity in and around the RFO would continue to increase under all DRMP/DEIS alternatives and the Proposed RMP.

Management from other resource programs (VRM, non-WSA with wilderness characteristic areas, WSAs, SSS, riparian, fish and wildlife, SRMAs, and ACECs) would also provide protection from surface disturbing activities that could damage cultural resource sites. Potential congressional designation of the WSR segment would require a Class III cultural resource survey to identify and monitor cultural resources. Some cultural resources would require additional mitigation as a result of public interaction with the resource. Under the Proposed RMP, cultural resources would be managed in compliance with federal law, regulation, and policies that require the preservation of cultural resources either in place or through data recovery, which would result in minor incremental impacts to cultural resources.

Paleontological Resources

The cumulative impact analysis area for paleontological resources includes the RFO and neighboring lands with connected paleontological resources. The cumulative effects of surface-disturbing activities within areas with scientifically significant paleontological resources, especially mineral development in the region, have the potential to damage this fragile, nonrenewable resource. However, existing laws, regulations, and policies provide for mitigation of effects through avoidance or data recovery efforts. Although it is expected that some fossils would be destroyed in the course of legitimate uses of public lands, as well as by natural weathering and erosion, mitigation measures would likely bring paleontologists to areas in which fossils had not been previously studied. Thus, fossils that would otherwise have been destroyed or disintegrated over time would be collected, placed in repositories, and protected in perpetuity. Beyond mineral development, cumulative impacts on paleontological resources could occur through incremental degradation of the resource base from a variety of sources, including wildfires, dispersed recreation, and cross-country OHV use, reducing the information and interpretive potential of the paleontological resource values. This combined with the actions on BLM-administered lands could result in minor incremental impacts to paleontological resources.

Visual Resources

Past and present actions causing cumulative impacts to visual resources include various construction projects and activities on public lands (or visible from public lands due to proximity and topography), including fire suppression, vegetative treatments, prescribed burns, residential development, farming, and mineral exploration, development, and extraction. All of these activities produce surface disturbances and are examples of the types of activities that have created visual contrasts in the past and have resulted in contrasts of texture, form, line, and color that are often visible to the casual observer at varying distances. Reasonably foreseeable future actions in the RFO include these same types of actions, which would continue to create visual contrasts within the landscape.

Recreational opportunities and use are also expected to increase, including OHV use, backcountry camping, mountain biking, rock climbing, and on-road sightseeing, with expected increased visitation to the adjacent national parks and national forests. Other foreseeable future increases include the demand for recreational facilities, and mineral exploration, development and extraction, including oil and natural gas well drilling.

The potential cumulative impacts of DRMP/DEIS Alternative N combined with past, present, and reasonably foreseeable future actions on visual resources could adversely affect visual resources and scenic quality from increasing minerals and recreation-related surface disturbances and from wildfires. However, mitigation would likely limit the impacts in viewsheds with high scenic quality in the RFO and in the adjacent national parks and national forests.

Past and present management, and reasonably foreseeable future actions, combined with the proposed action alternatives (the Proposed RMP, DRMP/DEIS Alternatives A, C, and D), would reduce the

potential for cumulative impacts on visual resources and preserve scenic quality. The risks of wildland fire would be reduced within the RFO and on adjacent national forests through increased vegetation treatments to reduce fuel loads; recreation activities and off-road travel would be managed to limit surface disturbances by greatly reducing areas open to OHV use, so that areas inventoried as having high scenic quality would be preserved. Mineral exploration, development and extraction, including oil and natural gas well drilling, are expected to increase over the next 15 years to 20 years, but visual resource management and associated mitigation would likely limit the impacts in viewsheds with high scenic quality and in the adjacent national parks and national forests. Visual resource management would include conformance of minerals exploration and development activities with VRM class objectives, which would preserve scenic quality in the long term in areas that the plan has designated for scenic quality protection.

The overall contribution of the Proposed RMP to the cumulative impact on visual resources is expected to be a minor incremental increase to the visual disturbances as a result of mineral resource development, transportation, wildland fire and vegetation treatments. Additionally, there would be incremental increases in the areas managed to protect visual resources.

Special Status Species

Cumulative effects include other future federal, state, tribal, local, or private actions that are reasonably certain to occur in the planning areas. The Richfield planning area is interspersed with parcels of non-BLM managed lands including federal, tribal, state, and privately owned lands. Activities taking place on these lands do have the potential to cumulatively impact natural resources within the planning area.

Existing and proposed activities on non-federal lands in the planning areas that have the potential to cumulatively affect SSS include:

- Non-discretionary livestock grazing
- Non-discretionary OHV use
- Non-discretionary land development
- Non-discretionary development of energy and mineral resources
- Non-discretionary herbicide and insecticide treatments
- Other non-discretionary surface disturbing activities.

As public lands within the Richfield planning area are interspersed and bordered by federal, tribal, state, and private lands, activities within these non-BLM managed lands are likely to affect natural resources within BLM managed areas. Future land uses within these tribal, state, and private lands are likely to include water development (dams and irrigation projects), energy and mineral development, livestock grazing, recreational development and use, and wildlife habitat management. Of these, energy and mineral development and livestock grazing on state and private lands represent a significant source of future activity within the state of Utah. Quantified data on the existing and future extent of these land uses are not available, but moderate to detrimental at localized areas impacts are reasonably certain to occur. Where these existing and future activities on non-BLM lands that interface with the SSS habitats, they would cumulatively add to the impacts of activities authorized in the planning area.

The contribution to the overall cumulative impact from the Proposed RMP would result in some increased level of cumulative impact greater than those non-discretionary actions alone. All future BLM-authorized management actions and developments would consider the cumulative impact of project implementation in conjunction with identified project-level and site-specific parameters. This would include the analyses of non-federal actions in the action area, and would provide a more meaningful cumulative impact

analysis than can be provided at the LUP level. Some SSS may be pushed closer to listing or extinction as a result of the cumulative degradation of BLM lands.

Some beneficial impacts would be obtained through the conservation measures identified in Chapter 2 of the PRMP/FEIS. The BLM- committed conservation measures have been developed in coordination with the USFWS, and are considered to be committed mitigation on the part of BLM. In addition, several best management practices (BMPs) which are optional measures that would further protect and conserve listed species when implemented. Implementation of these measures would provide flexibility of management, and more practicality in implementing protective measures for the conservation and recovery of listed species.

Fish and Wildlife

Cumulative effects include other future federal, state, tribal, local, or private actions that are reasonably certain to occur in the planning areas. The Richfield planning area is interspersed with parcels of non-BLM managed lands including federal, tribal, state, and privately owned lands. Activities taking place on these lands do have the potential to cumulatively impact natural resources within the planning area.

Existing and proposed activities on non-federal lands in the planning areas that have the potential to cumulatively affect SSS include:

- Non-discretionary livestock grazing
- Non-discretionary OHV use
- Non-discretionary land development
- Non-discretionary development of energy and mineral resources
- Non-discretionary herbicide and insecticide treatments
- Other non-discretionary surface disturbing activities

As public lands within the Richfield planning area are interspersed and bordered by federal, tribal, state, and private lands, activities within these non-BLM managed lands are likely to affect natural resources within BLM managed areas. Future land uses within these tribal, state, and private lands are likely to include water development (dams and irrigation projects), energy and mineral development, livestock grazing, recreational development and use, and wildlife habitat management. Of these, energy and mineral development and livestock grazing on state and private lands represent a significant source of future activity within the state of Utah. Quantified data on the existing and future extent of these land uses are not available, but moderate to detrimental at localized areas impacts are reasonably certain to occur. Where these existing and future activities on non-BLM lands that interface with the fish and wildlife habitats, they would cumulatively add to the impacts of activities authorized in the planning area.

The contribution to the overall cumulative impact from the Proposed RMP would result in some increased level of cumulative impact greater than those non-discretionary actions alone. All future BLM-authorized management actions and developments would consider the cumulative impact of project implementation in conjunction with identified project-level and site-specific parameters. This would include the analyses of non-federal actions in the action area, and would provide a more meaningful cumulative impact analysis than can be provided at the LUP level.

Some beneficial impacts would be obtained through the conservation measures identified in Chapter 2 of the PRMP/FEIS. The conservation strategy also includes those BLM- committed conservation measures which have been developed in coordination with the UDWR. In addition, several best management practices (BMPs) which are optional measures that would further protect fish and wildlife species when

implemented. Implementation of these measures would provide flexibility of management, and more practicality in implementing protective measures for the conservation and recovery of listed species.

Wild Horses and Burros

Cumulative impacts on wild horses and burros would result from vegetation removal, surface-disturbing activities, and general human disturbance from increased recreation use. The conversion or sale of State Trust lands that would include development within or adjacent to the Canyonlands HMA could result in reduced vegetation for wild horses and burros and additional disturbances from human activities. Land acquisitions by the BLM for the purposes of maintaining vegetation and wild horse and burro habitat could increase the potential to mitigate degradation of habitat, especially where such acquisitions by the BLM would result in large contiguous blocks of public land. The overall cumulative effect on the wild burros has been an increase in herd size exceeding previous forage allocations. The Proposed RMP would incrementally benefit the herd by allocating 600 AUMs for wild burros.

Fire and Fuels Management

Effects on fire frequency, intensity, and suppression activities resulting from actions taken by the BLM within the RFO would combine with similar effects caused by activities sponsored by other groups and private interests to create cumulative impacts to fire management. As development, recreational activities, and general use of the area increases, so would the number of potential ignition sources and consequently the probability of wildland fire occurrence, which would increase the need for federal, state, and local agencies to suppress wildland fires to protect life, property, and sensitive resources. Development of the area would also increase the amount of Wildland Urban Interface (WUI) areas, which would put additional pressure on fire suppression efforts, as these areas are high-priority areas for fire suppression. Suppression activities within WUI areas could be more dangerous, time-consuming, and expensive than suppression in undeveloped areas. Additionally, activities associated with fire suppression, recreation, development, and general land use would cumulatively contribute to the modification of the composition and structure of vegetation communities and increase the spread of noxious and invasive weeds. Such effects would, in turn, alter the fire regime of the planning area, potentially increasing the frequency, size, and intensity of wildland fires. Developed areas and associated roads and ROW corridors could also provide increased accessibility to remote areas for fire suppression equipment and provide fuel breaks in the case of wildland fire events. The Proposed RMP management actions would incrementally modify and improve the composition and structure of vegetation communities and move the decision area's fire regime towards condition Class I.

Areas with Wilderness Characteristics (Wilderness, WSAs and Non-WSA Lands with Wilderness Characteristics)

The cumulative impact analysis boundary for areas with wilderness characteristics (designated wilderness, WSAs, and non-WSA lands with wilderness characteristics) includes areas within the planning area with identified wilderness characteristics and those areas that overlap outside the planning area. In addition, areas with wilderness characteristics of adjacent land management agencies were considered as cumulative management of adjacent lands described above. Using this criteria, there are 4.3 million acres of designated wilderness, BLM WSAs and NPS administratively endorsed wilderness and non-WSA lands with wilderness characteristics being carried forward in the Proposed RMP.

As a result of implementing the management prescriptions under the Proposed RMP, wilderness characteristics on approximately 78,600 acres of areas with wilderness characteristics would be protected, preserved, and maintained within the decision area. Because of BLM WSA management, management of existing wilderness by the BLM and management of lands administratively endorsed for wilderness by

the NPS, the cumulative effect would be the protection of wilderness characteristics on 4.3 million acres throughout the region (all areas except wilderness characteristics areas within GSENM, which are not specifically managed to protect their wilderness characteristics). Not managing 604,000 acres of non-WSAs lands with wilderness characteristic areas within the RFO would contribute to a loss of areas with wilderness characteristics in the region. However, cumulatively the number of acres being protected for their wilderness characteristics in the region is much larger. In this context, the loss of wilderness characteristics of approximately 14 percent of the wilderness characteristics areas in the decision area would not result in a significant incremental loss of these resources in the region.

Preserving, protecting, and maintaining the 78,600 acres of non-WSAs lands with wilderness characteristics would enhance long-term ecological and scenic values, and generally it would maintain naturalness, solitude, opportunities for primitive recreation and special features. Managing the 604,000 non-WSAs with wilderness characteristics for other resource values could lead to long –term degradation of wilderness values on those lands.

Forestry and Woodland Products

The cumulative impacts of past, present, and reasonably foreseeable future actions would have long-term, beneficial and adverse impacts on woodland resources. Fire Management Plans for the BLM and USDA Forest Service Districts, fuel load reductions, vegetation treatments, and woodland salvaging would reduce the risks of wildland fire and long-term loss of woodland resources and productivity within the RFO. These activities (including stand thinning and salvage of dead, diseased, and infested trees) would also improve woodland resource productivity by indirectly improving woodland ecological conditions. These beneficial impacts would be greatest under DRMP/DEIS Alternative A and the Proposed RMP, which would potentially treat the most acres annually. Woodland productivity would be lost as woodlands were converted into rangeland for increased livestock forage. Cumulative travel management impacts would be beneficial to woodland resources because surface disturbance and associated soil loss would be reduced under all of the action alternatives and the Proposed RMP. Other resource use management actions could have adverse impacts on woodland resources by restricting resource harvesting (WSAs, ACECs, SRMAs, and wilderness characteristics areas) into the future. However, the area of harvesting restrictions would be relatively small compared to the area managed as open to opportunities for resource harvesting. The Proposed RMP management actions on the harvest of forest and woodland products would have a negligible incremental impact to the overall cumulative impact on the resource in the planning area.

Livestock Grazing

Cumulative impacts could result from activities on adjacent private lands, activities scheduled for SITLA lands and actions on adjacent National Forest System lands. Because livestock grazing occurs throughout the area and adjacent lands, it is reasonable to assume that impacts similar to those identified earlier in this chapter would occur elsewhere in the area.

Removal of vegetation as a result of surface-disturbing activities, the presence and abundance of grazing wildlife, and general human disturbance would result in diminished potential for livestock grazing in the planning area. Increased recreation use, urban development, and the conversion of private or Utah State Institutional Trust Lands to other uses could reduce livestock numbers and forage available for livestock by increasing soil disturbance, vegetation removal, and noxious and invasive weed proliferation. Impacts on livestock grazing could be greater near areas with high recreation use or areas developed for residential, commercial, or industrial uses. These factors could increase the demand for grazable land, which in turn could create scarcity within the RFO. However, because the amount of acres available for livestock consumption is not expected to substantially change over the life of this Proposed RMP, this

increased demand would not result in a decrease in rangeland quality in the years following the implementation of the Richfield RMP. The BLM management actions would have a negligible incremental impact to the overall cumulative impact on the resource in the planning area.

Recreation

Various past, present, and reasonably foreseeable future BLM actions have affected and will continue to affect recreational opportunities within the planning area, including mineral development, wildland fire suppression and fuels treatments, OHV travel, utility corridor development, grazing and recreational activities in riparian areas, and management within existing SRMAs and the ERMA. The increase in vehicle-based recreation and urban development and associated population growth all contribute to increased demand for recreational opportunities in the region. As a result, the planning area could experience increased recreational visitors over the life of the plan, which could degrade certain recreational settings, resulting in diminished recreational opportunities and experiences, or increase user conflicts associated with dispersed unconfined recreational opportunities. Similarly, increasing development or utilities within or near the RFO could degrade certain recreational settings. The increase in recreational activities is minimally a result of BLM actions. There would be a minor incremental impact to recreational opportunities and experiences from the Proposed RMP management actions.

Travel Management

The cumulative impact analysis boundary includes the planning area and immediately adjacent segments of state and local road networks including portions of Canyonlands National Park, Capital Reef National Park, Glen Canyon National Recreation Area, GSENM, Kanab Field Office, Price Field Office, Fillmore Field Office, Cedar City Field Office, Dixie National Forest, and regional State Trust Lands. These road networks include routes shared with BLM and other federal agencies and routes shared with GSENM. Past, present, and reasonably foreseeable future non-federal actions have affected, and will continue to affect, travel management within the planning area. These actions, which include urban development patterns, the continuing growth of vehicle-based recreation, planned road and highway projects, and population growth are expected to increase demand and construction of transportation routes near the RFO. Areas protected from development have guided in the past, and will continue to guide, the location and development of many highways and roads near and within the RFO. In contrast, the Proposed RMP and Alternatives A, C, and D management actions restrict travel within the RFO mostly to designated routes and very few, if any, additional routes would be developed. As a result, there could be increased concentrations of vehicles within certain areas of the RFO, that is, restricting the miles of roads open for motorized travel would be expected to increase vehicle concentrations more in the RFO than in surrounding areas that do not impose travel restrictions. Management actions that restrict OHV use would limit the degree of travel opportunities and the ability to access certain portions of the planning area. The Proposed RMP management actions for closing 99 percent of the decision area to cross-country OHV travel in combination with similar management actions of adjacent field offices and agencies would incrementally reduce opportunities for cross-country OHV travel. Other Proposed RMP management actions that could affect travel management would include the construction of routes for fire and fuels management to reduce the risks of wildland fire, vegetation treatments to control invasive species, new minerals exploration and development routes, managing for increasing recreational demand and visitation, and other changes in travel management. However, these incremental actions would likely be minor to the overall cumulative effect.

Lands and Realty

The number of land use authorizations, particularly ROWs and permits, is a function of demand for these uses. Additional future development of adjacent federal, state, and private lands would likely result in

additional requests for and approval of land use authorizations for facilities such as roads, utilities, and communication sites. City and county use plans generally encourage land development adjacent to BLM lands.

Restrictions on ROWs and utilities near the RFO could result from areas protected as open space, such as Canyonlands National Park, Glen Canyon National Recreation Area, and state parks. This could result in increased concentration of ROWs for utilities on public lands within the RFO. Sales or exchanges of state lands could result in extensive changes to surface management within the RFO. If the BLM acquired non-federal lands, the demand for both major utilities and smaller-scale distribution utilities could decrease over time because the potential for development of those lands (and the associated need for utilities) would decrease. In contrast, the BLM likely would need to issue increased ROWs to new areas if state lands were sold to private parties for future development.

The designation of ROW avoidance and exclusion areas on BLM lands, along with similar restrictions on ROW development on adjacent lands, particularly National Forest lands, would have a cumulative impact of reducing routing options for ROW facilities such as utilities and roads. Under the Proposed RMP, restrictions on ROWs in the decision area, combined with restrictions form other management plans in the planning area, would have a minor incremental effect by limiting the location of the ROW. DRMP/DEIS Alternatives C and D have the most avoidance and exclusion areas, with the least being in DRMP/DEIS Alternative A and the Proposed RMP.

Minerals and Energy

The cumulative impact analysis boundary for minerals and energy resources varies by the type of minerals resource. The analysis boundary for oil and gas is the RFO and contiguous geological structures and oil and gas fields that intersect the RFO. The analysis boundary for coal is the RFO and the boundaries of adjacent coal fields. The analysis boundary for locatable minerals is the RFO. The analysis boundary for salable minerals is the RFO and adjacent mineral material sources. Under the Proposed RMP, exploration and development of the various categories of minerals would be conducted in accordance with established rules and regulations in a program that allows for reasonable access to lands and provides protection for other natural resources. The primary impact to other resources would be the potential additional surface disturbance over the reasonably foreseeable future. Over the long term, most of these incremental impacts can be mitigated. BMPs would also reduce the incremental impact on other natural resources.

The development of oil and gas in the RFO could increase over the next several years. Stipulations on oil and gas leasing in the Proposed RMP would have a minor cumulative effect on the ability to develop oil and gas resources. Closing WSAs and the five mile stretch of WSR would preclude oil and gas leasing altogether. Applying NSO stipulations in order to protect some SSS, non-WSAs lands with wilderness characteristics, ACECs, Bull Creek Archeological District, part of the Dirty Devil SRMA, sensitive soils, riparian areas and recreation sites would likely incrementally impact or prevent some oil and gas recovery and could increase development costs. Applying CSU on the part of the Dirty Devil SRMA, some SSS, crucial mule deer, elk, bison, bighorn sheep, pronghorn, raptor habitats and protect sensitive soils would result in incremental impact or an increased cost to development and reclamation activities. Added cost associated with special leasing stipulations may lead to lower bids on lease parcels. Timing limitation stipulations incrementally impact or affect exploration and drilling operations by causing delays in operations, which may affect internal company project funding. However, adequate industry planning could substantially reduce this type of impact. Two or more timing stipulations, having different overlapping dates that encompass the same parcel could cause significant financial impact, depending on the total length of time the operations would be delayed.

Continued development along U.S. Highway 89, State Highways 12 and 24, and in local communities could increase the demand for mineral materials. Mineral material closures in the RFO would have a minor cumulative effect on the ability to develop mineral materials in the Proposed RMP. The application of surface stipulations could incrementally impact companies to look elsewhere to extract mineral materials. Suitable mineral material could likely be found in adjacent areas. However, relocating a site could incrementally impact or increase the cost of materials because of longer hauling costs. Good quality sand and gravel occurring within riparian areas would not be available for disposal actions. In addition to the above constraints, permittees would also have the incremental impacts or added costs associated with the control of fugitive dust, controlling noxious weeds, and assuring that equipment and reclamation materials are free of weeds in the weed free zone areas.

Under the Proposed RMP, restrictions and stipulations on mineral and energy development in the decision area, combined with restrictions form other management plans in the planning area, would have a minor incremental effect by limiting the timing and locations available for mineral and energy development.

Special Designations

Wild and Scenic Rivers

The Proposed RMP would recommend one segment with a tentative classification of Wild - the five mile Capitol Gorge as suitable for inclusion within the NWSRS. Impacts to the WSR would result from the river being managed to maintain its classification, free-flowing nature, and outstandingly remarkable values. Incremental impacts likely would not occur because eligible rivers are reviewed during the suitability process, and suitability is based on the environmental and economic consequences that would result from designation. Therefore, the overall cumulative effect would be minimal.

Areas of Critical Environmental Concern

The cumulative impact analysis area for ACECs is the potential ACEC boundaries. Cumulative impacts from the implementation of other federal agency and non-federal resource decisions within and outside of the RFO on currently designated and potential ACECs would be minimal, with the exception of mineral and travel management decisions. The nature of the relevant and important values associated with the potential ACECs tends to result in impacts that occur quickly but recover slowly, if at all in the case of some visual impacts, and impacts on cultural sites. As such, any impact would result in an incremental increase in the potential for irreparable damage to relevant and important values. Under the Proposed RMP, only the Old Woman Front and North Caineville Mesas would be designated; management associated with other resource program decisions would protect the R & I value, resources, processes, or systems in the other potential ACECs. Management actions of adjacent lands would incrementally protect the R & I values from irreparable damage. The relevant and important values of the potential ACECs not identified for designation would be protected through other resource decisions of the Proposed RMP, laws, rules and regulations.

Socioeconomic Environment

The boundary for cumulative impacts for social and economic conditions is the socioeconomic study area, which includes the entirety of the five-county area. Such impacts would include economic and social impacts related to short-term economic stimuli and possible short-term local community service impacts related to major construction projects and resource extraction activities in the socioeconomic study area. In addition to the SUFCO coal mine on RFO lands, such major projects would also include the possibility of additional oil and gas development and its ancillary facilities, the Westwide corridor project and development of tar sands in and adjacent to Glen Canyon. The Proposed RMP management actions would allow for the increased demand for salable minerals (sand and gravel) to complete these major projects.

The completion of these projects would indirectly allow for economic and population growth and the expansion of communities. Conversion of private agricultural lands to residential and other uses as the area grows would cumulatively add to the importance of public lands for the maintenance of the economy and culture of livestock grazing. The importance of public lands to maintenance of other local livelihoods, customs, and culture would also depend on cumulative decisions regarding management of other lands in the area, including NPS, USFS, BLM, State, and private lands.

Resource decisions from the Proposed RMP would combine with other past, present, and reasonably foreseeable actions to produce cumulative impacts to the social and economic conditions of each of the affected counties. Resource decisions could also potentially result in socioeconomic impacts to local communities. Changes in management actions that increase or decrease visitation to these areas could have beneficial or adverse impacts on the local economy, with regard to tourism-based revenue.

Mineral development outside the RFO's jurisdiction, but within or near the RFO, could also impact social and economic conditions. Under the Proposed RMP, oil and gas exploration, drilling and production would provide cumulative local economic benefits, including jobs and income. Continued livestock grazing, increased recreation and OHV recreation use, and reasonably foreseeable mineral development in the RFO, in conjunction with these activities on other lands, provides local economic benefits, including jobs and income. Mineral development, including the potential increase in uranium mining on BLM and non-BLM lands, could have short- and long-term beneficial impacts on local economic conditions with regard to employment and tax revenue. Increased mining activity could adversely impact visitor experience and recreation-related revenues, depending on the scale and location of those activities. However, uranium development is not projected to be extensive and, therefore, should not adversely impact visitor experience and recreation-related revenues. However, conflicts between these uses and user groups could occur in the long term. The Proposed RMP management actions would have a moderate cumulative effect on the overall economics of the planning area.

4.8 IRREVERSIBLE AND IRRETRIEVABLE COMMITMENTS OF RESOURCES

Section 102(2) (C) of NEPA requires a discussion of any irreversible or irretrievable commitments of resources that are involved in the proposal, should it be implemented. An *irreversible or irretrievable commitment* of a resource is one in which the resource or its use is permanently lost and cannot be reversed (e.g., extraction of any locatable mineral ore or oil and gas or the extinction of a species).

The Proposed RMP would result in surface-disturbing activities, including dispersed recreation, recreational OHV use, fire and fuels management, mineral and energy development, livestock grazing, and infrastructure development that could result in loss of irreversible or irretrievable resources. These surface-disturbing activities may permanently alter soil, water, and vegetation, visual resources, relevant and important values, ACECs, OHV use, tentative classifications of WSR segments, and potentially damage cultural and paleontological resources.

Habitats in nonfunctional condition may sustain sufficient degradation that they may no longer be capable of being restored to original site potential. If this change results in significant soil loss through channel down-cutting or incisement, or if riparian-wetland obligate plant species are replaced by facultative or upland species, these could represent irretrievable and irreversible impacts that cannot be corrected even through costly rehabilitation efforts.

Fire suppression in low-to-mid elevation forest and woodlands has led to the accumulation of fuels and makes these forests more susceptible to stand-replacing fires. The loss of forest products from stand-replacing fires is considered an irreversible, and in some instances, irretrievable commitment of resources if an extremely hot fire burned over a long time. If aspen continue to decline in the lands managed by the RFO, they could become rare to non-existent in some watersheds and might not be able to be restored.

Lands and realty policies may lead to irretrievable commitments of resources. This includes disposals of land and subsequent development and acquisition of land that results in removal of that land from the private property tax base.

Development of up to 454 oil and gas wells and leasable minerals over the next 15 years would represent an irretrievable commitment of nonrenewable fossil fuels. The extraction of locatable mineral resources also constitutes an irretrievable commitment of resources.

4.9 UNAVOIDABLE ADVERSE IMPACTS

Section 102(C) of NEPA requires disclosure of any adverse environmental effects that cannot be avoided should the proposal be implemented. Unavoidable adverse impacts are those that remain following the implementation of mitigation measures or impacts for which there are no mitigation measures. Implementing the Proposed RMP would cause some unavoidable adverse impacts.

Surface-disturbing activities could cause unavoidable adverse impacts. Although these impacts are mitigated to the extent possible, unavoidable damage is inevitable. Conversion of vegetation resources to other uses, such as transportation and mineral and energy development, reduces the quantity of vegetation resources. Energy and mineral resource extraction on public lands potentially creates air quality, water quality, visual intrusions, soil erosion, and soil compaction problems. Portions of the resource area with more intense recreational use experience scarring, increased soil erosion, and loss of vegetation. Although these impacts are unavoidable, they are usually concentrated in previously disturbed areas, which reduce the spread of impacts to more remote or less frequented areas.

Because some specific wildlife habitats coincide with the known areas of oil and gas potential, impacts to these habitats are unavoidable under current BLM policy to encourage responsible oil and gas development. However, oil and gas well sites and their associated infrastructure are mitigated to the extent possible to minimize impacts and avoid wildlife habitat values when possible. Competition is anticipated for habitat resources between wildlife, livestock, and wild horses and burros. The extent of the impacts varies by season as well as by drought cycle. Although there could be short-term periods of significant impacts, long-term management would endeavor to make these uses compatible to the extent possible.

Travel on or off roads could cause soil compaction and loss of protective vegetation cover, thereby increasing soil erosion and fugitive dust emissions. Increased soil erosion can adversely impact riparian-wetland areas through increased soil sedimentation. Weeds introduced by these and other management activities could cause a reduction in canopy coverage and leave soils subject to increased erosion as well. Any facility developments, including but not limited to recreation sites, livestock water and other range improvements, and utility and road facilities, that are not properly restored even after mitigation measures are applied, could result in increased soil erosion.

Inadvertent damage to, or loss of, cultural and paleontological resources from increased recreational use, OHV use, surface-disturbing activities, or natural deterioration is unavoidable. Although mitigation measures could be implemented for scientific data recovery (leaving portions of cultural resource sites undisturbed for future exploration), the area of excavation would be destroyed and future research would not be possible. The number of cultural sites or paleontological localities anticipated to be inadvertently damaged is unknown, but it is anticipated to be very low given the management decisions in the Proposed RMP.

Conflicts between user types, such as motorized recreationists and recreationists who seek more primitive types of recreation and motorized users who share recreation areas, are unavoidable adverse impacts. As recreation demand increases, recreational use disperses to other areas of the lands managed by the RFO, which could create conflicts with existing uses of those areas. Increasing recreation use can cause conflicts with other resource uses, such as livestock grazing or forest and woodland products harvest. Recreation use and experiences could conflict with the results of livestock grazing and timber harvest. Under the DRMP/DEIS alternatives in which mineral development is expected to be higher, recreational use is transferred from those areas, which would increase the extent and frequency of conflict between these incompatible user groups.

Numerous land use restrictions, imposed throughout the RFO to protect sensitive resources and other important values, by their nature, impact the ability of operators, individuals, and groups who use the public lands to do so freely without limitations. Although attempts are made to minimize these impacts by limiting the level of protection necessary to accomplish management objectives and by providing alternative use areas for impacted activities, some adverse impacts to such users are simply unavoidable.

4.10 RELATIONSHIP BETWEEN LOCAL SHORT-TERM USES AND LONG-TERM PRODUCTIVITY

Section 102(C) of NEPA requires discussion of the relationship between local, short-term uses of man's environment and the maintenance and enhancement of long-term productivity of resources. As described in the introduction to this chapter, *short term* is defined as anticipated to occur within 1 to 5 years of implementation of the activity. *Long term* is defined as following the first 5 years of implementation but within the life of the Proposed RMP.

Management actions result in various short-term effects, such as increased localized soil erosion, fugitive dust emissions, vegetation damage, and decreased visual resource quality. Surface-disturbing activities, including concentrated recreation, recreational OHV use, mineral and energy development, range improvements and developments, and infrastructure development, result in the greatest potential for impacts to long-term productivity. Management actions and best management practices are intended to minimize the effects of short-term uses and reverse change over the long term. However, BLM lands are managed to foster multiple uses and some long-term productivity impacts could result regardless of management approach.

The short-term effects of mineral development decrease the area and productivity of potential crucial mule deer, elk, and SSS habitats. Development of roads associated with oil and gas development is possibly the greatest contributor to habitat fragmentation. However, permanent mineral development sites and their associated infrastructure are mitigated to the extent possible to minimize fragmentation and avoid the most significant wildlife habitat values. In addition, management actions to improve soil, water, riparian, vegetation, and habitat resources improve the productivity of wildlife and SSS habitats throughout the lands managed by the RFO.

Management actions that disturb soil surfaces can cause short-term impacts to riparian-wetland areas and vegetation resources by increasing soil erosion and converting areas to early seral stages. Over the long term, these management actions are likely to improve riparian-wetland areas to proper functioning condition and increase vegetation productivity.

Management actions to implement the *Fundamentals of Rangeland Health* and *Standards and Guidelines for Grazing Administration*, and the Healthy Forests Restoration Act of 2003, could affect the areas available for livestock grazing and commercial forest and woodland products harvest. In the long term, these actions are anticipated to improve vegetation and forest productivity. Maximizing short-term use of forest resources, without an increase in woodland products harvest or vegetation treatments, results in a long-term continued build-up of large fuels, which results in uncharacteristically intense wildland fires and longer fire return intervals.

Concentrated recreation use could cause some long-term impacts to soil structure and vegetation. However, concentrating recreational use in certain areas prevents these adverse impacts from extending to other areas of the lands managed by the RFO. However, increases in short-term woodland product harvest (such as pole/post, dead and down fuel collection) and forest harvests reduce the long-term buildup of large fuels.

CHAPTER 5—PUBLIC INVOLVEMENT, CONSULTATION, AND COORDINATION

5.1 INTRODUCTION

The Richfield Proposed Resource Management Plan (RMP)/Final Environmental Impact Statement (EIS) represents the efforts and involvement of a broad range of participants, including public agencies, tribal councils, and private organizations and individuals. The Bureau of Land Management (BLM) met and consulted with various federal, state, tribal, and local agencies throughout the planning process. The BLM conducted and attended many meetings throughout the planning process to keep all interested parties informed, and to solicit opinions and input germane to management of public land resources within the Richfield Field Office (RFO). The general public was also included in the planning process. All interested parties were invited into the planning process by means of various formal and informal methods, including meetings (with public agencies, tribal councils, interest groups, and individuals), scoping meetings, workshops, e-mail correspondence, and distribution of planning posts. This section summarizes these activities.

5.2 CONSULTATION

Consultation is the formal effort to obtain the advice or opinion of another agency regarding an aspect of land use management for which that agency has particular expertise or responsibility, as required by statute or regulation. Federal laws require BLM to consult with Native American tribes, the State Historic Preservation Office, the United States Fish and Wildlife Service (USFWS), and the Environmental Protection Agency (EPA) during the planning/National Environmental Policy Act (NEPA) decision-making process. This section documents the specific consultation and coordination efforts undertaken by the BLM throughout the entire process of developing the Proposed RMP/Final EIS.

5.2.1 Consultation With Native American Tribes

Regardless of whether a federally recognized tribe enters into a cooperating agency relationship, its fundamental connection to the BLM is based on tribal sovereignty, manifested through the government-to-government relationship.

BLM provides government officials of federally recognized tribes with opportunities to comment on and to participate in the development of land use plans. The BLM considers comments, notifies consulted tribes of final decisions, and informs them of how their comments were addressed in those decisions. At a minimum, officials of federally recognized tribal governments must be offered the same level of involvement as state and county officials. Land use plans and coordination activities must address the following:

1. Consistency With Tribal Plans. Section 202(c)(9) of the Federal Land Policy and Management Act (FLPMA) requires the BLM to coordinate plan preparation for public lands with plans for lands controlled by Native American tribes so that the BLM's plans are consistent with tribes' plans for managing tribal resources to the extent possible, consistent with federal law. This coordination allows the BLM and tribes to develop management prescriptions for a larger land base than either agency can address by itself.

2. Protection of Treaty Rights. Land use plans must address the protection of treaty rights assured to Native American tribes concerning tribal uses of public lands and resources (such treaty rights in the West are generally limited to Northwestern tribes that were subject to the Stevens Treaties of the 1850s).

3. Observance of Specific Planning Coordination Authorities. In addition to the FLPMA consistency provisions discussed above, land use plans must comply with the following statutes and executive orders:

- **Section 101(d) (6) of the National Historic Preservation Act (NHPA).** This act requires the BLM to consult with Native American tribes when historic properties of traditional religious or cultural importance to a tribe would be affected by BLM decision-making.
- **American Indian Religious Freedom Act.** This act requires the BLM to protect and preserve the freedom of Native Americans and Alaska Natives in exercising their traditional religions, including access to sites and the freedom to worship through ceremonials and traditional rites.
- **Executive Order (EO) 13007 (Indian Sacred Sites).** This EO requires the BLM to accommodate access to and use of sacred sites and to avoid adversely affecting the physical integrity of sacred sites to the extent practicable, permitted by law, and consistent with essential agency functions. The BLM must ensure reasonable notice is provided to tribes, through government-to-government relations, of proposed actions or land management policies that may restrict future access to or ceremonial uses of, or adversely affect the physical integrity of, sacred sites, including proposed land disposals.
- **Executive Order 12898 (Environmental Justice).** This EO requires the BLM to take into account the relevant Council of Environmental Quality (CEQ) guidelines and Department of the Interior (DOI) policies and goals.
- **Consultation Under the Endangered Species Act With Indian Tribes.** DOI's Secretarial Order 3206: American Indian Tribal Rights, Federal-Tribal Trust Responsibilities, dated June 5, 1997, and the Endangered Species Act of 1973, requires DOI agencies to consult with Native American tribes when agency actions to protect a listed species, as a result of compliance with the Endangered Species Act, affect or may affect Native American lands, tribal trust resources, or the exercise of Native American tribal rights. Consultation under this Secretarial Order should be closely coordinated with regional or field offices of the USFWS and/or the National Oceanic and Atmospheric Administration (NOAA) Fisheries Service for game and non-game species.

Land use plans and their accompanying EISs must identify potential effects on Native American trust resources, trust assets, or tribal health and safety. Any effect must be explicitly identified and documented in the land use plan.

BLM representatives have met with several tribes to inform them of the planning process and solicit information on potential issues and concerns. The Utah Division of Indian Affairs has provided invaluable assistance to the BLM in consultation with the tribes. Tribal consultation on the RMP revision began in May of 2002 and is still ongoing. Meetings and consultation with Native American tribes and organizations are listed below.

May 2002	Hopi Tribe (Kykotsmovi, Arizona)
April 2003	Ute Tribe (Ft. Duchesne, Utah)
Feb. 13–17, 2006	Southern Ute Indian Tribe (Ignacio, Colorado)
	Ute Mountain Ute Tribe (Towaoc, Colorado)

	Navajo Nation (Window Rock, Arizona)
	Kaibab Band of Paiute Indians (Pipe Springs, Arizona)
	Paiute Indian Tribe of Utah (Cedar City, Utah)
April 19, 2006	Utah Division of Indian Affairs (Salt Lake City, Utah)
June 14, 2006	Navajo Utah Commission (Montezuma Creek, Utah)
June 15, 2006	Hopi Tribe (Kykotsmovi, Arizona)
July 26, 2006	Moapa Paiute Tribe (Moapa, Nevada)
July 18, 2006	Navajo Nation (Window Rock, Arizona)
July 19, 2006	Hopi Tribe (Kykotsmovi, Arizona)
August 30, 2006	Ute Tribe (Ft. Duchesne, Utah)
Oct. 30–Nov. 3, 2006	Ute Mountain Ute Tribe (Towaoc, Colorado)
	Southern Ute Tribe (Ignacio, Colorado)
	Navajo Nation (Window Rock, Arizona)
	Hopi Tribe (Kykotsmovi, Arizona)
	Kaibab Band of Paiutes and Southern Paiute Consortium (Pipe Springs, Arizona)
	Paiute Indian Tribe of Utah (Cedar City, Utah)
April 2–6, 2007	Paiute Indian Tribe of Utah (Cedar City, Utah)
	Navajo Nation (Window Rock, Arizona)
	Southern Ute Indian Tribe (Ignacio, Colorado)
November 5-6, 2007	Navajo Nation (Window Rock, Arizona)
	Hopi Tribe (Kykotsmovi, Arizona)
	Kaibab Band of Paiutes and Southern Paiute Consortium (Pipe Springs, Arizona)
	Paiute Indian Tribe of Utah (Cedar City, Utah)

All of these tribes and organizations expressed interest in the land use planning process and a desire to participate in the process. This participation ranges from the identification of areas important to the tribes within the RFO to being kept informed of the planning progress. The BLM made multiple visits to each tribe in an effort to keep them updated on the RMP's progress and obtain their input. Interests of the

Paiute Indian Tribe of Utah revolve around sacred and traditional use concerns in Quitchupah Canyon in eastern Sevier County. The Navajo Nation is interested in establishing a Traditional Cultural Property (TCP) in the Henry Mountains. This TCP is related to historical events significant in Navajo history concerning Kit Carson and the attempted removal and relocation of the Navajo from Arizona to New Mexico. The BLM has contacted the Navajo Utah Commission in an attempt to involve the Utah Navajo chapters and obtain input from them.

5.2.2 State Historic Preservation Office

The BLM has worked with the Utah State Historic Preservation Office (SHPO) during the planning process. Although formal consultation under Section 106 of the NHPA usually takes place during implementation, the BLM has consulted with SHPO regarding Proposed RMP/Final EIS cultural resource evaluation recommendations, before the Proposed RMP/Final EIS was issued. BLM has conducted cultural clearances on all OHV open areas in the Proposed RMP including consultation with SHPO.

5.2.3 U.S. Fish and Wildlife Service

The Utah BLM entered into a memorandum of agreement (MOA) with the USFWS to improve the efficiency and effectiveness of Section 7 consultation processes under the Endangered Species Act for RMP development. Through this MOA, the BLM agreed to promote the conservation of candidate, proposed, and listed species and to informally and formally consult and confer on listed and proposed species and designated and proposed critical habitat during planning to 1) ensure that activities implemented under these RMPs minimize or avoid adverse impacts on such species and any critical habitat; 2) ensure that such activities implemented under these RMPs do not preclude future conservation opportunities; 3) use, where possible, formal conference procedures specified in 50 Code of Federal Regulations (CFR) 402 to avoid conflicts between elements contained in the RMPs and the requirements for conservation of the proposed species and proposed critical habitat; and 4) analyze the effects of the RMPs on candidate species pursuant to agency planning requirements.

The BLM has initiated informal consultation with the USFWS. This consultation is being accomplished by meeting with the USFWS and preparing a draft biological assessment of the Draft RMP/EIS preferred alternative and the potential for beneficial or adverse impacts on threatened and endangered species. USFWS representatives participated regularly in the development of the Draft RMP/EIS. Formal Section 7 consultation will commence with the BLM's submission of a final biological assessment prepared for the Proposed RMP/Final EIS. The USFWS will respond with a biological opinion that will be included in the administrative record. Any terms and conditions identified in the biological opinion would be incorporated into the Record of Decision (ROD) for the Approved RMP.

5.2.4 Environmental Protection Agency

The Denver office of the EPA assigned a liaison to consult with the BLM on the Richfield RMP. To date, communication with EPA has been informal through phone calls and e-mails. EPA staff has also participated as members of the Air Quality Protocol Group, which includes the BLM, United States Forest Service (USFS), the State of Utah, and the National Park Service (NPS). The Richfield Draft RMP/EIS was submitted to EPA for review as required by CEQ regulations.

Table 5-1 lists the agencies that assisted with the Richfield Draft RMP. The table also gives a short discussion of the role of each agency.

Table 5-1. Coordination, Cooperation, and Consultation Actions

Agency	Coordination, Cooperation, or Consultation Role
FEDERAL AGENCIES	
U.S. Department of the Interior	
Fish and Wildlife Service	Consultation: Reviews proposals affecting threatened or endangered fish, wildlife, or plant species under Section 7 of the Endangered Species Act. Participates on Interdisciplinary (ID) Team; provides biological opinion on Proposed RMP/Final EIS.
Geological Survey	Coordination: Assigns a liaison and provides planning input.
National Park Service	Coordination: Provides planning input on issues of mutual concern. Participates on ID Team.
U.S. Department of Agriculture	
U.S. Forest Service	Coordination: Coordinates, along with BLM, on matters of mutual interest, particularly potential resource conflicts along mutual borders. Participates on ID Team.
Animal and Plant Health Inspection Service–Wildlife Services	Coordination: Coordinates annual management plan for animal damage control activities on public lands.
U.S. Environmental Protection Agency	
Environmental Protection Agency	Consultation: Reviews BLM plans for NEPA compliance. Files *Federal Register* notices.
STATE AGENCIES	
State of Utah	Cooperation: Provides information concerning environmental issues for which the State of Utah has jurisdiction by law or special expertise. Provides information from state records, including Richfield Proposed RMP/Final EIS project impacts on air quality and Class 1 airsheds, fish and wildlife, domestic livestock grazing, socioeconomic impacts, minerals, and State of Utah permitting requirements.
Governor's Office of Planning and Budget	Coordination: Provides leadership for the initiatives of the Governor— budgeting, planning, and coordinating issues by providing accurate and timely data, impartial analyses, and objective recommendations.
Utah Department of Environmental Quality (UDEQ), Division of Water Quality (UDWQ)	Coordination and cooperation: Coordinates and cooperates on water quality, development of monitoring for visibility standards and guidelines, and collection of air quality data.
Utah Department of Natural Resources, Division of Oil, Gas and Mining (UDOGM)	Coordination: Issues permits for mineral operations on federal, state, and private land. Permits are issued only after review of each mine plan. The BLM coordinates with UDOGM on mining authorization.
School and Institutional Trust Land Administration (SITLA)	Manages state school and institutional trust lands.
Utah State Forestry, Emergency Management Agency, State Fire Marshal's Office	Coordination: Coordinates forest management and fire activities on state lands adjacent to public lands.

Agency	Coordination, Cooperation, or Consultation Role
Utah Department of Natural Resources, Division of Wildlife Resources	Coordination and cooperation: Coordinates and cooperates on vegetation treatment projects, wildlife habitat management, big game herd objectives, and special status species.
Utah Department of Natural Resources, Division of Parks and Recreation	Coordination: Administers and manages state parks.
Utah Department of Transportation	Coordination and cooperation: Coordinates and cooperates on transportation planning and highway access.
Utah Geological Survey	Cooperates on data sharing.
State Historic Preservation Office	Consultation: The BLM consults with the Utah SHPO under Section 106 of the NHPA in accordance with the National Programmatic Agreement (NPA) as implemented in the Utah protocol to the NPA.
COUNTY GOVERNMENTS	
Sanpete County Sevier County Piute County Wayne County Garfield County Emery County	Consultation: The BLM consults and coordinates with counties throughout the land use planning process; counties participate in ID Team meetings and provide input on issues for which each county has special expertise or jurisdiction by law.

5.3 COORDINATION AND COOPERATION

Coordination, as required by FLPMA 43 United States Code (U.S.C.) § 1712(c)(a), involves ongoing communication between BLM managers and state, local, and tribal governments to ensure that the BLM considers pertinent provisions of non-BLM plans in managing public lands; seeks to resolve inconsistencies between such plans; and provides ample opportunities for state, local, and tribal government representatives to comment on the development of BLM's RMPs (43 CFR 1610.3-1). CEQ regulations further require timely coordination by federal agencies in addressing interagency issues (40 CFR 1501.6) and in avoiding duplication with tribal, state, county, and local procedures (40 CFR 1506.2).

Cooperation goes beyond the coordination requirement of FLPMA, entailing collaboration between the BLM and other governmental entities (federal, state, local, or tribal) to develop a land use plan and NEPA analysis, as defined by the lead and cooperating agency provisions of the CEQ's NEPA regulations (40 CFR 1501.5 and 1501.6). Cooperating agency and related roles may be formalized through an agreement.

5.3.1 Coordination With Other Federal Agencies

In developing this Proposed RMP/Final EIS, BLM coordinated with numerous other federal agencies. (Additional agencies are listed below under consultation.)

- **National Park Service:** Contacts were made early in the planning process with Capitol Reef National Park, Canyonlands National Park, and Glen Canyon National Recreation Area (NRA), the three national park units that share boundaries with the RFO. BLM staff from the Price and Richfield Field Offices met with the Capitol Reef Park Superintendent and his staff during

scoping and discussed issues of mutual concern. The land use planner and field manager communicated regularly with the superintendent throughout the process through e-mails, phone calls, and field trips. The superintendent and his staff provided invaluable advice and counsel, as well as special expertise on critical issues, including areas of critical environmental concern (ACEC) and wild and scenic rivers (WSR). Staff at Canyonlands National Park was contacted regarding Horseshoe Canyon, a detached unit of Canyonlands surrounded by public lands administered by the RFO. Glen Canyon NRA submitted formal scoping comments addressing several issues and more recently assigned a liaison to work with the BLM on the Richfield RMP.

- **U.S. Forest Service:** The RFO shares common boundaries with the Dixie, Fishlake, and Manti-LaSal National Forests. The USFS is engaged in revising land use plans for those national forests concurrent with the BLM revising its plans. Along with sharing boundaries, the two agencies share many common issues. Communication with the USFS regarding planning has been frequent and largely informal. USFS and BLM personnel reviewed a potential WSR segment that crossed national forest and public lands, and planning personnel from both agencies meet informally to better coordinate planning efforts. USFS personnel occasionally participate in the BLM's planning-related interdisciplinary team meetings.
- **U.S. Geological Survey:** The United States Geological Survey (USGS) assigned a staff specialist from its Moab office to serve as a liaison with the BLM on the Richfield Proposed RMP/Final EIS. To date, USGS has submitted formal comments on the Proposed RMP/Final EIS and provided a scientific review of a preliminary study on Mancos Shale erosion.
- **U.S. Fish and Wildlife Service:** Early in the planning process, BLM developed a Regional Consultation Agreement with the USFWS that provided for the participation of USFWS personnel on BLM interdisciplinary teams. Through this agreement, they were given an opportunity to provide input on planning issues, data collection and review, and development of alternatives. USFWS staff also provided written input on resource concerns. (Endangered Species Act consultation is discussed in Section 5.2.3 above.)

Administration of Grazing Allotments in National Park Service Units

The RFO has responsibility for administering grazing allotments within portions of Capitol Reef National Park and Glen Canyon NRA. A description of grazing within the park and recreation area and BLM's responsibilities follows.

Glen Canyon National Recreation Area

Glen Canyon NRA was established on October 27, 1972, under Public Law (P.L.) 92–593. In establishing Glen Canyon NRA, Congress directed that, "The administration of…grazing leases within the recreation area shall be by the BLM. The same policies followed by the BLM in issuing and administering…grazing leases on other lands under its jurisdiction shall be followed in regard to lands within the boundaries of the recreation area, subject to provisions of Section 3(a) and 4 of this Act." The RFO administers livestock grazing on eight allotments that occur on public land and within Glen Canyon NRA: Rockies, Sewing Machine, Waterpocket, Bullfrog, Robbers Roost, Horseshoe Canyon South, Flint Trail, and Slickrock. Horseshoe Canyon South, Flint Trail, and Slickrock allotments currently have no animal unit months (AUM) allocated for livestock grazing, and the Robbers Roost Allotment has no AUMs allocated for livestock grazing in the Glen Canyon NRA portion of the allotment. Specific management direction for livestock grazing in Glen Canyon NRA is provided for under the Glen Canyon National Recreation Area Grazing Management Plan (NPS 1999).

Capitol Reef National Park

On December 18, 1971, Congress abolished the presidentially proclaimed Capitol Reef National Monument and established Capitol Reef National Park, with its final boundary encompassing 241,904 acres (85 Stat. 639, 16 U.S.C. §273 et seq.). This act made provisions for management of grazing, trailing, and stock watering but eliminated grazing after one 10-year renewal of existing permits. P.L. 100–446 in 1988 extended grazing privileges within the park and allowed permittees who legally used park lands for livestock grazing before December 18, 1971, to continue the practice during their lifetime. The law further provided that grazing privileges would be extended for the lifetime of permittees' children who were born before the park was established.

At this time, grazing occurs on only two allotments within the park: Sandy 3 and Hartnet. The portion of the Sandy 3 allotment within the park is fenced and administered by the NPS. The Hartnet Allotment overlaps both BLM and NPS lands.

The BLM and the NPS consult, cooperate, and coordinate their efforts in the administration of grazing on the Hartnet Allotment within the park. The goal of this cooperation is to ensure that respective grazing authorizations, range improvements, allotment management plans, resource monitoring, and other grazing actions do not conflict, and to allocate resources appropriately in joint allotments. In 1995, a memorandum of understanding (MOU) was signed by managers from the NPS and the BLM to provide for a transfer of grazing management responsibilities to the park when sufficient resources, funding, and staffing were present to carry out those responsibilities. At that time, the park took over the issuance of permits for seasonal livestock trailing across its lands. In 1999, Capitol Reef assumed all administration of the Sandy 3 Allotment. The Allotment Management Plan for the Hartnet Allotment, which is currently being revised, will define each agency's roles and responsibilities. Once the plan is completed, the park will fully administer its portion of the allotment.

5.3.2 Cooperating Agencies

As discussed in Section 1.7.2, the BLM is required by law to prepare NEPA analysis and documentation in cooperation with state and local governments, and other agencies with jurisdiction by law or special expertise (42 U.S.C. 4331(a), 4332(2)). Qualified agencies, tribes, or other governments that enter into formal cooperation under this provision are called cooperating agencies. In support of the cooperating agency mandate, BLM invited local, county, state, and tribal agencies to become cooperating agencies in the development of the Richfield RMP. Seven agencies accepted the invitation to become formal cooperating agencies in developing the RMP and signed cooperating agency agreements: the State of Utah; Garfield, Piute, Sevier, and Wayne counties; and the USFWS. Emery County, outside but adjacent to the planning area, was likewise afforded cooperating agency status based on its MOU with the Price Field Office.

The cooperating agency agreements define the relationship between the BLM and the agencies in developing the Richfield RMP. As stated in the MOUs:

…BLM is required to assure the RMP complies with the Federal Land Policy and Management Act of 1976 (FLPMA), particularly Title II, Section 202, Land Use Planning, including Section 202(c)(9) that, among other things, directs the BLM to coordinate its land use planning activities with local governments, to consider local plans in developing BLM land use plans, to assist in resolving, to the extent possible, inconsistencies between Federal and non-Federal government plans, and to be consistent with state and local plans to the maximum extent, consistent with Federal law and the purposes of the Act.

Cooperating agency representatives participated regularly in the Proposed RMP/Final EIS planning process, including serving on interdisciplinary teams and subteams, and were given full access to and opportunities to comment on working documents and other predecisional information. In particular, the counties have been engaged in the travel management issues including off-highway vehicles (OHV) route inventory and designation process and, to date, have cooperated in more than 60 information sharing meetings.

The Utah Governor's Office will receive copies of this Proposed RMP/Final EIS for its use in determining consistency with state plans.

5.4 PLANNING CONSISTENCY

The BLM's planning regulations require that RMPS be consistent with officially approved or adopted resource-related plans of other federal agencies, state and local governments, and Native American tribes, as long as the guidance and RMPs are also consistent with the purposes, policies, and programs of federal law and regulations applicable to public lands.

43 U.S.C. §1712(c) (9) states that the Secretary of the Interior (through the land use plans of the federal agencies under it) shall

> coordinate the land use inventory, planning, and management activities of or for such lands with the land use planning and management programs of other Federal departments and agencies and of the States and local governments within which the lands are located.
>
> *It further states that* the Secretary shall assure that consideration is given to those state, local, and tribal plans that are germane in the development of land use plans for public lands [and] assist in resolving, to the extent practical, inconsistencies between Federal and non-Federal Government plans…

This language does not require the BLM to adhere to or adopt the plans of other agencies or jurisdictional entities, but rather to give consideration to these plans and make an effort to resolve inconsistencies to the extent practical.

The BLM is aware that there are specific county and state plan decisions relevant to aspects of public land management that are discrete from, and independent of, federal law. However, the BLM is bound by federal law. The FLPMA requires that the development of an RMP for public lands be coordinated and consistent with county plans, to the maximum extent possible by law, and inconsistencies between federal and non-Federal Government plans be resolved to the extent practical (FLPMA, Title II Sec. 202 (c)(9)). As a consequence, where state and local plans conflict with federal law, there may be an inconsistency that cannot be resolved or reconciled.

Thus, while county and federal planning processes, under FLPMA, are required to be as integrated and consistent as practical, the federal agency planning process is not bound by or subject to county plans, planning processes, or planning stipulations. The BLM will identify these conflicts in the Proposed RMP/Final EIS, so that the state and local governments have a complete understanding of the impacts of the Proposed RMP on state and local management options. A consistency review of the Proposed RMP with the state and county master plans is included in Chapter 5. In addition, the relevant goals, objectives, or policies of a county are often equivalent to an activity or implementation-level decision and not a land use plan decision. The very specific county goals would be addressed in any subsequent BLM activity or implementation-level decision.

Table 5-2 through Table 5-8 outline the planning consistency of the Proposed RMP with the approved management plans, land use plans, and controls of other agencies with jurisdiction in or adjacent to the planning area. The authorized officer will continue to collaborate with federal agencies, state and local governments, and Native American tribes on implementation of the RMP and on pursuing consistency with other plans and will move toward integration of such plans to the extent that they are consistent with federal laws, regulations, and policy directives. Additional discussion is contained in Chapter 1.

Table 5-2. Garfield County General Plan

Resources	Garfield County General Plan (1/1998)	Consistent
Solid Waste	Garfield County will develop a policy regarding the amount of solid waste it will accept from public lands and develop a fee schedule for public lands solid waste management.	N/A
Air Quality	The preservation of clean air is one of the goals of the county. Most areas are Class 2 and development is permitted.	Yes
Water Quality	The county supports using unused water resources, using existing sources in the most efficient manner, eliminating existing pollution and preventing new pollution.	Yes
Economic	The county supports aggressively pursuing coal and other mineral resource development, exploring tourism and recreational opportunities, retaining and expanding existing agricultural/timber-related businesses, increases in payments in lieu of taxes (PILT), and creating new attractions and recreational facilities. BLM/USFS land management practices should encourage economic ecological sustainability.	Yes
Land/Realty	State school land exchanges should consider future impacts on the growth of county's communities. State school land/federal land exchanges should increase "in-county" state land acreage totals or county-benefiting economic value. Existing public access to public lands should be preserved and enhanced and all RS-2477 right-of-way (ROW) should be preserved. Transfers of private lands to federal/state ownership should not result in a net "private land" acreage loss, unless they result in long-term, ongoing economic benefit to the county.	Yes
Safety	The county reserves the right to establish user fees for search and rescue activities, based on a user pay concept.	N/A
Wildlife	Wildlife numbers should be established for designated areas. The introduction of any exotic plant or animal species into the county should not take place without formal concurrence by the County Commission, and public hearings should be held. Watchable wildlife areas should be developed.	Yes
Grazing	The number of AUMs allocated should be expanded to the full carrying capacity of the forage resource.	Partial
Timber	Partnerships should be created and should promote long-term timber industry development to stabilize, maintain, and expand the industry through the combined efforts of business and the public. The county wants to ensure that forests are maintained as a	Yes

Resources	Garfield County General Plan (1/1998)	Consistent
	healthy renewable resource.	
Wild and Scenic Rivers	The county will comment on and may develop and submit designation proposals to the appropriate federal agencies.	Yes

Table 5-3. Garfield County General Management Plan Resource Management Amendment (12/2007)

Resources	Garfield County General Management Plan Resource Management Amendment	Consistent
Air Quality	Management direction for this resource/resource use has not been completed. It is intended that management direction for this resource/resource use will be completed, subject to public comment, and adopted at some point in the future.	Yes
Geology, Topography, and Climate	Management direction for this resource/resource use has not been completed. It is intended that management direction for this resource/resource use will be completed, subject to public comment, and adopted at some point in the future.	Yes
Soil Resources	Management direction for this resource/resource use has not been completed. It is intended that management direction for this resource/resource use will be completed, subject to public comment, and adopted at some point in the future.	Yes
Water Resources	Management direction for this resource/resource use has not been completed. It is intended that management direction for this resource/resource use will be completed, subject to public comment, and adopted at some point in the future.	Yes
Vegetation	Management direction for this resource/resource use has not been completed. It is intended that management direction for this resource/resource use will be completed, subject to public comment, and adopted at some point in the future.	Yes
Noxious/Invasive Weeds	Large infestations of Tamarisk and Russian Olive have impacted many of the streams, riparian areas, and groundwater resources of the county. Continued efforts are needed to completely eradicate the species and protect the area from recurrent infestations.	Yes
Special Status Species (Threatened, Endangered, and Sensitive)	Management direction for this resource/resource use has not been completed. It is intended that management direction for this resource/resource use will be completed, subject to public comment, and adopted at some point in the future.	Yes
Fish and Wildlife	Management direction for this resource/resource use has not been completed. It is intended that management direction for this resource/resource use will be completed, subject to public comment, and adopted at some point in the future.	Yes
Forage	It is the county's position that forage allocations be balanced between competing users based on fair and equitable assumptions and considering local goals and desires. Perhaps the greatest concern is that there needs to be a clear	Yes

Resources	Garfield County General Management Plan Resource Management Amendment	Consistent
	understanding is needed of much how forage is available to be allocated between livestock and wildlife, and how much of that forage goes to each.	
Wildland Fire Ecology	Management direction for this resource/resource use has not been completed. It is intended that management direction for this resource/resource use will be completed, subject to public comment, and adopted at some point in the future.	Yes
Cultural Resource Management	The county identifies several desired conditions and policies related to improving inventory, completing compliance in a timely manner, retaining existing resources, constructing a curation facility, capitalizing on economic opportunities associated with research and identification (etc), and issuing permits.	Yes
Paleontological Resources	The county identifies several desired conditions and policies related to improving inventory, completing compliance in a timely manner, retaining existing resources, constructing a curation facility, capitalizing on economic opportunities associated with research and identification (etc), and issuing permits.	Partial
Visual Resources	Each federal agency has its own system for classifying visual resources and for scenery management. No two agencies are completely consistent with the county's planning efforts or expressed desires. Generally, visual classification areas are more restrictive than needed outside national parks and designated Wilderness**.**	No
Forestry and Woodland Products	Resource/resource use has not been completed. It is intended that management direction for this resource/resource use will be completed, subject to public comment, and adopted at some point in the future.	Yes
Transportation	County desired conditions and policies include resolving issues in a timely manner, preserving access to public and private lands, recognizing the transportation network, resolving RS-2477 issues, incorporating sufficient scope to reduce additional analysis, eliminating the unauthorized use of cross-country travel on public and private lands and working cooperatively with federal agencies to resolve valid existing rights, transportation needs, maintenance requirements, improvement projects, and other ROW and/or scope issues.	Partial
Minerals and Energy Development	Resource/resource use has not been completed. It is intended that management direction for this resource/resource use will be completed, subject to public comment, and adopted at some point in the future.	Yes
Special Designations	Current settings, need for management changes, desired conditions, policies, goals, objectives, and criteria related to special designations were described by the county. Management actions must be consistent to the maximum extent allowed by law with Garfield County's General Management Plan. Unless directed by federal or state law, management actions that are contrary to the stated positions are inconsistent with Garfield County's General Management Plan. When no body of law exists regarding land management decisions or when decisions are left	Partial

Resources	Garfield County General Management Plan Resource Management Amendment	Consistent
	to the agencies' discretion, management actions must be consistent with the positions identified in this plan.	
Wilderness	The county identifies several desired conditions and policies related to designating eligible and suitable Wilderness: releasing other lands from wilderness character; compensating the county for visitor services; basing Wilderness, primitive and non-motorized types of recreation, and non-wilderness study area (WSA) lands with wilderness characteristics areas on county approved designations; and developing BLM lands not designated as Wilderness to the maximum allowed by law for commodity production and socioeconomic growth.	No
Research Natural / Geological / Botanical Areas	The county identifies several desired conditions and policies related to these lands before designations are made: the proposal needs to meet the county's identified criteria; a thorough inventory needs to be made to consider whether a similar area is already being protected; these areas need to be consistent with the county's plan and, absent federal law to the contrary, be subject to local law, ordinance, or other special consideration; and areas need to be limited to only those areas that can provide significant scientific information and interpretive opportunities while preserving the custom and culture and enhancing the socioeconomics.	N/A
Scenic Byways/Highways	It is the objective of the county to promote these designations as showcases of multiple use and to oppose management of adjacent lands that is inconsistent with the Garfield County General Management Plan. It is the policy of Garfield County to cooperate with other agencies to determine the demonstrated need and the minimum land necessary to accomplish desired outcomes. It is the policy of Garfield County to support only scenic highways that are consistent with local bodies of law, ordinances, plans, and are the subject of a cumulative environmental review, which determines the impact to local and regional environments and social and economic impacts caused by the designation.	Yes
Areas of Critical Environmental Concern	The county will be proactive in the management of ACECs. Approximately 1,041,245 acres of Garfield County's 3,331,065 acres are included in Bryce Canyon National Park, Capitol Reef National Park, Canyonlands National Park, Glenn Canyon National Recreation Area, and the Grand Staircase/Escalante National Monument. In addition, the USFS manages one designated Wilderness Area. It is the county's position that relevant/important scenic, cultural, and recreation lands (approximately one-third of the county) are already protected. The county will support only those ACEC designations that can be demonstrated to have relevant and important values as defined herein that are being threatened with irreparable damage.	Yes
Wilderness Study Areas	It is the county's policy to support Wilderness designation for lands the county has deemed eligible and suitable for Wilderness	No

Resources	Garfield County General Management Plan Resource Management Amendment	Consistent
	under P.L. 88-577. It is the county's policy to oppose Wilderness designation and/or management for wilderness characteristics on lands the county has deemed are not eligible and suitable for Wilderness designation under P.L. 88-577. It is the county's policy, to the maximum extent allowed by law, that all lands deemed not eligible and suitable for Wilderness designation and/or management for wilderness characteristics be released from prescriptive management and returned to commodity production or multiple use/sustained yield management. It is the policy of the county to work cooperatively with land managing agencies, the State of Utah, and Utah's congressional delegation to have the lands identified through the county review, study, and recommendation process appropriately designated and managed. The county agrees that some public lands need specific restrictions, but it believes those restrictions should be the minimum necessary and should be developed in a spirit of cooperation, ensuring the greatest use and enjoyment by the public and local residents. Areas identified in the Utah BLM Statewide Wilderness Final EIS as failing to meet outstanding solitude or primitive recreation standards should not be managed for primitive or semi-primitive non-motorized recreation.	
National Trails	It is the policy of the county to consider each proposed trail on a case-by-case basis, considering other values that might be affected by designation; subject to goals and objectives of the Garfield County General Management Plan and demonstrated need including outstanding remarkable values emphasized by designation.	Yes
Wild and Scenic Rivers	It is the county's policy that, once undertaken, all WSR evaluations be completed through the suitability stage. It is the county's policy to support only those river segments that meet the quality standards set forth by the county in a public-supported process.	Yes
Backcountry/ Roadless/Primitive Areas	It is the goal of the county to work cooperatively with federal land management agencies regarding designation of backcountry/roadless/primitive areas. It is the policy of the county to manage only those areas identified in the Garfield County General Management Plan as Rec Ib—near Wilderness as backcountry/roadless/ primitive. Any deviation from the plan, without approval of the County Commission, is inconsistent with the local planning process. Backcountry/roadless/primitive areas shall be designated and managed, to the maximum extent allowed by law, in accordance with county stated desired conditions.	Partial
Special Recreation Management	It is the goal of the county to establish SRMAs only for resources that significantly enhance the socioeconomic vitality, community	No

Resources	Garfield County General Management Plan Resource Management Amendment	Consistent
Areas (SRMA)	viability, custom, and culture while expanding agency financial, infrastructure, and management support to fully develop use and enjoyment of the resource. It is the policy of the county to oppose the designation of SRMAs when management scenarios restrict use and enjoyment of resources or when financial, infrastructure, and management commitments fail to fully develop use and enjoyment of resources. SRMAs are inconsistent with primitive recreation because SRMAs require intense management, increased facilities, and investments that impact the land. These requirements conflict with the concepts of primitive recreation ("untrammeled by man," "without man's influence," and "infrequent contact with man and his influence.") SRMAs are an appropriate management tool to fulfill agency responsibility to ensure traditional, diverse recreation relating to cross-country travel and open OHV use. Failure to allocate at least 1 percent of agency land in the county as SRMAs (or other appropriate designations) for cross-country travel and/or open OHV use is considered an abrogation of recreation planning responsibility and is inconsistent with the Garfield County General Management Plan. The county will consider and support/oppose SRMA management on a case-by-case basis for lands that contain special features of recreation interest, which do not qualify for ACEC, WSR, or other special designation.	
Non-WSA Lands With Wilderness Character	The county accepts and adopts the BLM determination reached in the original wilderness inventory that these lands clearly and obviously lack wilderness character and incorporates the inventory and determinations by reference. The county adopts the determination identified on page A1, column 3, paragraph 1 of the Utah 1996 Wilderness Re-inventory that these areas do not have wilderness character on every acre. The county adopts the determination identified on A1, column 3, paragraph 1 of the Utah 1996 Wilderness Re-inventory that non-WSA lands with wilderness character located adjacent to WSAs were not evaluated. Where inconsistencies exist between the original wilderness inventory conducted as directed by Congress in response to the Wilderness Act of 1964 and Utah 1996 Wilderness Re-inventory, the county adopts the original inventory and determinations as correct, accurate, and the best/most current data. In addition, the county rejects inconsistent findings of Utah 1996 Wilderness Re-inventory as inaccurate and based on subjective, unauthorized criteria. It is the policy of the county that non-WSA lands with wilderness character be managed for commodity production or multiple use and sustained yield. Management actions must be consistent to the maximum extent allowed by law with the Garfield County	No

Resources	Garfield County General Management Plan Resource Management Amendment	Consistent
	General Management Plan, and failure to comply will be considered arbitrary and capricious.	
Visual Resource / Scenery Management	Visual Resource Management (VRM) is subjective, and discretionary management that is not consistent with the Garfield County General Management Plan fails to meet the standards required by FLPMA 202(c). It is the policy of the county that any specific action to manage or change visual management or scenery classifications comply with the Garfield County General Management Plan or be approved by the Garfield County Commission. The Garfield County General Management Plan will serve as the governing body of local law concerning the management of visual resources. Before any discretionary action can be taken or approved by federal land managers, it must be shown that the action has been subjected to direct, indirect, and total cumulative impact analysis, have the support of the local Board of County Commissioners, and be consistent with the Garfield County Resource Management Plan. Establishment of visual resource/scenery management classifications, which place restrictions on public lands without considering cumulative impacts associated with congressional designations and preservation areas (national parks, national monuments, NRAs, and designated Wilderness), is inconsistent with the Garfield County General Management Plan. The county supports the least restrictive visual resource classification allowed by law unless otherwise approved by the Garfield County General Management Plan or the County Commission. The county deems VRM scenarios that are more restrictive than the least restrictive allowed by law in conflict and inconsistent with the Garfield County General Management Plan unless authorized by the Plan or the County Commission.	No
No Surface Disturbance	The county has developed a component for surface disturbing activities as part of the Garfield County General Management Plan to provide consistency across agency boundaries. Before any action is taken that will place an area into this no surface occupancy, the following criteria shall be followed: 1. A demonstrated need; threat to human health, safety, or welfare of the human environment; or a critical environmental issue that can be managed by no other designation must exist. 2. A demonstrated need must be brought before the Garfield County Board of Commissioners for discussion. 3. Prior to a final agency action, the proposal must be brought to the attention of the Public Lands Steering Committee and local community governments, and public hearings must be held so that all aspects, issues, and concerns of local citizenry can be discussed. 4. Best management practices must be developed and an environmental document be completed, which addresses the total cumulative impacts to the biological environment and social	Partial

Resources	Garfield County General Management Plan Resource Management Amendment	Consistent
	and emotional impacts as well as the economic impacts to the local area. 5. When the process is complete, the Board of Commissioners will accept, reject, or suggest modifications to the proposal and make a final decision on which action will be in the best interest of the county. 6. That decision will be considered as final local law in Garfield County.	
Special Protective Orders	Special Protective Orders will be considered only as a management tool used as a last resort. It is the policy of the county that Special Protective Orders be used, only in areas in which there are remarkable values; a demonstrated need for the protection, safety, health, or other human needs; emergency conditions; and with the concurrence of the Garfield County Commission.	N/A
Multiagency Concerns	The Garfield County Commission is a duly elected body and represents a legal subdivision of state government. The county must be a full partner in all laws, ordinances, policies, planning, and needful decisions relating to management of public lands in Garfield County. With the increasing influx of visitors to public lands, providing public services has become increasingly burdensome. Federal and state agencies must accept their share of the responsibility for providing critical services. Managers and visitors are jointly responsible for impacts to public services. The county will classify public lands in the county consistent with federal procedures for visual resource/scenery management, recreation opportunity spectrum analysis, wise stewardship, and responsible protection of the health and welfare of the land. The county will support management of public lands in accordance with Garfield County's General Management Plan and Land Use Policy; multiple use lands administered by the Federal Government, unless specifically withdrawn through congressional mandate for specific purposes, must be managed under the principles of “multiple use and sustained yield.” Federal land managers are inconsistent with the definition of “multiple use”. Multiple use means, but is not necessarily limited to, those items historically and traditionally practiced, both consumptive and non-consumptive, which include grazing, mining, recreation, oil and gas exploration, timber production (including wood products like fence posts and firewood), wildlife, vegetative management, and water use and development. Garfield County asserts these uses are generally compatible and true “multiple use.” Management allows the land and its resources to be used for multiples uses simultaneously or in concert with each other. More than one use can occur at the same time, and many activities are mutually beneficial. Wilderness values should not be applied as suitability criteria in determining grazing capacities in designated wilderness or wilderness study areas. Standards for Rangeland Health should	Partial

Resources	Garfield County General Management Plan Resource Management Amendment	Consistent
	be used for grazing allocations. County custom, culture, and economic stability depend on agriculture, livestock production, mining, tourism, recreation, the timber industry, the continued use and availability of public lands, and accompanying resources. Federal and state management plans must identify and address the impacts their proposed management decisions and practices have on traditional resource uses, custom, and culture. Sufficient land within the county has been designated for primitive recreation and preservation purposes (parks, monuments, recreation areas, and Wilderness). The county opposes additional lands administered under single-use management schemes unless specifically approved by the County Commission. The county actively supports public land practices that provide for traditional multiple uses, support the custom and culture of the county, and enhance commodity production consistent with man's role as steward of the land. Garfield County supports motorized and non-motorized access to public lands. Access to public land has a direct impact on the county's economic stability, custom, and culture. Open access maintains stability in the county. Garfield County will participate in all relevant federal and state access decisions, including RS 2477 determinations, Title V issues, closure discussions, and transportation decisions. The county has developed a transportation system that identifies the minimum infrastructure necessary to maintain the custom, culture, and socioeconomic needs of the county. County concurrence must be sought prior to access reduction to prevent negative impacts to the sustainability of local communities. Given the importance of public land access, the county asserts roads, paths, ways, and trails constitute valid existing rights if created before the passage of FLPMA and/or enabling authority. The county declares federal actions regarding RS 2477 are unjust and illegal and have placed an unfair burden on Garfield County to protect its ROWs. Garfield County will aggressively protect its right to public access. Agencies that adopt management alternatives that impact the transportation network prior to final determination of jurisdiction fail to recognize valid existing rights. Restrictions placed on existing roads, paths, ways, and trails prior to final determinations of jurisdiction are speculative, arbitrary, capricious, and is inconsistent with the Garfield County General Management Plan.	
Livestock Grazing	Wilderness values should not be applied as suitability criteria in determining grazing capacities in designated wilderness or WSAs. Standards for Rangeland Health should be used for grazing allocations. County custom, culture, and economic stability depend on agriculture, livestock production, mining, tourism, recreation, the timber industry, the continued use and availability of public lands, and accompanying resources. Federal and state management	Yes

Resources	Garfield County General Management Plan Resource Management Amendment	Consistent
	plans must identify and address the impacts their proposed management decisions and practices have on traditional resource uses, custom, and culture.	
Lands/Realty	Sufficient land within the county has been designated for primitive recreation and preservation purposes (parks, monuments, recreation areas, and Wilderness). The county opposes additional lands administered under single-use management schemes unless specifically approved by the County Commission. The county actively supports public land practices that provide for traditional multiple uses, support the custom and culture of the county, and enhance commodity production consistent with man's role as steward of the land. Private and Public Land Ratios—Public land acreage currently owned and managed by federal and state agencies is more than sufficient for the public interest. Approximately 94 percent of the county is owned or controlled by federal and state entities. Sufficient acreage exists in the national parks system, national monument system, and other areas of special designation. The county has a "no net loss of private land" and "no expansion of national parks/monuments" position relative to federal-state property exchanges and transfers without the approval of the County Commission. The determination of "no net loss" should consider both acreage and values. The county supports a "net gain of private lands" regarding acreage and value. It is therefore the policy of the county to place maintenance and improvement of transportation facilities as a higher priority than protecting visual resources adjacent to the transportation facilities. Where existing transportation facilities are present (roads, paths, ways, trails, airstrips, trailheads, parking areas, airports, etc.), the area is considered to have enhanced visual characteristics, because the public has an opportunity to view it. Best management practices, which support appropriate visual resource objectives, will be applied to transportation maintenance and improvement projects.	Yes
Access	The county supports motorized and non-motorized access to public lands. Access to public lands has a direct impact on the county's economic stability, custom, and culture. Open access maintains stability in the county. Garfield County will participate in all relevant federal and state access decisions, including RS 2477 determinations, Title V issues, closure discussions, and transportation decisions. The county has developed a transportation system that identifies the minimum infrastructure necessary to maintain the custom, culture, and socioeconomic needs of the county. County concurrence must be sought prior to access reduction to prevent negative impacts to the sustainability of local communities. Given the importance of public land access, the county asserts roads, paths, ways, and trails constitute valid existing rights if created prior to the passage of FLPMA and/or enabling authority. The county declares federal actions regarding RS 2477 are	Partial

Resources	Garfield County General Management Plan Resource Management Amendment	Consistent
	unjust, illegal, and have placed an unfair burden on Garfield County to protect its ROWs. The county will aggressively protect its right to public access. Agencies that adopt management alternatives that impact the transportation network prior to final determination of jurisdiction fail to recognize valid existing rights.	
Recreation and Tourism	Visitors to public lands have a direct bearing on the economic well-being of the county and its communities. Visitors also impact county services including search and rescue, emergency medical, solid waste collection and disposal, law enforcement, and fire response. The county supports increased recreational activity on public lands. However, federal and state agencies must acknowledge, and more aggressively address, the impacts associated with their visitors. Federal and state land managers are jointly responsible with their visitors to compensate the county for public services. The county adopts the BLM's Final Wilderness EIS finding that primitive recreationists spend approximately $4.10 per day.	Yes

Table 5-4. Garfield County Economic Development Plan (2007)

Resources	Garfield County Economic Development Plan	Consistent
Economic Development	The county's economy has expanded from chiefly farm-based and natural resource extraction-based, to one that includes industry, retail and tourism, and other service-oriented businesses. The county must continue to seek innovative ways to diversify its economy, provide job opportunities for all county citizens, safeguard precious and irreplaceable resources, and wisely plan for change.	Yes

Table 5-5. Sevier County General Plan (12/2006)

Resources	Sevier County General Plan	Consistent
Multiple Use	In Sevier County, multiple use activities should continue and include uses such as agricultural grazing, fishing and hunting, mineral exploration and mining, recreation, wildlife habitat, and timber sales.	Yes
Livestock Grazing	Agencies should continue to promote, permit, and regulate grazing on public lands. Removing livestock should not be the only option for managing public lands for utilization. The county should support the current Public Rangelands Improvement Act (PRIA) formula for determining AUM costs for grazing on public lands. Local agricultural boards, councils, and permittees should be consulted by federal land managers to provide local input on grazing issues.	Yes
Roads/RS-2477	The county will continue the road use agreements with the BLM, USFS, and other agencies that own public and private lands so that ROWs and access to public lands are maintained. All present or expanded RS-2477 roads within the county shall be recognized	Yes

Resources	Sevier County General Plan	Consistent
	by applicable federal land management agencies.	
Vegetation and Watersheds	The county supports efforts to improve vegetative management and protect the watershed on public lands. Activities such as chaining, burning, fencing, reseeding, grazing, and others are beneficial to the watershed.	Yes
Wildlife	The county encourages the use of alternate funding sources to improve habitat. It seeks to resolve conflicts between elk habitat and livestock grazing. Managing and enhancing wildlife populations and habitat support economic and recreational opportunities for the county. The county supports reasonable wildlife management as long as it does not create a single-use status adversely impacting or limiting other resources on public lands.	Yes
Mineral Resources	The use, monitoring, permitting, or extracting of resources such as clay, coal, gypsum, salt, sand/gravel, natural stone and petroleum, gas and oil shale continues to be important to the county.	Yes
Water Resources	Management of the Central Sevier Valley and Sevier-Sigurd Basin systems, culinary springs and wells, diversions, canal and irrigation companies, water quality, and water rights continues to be a vital interest of the county.	Yes
	The county recommends that appropriate access and source protection zones continue to be closely monitored to maintain water quality.	Yes
	The county recommends that flood plain detention basins and flash flood channels be protected from development and be well maintained.	Yes
	The county will cooperate with entities to ensure that known and potential inventories of spring and well sources of culinary waters are identified and appropriately protected.	Yes
Easements/ROW	Special purpose or prescriptive easements and established ROWs for irrigation bridges, canals, and waterways will be maintained and recorded. The county recommends that easements be no greater than 30 feet and not encroach on private property. Corridors, easements, or ROWs should be maintained, preserved, protected, and recorded as development is approved in the unincorporated areas of the county.	Yes
Access	Access to natural resources will be preserved and protected. Minerals, mining and mineral-related production, and timbering will be actively extended and promoted.	Yes
Wildfire and Hazards	The county intends to adopt agreements and ordinances consistent with fire, interface, mitigation, and natural hazard codes that assist in protecting private and public property from natural hazards and wildland fires.	Yes
Hazardous Wastes	The county promotes training and strengthening the operations of public health and safety personnel to prevent the unauthorized, negligent disposal of debris, solid wastes, and hazardous or potentially hazardous wastes. The intent of this policy is to protect land resources, the visual environment, and ecology of surface	Yes

Resources	Sevier County General Plan	Consistent
	and groundwaters.	

Table 5-6. General Plan of Wayne County (5/1994)

Resources	General Plan of Wayne County	Consistent
Multiple Use	Wayne County supports preserving traditional multiple use of resources. The county feels that these uses should take precedence when conflicts between competing uses arise, i.e., wildlife vs. livestock, timber harvesting vs. recreation.	Yes
Private Property Rights	The county supports protecting private property rights, as well as county interests and values, through the development of land use regulations.	Yes
Water Rights	The county wishes to preserve and expand existing water rights.	Yes
National Park Boundaries	The county believes that national park boundaries (buffers) should not be expanded solely through national park or congressional decisions. The county desires that the federal land managers improve their coordination for decisions and practices on public lands adjacent to the park boundaries.	Yes
Tourism and Recreation	The county supports exploring tourism and recreational opportunities. The county wishes to create new attractions and recreational facilities within the county.	Yes
Livestock	BLM and USFS rangelands will be managed and improved using accepted traditional range improvement/conservation practices. The county supports maintaining the number of AUMs.	Yes
Economic	The county supports retaining and expanding agricultural businesses, specifically, livestock, dairy/cheese industry, timber-related industries, and commercial fisheries.	Yes
Wildlife	The county supports establishing and maintaining upper limits on big game herd sizes.	Yes
Lands/Realty	No net increase in federal ownership as a result of state school land/federal land exchanges within the county. State school trust sections within parks are exchanges for other federal lands within the county. No involuntary transfer of private lands to public ownership if such transfers result in a tax revenue and value loss. State school trust lands should not be consolidated; checkerboard should be maintained on BLM lands. The county supports privatization of land. Transfers of private lands to federal or state ownership should not result in a net “private land” acreage loss. The county supports pursuing an increase in PILTs by the Federal Government.	Yes
Transportation	All transportation routes on public lands, i.e., primitive ROWs, trails, roads, canals, ditches, pipelines, transmission lines,	Yes

Resources	General Plan of Wayne County	Consistent
	livestock driveways, and any other traditional use should be protected.	
Law Enforcement	The county believes that the Federal Government should cover emergency/law enforcement costs.	N/A
Forestry	The county seeks to maintain the current level of timber harvest of 4 million board feet. The county supports restructuring timber sale contracts to eliminate the discrimination of our local mills caused by the current sale size and administration.	Yes
Parker Mountain Complex	The county supports livestock grazing and the established seasons of use, allotment boundaries, numbers, and dates; controlled livestock numbers; and the protection of all water rights.	Yes
	The county supports a controlled antelope herd of 400 head and enforcing that number with hunts and trapping.	Yes
	The county supports the recognition and protection of water rights and privileges by the BLM.	Yes
	The county feels that all roads and highways, bridges, flumes, and culverts should be recognized and maintained/improved and that 60–100 foot ROWs be allowed. Obstructions or gates should not be put in place unless there is agreement by all concerned.	Yes
	Where possible and necessary, any public land needed by towns or cities for expansion purposes should be provided if it does not infringe on others with established uses.	Yes
Fremont River Complex	The county does not favor any land being designated as wilderness. The lands should be available for multiple use and production as needed.	No
	The county feels that special designations (ACEC) should not be considered and that they are too restrictive for the multiple use concept.	No
	The county feels that it does not have any rivers or streams that qualify for WSR designation and that this designation is too restrictive and interferes with upstream water rights.	No
	The county feels that any land exchange should benefit all parties and that these transactions should be brought to the attention of the Commission.	Yes
	The county believes that all historical and cultural resources should be identified, recognized, and honored.	Yes
	The county believes that salinity problems should be addressed by federal entities that possess the means to solve the problems.	Yes
	The county feels that all roads and highways, bridges, flumes, and culverts should be recognized and maintained/improved and that 60–100 foot ROWs be allowed. Obstructions or gates should not be put in place unless there is agreement by all concerned.	Yes

Resources	General Plan of Wayne County	Consistent
	The county believes all resources should be managed for the multiple use concept, grazing, mining, and timber. It also favors the current formula for establishing grazing fees on BLM and USFS land.	Yes
Henry Mountain Complex	The county feels that all WSA lands should be released immediately and opened as needed for mineral exploration.	No
	The county believes that bison are a part of the region and the herd should not exceed 200 head.	Yes
	The county believes that the BLM should be allowed to manage the NPS lands as though they were regular BLM land, except for the ACEC near the campground/visitor center.	No
	The county believes that the current bighorn sheep management should continue.	Yes
	The county believes that recreation, hunting, hiking, boating, camping, and four wheeling should be managed to protect the environment as other uses are.	Yes
	The county believes that special designations (ACEC) should occur only in the national parks. The county does not feel that the Fremont River meets the WSR criteria. The county also supports the multiple use concept relative to water rights.	No
	The county maintains that water rights and privileges be protected.	Yes
	The county feels that all roads and highways, bridges, flumes, and culverts should be recognized and maintained/improved and that 60–100 foot ROWs be allowed. Obstructions or gates should not be put in place unless there is agreement by all concerned.	Yes

Table 5-7. Sanpete County General Plan (6/1997)

Resources	County Plan Decision	Consistent
Culture, Historic Preservation, Recreation, and Tourism	Sanpete County's mission is to coordinate the efforts needed to preserve and renew the shared culture and economic and natural heritage through business and tourism development. The county supports increased commerce, travel, tourism, and other uses that are compatible with the present multiple uses. The county recognizes the preservation of its historic and cultural resources. The county wishes to preserve, protect, and promote increased use of recreation resources.	Yes
Economic Development and Employment	The county supports efforts to identify and develop resources that will provide growth and promote businesses.	Yes
Orderly Growth and Demographics	The county maintains that open lands, especially public lands, be promoted for summer and winter recreational purposes. The county wants the best utilization of natural resources, maintenance of their quality of life, and the preservation of the	Yes

Resources	County Plan Decision	Consistent
	environment.	
County, Federal, Municipal, and State Lands	The county wishes to reposition public trust lands to facilitate local development through appropriate selections and exchanges. The county maintains that all users of public land should bear a proportionate share of the costs associated with administering through uniformly applied user fees.	Yes
Agriculture, Water, Minerals, and Natural Resources	The county believes that no use, or proposed land use, should materially alter the current land ratio designed or devoted to agricultural production or use. The county requires that water rights be maintained. The county wants monitoring of agricultural or commercial activities to prevent point sources of pollution to streams and drainages.	Yes

Table 5-8. General Plan for Piute County (12/1994)

Resources	General Plan for Piute County	Consistent
Livestock	It is Piute County's desire to preserve and enhance livestock and agricultural industries.	Yes
Tourism/Recreation	It is the county's desire to strengthen its economic base by responsively developing traditional recreational uses (hunting, fishing, and camping) and popular activities (mountain biking, all-terrain vehicle [ATV] riding, cross-country skiing, and rock hounding).	Yes
Wildlife	It is the county's desire that wildlife resources be comprehensively managed to preserve and enhance economic and recreational opportunities (consumptive and non-consumptive).	Yes
Water	It is the county's interest to protect existing water rights and to pursue the acquisition of additional water rights for culinary, agricultural, and recreational purposes.	Yes
Mineral	It is the county's interest that federal and state management plans continue to provide opportunities for the growth and development of the mining industry.	Yes
Timber	The county supports responsible timber and woodland resource management.	Yes
Multiple Use/Access	It is the county's interest that BLM and USFS lands be managed for multiple use and access be maintained on public lands.	Yes
RS-2477	It is the county's wish to ensure that local input regarding access on existing roads (RS-2477) be maintained.	Yes
Wilderness Characteristic	It is the county's position that the continued expansion of proposed wilderness areas and the continually diminishing standards by which wilderness characteristics are identified will dilute the importance of the wilderness concept and destroy what should be an important and special aspect of our public lands. As indicated, the impacts on Piute County from the heavy	Yes

Resources	General Plan for Piute County	Consistent
	presence of federal lands are substantial, and any increase in the number of restrictions that result from new management protocols would be devastating to the county's economy. The county believes that the lands identified as having wilderness characteristics within the boundaries of Piute County should be managed for multiple use-sustained yield, and we believe that the data we have supplied support this position, indicate that the lands have had long and diverse use, and show that the areas that have not been impacted by use are too small to be practicably managed for their wilderness characteristics.	
A recommended proposal for amending the Piute County General Plan to clarify longstanding policies for the following regions: **Kingston Ridge** **Phonolite Hill** **Rocky Ford**	Achieve and maintain a continuing yield of mineral resources, livestock grazing, water resources, and traditional access to outdoor recreational opportunities, at the highest reasonably sustainable levels. Maintain and keep open all roads in the region that appear on Piute County's most recent transportation map and provide for such additional roads and trails as may be necessary from time to time. Manage the region to not interfere with the fiduciary responsibility of SITLA with respect to trust lands located in that region. Avoid managing part or all of the region for so-called wilderness characteristics because it would violate FLPMA, contradict the state's public land policy, and contradict the foregoing plans of Piute County for managing the region. Avoid imposing any of the ACEC designation alternatives currently under consideration in the Richfield RMP revision process, because it would contradict Piute County's plan for managing the region. Avoid including any river segment in the region in the national WSR system because it would violate the National Wild And Scenic Rivers Act and related regulations, contradict the state's public land policy, and contradict the foregoing plans of Piute County for managing the region. Assigning a VRM Class I or II rating for any part of the region would contradict the state's public land policy and contradict Piute County's plan for managing the region.	No

This PRMP/FEIS is consistent with Wildlife Management Plans, the State Water Plan, State Park Plans (Fremont Indian State Park, Piute State Park, Otter Creek State Park, Palisades State Park, and Goblin Valley State Park). Table 5-9 discusses the consistency between the State of Utah Code 63j-4-401 and the Richfield PRMP/FEIS.

Table 5-9. Consistency with State of Utah Code 63j-4-401

Resource	State of Utah Code 63j-4-401	BLM
ACECs	**State of Utah**: It is the policy of the State of Utah to withhold support for ACEC designation unless or until relevant and important values or significant natural hazards are clearly identified	**BLM**: The potential ACECs brought forward for designation into the Proposed RMP have gone through a rigorous and stringent process in accordance with

Resource	State of Utah Code 63j-4-401	BLM
	and the area requires special management protections not afforded by normal multiple-use management. ACECs should be no larger than necessary and management should be no more restrictive than necessary to prevent irreparable damage to relevant and important values or protect human safety. To the extent allowed by federal law, management prescriptions should comport with the plans and policies of the State and of the county where the proposed designation is located. These prescriptions should not result in management equivalent to that afforded congressionally designated wilderness areas.	FLPMA, the planning regulations at 43 CFR 1600, Land Use Planning Handbook (H- 1601-1), and in accordance with BLM Manual 1613 and ACEC Policy and Procedures Guidelines (45 FR 57318). Appendix 1 outlines the process the interdisciplinary team underwent to determine whether a nominated ACEC had relevance and/or importance values. The size of the proposed ACECs is limited only to the area(s) of geography where the relevance and importance values are manageable to protect and prevent irreparable damage. In the Proposed RMP, the potential ACECs generally do not have redundant special designations and/or other existing protections applied. The potential ACECs carried forward into the Proposed RMP necessitate an ACEC designation because special management protection is necessary (outside of normal multiple-use management) to specifically protect the relevance and importance values within the areas identified. The special management prescriptions that have been proposed are narrowly tailored to protect the identified relevant and important values; none of which are recognized as wilderness resources. For these reasons, the potential ACEC decisions carried forward into the Proposed RMP are considered by BLM to be consistent with Utah Code 63j-4-401.
Wild and Scenic Rivers	**State of Utah:** It is the policy of the State of Utah that federal land managers should refrain from applying a non-impairment management standard to river segments inventoried as "eligible" for inclusions in the national Wild and Scenic Rivers and all eligible segments should promptly be evaluated for suitability. The State of Utah will work with federal land managers to identify suitable segments and work towards a recommendation to congress for designation where careful analysis: (1) identifies and evaluates regionally significant segments, (2) addresses the impact designation will have on physical, biological, and economic resources, (3) demonstrates that suitable segments have water present and flowing at all times, and (4) not interfere with water resources development. Interim management of suitable segments should not interfere with development of valid existing water rights, including development of waters apportioned to the State under all interstate compacts or agreements, including the Bear River Compact and the Upper Colorado River Compact. To the extent allowable by federal law and where not in conflict with state law or policy, interim management of suitable segments and	**BLM:** The State of Utah has worked as a Cooperating Agency throughout this planning process and has been intimately involved with the BLM's wild and scenic river planning process. The State has assisted Field Office specialists to help determine eligibility findings for each of the river segments, and has provided social and economic expertise and advice as the BLM determined which eligible segments to carry forward as suitable into the Proposed RMP. BLM has committed to working cooperatively among Federal, State, and local governments and communities during the post-planning wild and scenic river study phase when statewide recommendations for inclusion of river segments into the National Wild and Scenic Rivers System would go forward to Congress. Prior to this post-planning phase, BLM would work with affected partners to help identify in-stream flows necessary to protect the outstandingly remarkable values for which the subject river segments were found suitable via this planning process. Thus, because there are

Resource	State of Utah Code 63j-4-401	BLM
	congressional recommendations for designation should be consistent with plans and policies of the county or counties where the river segment is located.	no effects of this planning decision on valid existing rights, and because suitability findings in this planning process do not create new water rights for the BLM, the land use planning wild and scenic river suitability determinations are found by BLM to be consistent with the Utah Code 63j-4-401.
Grazing	**State of Utah:** It is the policy of the State of Utah that the citizens of the state are best served by applying multiple-use and sustained-yield principles in public land use planning and management. Public lands should continue to produce food and fiber, and the rural character and landscape should be preserved through a healthy and active agricultural and grazing industry. Land management plans should maximize forage availability for domestic livestock and wildlife use. The State favors active management to restore and maintain rangeland health, increase forage, and improve watershed for the mutual benefit of local communities, domestic livestock, and wildlife. Adjustments in AUM levels may occur as required by range and watershed conditions, based on scientific, on-the-ground analysis. Grazing AUMs should be placed in suspension where range conditions will not sustain the current level of AUMs or where necessary to protect range and watershed health. Any suspended AUMs should be returned to active use when range conditions improve. The State generally opposes forced relinquishment or forced retirement of grazing AUMs but will continue to recognize voluntary relinquishments and retirements agreed to prior to RMP revisions.	**BLM:** Grazing decisions carried forward into the Proposed RMP are considered by BLM to be consistent with Utah Code 63j-4-401. Proposed RMP decisions on public lands would continue to promote a healthy active grazing industry. Forage allocations for livestock and wildlife are fully allocated on public lands. Numerous RMP decisions under other identified resources allow for the restoration and maintenance of rangeland and watershed health. For example, the Proposed RMP provides the umbrella to allow implementation-level actions for hazardous fuel reductions, fire rehabilitation, vegetation treatments, riparian improvements, range and wildlife habitat improvements, UPCD projects – including Healthy Lands Initiative projects, seed collection, etc. Minor, if any, adjustments to current permitted livestock AUMs are made in the Proposed RMP. Prior voluntary relinquishments and/or retirements have been recognized.
Wilderness Characteristics	**State of Utah:** It is the policy of the State of Utah to oppose management of public lands as wilderness except where congress designates lands as wilderness. Under State policy and FLPMA's multiple-use mandate, BLM ascribed management prescriptions for non-WSA lands inventoried as possessing wilderness characteristics should take into account the long-term needs of future generations for renewable and non-renewable resources, including, but not limited to, recreation, range, timber, minerals, watershed, wildlife, and fish. Designation as VRM Class I, closure to oil and gas leasing, withdrawal from mineral entry, and closure to motorized and mechanized use affords protections comparable to those associated with formal wilderness designation and should be avoided for non-WSA lands with wilderness characteristics. Non-WSA lands with wilderness characteristics should be managed in a manner consistent with the multiple-use, sustained yield standard that applies to BLM lands other than	**BLM:** The Proposed RMP identifies certain "non-WSA lands with wilderness characteristics" in order to protect, preserve, and maintain their wilderness characteristics. BLM recognizes that it cannot, through the planning process, designate these lands as WSAs nor is it possible to manage them in accordance with IMP. For example, there is no provision to meet the "non-impairment criteria" mandated in IMP for WSA management. However, in following Section 201 of FLPMA, BLM has maintained its wilderness inventory and has determined that lands previously found not to possess wilderness characteristics during the FLPMA Section 603 inventory process in the late 1970's and early 1980's, now have been determined to possess them. The focus of management in the areas carried forward in the Proposed RMP is to primarily provide for an experience of solitude and primitive recreation. This is

Resource	State of Utah Code 63j-4-401	BLM
	congressionally designated wilderness or WSAs.	enhanced by maintaining the naturalness of the geographic areas. However, management prescriptions do not mirror those for WSAs or designated wilderness since these two management objectives are sufficiently dissimilar that imposing similar prescriptions would not allow BLM to meet the planning objectives outlined in the Draft RMP/Draft EIS. WSAs and designated wilderness are rights-of-way exclusion areas, closed to fluid mineral leasing by law, and do not allow for surface disturbing activities. In comparison, lands with wilderness characteristics have no set management by either law, rule, regulation, or policy. The Proposed RMP would allow for surface disturbing activities where and when they are compatible with enhancing management objectives identified in the Proposed RMP. In order to ensure that BLM's planning decisions regarding the management of wilderness characteristics are consistent with Utah law, potential adjustments may be made in the Record of Decision to nomenclature. This editorial change would not affect management or goals and objectives.
RS-2477 Assertions	**State of Utah:** The State of Utah will defend its interest, and that of its political subdivisions, in rights-of-way accepted under the self-effectuating grant process set forth in Revised Statute 2477 (repealed by the Federal Land Policy and Management Act of 1976) and SUWA v. BLM, 425 F.3d 735 (10th Cir. 2005). The State of Utah expects and requests the BLM to fully consider all information concerning individual rights-of-way submitted to BLM. Further, the State of Utah expects and requests BLM's consideration of this information as part of the preparation and implementation of Resource Management or Management Framework Plans, and preparation or implementation of Transportation Plans as part of the ongoing inventory of resources on the public lands.	**BLM:** The Proposed RMP makes no commitments with respect to any valid existing rights, particularly those concerning RS-2477. Chapter 1 of this land use plan states that resolution of this issue is outside the purview and scope of public lands planning efforts and must be adjudicated by a court of law or other legal means. Therefore, nothing in this plan extinguishes any valid rights-of-way or alters, in any way, the legal rights of the State of Utah to assert RS-2477 rights or to challenge any use restrictions imposed by the RMP that they believe are inconsistent with their rights.

The RFO RMP is consistent with the following agency plans: Dixie National Forest Plan 1997, Fishlake National Forest Plan 1996, Canyonlands National Park Plan 1994, Capitol Reef National Park Plan 1995, and Glen Canyon National Recreation Area 1999. **Comments were not received to indicate inconsistency of these plans with the draft RMP.**

5.5 PUBLIC INVOLVEMENT

The public participation process for the RMP/EIS has been ongoing throughout the development of the RMP/EIS and will continue to the ROD. It includes a variety of efforts to identify and address public

concerns and needs. In addition to formal public participation activities, informal contacts occur frequently with public land users, industry, and interested persons through meetings, field trips, telephone calls, or letters. All public participation applicable to the RMP/EIS has been documented and analyzed as part of the planning process and kept on file in the RFO.

5.5.1 Scoping

The land use planning process for the RFO formally began on November 1, 2001, when a notice announcing the "Intent to Prepare a Resource Management Plan for Public Lands and Resources in Garfield, Piute, Sanpete, Sevier, and Wayne Counties, UT" was published in the *Federal Register*. Key points regarding public involvement stated in the Notice of Intent (NOI) were as follows:

- The BLM will work closely with interested parties to identify potential management decisions that are best suited to the public's needs.
- This collaborative process will take into account local, regional, and national needs and concerns….
- This notice initiates the public scoping process to identify planning issues….
- To ensure local community participation and input, public meetings will be held….
- Early participation by all interested parties is encouraged and will help determine the future management of the RFO public lands….
- Written comments will be accepted throughout the planning process….

The NOI invited the public to nominate ACECs and WSRs, and also to comment on the "Preliminary Planning Criteria" (criteria are included in Chapter 1 of this document).

The BLM conducted a formal scoping period, which ran for 151 days, from November 1, 2001, to April 1, 2002. (The minimum requirement is for a 60-day scoping period.) Comments received during that time were summarized in the *Richfield RMP Scoping Report, July 2002* (available for review on the RMP planning web page at www.blm.gov/ut/st/en/fo/richfield/planning.html). Comments received since the scoping period closed were not summarized in the scoping report; nonetheless, they were considered in developing the Draft RMP/EIS and are included in the administrative record. Comments submitted during scoping for the Henry Mountain RMP in the early 1990s (which was never completed) were also referenced and considered in this planning process.

Scoping Public Meetings

The BLM held public scoping meetings in five Utah communities in March 2002 (Table 5-10). Registered attendance at the meetings totaled 182. The meetings were structured so that all attendees were given an opportunity to comment if they chose to do so. Five-hundred and sixty individual comments were recorded.

Table 5-10. Public Scoping Meetings

Date	Location	Attendance	Main Issues
March 12, 2002	Richfield, Utah	48	Access, recreation, OHV
March 13, 2002	Junction, Utah	28	Access, transportation, special designations

Date	Location	Attendance	Main Issues
March 14, 2002	Manti, Utah	24	Range, access, special designations
March 19, 2002	Loa, Utah	52	Special designations, recreation, OHV
March 21, 2002	Salt Lake City, Utah	30	Recreation, OHV, special designations

Written Comments

Written comments submitted during scoping totaled 1,061, including letters and cards, e-mails, faxes, and two petitions with 619 signatures. Comments were submitted from across the nation, but almost half came from Utah. Among the written comments—excluding the petitions—the top issues were wilderness and special designations. These issues were followed closely by recreation and OHV use, then range management and livestock grazing, oil and gas leasing and development and mining, and access/transportation. Access/transportation and recreation/OHVs were the big issues identified in the petitions.

Written and oral comments were compiled and analyzed in the *Richfield RMP Scoping Report, July 2002*, available online at http://www.blm.gov/ut/st/en/fo/richfield/planning.html. Selected scoping comments are included in *What You Said: Selected Comments From the Richfield RMP Scoping, August 2002*, also available online at the URL above.

5.5.2 Mailing List

An initial mailing list for land use planning was developed from existing RFO mailing lists. This mailing list has been revised and updated regularly throughout the planning process. Those on the mailing list received *Planning Posts* and other notices reporting on the progress of the Richfield RMP.

5.5.3 Planning Posts

At key points in the planning process, *Planning Posts* were issued.

- **Planning Post 1, February 2002:** Described the Richfield Draft RMP/EIS process and the reason it was needed, listed preliminary planning issues, and provided a notice of public meetings, preliminary schedule, and comment form.
- **Planning Post 2, August 2002:** Summarized the results of scoping.
- **Planning Post 3, March 2004:** Announced the extended schedule for completing the RMP, summarized the draft alternatives, described the WSR evaluation process, listed river segments found eligible in the preliminary evaluation, and invited comments on the evaluation.

5.5.4 Website

A website to provide Internet access to planning information was established early in the process at http://www.blm.gov/ut/st/en/fo/richfield/planning.html. The site serves as a repository for documents related to the RMP development that are maintained in portable document format (PDF) to ensure that

they are available to the widest range of users. The website also provides the public with the means to submit comments or add their names to the mailing list.

5.5.5 Informal Communication

In the spirit of the Secretary of Interior's "4 Cs"—communication, consultation, cooperation, all in the service of conservation—the field manager, land use planner, and other staff communicated with various individuals and groups interested in the RMP, including the following:

- Blue Ribbon Coalition
- Friends of Grover
- Southern Utah Wilderness Alliance (SUWA)
- Sportsmen for Fish and Wildlife
- The Nature Conservancy
- Utah Farm Bureau
- Utah Rivers Council
- Utah Shared Access Alliance (USA-ALL)

5.5.6 Notice of Availability of Draft RMP/EIS

On October 3, the BLM filed with the EPA its Draft RMP/EIS for the RFO. On October 26, 2007, the BLM and EPA published a Notice of Availability in the *Federal Register*, which marked the beginning of the formal 90-day public review comment period. The Draft RMP/EIS states that BLM is revising its current land use plan and proposes several alternative ways of managing public lands within the Richfield Planning Area. The Draft RMP/EIS was designed to provide a comprehensive look at the impacts to natural and cultural resources from various planning alternatives. The formal 90-day public comment period ended on January 23, 2008. The BLM provided hard copies and CDs of the Draft RMP/EIS directly to cooperating agencies; other federal, state, and local agencies; and tribal representatives. Hard copies and CDs also were made available to the public at the Richfield Field Office, the Utah State Office, and during public meetings. The Draft RMP/EIS was also available electronically on the BLM's website. In addition, the BLM widely distributed notices regarding the availability of the Draft RMP/EIS.

5.5.7 Draft RMP/EIS Public Comment Meetings

During the 90-day public comment period, the BLM held public meetings in six locations (Table 5-11) in an effort to inform the interested and affected public about the Draft RMP/EIS. These meetings were attended by 102 people and were structured in an open house format with BLM specialists available to provide information and answer questions. The public was also able to submit written comments at the meetings. The public meetings were announced in local newspapers, on the project website, and through postcards mailed to individuals on the Richfield RMP mailing list.

Table 5-11. Draft RMP/EIS Public Comment Meetings

Date	Location	Attendance
December 3, 2007	Richfield, UT	19
December 6, 2007	Panguitch, UT	5
December 10, 2007	Bicknell, UT	37

Date	Location	Attendance
December 11, 2007	Manti, UT	5
December 12, 2007	Salt Lake City, UT	26
December 13, 2007	Junction, UT	10
Total		**102**

5.5.8 Draft RMP/EIS Public Comment Response Process

During the 90-day formal DRMP/EIS public comment period, the RFO received 15,367 comments. Of these, the BLM identified 14,706 to be form letters and 661 to be unique submissions. The BLM carefully compiled, reviewed and analyzed, and addressed all of these submissions, where substantive. Comments from cooperating agencies and responses to those comments are addressed in Section 5.5.10 below. Comments and responses to other substantive comments are provided on a CD attached to this document. In addition to comments received during the formal public comment period, the RFO received additional submissions after the close of the comment period which the BLM maintains in its files.

According to NEPA, the BLM is required to identify and formally respond to all substantive public comments. The BLM developed a systematic process for responding to comments to ensure all substantive comments were tracked and the content seriously considered. A description of this system follows.

First, BLM developed a **coding structure** to help sort comments into logical groups by topics and issues. Codes were derived from resources covered in the Draft EIS or by common issues. Submissions (letters, e-mails, faxes, etc.) were given a unique identifier for tracking purposes and then each submission was carefully reviewed to capture all comments, if substantive (additional description of this process can be found below). All comments received can be tracked to the original submission.

Second, BLM created a **Comment Database**. For each comment in a unique submission, BLM captured the name and address of the commenter, assigned a code to the comment, and captured the text of all substantive comments.

The coding and comment database processes aimed at assisting the ID Team in determining whether the substantive issues raised by the public warranted modification of one or more of the alternatives or further analysis of issues and impacts. With the information provided through the public review process, the BLM reconsidered the draft alternatives, made changes as appropriate, and developed the Proposed RMP and Final EIS. Factual or grammatical errors, which led to a change in text, are not summarized but were incorporated into the Proposed RMP/Final EIS.

Finally, BLM used the comment database to prepare a narrative summary of the substantive comments. Opinions, feelings, and preferences for one element or one alternative over another, and comments of a personal and/or philosophical nature were all read, analyzed, and considered, but because such comments are not substantive in nature, BLM did not respond to them.

5.5.9 Public Comments

During the public comment period, the BLM received 15,367 comments at public meetings, by fax, by e-mail, and by regular mail from the public, cooperating agencies, other federal agencies, Native American tribes, organizations, and businesses. Where warranted, the BLM responded to substantive comments by

making revisions to the Proposed RMP/Final EIS (text changes). If no change was warranted, the BLM responded to the substantive comment in writing. The BLM considered every comment in the content analysis process, whether it came repeatedly from many people with the same message(s) or from a single person raising a technical or personal point. In analyzing comments, the BLM emphasized the content of the comment rather than the number of times a comment was received. The BLM responded to all substantive comments.

Respondents invested considerable time and effort to submit comments on the Draft RMP/EIS. Comments covered a wide spectrum of thoughts, opinions, ideas, and concerns. The most commonly addressed themes included travel, specials designations (ACECs, WSRs) and wilderness values, recreation, and minerals/energy development. While each person's viewpoint was diligently considered, the threshold analysis involved determining whether a comment was substantive or non-substantive; because NEPA requires that BLM respond only to substantive comments, BLM relied on the CEQ's regulations, to determine what constituted a substantive comment.

A **substantive comment** does one or more of the following:

- Questions, with a reasonable basis, the accuracy of the information and/or analysis in the EIS
- Questions, with a reasonable basis, the adequacy of the information and/or analysis in the EIS
- Presents reasonable alternatives other than those presented in the Draft EIS that meet the purpose and need of the proposed action and addresses significant issues
- Questions, with a reasonable basis, the merits of an alternative or alternatives
- Causes changes in or revisions to the proposed action
- Questions, with a reasonable basis, the adequacy of the planning process itself.

The NEPA handbook identifies the following types of substantive comments:

- **Comments on the Adequacy of the Analysis:** Comments that express a professional disagreement with the conclusions of the analysis or assert that the analysis is inadequate are substantive in nature but may not lead to changes in the Proposed RMP/Final EIS. Interpretations of analyses should be based on professional expertise. When there is disagreement within a professional discipline, a careful review of the various interpretations is warranted. In some cases, public comments may necessitate a reevaluation of analytical conclusions. If, after reevaluation, the manager responsible for preparing the EIS (authorized officer or AO) does not think that a change is warranted, the response should provide the rationale for that conclusion.
- **Comments That Identify New Impacts, Alternatives, or Mitigation Measures**: Public comments on a draft EIS that identify impacts, alternatives, or mitigation measures that were not addressed in the draft are substantive. This type of comment requires the AO to determine whether it warrants further consideration. If it does, the AO must determine whether the new impacts, new alternatives, or new mitigation measures should be analyzed in either the Final EIS; a supplement to the Draft EIS; or a completely revised and recirculated Draft EIS.
- **Disagreements With Significance Determinations**: Comments that directly or indirectly question, with a reasonable basis, determinations regarding the significance or severity of impacts are substantive. A reevaluation of these determinations may be warranted and may lead to changes in the Final EIS. If, after reevaluation, the AO does not think that a change is warranted, the response should provide the rational for that conclusion.

Non-substantive comments simply state a position in favor of, or against, an alternative or a management action proposed in an alternative, merely agree or disagree with BLM policy, provide information not directly related to issues or impact analyses, or otherwise express an unsupported

personal preference or opinion. For additional clarification, types of non-substantive comments are as follows:

- **Expressions of Personal Preferences or Opinion**: Comments that express personal preferences or opinions on the proposals are non-substantive and thus do not require further agency action. This includes comments in favor of or against the proposed action or alternatives, comments that only agree or disagree with BLM policy, or comments that raise, debate, or question a point of fact or policy. However, such comments are summarized whenever possible and brought to the attention of the AO.

The BLM has reviewed and considered all non-substantive comments but has not provided formal responses to such comments. Although personal preferences and opinions may be considered by the decision-maker as it chooses the final agency's preferred action, they generally will not affect the analysis. Table 5-12 and Table 5-13 include a list of the organizations and individuals that submitted substantive comments.

Table 5-12. Organizations That Submitted Substantive Comments

Blue Ribbon Coalition	Brendell Manufacturing Inc.	Bullhead 4 Wheelers
Capital Trail Vehicle Association	Coalition to Preserve Rock Art	Colorado 500
Colorado Plateau Archaeological Alliance	Congress of the United States	Dorsey and Whitney LLP
Emery County Public Lands	Garfield County	Garkane Energy Cooperative

5.5.10 Summary of Public Comments

The results of the content analysis were important to the development of the Proposed RMP/Final EIS. From the nearly 15,367 total submissions that BLM received on the Draft RMP/EIS, it extracted 1,338 individual substantive comments. As required by law, BLM has summarized these comments in this Proposed RMP/Final EIS and has presented them, along with a response. The response to substantive comments is included as a CD attached to this document. Comments from cooperating agencies and responses to those comments are presented below.

Sanpete County

Comment: *Sanpete County would also encourage the development of Reasonably Foreseeable Development (RFD) Scenarios to include post-exploration development in Sanpete County that could occur over the lifetime of the plan.*

Response: The RFD considers exploration and development and the Draft RMP/EIS analyzes impacts from exploration and development.

Comment: *3. Where it makes sense and is feasible for the best use of isolated/landlocked BLM parcels, Sanpete County would support the trading/purchase/consolidation of those parcels with public stakeholders (DWR, SITLA, County, etc) in the County to protect and preserve public access to and for the best use of the resources.*

Response: The local governments were given the opportunity to identify isolated and/or uneconomical parcels that they may have interest in as part of the RMP process. The tables in Appendix 5 identify parcels that local governments desire for potential future community expansion. However, local, county, or state governments may apply for any of the parcels identified in the tables for FLPMA Section 203 sale or other public land under other current authorities for public purposes. Preference is generally given to applicants that would provide a public benefit.

Comment: *4. Sanpete County also shares the concern of the State Engineer if any valid, existing water right would be affected by BLM actions, mitigation and/or compensation actions should be negotiated with the affected parties.*

Response: BLM is obligated by law to honor valid, existing rights. Similarly, holders of valid, existing rights are obligated to honor federal laws regarding the use of federal lands for the exercise of those rights. BLM does not foresee frequent situations in which BLM's obligations under federal law would cause the agency to take actions that would prevent the holders from fully exercising their valid existing rights. BLM works diligently with the owners of valid, existing rights to prevent such situations from occurring. If the holder of a valid, existing right believes the BLM has taken an action that prevents the exercise of that right, the proper venue for determining equitable compensation or mitigation is in a court of valid jurisdiction, not within the context of a land use plan.

Comment: *5. Sanpete County is categorically opposed to any VRM I or II designations. No BLM lands in Sanpete County-or anywhere in the Richfield Field Office planning area for that matter-meet the criteria for Class I or II designations. Even with respect to the Class III designations in Sanpete County, the County is concerned in that the DRMPIEIS sets forth no criteria to support even that designation. The Class III/Class IV dichotomy for Sanpete County BLM lands appears to be subjective and lacking a basis or any criteria or application of criteria. Sanpete County is concerned that such a VRM distinction may be used as a basis for constraining or limiting surface disturbing activities which is inconsistent with the purpose of the inventory system.*

Response: The Draft RMP/EIS does not propose any VRM Class I lands for Sanpete County. The Visual Resource Inventory (VRI) was used to develop the VRM classes, with consideration from other resources and resource uses.

Comment: *6. Sanpete County also strongly recommends that the BLM seriously review the socioeconomic study currently being completed through the 6-county AOG. The current RMP undervalues the socio-economic and grazing impacts to our counties.*

Response: BLM has reviewed the Utah State University (USU), October 2006, Review of the Socioeconomic Analysis in the Draft EIS prepared by the BLM RFO, which was funded by the six-county AOG. The study expressed concerns with the socioeconomic analysis of livestock grazing, oil and gas production, socioeconomic groups (or "neighborhoods"), and OHV use for the counties. The AOG study was a critique of the original Draft EIS; the current, public Draft EIS has been modified considerably and has taken into account, directly or indirectly, many of the concerns expressed in the original AOG critique.

Sec. 1502.2, Implementation of the CEQ Regulations, sets forth how the BLM is to prepare EISs following:

"(a) Environmental impact statements shall be analytic rather than encyclopedic.

(b) Impacts shall be discussed in proportion to their significance. There shall be only brief discussion of other than significant issues. As in a finding of no significant impact, there should be only enough discussion to show why more study is not warranted.

(c) Environmental impact statements shall be kept concise and shall be no longer than absolutely necessary to comply with NEPA and with these regulations. Length should vary first with potential environmental problems and then with project size.

(d) Environmental impact statements shall state how alternatives considered in it and decisions based on it will or will not achieve the requirements of Sections 101 and 102(1) of the Act and other environmental laws and policies.

(e) The range of alternatives discussed in environmental impact statements shall encompass those to be considered by the ultimate agency decision-maker.

(f) Agencies shall not commit resources prejudicing selection of alternatives before making a final decision (Sec. 1506.1).

(g) Environmental impact statements shall serve as the means of assessing the environmental impact of proposed agency actions, rather than justifying decisions already made."

Based on CEQ Sec. 1502.2 BLM's policies and guidelines require BLM to analyze the impacts of significant differences from the current situation (i.e., the Alternative N: No Action). Given that the percent change in AUMs across alternatives is only 0.7 percent, there is no need to do the depth of livestock grazing analysis suggested by the AOG. Furthermore, the Proposed RMP shows no significant difference from the current situation, and therefore no impact from BLM decisions reached in the plan.

The BLM acknowledges the planning area contains distinct socioeconomic "neighborhoods" that likely have differential ties to the BLM lands and would likely experience differential impacts from BLM management changes. A land use plan is a landscape-level plan addressing BLM actions on the entire planning area. This focus is not intended to deny that real differences exist among the various communities and groups within the planning area. The plan takes a broader view. The BLM is unaware of any data suggesting that a "neighborhood"-level analysis would have affected the decisions reached in the plan.

Comment: *7. Sanpete County has concerns relative to cultural resources and their designation or study for designation. Some cultural resource designations may be too easily implemented with little input or coordination with the counties.*

Response: The BLM is aware that there are specific county and state plan decisions relevant to aspects of public land management that are discrete from, and independent of, federal law. However, the BLM is bound by federal law. The FLPMA requires that the development of an RMP for public lands must be coordinated and consistent with county plans, to the maximum extent possible by law, and inconsistencies between federal and non-Federal Government plans be resolved to the extent practical (FLPMA, Title II Sec. 202 (c)(9)). As a consequence, where state and local plans conflict with federal law, there will be an inconsistency that cannot be resolved or reconciled. Under 36 CFR 800.2(4)c(3) the county can request to be a consulting party during the Section 106 process and help determine site eligibility, effects and mitigation.

Thus, while county and federal planning processes, under FLPMA, are required to be as integrated and consistent as practical, the federal agency planning process is not bound by or subject to county plans, planning processes, or planning stipulations. The BLM has identified these conflicts in the Proposed RMP/Final EIS, so that the local governments have a complete understanding of the impacts of the Proposed RMP on state and local management options. A consistency review of the Proposed RMP with county master plans is included in Chapter 5. In addition, the BLM has worked closely with the counties as a cooperating agency on the current planning effort, including attending alternative development meetings and reviews of various drafts. The BLM will maintain close coordination with the counties so management of cultural resources on public lands is as consistent as practical, while complying with all federal laws and regulations regarding protection of cultural resources.

Comment: *The DRMP/EIS should be modified to expressly provide for seismic and other exploratory activities to occur on Sanpete County BLM lands.*

Response: The Draft RMP/EIS allows for seismic and other exploratory activities.

***Comment**: The County requests that the BLM recognize the routes already submitted by the County and also those established in the County transportation plan to be completed and amended to the County general plan.*

Response: The County routes provided in GIS were used to augment BLM's route inventory. This information was used in making route designations, using the process described in Appendix 9.

***Comment:** 11. The transportation plan that is included in the RMP should require the Richfield Field Office to do on-the-ground truthing of routes. The inventory of routes in Sanpete County is incomplete. the inventory process should be ongoing both for adding routes to and subtracting routes from the inventory in cooperation with Sanpete County.*

Response: The BLM has crafted language for this and has been added to the Proposed RMP/Final EIS. Under Management Actions Common to All Alternatives, travel routes can be added or deleted from the Travel Plan based on public demand or unacceptable impacts to resources. This action would be based on monitoring and site specific NEPA analysis.

***Comment:** The County requests that the Richfield Field Office use flexibility in identifying seasonal closures of routes again in cooperation with the County as need and reasons change over time.*

Response: The BLM has crafted language for this and has been added to the Proposed RMP/Final EIS. Under Management Actions Common to All Alternatives, travel routes can be added or deleted from the Travel Plan based on public demand or unacceptable impacts to resources. This action would be based on monitoring and site specific NEPA analysis.

***Comment:** 13. Sanpete County has serious concerns regarding the designation of the limited number of acres as open under Alternative B. Currently 78% of the RFO lands are open for public travel. It is obvious additional restriction of travel from open (cross country) to designated roads and trails is needed. However, Alternative B recommends only 8,400 acres of open lands, or 0.4%, a decrease of 192 times. Some 1,900 acres are in Sanpete near Mayfield. Such a reduction will concentrate open riders in a few isolated areas, creating additional management problems and over utilizing the ground. It is important to provide recreational opportunities for one of the fastest growing and largest recreational use by the public. Many of the open areas included in Alternative A should be considered with Alternative B, especially Factory Butte, Big Rocks, Sahara Sands, Gunnison Reservoir, Fayette Play Area, and Salina to Mayfield as appropriate.*

Response: The Draft RMP/EIS considered a range of alternatives that included open OHV use in 1,636,400 acres to no cross-country OHV use. This range of alternatives included Factory Butte, Big Rocks, Sahara Sands, Gunnison Reservoir, Fayette Play Area, and Salina to Mayfield as open OHV areas. The Proposed RMP would designate the following areas as OHV open areas: Factory Butte (8,000 acres), Big Rocks (90 acres), Glenwood Play Area (1,000 acres), and Aurora Play Area (300 acres). BLM would close the Mayfield OHV open area in the Proposed RMP to protect rare plants.

***Comment:** 15. Sanpete County recommends that Alternative A (300 feet of centerline) for vehicle access to campsites in OHV limited areas be used; additionally, access to current established campsites that go beyond the 300 foot limit should be included on the travel map for ingress and egress access to these dispersed campsites as identified through on-the-ground inventory and truthing.*

Response: The management suggested within the comment was included within the range of alternatives. Many routes which provide access to campsites have been identified and would be designated routes. Appendix 9 provides criteria to consider the addition of designated routes in future if necessary to better address resources and resource use conflicts.

Comment: *18. Desired outcomes do not list land management strategies that will increase water retention and production. Sanpete County believes such direction should be provided in the RMP and Management Action listed that will increase beneficial water production.*

Response: The Federal Government has delegated the authority to allocate water within state boundaries to state governments. This means that even though BLM is a federal agency, it must seek water rights from state governments to obtain and provide water for BLM uses. Increases in water production need to be addressed by the State Engineer and/or the Utah Division of Water Resources.

Comment: *22. The County would also be opposed to the trading/redesignation of AUMs for the introduction of Big-Horn Sheep. Similarly, in a revisit of the grazing alternatives summary chart, it appears there is a direct conflict in the goals for wildlife and Big Horn Sheep compared to no changes in the AUMs. Additionally, it is not clear whether alternatives B, C, and D hold permitted use constant for each allotment or whether reallocation of AUMs between allotments would occur without changing the overall number of AUMs.*

Response: Bighorn sheep were addressed in the multiagency Big Horn Sheep Habitat Management Plan. This plan addresses the area east of Capitol Reef National Park. Bighorn sheep have not been identified for introduction in Sanpete County because of lack of appropriate habitat and the financial impact it would make to the large domesticated sheep industry in the county. Concerning the level of permitted use in Alternatives B, C and D, there is no reallocation of AUMs, except for the Robbers Roost Allotment, as described in Appendix 7 of the Draft RMP/EIS.

Comment: *Dictating changes in the seasons of use from the RMP also violates the requirement that BLM coordinate, consult, and cooperate with individual permittees before amending an allotment management plan—See 43 U.S.C. §1752(d); 43 C.F.R. §4110.3-2.*

Response: The Draft RMP/EIS does not change any seasons of use. It does present criteria by which changes to seasons of use would be considered. Changes in seasons of use are implementation actions. It is mandatory that the BLM involve the permittee in any changes that are made to the season of use. These changes are made only after proper NEPA has been completed. The intent of the change and NEPA documentation is also listed on the BLM's NEPA Electronic Bulletin Board, which the public has access to.

Comment: *25. Sanpete County would also support the use of f1exibility for livestock grazing time and timing. The DRMP/EIS should make express provision for relaxing and modifying on and off dates and season of use parameters in certain grazing allotments as needed on a year-to-year basis, as a prescriptive fire control measure to control cheat grass and other invasive plants. Expressly prescribing such flexibility will aid in the control of noxious weeds or other undesirable plant species and in the control of fuels that were responsible for the Salt Creek fire in Sanpete County and other fires throughout the state. Sanpete County would support early grazing of cheat grass and the re-establishment of natural and/or non natives foliage/vegetation that is better for the land and for grazing (which ultimately returns suspended allotments to active allotments, protects the watershed, and provides for fire suppression). Simply stated, grazing should be a tool for fuels management outside of the permitted season of use.*

Response: The BLM's grazing regulations (43 CFR 4100) require each grazing permit to have mandatory terms and conditions, including a specified season of use, kind of livestock, and other terms and conditions as necessary. The Draft RMP/EIS has been modified to include an alternative that provides for using livestock grazing for site-specific fuels management outside the season of use.

Comment: *26. Sanpete County also notes that Alternatives C & D for Transportation would significantly limit access for grazers to take care of their cattle or sheep within their allotments and would oppose the RMP adopting these alternatives for implementation.*

Response: Access to administer BLM-permitted actions could be allowed on a case-by-case basis.

Comment: *Sanpete County recommends the BLM establish the first priority to sell, trade, or exchange identified lands to enhance public resource uses (i.e., consolidation of wildlife habitat, providing needed or improved public access, providing local public managed recreation areas and other such public benefits.*

Response: The Draft RMP-EIS Appendix 5, land tenure adjustment criteria 2, and Table 2-18 lands and realty desired outcomes address this concern.

Comment: *Sanpete County believes direction should be given in. the RMP that protects the rights of the surface land owner if and when the mineral rights are leased or claimed.*

Response: As stated in Table 2-19 of the Draft RMP/EIS: BLM would lease split-estate lands according to BLM RMP stipulations for adjacent or nearby public lands or plans of other surface management agencies as consistent with federal laws, 43 CFR 3101, and the surface owner's rights.

Comment: *Vegetation treatments Management Actions should also state actions to control and reduce prevalence of noxious and invasive weeds including those listed by the County.*

Response: The BLM is committed to controlling invasive weeds, which is important in maintaining or improving rangeland health. The presence of invasive weeds is an important indicator of rangeland health problems. BLM cooperates with local Cooperative Weed Management Areas (CWMA) to control weeds. The BLM has a Presidential directive, EO 13112, (February 3, 1999) that provides direction that the Federal Government will actively pursue weed control. The BLM also has a national weed management plan, "Meeting the Invasive Species Challenge," and an action plan for the BLM, "Partners Against Weeds," which helps direct weed control efforts. The Draft RMP/EIS Chapter 2 includes language for management of noxious weeds and invasive species (page 2-16).

Comment: *A proper baseline should be established that is based on average case scenarios as opposed to worse case scenarios. It is also important to install air quality monitoring stations that apply the best available control technology in order to accurately reflect the true air quality conditions in Sanpete County. Absence of such a baseline and technology undermines the quality of any baseline scenarios. According to air quality expert Howard Vickers, "a slight variation in how data is presented can alter greatly and sometimes unfairly, the analysis of air quality," He states, "Small differences in data or modeling technique can produce substantial problems with the results." It is important that Sanpete County as a stake holder be involved in any air quality analysis that is done so that the County can be assured that proper modeling and data techniques are used.*

Response: The "Air Quality Impact Analysis" section of the Proposed RMP/Final EIS includes baseline emission calculations. BLM stands by the assumptions on page 4-7 of the Draft RMP/EIS: "The most conservative case assumptions for air quality were used for the qualitative analysis. When a range of activity factors was assumed, the upper limit of the range was used to complete calculations for future time frames."

Comment: *Any grazing AUMs reduced in the RFO planning area due to rangeland health concerns should be restored to livestock when rangeland conditions improve and not be converted to wildlife use.*

Response: Increases or decreases in AUMs are allocated to livestock or wildlife depending on the allotment objectives contained in the RMP and Rangeland Program Summary.

Piute County

Comment: *We ask the BLM to review the County General Plan, as amended by this planning process, before a final RMP is adopted.*

Response: The BLM RFO is aware that the counties updated their general management plans in 2007. The revised general management plan was provided to BLM late in the planning process and may need to be reviewed further in development of the Proposed RMP/Final EIS. The BLM is aware that there are specific county and state plan decisions relevant to aspects of public land management that are discrete from, and independent of, federal law. However, the BLM is bound by federal law. The FLPMA requires that the development of an RMP for public lands be coordinated and consistent with county plans, to the maximum extent possible by law, and inconsistencies between federal and non-Federal Government plans be resolved to the extent practical (FLPMA, Title II Sec. 202 (c)(9)). As a consequence, where state and local plans conflict with federal law, there will be an inconsistency that cannot be resolved or reconciled. Thus, while county and federal planning processes, under FLPMA, are required to be as integrated and consistent as practical, the federal agency planning process is not bound by or subject to county plans, planning processes, or planning stipulations. The BLM will identify these conflicts in the Proposed RMP/Final EIS, so that the state and local governments have a complete understanding of the impacts of the Proposed RMP on state and local management options. A consistency review of the Proposed RMP with the state and county master plans is included in Section 5.4 of this document.

Comment: *Further, the County would like BLM to explain why VRM I or even VRM II is necessary. The lands proposed under the preferred alternative seem to be mostly WSAs which were established under VRM II but are now managed under VRM I.*

Response: Instruction Memorandum **(**IM)-2000-96 states "it is the Bureau position… that all WSAs should be classified as Class I, and managed according to VRM Class I management objectives until such time as the Congress decides to designate the area as wilderness or release it for other uses." The IM further explains "…the VRM management objectives are being used to support WSA management objectives. For WSAs, this is not only about visual values as many WSAs do not necessarily contain exceptionally high scenic values. The primary objective of WSA management is to retain the WSA's natural character essentially unaltered by humans during the time it is being managed as a WSA." Because the VRM I objective is to "preserve the existing character of the landscape" (BLM-H-8410), such a designation would complement WSA management as explained in the Interim Management Policy (IMP).

Comment: *The County does not believe BLM has the authority to create a special management criteria based solely on wilderness characteristics. We believe that the authority governing the inventory and management of lands with wilderness characteristics was passed to BLM through section 603 of the Federal Land Policy and Management Act, and that section 603 has now expired. And, while BLM may have authority to inventory their lands for various purposes, they still require Congressional authorization to manage for wilderness.*

Response: BLM's authority for managing lands to protect or enhance wilderness characteristics comes directly from FLPMA Section 202 (43 U.S.C. §1712). This section of BLM's organic statute gives the Secretary of the Interior authority to manage public lands for multiple use and sustained yield. Nothing in this section constrains the Secretary's authority to manage lands as necessary to "achieve integrated consideration of physical, biological, economic, and other sciences." FLPMA, Section 202(c)(2) (43 U.S.C. §1712(c)(2)). Further, FLPMA makes it clear that the term "multiple use" means that not every use is appropriate for every acre of public land and that the Secretary can "make the most judicious use of the land for some or all of these resources or related services over areas large enough to provide sufficient latitude for periodic adjustments in use…" FLPMA, Section 103(c) (43 U.S.C. §1702(c)). FLPMA

intended for the Secretary of the Interior to use land use planning as a mechanism for allocating resource use, including wilderness character management, among the various resources in a way that provides uses for current and future generations. BLM has long acknowledged that FLPMA Section 603 (43 U.S.C. §1782) requiring a one-time wilderness review has expired. All current inventory of public lands is authorized by FLPMA Section 201 (43 U.S.C. §1711). In September 2006, the Utah District Court affirmed that the BLM retained authority to protect lands it determined to have wilderness characteristics in a manner substantially similar to the manner in which such lands are protected when protected as WSAs. Finally, the Utah v. Norton Settlement Agreement does not affect BLM's authority to manage public lands. This agreement merely remedied confusion by distinguishing between WSAs established under FLPMA § 603 and required to be managed under § 603's non-impairment standard, and other lands that fall within the discretionary FLMPA § 202 land management process. See also IM 2003-275.

Comment: *We would like the BLM to explain how these lands went from having no wilderness characteristics to the current status as "likely to have" wilderness characteristics, We also deeply object to any management practice which is initiated based on a standard of "likely to have" a certain need or characteristic.*

Response: When developing new land use plans, the BLM must, as with any new information, determine whether the BLM wilderness inventories or public wilderness proposals contain significant new circumstances or information relevant to environmental concerns and bearing on the proposed action or impacts that have not previously been analyzed. To help determine whether the new information or circumstances are significant, the BLM looks at the definition of "significantly" at 43 CFR 1508.27, which requires consideration of both context and intensity. The new inventory information was reviewed and found to be significant. FLPMA specifically identifies "scenic values," "outdoor recreation," and other resource values as resources for inventory and management. See also 43 CFR 1711. A range of alternatives was considered in the Draft RMP/EIS to manage areas with wilderness characteristics. This range of alternatives is consistent with FLPMA.

Comment: *Given our concerns over this potential management strategy, the County has submitted, with these comments, its own inventory of the lands identified in Alternative D as having wilderness characteristics.*

Response: The presence or absence of man-made intrusions does not mean that an area does not possess wilderness characteristics. It is the cumulative significance of these features that determines whether an area possesses wilderness characteristics. As part of its wilderness characteristics inventory maintenance, BLM used a combination of field checks, Interdisciplinary Team review of data such as range files, county and BLM geographic information system (GIS) data, and review of high-resolution 2006 aerial photographs. Having reviewed the information submitted and determined that the information is not new and significant, BLM stands by its determination.

Comment: *We have enclosed the data from this inventory in Appendix A. The information in Appendix A was gathered in four ways. First, collaborative meetings with a broad base of stakeholders who use and know the subject lands; second, meetings with people who own grazing permits or mineral rights who have extensive historical familiarity with the lands; third, scrutiny of all data layers as provided by the State's Automated Geographic Reference Center (AGRC), the County, and others; and fourth, field research with GPS units and digital cameras, in an effort to ground-truth the above data.*

Response: The presence or absence of man-made intrusions does not mean that an area does not possess wilderness characteristics. It is the cumulative significance of these features that determines whether an area possesses wilderness characteristics. As part of its wilderness characteristics inventory maintenance, BLM used a combination of field checks, Interdisciplinary Team review of data such as range files, county and BLM GIS data, and review of high-resolution 2006 aerial photographs. Having reviewed the

information submitted and determined that the information is not new and significant, BLM stands by its determination.

Comment: *The conclusion that we have made, based on this information, is that while there are some small areas that remain relatively undisturbed by man, the BLM has failed to demonstrate the necessary standard on size, naturalness, and outstanding nature. Further, in most areas, the BLM fails to demonstrate the necessary standard on isolation and opportunity for solitude.*

Response: The presence or absence of man-made intrusions does not mean that an area does not possess wilderness characteristics. It is the cumulative significance of these features that determines whether an area possesses wilderness characteristics. As part of its wilderness characteristics inventory maintenance, BLM used a combination of field checks, Interdisciplinary Team review of data such as range files, county and BLM GIS data, and review of high-resolution 2006 aerial photographs. Having reviewed the information submitted and determined that the information is not new and significant, BLM stands by its determination.

Comment: *Piute County has several other concerns about the proposed wilderness character lands. First, we are in a process of amending our County General Plan based on the aforementioned collaborative process, and have included a statement of opposition to the management of the described for their wilderness character.*

Response: BLM is aware that there are specific state laws relevant to aspects of public land management that are discrete from, and independent of, federal law. However, the BLM is bound by federal law. As a consequence, there may be inconsistencies that cannot be reconciled. FLPMA requires that BLM's land use plans be consistent with state and local plans "to the extent practical" where state and local plans conflict with federal law there will be an inconsistency that cannot be resolved. The BLM will identify these conflicts in the Proposed RMP/Final EIS so that the state and local governments have a complete understanding of the impacts of the Proposed RMP on state and local management options.

Comment: *Second, as we have stated above, we are troubled by any management condition implemented based on statements such as "likely to have wilderness characteristics."*

Response: Sections 103, 201, and 202 of FLPMA direct the BLM to take into account the national interest, as well as the local interest. In accordance with FLPMA and BLM rules, regulations, and policies, the BLM must provide for the balanced management of all resources and resource uses on public lands.

The BLM gave consideration to the concerns of local governments throughout the planning process. In particular, Piute County is a cooperating agency and has been an active cooperator, including during the development of alternatives where non-WSA areas with wilderness characteristics were considered. The Proposed RMP management actions would not manage for any non-WSA lands with wilderness characteristics in Piute County.

Comment: *We assert that grazing contributes to the overall health of watersheds, wildlife habitat, and the general rangeland. It is the County's further contention that BLM should adopt a vigorous program of treatment where once available grazing forage has moved to Juniper and Pinion or other woody plants, or where the health of the range has suffered for any other reason. This should include mechanical treatments such as chaining, logging, burning, seeding, or other such methods. We further ask BLM to consider using creative and innovative management in their use of grazing. This may include the use of spring grazing where appropriate, to help with problems of cheat grass and other invasives, and to improve rangeland conditions generally.*

Response: The Proposed RMP supports the statement of reducing juniper and pinyon encroachment. Table 2-15 of the Draft RMP/EIS allows for using livestock grazing to enhance ecosystem health or mitigate resource problems (e.g., noxious/invasive weed control, hazardous fuel reduction) where supported by site-specific environmental analysis.

Comment: *We also ask BLM to refer to our County General Plan. We believe that insufficient weight is given in socio-economic studies to the value of the cattle and sheep industry, and associated grazing activities, to the overall economic well-being of rural counties, and Piute County in particular.*

Response: Selections from the county plans were considered for socioeconomics in Sections 3.6.1 and 4.6.1 of this document. Appendix 13 summarizes statements, comments, and direction provided by the counties on public land and resource management contained in the general plans of the five counties encompassed by BLM's RFO. In addition, BLM has reviewed both USU's Review of the Socioeconomic Analysis in the Draft EIS prepared by the USDI—BLM RFO, sometimes referred to as the Six-County AOG study, and portions of its Trend Information for the Richfield RMP: Livestock Industry Issues. The AOG study expressed concerns with the Draft RMP/EIS analyses of livestock grazing in the counties. Portions of the Trend Information for the Richfield RMP: Livestock Industry Issues expressed additional livestock issues such as a desire for flexible livestock grazing management provisions.

The AOG study was a critique of the original Draft EIS; the current, public Draft EIS has been modified considerably and has taken into account, directly or indirectly, many of the concerns expressed in the original AOG critique. The RMP provides a balanced approach and equal consideration was given to socioeconomics.

Based on CEQ Sec. 1502.2 BLM's policies and guidelines require BLM to analyze the impacts of significant differences from the current situation (i.e., the Alternative N: No Action). Given that the percent change in AUMs across alternatives is only 0.7 percent, there is no need to do the depth of livestock grazing analysis suggested by the livestock studies mentioned earlier.

Furthermore, the BLM objectively determined a reasonable range of alternatives that best addressed the issues, concerns, and alternatives identified by the public, including BLM management of livestock grazing. Alternative A would have an additional 1.079 AUMs and 36,950 acres available for livestock grazing. There would be no change in livestock grazing management from current management under any of the other alternatives. The Proposed RMP shows no significant difference from the current situation; therefore, there is no significant impact from BLM decisions reached in the plan.

Comment: *Our main concern is that the OHV community, so vital to the economies of our small rural communities, seems to be under constant attack, and pressure to diminish their presence on our public lands is continually increasing. For example, under the preferred alternative, you close very large areas to open use which are currently heavily used and popular with the OHV Community, and you leave only 1% of the entire RFO area available to open OHV use.*

Response: BLM considered a range of alternatives to address OHV use. Under *The National OHV Strategy*, the BLM is moving from mostly open to designated routes for the protection of natural and cultural resources. Under the Proposed RMP, the majority of routes currently in use would continue to be available for use, but not for cross-country travel. The Proposed RMP would designate 2 SRMAs (Factory Butte and Big Rocks) and the Glenwood and Aurora play areas to allow for a continued OHV cross country experience.

Comment: *We also note that the County has a travel map showing all our roads and trails, and the BLM's travel plan should be consistent with the County's information.*

Response: As described in the Draft RMP/EIS, the BLM used a variety of methods to inventory existing routes/ways within the RFO for consideration in the planning process, including global positioning system data (when available), data provided by the counties, map and orthophoto data, and staff/cooperator knowledge. Based on this inventory, the BLM identified 4,380 miles of routes/ways (Map 3-10 of the Draft RMP/EIS) within the RFO. It should be noted that route designations are implementation decisions and that the resulting transportation network could change over time. Management direction for OHVs is provided in 43 CFR 8340, BLM Manual 8340, and the BLM National OHV Management Strategy.

Comment: *Piute County is not comfortable with the BLM's RFD, or the manner in which the BLM determines the potential future economic viability of certain minerals. It does not match county planning or the county's assessment of potential value.*

Response: The RFD predicts a reasonable development scenario for oil and gas activity. The commenter does not substantiate deficiencies in the analysis or RFD. The mineral potential report addressed the likelihood of mineral development. Chapter 3 of the Draft RMP/EIS updated the mineral potential report. The commenter does not substantiate deficiencies in the analysis. The coal resource reports identified areas with mineable resources. The unsuitability criteria were applied to determine areas suitable for consideration of coal leasing. The commenter does not substantiate deficiencies in the analysis.

Comment: *Designation of any segments of as wild and scenic would unnecessarily restrict the ability of the water users to carry on the daily management of their water.*

Response: Barring congressional action, there is no effect on water rights or in-stream flows related to suitability findings made in a land use plan decision. Even if Congress were to designate rivers into the National Wild and Scenic Rivers System, any such designation would have no effect on existing water rights. Section 13(b) of the Wild and Scenic River Act states that jurisdiction over waters is determined by established principles of law. In Utah, the State has jurisdiction over water. Although the Wild and Scenic Rivers Act implies a Federal reserved water right for designated rivers, it does not require or specify any amount, and as noted above, confirms that Utah has jurisdiction over water rights. The BLM would be required to adjudicate the water right, in the same manner as any other entity, by application through State processes. Thus, for congressionally designated rivers, the BLM may assert a Federal reserved water right for appurtenant and unappropriated water with a priority date as of the date of designation (junior to all existing rights), but only in the minimum amount necessary to fulfill the primary purpose of the reservation.

Comment: *We are also concerned about the management before actual Congressional action creates formal wild and scenic designation.*

Response: Management protection afforded rivers is found in Section 5(d) of the Wild and Scenic River Act and depends on whether the identified river segment is found eligible or suitable. River segments found eligible are managed at the discretion of the administering agency to protect free-flow, outstandingly remarkable values, and tentative classification until a suitability determination is made; rivers found suitable are managed at the discretion of the administering agency for the same values and recommended classification pending congressional action or for the duration of the RMP, but not as a designated WSR, which is specified by Congress. Management prescriptions under both suitability and eligibility phases are subject to valid existing rights.

Comment: *We reiterate that we do not believe BLM has met the suitability standards based on the requirements of state law.*

Response: Federal law, with which the BLM must comply, takes precedence over others: Section 16(b) of the Wild and Scenic River Act defines a river as “a flowing body of water or estuary, or a section,

portions, or tributary thereof, including rivers, streams, creeks, runs, rills, kills, and small lakes". For purposes of evaluation, the volume of water flow need only be sufficient to sustain or complement the identified resource values—rivers with intermittent or non-perennial flows already exist within the national river system.

Wayne County

Comment: *We ask the BLM to review the County General Plan, as amended by this planning process, before a final RMP is adopted.*

Response: The BLM RFO is aware that the counties have updated their general management plans in 2007. The revised general management plan was provided to BLM late in the planning process and may need to be reviewed further in development of the Proposed RMP/Final EIS. The BLM is aware that there are specific county and state plan decisions relevant to aspects of public land management that are discrete from, and independent of, federal law. However, the BLM is bound by federal law. The FLPMA requires that the development of an RMP for public lands be coordinated and consistent with county plans, to the maximum extent possible by law, and inconsistencies between federal and non-Federal Government plans be resolved to the extent practical (FLPMA, Title II Sec. 202 (c)(9)). As a consequence, where state and local plans conflict with federal law there will be an inconsistency that cannot be resolved or reconciled. Thus, while county and federal planning processes, under FLPMA, are required to be as integrated and consistent as practical, the federal agency planning process is not bound by or subject to county plans, planning processes, or planning stipulations. The BLM will identify these conflicts in the Proposed RMP/Final EIS, so that the state and local governments have a complete understanding of the impacts of the Proposed RMP on state and local management options. A consistency review of the Proposed RMP with the state and county master plans is included in Section 5.4 of this document.

Comment: *Therefore, we believe, as policy, there should be less focus on creating ever-expanding areas where management is restricted or prohibited, and more active management of those areas to address issues of fire and vegetation.*

Response: The RFO considered fire and vegetation issues in selecting new areas for managing non-WSA lands with wilderness characteristics.

Comment: *Also, the statement in your explanatory materials that "the citizens of Wayne County support VRM I or II management" is simply not true. We constantly hear from our citizens regarding this matter, and the overwhelming majority do not support VRM l.*

Response: BLM acknowledges that there are varying opinions on VRM Classes among the citizens of Wayne County.

Comment: *Further, the County would like BLM to explain why VRM I or even VRM II is necessary. The lands proposed under the preferred alternative seem to be mostly WSAs which were established under VRM II but are now managed under VRM I.*

Response: IM-2000-96 states "it is the Bureau position… that all WSAs should be classified as Class I, and managed according to VRM Class I management objectives until such time as the Congress decides to designate the area as wilderness or release it for other uses." The IM further explains "…the VRM management objectives are being used to support WSA management objectives. For WSAs, this is not only about visual values as many WSAs do not necessarily contain exceptionally high scenic values. The primary objective of WSA management is to retain the WSA's natural character essentially unaltered by humans during the time it is being managed as a WSA." Because the VRM I objective is to "preserve the

existing character of the landscape" (BLM-H-8410), such a designation would complement WSA management as explained in the IMP.

Comment: *The County does not believe BLM has the authority to create a special management criteria based solely on wilderness characteristics.*

Response: BLM's authority for managing lands to protect or enhance wilderness characteristics comes directly from FLPMA Section 202 (43 U.S.C. §1712). This section of BLM's organic statute gives the Secretary of the Interior authority to manage public lands for multiple use and sustained yield. Nothing in this section constrains the Secretary's authority to manage lands as necessary to "achieve integrated consideration of physical, biological, economic, and other sciences." FLPMA, Section 202(c)(2) (43 U.S.C. §1712(c)(2)). Further, FLPMA makes it clear that the term "multiple use" means that not every use is appropriate for every acre of public land and that the Secretary can "make the most judicious use of the land for some or all of these resources or related services over areas large enough to provide sufficient latitude for periodic adjustments in use…" FLPMA, Section 103(c) (43 U.S.C. §1702(c)). FLPMA intended for the Secretary of the Interior to use land use planning as a mechanism for allocating resource use, including wilderness character management, among the various resources in a way that provides uses for current and future generations. BLM has long acknowledged that FLPMA Section 603 (43 U.S.C. §1782) requiring a one-time wilderness review has expired. All current inventory of public lands is authorized by FLPMA Section 201 (43 U.S.C. §1711). In September 2006, the Utah District Court affirmed that the BLM retained authority to protect lands it determined to have wilderness characteristics in a manner substantially similar to the manner in which such lands are protected when protected as WSAs. Finally, the Utah v. Norton Settlement Agreement does not affect BLM's authority to manage public lands. This agreement merely remedied confusion by distinguishing between WSAs established under FLPMA § 603 and required to be managed under § 603's non-impairment standard, and other lands that fall within the discretionary FLMPA § 202 land management process. See also IM 2003-275.

Comment: *We would like the BLM to explain how these lands went from having no wilderness characteristics to the current status as "likely to have" wilderness characteristics.*

Response: When developing new land use plans, the BLM must, as with any new information, determine whether the BLM wilderness inventories or public wilderness proposals contain significant new circumstances or information relevant to environmental concerns and bearing on the proposed action or impacts that have not previously been analyzed. To help determine whether the new information or circumstances are significant, the BLM looks at the definition of "significantly" at 43 CFR 1508.27, which requires consideration of both context and intensity. The new inventory information was reviewed and found to be significant. FLPMA specifically identifies "scenic values," "outdoor recreation," and other resource values as resources for inventory and management. See also 43 CFR 1711. A range of alternatives was considered in the Draft RMP/EIS to manage areas with wilderness characteristics. This range of alternatives is consistent with FLPMA.

Comment: *The County has submitted, with these comments, its own inventory of the lands identified in Alternative D as having wilderness characteristics.*

Response: The BLM considered the county's inventory in developing the Proposed RMP and, based upon all available information, BLM carried forward 78,600 acres (12 percent) of the 682,600 acres of non-WSA lands with wilderness characteristics identified in the Draft RMP Alternative D. The presence or absence of man-made intrusions does not mean that an area does not possess wilderness characteristics. It is the cumulative significance of these features that determines whether an area possesses wilderness characteristics. As part of its wilderness characteristics inventory maintenance, BLM used a combination of field checks, Interdisciplinary Team review of data such as range files, county and BLM GIS data, and

review of high-resolution 2006 aerial photographs. Having reviewed the information submitted and determined that the information is not new and significant BLM stands by its determination.

Comment: *The BLM has failed to demonstrate the necessary standard on size, naturalness, and outstanding nature. Further, in most areas, the BLM fails to demonstrate the necessary standard on isolation and opportunity for solitude.*

Response: As part of its wilderness characteristics inventory maintenance, BLM used a combination of field checks, Interdisciplinary Team review of data such as range files, county and BLM GIS data, and review of high-resolution 2006 aerial photographs. Having reviewed the information submitted and determined that the information is not new and significant, BLM stands by its determination.

Comment: *A statement of opposition to the management of the described lands for their wilderness character. We have enclosed that statement in Appendix B. Second, as we have stated above, we are troubled by any management condition implemented based on statements such as "likely to have wilderness characteristics." We believe that the County's inventory of those lands represents an accurate picture of the condition and use of those lands, and that our ground-proofing information is much more reliable.*

Response: The BLM considered the County's inventory in developing the Proposed RMP, and based upon all available information BLM carried forward 78,600 acres (12 percent) of the 682,600 acres of non-WSA lands with wilderness characteristics identified in the Draft RMP Alternative D. The presence or absence of man-made intrusions does not mean that an area does not possess wilderness characteristics. It is the cumulative significance of these features that determines whether an area possesses wilderness characteristics. As part of its wilderness characteristics inventory maintenance, BLM used a combination of field checks, Interdisciplinary Team review of data such as range files, county and BLM GIS data, and review of high-resolution 2006 aerial photographs. Having reviewed the information submitted and determined that the information is not new and significant BLM stands by its determination.

Comment: *Third, nearly 40% of the lands BLM has indicated statewide as "likely to have" wilderness characteristics are within Wayne County. Given that the County already lives with the limitations of having only 3% of their lands in private ownership, having that much land under a new level of special management is an unacceptable burden.*

Response: Sections 103, 201, and 202 of FLPMA direct the BLM to take into account the national interest, as well as the local interest. In accordance with FLPMA and BLM rules, regulations, and policies, the BLM must provide for the balanced management of all resources and resource uses on public lands.

The BLM gave strong consideration to the concerns of local governments throughout the planning process. In particular, Wayne County is a cooperating agency and was included during the development of alternatives when non-WSA areas with wilderness characteristics were considered.

Under the Proposed RMP, only 12 percent of the identified non-WSA lands with wilderness characteristics would be managed to protect wilderness values. Approximately 88 percent of these areas would continue to be managed for multiple-use.

Comment: *BLM should adopt a vigorous program of treatment where once available grazing forage has moved to Juniper and Pinion or other woody plants, or where the health of the range has suffered for any other reason. This should include mechanical treatments such as chaining, logging, burning, seeding, or other such methods. We further ask BLM to consider using creative and innovative management in their use of grazing. This may include the use of spring grazing where appropriate, to help with problems of cheat grass and other invasives, and to improve rangeland conditions generally.*

Response: The proposed alternative supports the statement of reducing juniper and pinyon encroachment. Table 2-15 of the Draft RMP/EIS allows for using livestock grazing to enhance ecosystem health or mitigate resource problems (e.g., noxious/invasive weed control, hazardous fuel reduction) where supported by site-specific environmental analysis.

Comment: *We believe that insufficient weight is given in socio-economic studies to the value of the cattle and sheep industry, and associated grazing activities, to the overall economic well-being of rural counties, and Wayne County in particular.*

Response: Selections from the county plans were considered for socioeconomics in Sections 3.6.1 and 4.6.1 of this document. Appendix 13 summarizes statements, comments, and direction provided by the counties on public land and resource management contained in the general plans of the five counties encompassed by BLM's RFO. In addition, BLM has reviewed both USU's Review of the Socioeconomic Analysis in the Draft EIS prepared by the USDI—BLM RFO, sometimes referred to as the Six-County AOG study, and portions of its Trend Information for the Richfield RMP: Livestock Industry Issues. The AOG study expressed concerns with the Draft RMP/EIS analyses of livestock grazing in the counties. Portions of the Trend Information for the Richfield RMP: Livestock Industry Issues expressed additional livestock issues such as a desire for flexible livestock grazing management provisions.

The AOG study was a critique of the original Draft EIS; the current, public Draft EIS has been modified considerably and has taken into account, directly or indirectly, many of the concerns expressed in the original AOG critique. The RMP provides a balanced approach and equal consideration was given to socioeconomics.

Based on CEQ Sec. 1502.2 BLM's policies and guidelines require BLM to analyze the impacts of significant differences from the current situation (i.e., the Alternative N: No Action). Given that the percent change in AUMs across alternatives is only 0.7 percent, there is no need to do the depth of livestock grazing analysis suggested by the livestock studies mentioned earlier.

Furthermore, the BLM objectively determined a reasonable range of alternatives that best addressed the issues, concerns, and alternatives identified by the public, including BLM management of livestock grazing. Alternative A would have an additional 1.079 AUMs and 36,950 acres available for livestock grazing. There would be no change in livestock grazing management from current management under any of the other alternatives. The Proposed RMP shows no significant difference from the current situation; therefore, there is no significant impact from BLM decisions reached in the plan.

Comment: *Our main concern is that the OHV community, so vital to the economies of our small rural communities, seems to be under constant attack, and pressure to diminish their presence on our public lands is continually increasing. For example, under the preferred alternative, you close very large areas to open use which are currently heavily used and popular with the OHV Community, and you leave only 1% of the entire RFO area available to open OHV use. How does this compare to the total area made available for primitive and semi-primitive activities? Areas of public land where OHV use is allowed remain fully accessible by the hiking/biking enthusiasts, as well as other users. However, the ever-increasing "primitive or semi-primitive" areas are basically unavailable to OHV use. How does this compare to the total area made available for primitive and semi-primitive activities?*

Response: BLM considered a range of alternatives to address OHV use. Under the Proposed RMP, the majority of routes currently in use would continue to be available for use, but not for cross-country travel.

Comment: *We also note that the County has a travel map showing all our roads and trails, and the BLM's travel plan should be consistent with the County's information.*

Response: As described in the Draft RMP/EIS, the BLM used a variety of methods to inventory existing routes/ways within the RFO for consideration in the planning process, including global positioning system data (when available), data provided by the counties, map and orthophoto data, and staff/cooperator knowledge. Based on this inventory, the BLM identified 4,380 miles of routes/ways (Map 3-10 of the Draft RMP/EIS) within the RFO. It should be noted that route designations are implementation decisions and that the resulting transportation network could change over time. Management direction for OHVs is provided in 43 CFR 8340, BLM Manual 8340, and the BLM National OHV Management Strategy. Nothing in this RMP extinguishes any valid ROW, or alters in any way the legal rights the State of Utah and Garfield, Piute, Sanpete, Sevier, and Wayne counties have to assert and protect RS 2477 rights, and to challenge in federal court or other appropriate venue any use restrictions imposed by the RMP that they believe are inconsistent with their rights.

Comment: *Wayne County is not comfortable with the BLM's RFD, or the manner in which the BLM determines the potential future economic viability of certain minerals. It does not match county planning or the County's assessment of potential value.*

Response: The RFD predicts a reasonable development scenario for oil and gas activity. The commenter does not substantiate deficiencies in the analysis or RFD. The mineral potential report addressed the likelihood of mineral development. Chapter 3 of the Draft RMP/EIS updated the mineral potential report. The commenter does not substantiate deficiencies in the analysis. The coal resource reports identified areas with mineable resources. The unsuitability criteria were applied to determine areas suitable for consideration of coal leasing. The commenter does not substantiate deficiencies in the analysis.

Comment: *Designation of any segment of the Fremont and Dirty Devil system as wild and scenic would unnecessarily restrict the ability of the water users to carry on the daily management of their water.*

Response: Barring congressional action, there is no effect on water rights or in-stream flows related to suitability findings made in a land use plan decision. Even if Congress were to designate rivers into the National Wild and Scenic Rivers System, any such designation would have no effect on existing water rights. Section 13(b) of the Wild and Scenic River Act states that jurisdiction over waters is determined by established principles of law. In Utah, the State has jurisdiction over water. Although the Wild and Scenic Rivers Act implies a Federal reserved water right for designated rivers, it does not require or specify any amount, and as noted above, confirms that Utah has jurisdiction over water rights. The BLM would be required to adjudicate the water right, in the same manner as any other entity, by application through State processes. Thus, for congressionally designated rivers, the BLM may assert a Federal reserved water right for appurtenant and unappropriated water with a priority date as of the date of designation (junior to all existing rights), but only in the minimum amount necessary to fulfill the primary purpose of the reservation.

Comment: *We are also concerned about the management before actual Congressional action creates formal wild and scenic designation.*

Response: Management protection afforded rivers is found in Section 5(d) of the Wild and Scenic River Act and depends on whether the identified river segment is found eligible or suitable. River segments found eligible are managed at the discretion of the administering agency to protect free-flow, outstandingly remarkable values, and tentative classification until a suitability determination is made; rivers found suitable are managed at the discretion of the administering agency for the same values and recommended classification pending congressional action or for the duration of the RMP but not as a designated WSR, which is specified by Congress. Management prescriptions under both suitability and eligibility phases are subject to valid existing rights.

Comment: *The one-quarter mile corridor set aside for wild and scenic would most certainly impact potential mineral development, especially the uranium resources along the Dirty Devil.*

Response: The Proposed RMP does not recommend the Dirty Devil as a suitable for inclusion in the wild and scenic river system. The lands within the Dirty Devil river corridor are for the most part within the Dirty Devil WSA and subject to the IMP restrictions which provide protection for the river's outstandingly remarkable values. Also, the lands within the Dirty Devil river corridor are for the most part within the Dirty Devil WSA and subject to the IMP restrictions until Congress makes a final determination on Wilderness designation. The one-quarter mile corridor outside of the WSA is essentially a near- vertical cliff with some bench lands, which have restricted access.

Comment: *We do not believe BLM has met the suitability standards based on the requirements of state law.*

Response: Federal law, with which the BLM must comply, takes precedence over others: Section 16(b) of the Wild and Scenic River Act defines a river as "a flowing body of water or estuary, or a section, portions, or tributary thereof, including rivers, streams, creeks, runs, rills, kills, and small lakes." For purposes of evaluation, the volume of water flow need only be sufficient to sustain or complement the identified resource values; rivers with intermittent or non-perennial flows already exist within the national river system.

Comment: *The only conclusion is that the single justification for proposing new ACECs is to act as a fail-safe method to insure that some higher level of restrictive management occurs on these areas.*

Response: The Proposed RMP includes the designation of 2 ACECs, Old Woman Front and North Cainville Mesa, which do not overlap WSAs. The BLM has separate policies and guidelines, as well as criteria, for establishing ACECs and WSAs. These differing criteria make it possible that the same lands will qualify as both an ACEC and a WSA but for different reasons. The BLM is required to consider these different policies.

The values protected by WSA management prescriptions do not necessarily protect those values found relevant and important in ACEC evaluation, and vice versa. The relevant and important values of ACECs within or adjacent to WSAs were noted in the ACEC Evaluation (Appendix 1). The ACECs are evaluated and ranked based on the presence or absence of the stated relevant and important values. None of these values includes wilderness characteristics. Additionally, the management prescriptions for the ACECs is limited in scope to protect the relevant and important values, and the BLM maintains that the size of the ACEC areas is appropriate for protection of the relevant and important values identified.

Comment: *The DRMP/EIS would turn the Kimball decision on its head by purporting to create the new Alternative D management standard.*

Response: The BLM's authority for managing lands to protect or enhance wilderness characteristics is derived directly from FLPMA Section 202 (43 U.S.C. §1712).

This section of BLM's organic statute gives the Secretary of the Interior authority to manage public lands for multiple use and sustained yield. Nothing in this section constrains the Secretary's authority to manage lands as necessary to "achieve integrated consideration of physical, biological, economic, and other sciences." (FLPMA, Section 202(c)(2) [43 U.S.C. §1712(c)(2)]) Further, FLPMA makes it clear that the term "multiple use" means that not every use is appropriate for every acre of public land, and that the Secretary can "make the most judicious use of the land for some or all of these resources or related services over areas large enough to provide sufficient latitude for periodic adjustments in use…" (FLPMA, Section 103(c) [43 U.S.C. §1702(c)]) The FLPMA intended for the Secretary of the Interior to use land use planning as a mechanism for allocating resource use, including wilderness character management, among the various resources in a way that provides uses for current and future generations.

The BLM has long acknowledged that FLPMA Section 603 (43 U.S.C. §1782) requiring a one-time wilderness review has expired. All current inventory of public lands is authorized by FLPMA Section 201 (43 U.S.C. §1711). In September 2006, the Utah District Court affirmed that the BLM retained authority to protect lands it determined to have wilderness characteristics in a manner substantially similar to the manner in which such lands are protected as WSAs.

The BLM is aware that there are specific state laws relevant to aspects of public land management that are discrete from, and independent of, federal law. However, BLM is bound by federal law. As a consequence, there may be inconsistencies that cannot be reconciled. The FLPMA requires that BLM's land use plans be consistent with state and local plans "to the extent practical" where state and local plans conflict with federal law, there will be an inconsistency that cannot be resolved. The BLM will identify these conflicts in the Proposed RMP/Final EIS so that the state and local governments have a complete understanding of the impacts of the Proposed RMP on state and local management options.

Finally, the Utah v. Norton Settlement Agreement does not affect BLM's authority to manage public lands. This agreement merely remedied confusion by distinguishing between WSAs established under FLPMA §603 and those lands required to be managed under §603's non-impairment standard, and other lands that fall within the discretionary FLMPA §202 land management process.

Comment: *Adopting Alternative D would violate the restrictions of BLM's own Instruction Memorandum No. 2003-275, which states "it is no longer BLM policy to continue to make formal determinations regarding wilderness character, designate new WSAs through the land use planning process, or manage any lands - [except Section 603 WSAs) in accordance with the non-impairment standard prescribed in the IMP [Interim Management Policy for WSAs]." (Emphasis added.)*

Response: The BLM's authority for managing lands to protect or enhance wilderness characteristics comes directly from FLPMA Section 202 (43 U.S.C. §1712). This section of BLM's organic statute gives the Secretary of the Interior authority to manage public lands for multiple use and sustained yield. Nothing in this section constrains the Secretary's authority to manage lands as necessary to "achieve integrated consideration of physical, biological, economic, and other sciences." (FLPMA, Section 202(c)(2) [43 U.S.C. §1712(c)(2)]) Further, FLPMA makes it clear that the term "multiple use" means that not every use is appropriate for every acre of public land and that the Secretary can "make the most judicious use of the land for some or all of these resources or related services over areas large enough to provide sufficient latitude for periodic adjustments in use…" (FLPMA, Section 103(c) [43 U.S.C. §1702(c)]) The FLPMA intended for the Secretary of the Interior to use land use planning as a mechanism for allocating resource use, including wilderness character management, among the various resources in a way that provides uses for current and future generations. In addition, the BLM's *Land Use Planning Handbook* (H-1601-1) directs BLM to "identify decisions to protect or preserve wilderness characteristics (naturalness, outstanding opportunities for solitude, and outstanding opportunities for primitive and unconfined recreation) including goals and objectives to protect the resource and management actions necessary to achieve these goals and objectives. For authorized activities, include conditions of use that would avoid or minimize impacts to wilderness characteristics."

Comment: *Managing the Subject Lands Under Alternative D Would Clash With State and Local Policies and Plans for Managing Those Lands, and Would Thus Violate the Consistency Requirement of FLPMA Section 202(c)(9).*

Response: BLM is aware that there are specific state laws relevant to aspects of public land management that are discrete from, and independent of, federal law. However, BLM is bound by federal law. As a consequence, there may be inconsistencies that cannot be reconciled. FLPMA requires that BLM's land use plans be consistent with state and local plans "to the extent practical" where state and local plans conflict with federal law, there will be an inconsistency that cannot be resolved. BLM will identify these

conflicts in the Proposed RMP/Final EIS so that the state and local governments have a complete understanding of the impacts of the Proposed RMP on state and local management options.

Comment: *Managing the subject lands under Alternative D would arbitrarily and capriciously ignore the documentation and information submitted by wayne county which show the subject lands lack true wilderness character.*

Response: The presence or absence of man-made intrusions does not mean that an area does not possess wilderness characteristics. It is the cumulative significance of these features that determines whether an area possesses wilderness characteristics. As part of its wilderness characteristics inventory maintenance, BLM used a combination of field checks, Interdisciplinary Team review of data such as range files, county and BLM GIS data, and review of high-resolution 2006 aerial photographs. Having reviewed the information submitted and determined that the information is not new and significant, the BLM stands by its determination.

Comment: *A proper baseline should be established.*

Response: The "Air Quality Impact Analysis" section of the Proposed RMP/Final EIS includes baseline emission calculations. BLM stands by the assumptions on page 4-7 of the Draft RMP/EIS: "The most conservative case assumptions for air quality were used for the qualitative analysis. When a range of activity factors was assumed, the upper limit of the range was used to complete calculations for future time frames."

Comment: *It is important to the County, as stake holder, that we be involved in any air quality analysis that is done so that we can be assure that proper modeling and data techniques are used.*

Response: The "Air Quality Impact Analysis" section of the Proposed RMP/Final EIS includes baseline emission calculations. BLM stands by the assumptions on page 4-7 of the Draft RMP/EIS: "The most conservative case assumptions for air quality were used for the qualitative analysis. When a range of activity factors was assumed, the upper limit of the range was used to complete calculations for future time frames."

Comment: *First and foremost, Wayne County believes that BLM's process by which it attempted to study Wild & Scenic River suitability is procedurally flawed by its failure to follow NEPA procedures and Wild and Scenic guidelines for determining suitability.*

Response: BLM, USFS, and NPS developed a statewide interagency agreement to ensure coordination and consistency for WSR planning efforts in the state. As a result, the three agencies jointly prepared and then released in January 1997, the document, *Wild and Scenic River Review in the State of Utah, Process and Criteria for Interagency Use*. This document provides evaluation criteria and procedures and emphasizes interagency cooperation as well as other agency and government coordination and public involvement. It supplements general national wild and scenic guidance for each of the three agencies. This guideline is consistent with the Wild and Scenic River Act and the BLM manual.

Comment: *BLM should conclude that no proposed segment in Wayne County is suitable for designation, for the additional reason that prohibitions on impoundment that accompany designation would violate the pre-existing rights of impoundment granted under the 1922 Colorado River Compact. Furthermore, it is obvious BLM failed to consider for NEPA purposes, the impact of a suitability designation on the pre-existing right of impoundment provided under the 1922 Colorado River Compact.*

Response: The Colorado River Compact granted the signatory states a general authority to impound water as necessary within their borders for the purpose of making beneficial use of waters allocated to each state under the compact. The compact did not establish specific rights to impound waters in specific locations within each state. The authority to create specific rights to build and operate storage facilities

was delegated to state governments that have the authority to allocate water within their boundaries. Absent a specific decree or state permit authorizing a storage structure, there is no specific right to store water at any location on the streams within the planning area. In addition, a legal prohibition on building storage structures does not occur as part of a BLM suitability determination on a stream reach. The legal prohibition occurs only when Congress acts to designate a specific stream reach as part of the national WSR system. When making WSR designations, Congress is obligated to consider the impact of that designation on Utah's rights under the Colorado River Compact, and to consider the impact on existing storage decrees and permits.

Comment: *BLM failed to consider for NEPA purposes, the impact of a suitability designation on the pre-existing right of impoundment provided under the 1922 Colorado River Compact.*

Response: The Colorado River Compact granted the signatory states a general authority to impound water as necessary within their borders for the purpose of making beneficial use of waters allocated to each state under the compact. The compact did not establish specific rights to impound waters in specific locations within each state. The authority to create specific rights to build and operate storage facilities was delegated to state governments that have the authority to allocate water within their boundaries. Absent a specific decree or state permit authorizing a storage structure, there is no specific right to store water at any location on the streams within the planning area. In addition, a legal prohibition on building storage structures does not occur as part of a BLM suitability determination on a stream reach. The legal prohibition occurs only when Congress acts to designate a specific stream reach as part of the national WSR system. When making WSR designations, Congress is obligated to consider the impact of that designation on Utah's rights under the Colorado River Compact, and to consider the impact on existing storage decrees and permits.

Comment: *To manage eligible and suitable segments as if they were already designated for inclusion by Congress also incorrectly implies that a federal reserved water right exists, thereby impacting the future management and utilization of valid existing water rights above.*

Response: Under WSR designation, the managing agency is obligated to honor valid, existing rights, including water rights. Within a designated segment, water users are entitled to implement reasonable, historic operation and maintenance practices. Water users are also allowed to change and upgrade their facilities to the extent that the change does not diminish the outstandingly remarkable values or free-flowing nature of the stream segment. The flow protection associated with a designated river is implemented in the form of a junior water right claimed by the managing agency. By law, junior water rights cannot take water from senior water rights. Even under designation, senior water rights holders would be able to divert their full water rights decrees.

Comment: *Wayne County also objects to the following language common to alternatives A–D on page 2-8: "Manage suitable river segments in a manner that would protect their outstandingly remarkable values, tentative classification, and free flowing nature." That language should be substituted with the following language: "River corridors of suitable rivers will be managed according to other resource decisions with respect to that corridor, unless and until such time as Congress may designate such corridors for inclusion in the National Wild and Scenic River System."*

Response: Management protection afforded rivers is found in Section 5(d) of the Wild and Scenic River Act and depends on whether the identified river segment is found eligible or suitable. River segments found eligible are managed at the discretion of the administering agency to protect free-flow, outstandingly remarkable values, and tentative classification until a suitability determination is made; rivers found suitable are managed at the discretion of the administering agency for the same values and recommended classification pending congressional action or for the duration of the RMP but not as a

designated WSR, which is specified by Congress. Management prescriptions under both suitability and eligibility phases are subject to valid existing rights.

Comment: *page 2-8. "Manage suitable river segments in a manner that would protect their outstandingly remarkable values, tentative classification, and free flowing nature." That language should be substituted with the following language: "River corridors of suitable rivers will be managed according to other resource decisions with respect to that corridor, unless and until such time as Congress may designate such corridors for inclusion in the National Wild and Scenic River System."*

Response: Management protection afforded rivers is found in Section 5(d) of the Wild and Scenic River Act and depends on whether the identified river segment is found eligible or suitable. River segments found eligible are managed at the discretion of the administering agency to protect free-flow, outstandingly remarkable values, and tentative classification until a suitability determination is made; rivers found suitable are managed at the discretion of the administering agency for the same values and recommended classification pending congressional action or for the duration of the RMP but not as a designated WSR, which is specified by Congress. Management prescriptions under both suitability and eligibility phases are subject to valid existing rights.

Comment: *Utah Code Section 63-38d-401 essentially states that if rangeland conditions improve that suspended AUMS would be returned to livestock before additional AUMS would be provided for wildlife. We are concerned that this has not and is not being adhered to in the RMP.*

Response: Per the 43 CFR 4100 regulation, suspended AUMs are restored to the operator to the amount of the suspension if conditions allow. Beyond this, AUMs are allocated to livestock or wildlife depending on the allotment objectives contained in the RMP and Rangeland Program Summary.

Comment: *The DRMP/EIS grazing that would reduce grazing AUM levels is faulty because the DRMP/EIS fails to articulate a legal or factual basis to reduce domestic livestock.*

Response: The Draft RMP/EIS does not include any alternatives that consider decreases in livestock grazing; therefore, this comment does not apply to this document.

Comment: *Wayne County objects to the extent any grazing alternative in the DRMP/EIS attempts to authorize the retirement of grazing permits and their reallocation to wildlife. This violates the Taylor Grazing Act, 43 U.S.C. § 315, FLPMA, 43 U.S.C. § 1742, and the terms of the Executive Orders No. 6910, 54 J.D. 539 (1934), and No. 6964 (Feb. 5, 1935), which withdrew public lands as chiefly valuable for grazing.*

Response: This Draft RMP/EIS does not authorize the retirement of grazing permits and their automatic reallocation to wildlife. If such an action were to be proposed in the future, a separate NEPA document would be prepared to analyze the impacts of an amendment to the land use plan. This process is described on page 2-40 of the Draft RMP/EIS.

Comment: *Of particular concern is the purported transfer of livestock AUMs in the Henry Mountains area to bison. It has long been the County's position that transfers were and are illegal.*

Response: This Draft RMP/EIS does not authorize the retirement of grazing permits and their automatic reallocation to bison or other wildlife. If such an action were to be proposed in the future, a separate NEPA document would be prepared to analyze the impacts of an amendment to the land use plan. This process is described on page 2-40 of the Draft RMP/EIS.

Garfield County

Comment: *Section 1.5.1 should be updated to include existing state law and Garfield County's 2007 General Management Plan Amendment.*

Response: The BLM RFO is aware that Garfield County updated its general management plan in 2007. The updated plan has been reviewed and considered.

Comment: *1. Failure to identify and/or depict known routes under Garfield County's jurisdiction. 2. Failure to identify routes asserted to be under BLM jurisdiction. 3. Failure to consider road repair, road rehabilitation, road construction, and maintenance standards appropriate to transportation facilities within the field office. 4. Intentionally omitting transportation facilities that may be in conflict in certain alternatives, while including them for closure in others.*

Response: As described in the Draft RMP/EIS, the BLM used a variety of methods to inventory existing routes/ways within the RFO for consideration in the planning process, including global positioning system data (when available), data provided by the counties, map and orthophoto data, and staff/cooperator knowledge. Based on this inventory, the BLM identified 4,380 miles of routes/ways (Map 3-10 of the Draft RMP/EIS) within the RFO. It should be noted that route designations are implementation decisions and that the resulting transportation network could change over time. Management direction for OHVs is provided in 43 CFR 8340, BLM Manual 8340, and the BLM National OHV Management Strategy. Nothing in this RMP extinguishes any valid ROW, or alters in any way the legal rights the State of Utah and Garfield, Piute, Sanpete, Sevier and Wayne counties have to assert and protect RS 2477 rights, and to challenge in federal court or other appropriate venue any use restrictions imposed by the RMP that they believe are inconsistent with their rights.

Comment: *5. Failure to disclose lands being considered for wilderness management are classified as semi-primitive motorized or roaded natural.*

Response: The optional BLM management tool Recreation Opportunity Spectrum (ROS) discloses land classifications. RFO has not yet developed an optional ROS classification. Therefore, the RMP defaults back to the best available data.

Comment: *6. Application of the restrictive VRM classes without analysis or consideration of less restrictive classes.*

Response: BLM is required by FLPMA to manage for scenic resources. BLM meets this responsibility through the VRM program. VRM classes (BLM-H-8431) are based on the VRI (BLM-H-8410). The "Cumulative Impacts" Section 4.7.4.1.6 of the DRMP/DEIS analyzes the impacts to visual resources from past, present, and reasonably foreseeable future actions on non-federal lands. The Preferred Alternative in the Draft RMP/EIS and the Proposed RMP would only designate VRM Class III or IV in and immediately adjacent to the Covenant Field.

Comment: *7. Failure to comply with the memorandum of understanding regarding participation of cooperating agencies. 8. Failure to provide opportunities for cooperating agencies to review draft documents prior to releasing them to the public. Garfield County asserts that many of these practices lack objectivity, integrity, and constitute a violation of federal, state and local law.*

Response: Cooperating agency status was extended to federal, state, and local agencies, including Garfield County. The BLM RFO held regular meetings with Garfield County during the development of the Draft RMP/EIS. While Garfield County asserts that the BLM lacks objectivity and integrity, BLM asserts that it has complied with the MOU and has met the intent of federal, state, and local law. BLM will continue to involve cooperating agencies during the planning process. BLM conducted a consistency review between Garfield County General Management Plan and the Draft RMP/EIS.

Comment: *The State of Utah will be providing summaries and copies of these studies as they are completed. Garfield County requests that the BLM considers this information as you prepare the Final RMP and Final EIS. The studies may include but not be limited to: The Utah Public Lands Study, The Utah Recreational Off-Highway Vehicle Use Study, Dependency on and Alternatives to Public Land Grazing by Operators in Utah, Review of the Socioeconomic Analysis in the Draft Environmental Impact Statement Prepared by the USDI-Bureau of Land. Management Richfield Field Office, The Structure and Economic Impact of Utah's Oil and Gas Exploration and Production Industry: Phase I - the Uinta Basin, and Phase IT Carbon and Emery Counties. The Utah Public Lands study is included as Exhibit 1.*

Response: On Jan 28, 2008, The BLM RFO received several studies (or portions of studies) from The State of Utah including:

• Utah State University, 2007, Utah Public Lands Study: Key Social Survey Findings for Garfield, Piute, Sanpete, Sevier, and Wayne Counties;

• University of Utah, 2007, The Structure and Economic Impact of Utah's Oil and Gas Exploration and Production Industry Phase I – The Uinta Basin;

• University of Utah, November 2007, The Structure and Economic Impact of Utah's Oil and Gas Exploration and Production Industry Phase II – Carbon and Emery Counties;

• Utah State University, October 2006, Review of the Socioeconomic Analysis in the Draft EIS prepared by the USDI – BLM RFO (sometimes referred to as the Six County Association of Governments (AOG) study); and

• (Portions of) Utah State University, publication date unknown, Trend Information for the Richfield RMP: Livestock Industry Issues.

The State of Utah also provided a copy of Wayne, Sevier, and Garfield Counties' proposal concerning OHV use in the Factory Butte area titled January 21, 2008 Draft of Counties' Comments Re Factory Butte Recreation Plan: Comments of Wayne, Sevier, and Garfield Counties Regarding Motorized Recreation Plan Around the Factory Butte Area in Wayne County. BLM has reviewed the studies that The State of Utah provided. The Utah Public Lands Study: Key Social Survey Findings for Garfield, Piute, Sanpete, Sevier, and Wayne Counties was considered for insights into local community social values. The BLM acknowledges the currency and relevance of several of the study's findings, and has incorporated them in appropriate sections of Chapters 3 and 4. However, as the study suggests, interpretations are best done for the State of Utah as whole rather than at the county level because of the small number of respondents in some counties such as Piute and Wayne Counties.

The University of Utah's The Structure and Economic Impact of Utah's Oil and Gas Exploration and Production Industry Phase I - The Uinta Basin and Phase II - Carbon and Emery Counties studies were found to have no information which would have altered the approach taken in the economic impact analyses of Chapter 4 in the DRMP/DEIS. The BLM acknowledges that there are important fiscal impacts from oil and gas activities, and these have been incorporated in the PRMP/FEIS.

The AOG study expressed concerns with the analyses of livestock grazing, oil and gas production, socioeconomic groups (or "neighborhoods"), and OHV use in the counties. The AOG study was a critique of the original DEIS; the current, public DEIS has been modified considerably, and has taken into account, directly or indirectly, many of the concerns expressed in the original AOG critique. Sec. 1502.2 Implementation of the CEQ regulations sets forth how the BLM is to prepare environmental impact statements following: "(a) Environmental impact statements shall be analytic rather than encyclopedic. (b) Impacts shall be discussed in proportion to their significance. There shall be only brief discussion of

other than significant issues. As in a finding of no significant impact, there should be only enough discussion to show why more study is not warranted. (c) Environmental impact statements shall be kept concise and shall be no longer than absolutely necessary to comply with NEPA and with these regulations. Length should vary first with potential environmental problems and then with project size. (d) Environmental impact statements shall state how alternatives considered in it and decisions based on it will or will not achieve the requirements of sections 101 and 102(1) of the Act and other environmental laws and policies. (e) The range of alternatives discussed in environmental impact statements shall encompass those to be considered by the ultimate agency decisionmaker. (f) Agencies shall not commit resources prejudicing selection of alternatives before making a final decision (Sec. 1506.1). (g) Environmental impact statements shall serve as the means of assessing the environmental impact of proposed agency actions, rather than justifying decisions already made." Based on CEQ Sec. 1502.2 BLM's policies and guidelines require BLM to analyze the impacts of significant differences from the current situation (i.e. Alternative N: No Action). With respect to the grazing analysis, given that the percent change in AUMs across alternatives is only 0.7 percent, there is no need to do the depth of livestock grazing analysis suggested by the AOG. Furthermore, the preferred alternative shows no significant difference from the current situation, and therefore there is no significant impact from BLM decisions reached in the plan. The BLM acknowledges the planning area contains distinct socioeconomic "neighborhoods" that likely have different ties to the BLM lands, and would likely experience differential impacts from BLM management changes. A land use plan is a landscape level plan addressing BLM actions on the entire planning area. This focus is not intended to deny that real differences exist among the various communities and groups within the planning area. The plan takes a broader view. The BLM is unaware of any data suggesting that a "neighborhood" level analysis would have affected the decisions reached in the plan. In developing land use plans, the BLM is mandated by FLPMA to observe the principles of multiple use and sustained yield. FLPMA defines multiple use as "the management of the public lands and their various resource values so that they are utilized in the combination that will best meet the present and future needs of the American people…the use of some land for less than all of the resources, a combination of balanced and diverse resource uses that takes into account the long term needs of future generations for renewable and nonrenewable resources….with consideration given to the relative values of the resources and not necessarily to the combination of uses that will give the greatest economic return or the greatest unit output".

The BLM used the scoping process to explore and objectively determine a reasonable range of alternatives that best addressed the issues, concerns, and alternatives identified by the public. As a result, five alternatives were identified (including the No Action Alternative) for further analysis. Each alternative considers various levels or degrees of resource use or resource protection to give the public the ability to fully compare the consequences of each management prescription or action. Alternative A favors mineral development over protection of resources. Alternative C of the Draft RMP/EIS favors the protection of resources over the extraction of mineral development. Alternative D is the same as Alternative C except it includes management of lands with wilderness characteristics to preserve those characteristics. Alternative B is designed to be a balance between mineral development and protection of resources. Table 2.1 in the Richfield DRMP/DEIS provides in comparative form the management actions associated with each alternative. Portions of the Trend Information for the Richfield RMP: Livestock Industry Issues expressed additional livestock issues such as a desire for flexible livestock grazing management provisions. The BLM objectively determined a reasonable range of alternatives that best addressed the issues, concerns, and alternatives identified by the public including BLM management of livestock grazing. Alternative A would have an additional 1.079 AUMs and 36,950 acres available for livestock grazing. There would be no change in livestock grazing management from current management under any of the other alternatives.

Comment: *The Final RMP should contain and rely on a more aggressive, robust monitoring program so resource managers and users can communicate, learn, assign responsibilities, and use adaptive management to meet land health objectives.*

Response: RFO would continue to comply with BLM policies, including Fundamentals of Standards for Rangeland Health for Grazing Administration, and Utah's Standards for Rangeland Health for Livestock Grazing. Rangeland health would be assessed according to the Standards for Rangeland Health, which would provide strategies to achieve standards and other desired resource conditions and management objectives (See Draft RMP/EIS p. 4–2).

Comment: *It should also be noted, Garfield County believes the BLM should only employ the term "critical habitat" when referring to the legal habitat designations for endangered and threatened species under the Endangered Species Act. The County also calls upon the BLM to use the "crucial habitat" designations mapped by the Division of Wildlife Resources solely as descriptive wildlife habitat characterizations and not as exclusion zones for other multiple uses. The County also questions the practice of altering these designations from alternative to alternative. Crucial habitat is defined based on DWR's wildlife inventories and may be refined or altered by the State as conditions require.*

Response: During the development of the Draft RMP/EIS, Division of Wildlife Resources (DWR) dropped using the term "critical" and formulated a new connotation for "crucial." Also, the term "designated critical habitat" should only be used in reference to species listed as threatened or endangered under the Endangered Species Act. The Final RMP/EIS has been changed to correct the issues discussed above.

Comment: *Criteria used by the BLM are inconsistent with the Garfield County General Management Plan and with suggestions made by the County throughout the planning process.*

Response: The BLM is aware that there are specific county and state plan decisions relevant to aspects of public land management that are discrete from, and independent of, federal law. However, the BLM is bound by federal law. The FLPMA requires that the development of an RMP for public lands must be coordinated and consistent with county plans, to the maximum extent possible by law, and inconsistencies between federal and non-Federal Government plans be resolved to the extent practical (FLPMA, Title II Sec. 202 (c)(9)). As a consequence, where state and local plans conflict with federal law, there will be an inconsistency that cannot be resolved or reconciled.

Thus, while county and federal planning processes, under FLPMA, are required to be as integrated and consistent as practical, the federal agency planning process is not bound by or subject to county plans, planning processes, or planning stipulations. The BLM will identify these conflicts in the Proposed RMP/Final EIS, so that the state and local governments have a complete understanding of the impacts of the Proposed RMP on state and local management options. A consistency review of the Proposed RMP with the state and county master plans is included in Chapter 5.

Comment: *It is Garfield County's policy that the suitability determination phase is the proper time to begin analysis concerning any potential federal reserved water rights. At a minimum, Garfield County calls upon the BLM to catalog all valid, existing water rights which may be affected by any Wild and Scenic River eligibility or suitability designation, identify the maximum, minimum and anticipated impacts to said water rights and identify potential solutions to all potential water right conflicts.*

Response: The Wild and Scenic Rivers Act infers a federal reserved water right upon designation. However, it does not quantify the right other than to place limitations on it. The act states that it shall not be construed as a reservation for purposes other than those specified in the act, or in quantities greater than necessary to accomplish these purposes. The amount of the federal right will therefore depend on the river's flow, the values for which the river is being protected, and the unappropriated quantities in the

river. It would be adjudicated through the state and would be junior to any rights existing prior to the date of designation (see Draft RMP/EIS Appendix 3).

Comment: *Garfield County found the analyzed tributaries lacked outstandingly remarkable values, failed to meet eligibility and suitability criteria and were dry at the time of analysis. On the ground evidence indicated absence of water for a significant period. For these reasons, Garfield County opposes inclusion of the Dirty Devil River's tributaries in the Wild and Scenic Rivers System.*

Response: Federal law takes precedence over others: Section 16(b) of the Wild and Scenic River Act defines a river as "a flowing body of water or estuary, or a section, portions, or tributary thereof, including rivers, streams, creeks, runs, rills, kills, and small lakes." For purposes of evaluation, the volume of water flow need only be sufficient to sustain or complement the identified resource values; rivers with intermittent or non-perennial flows already exist within the national river system.

Comment: *Non-WSA lands with wilderness characteristics should not be given the preferential treatment of having their own alternative. This gives such lands a greater weight/value than other values, uses and needs. Garfield County objects to BLM's stand-alone alternative for managing non-WSA lands with wilderness characteristics and asserts that such practice is a violation of BLM's policy, program and planning procedures. Even if BLM has such authority, it is disingenuous, arbitrary, and capricious to select one resource use for preferential treatment. In order to provide a full range of alternatives, the BLM must evaluate all other resource values, uses, and needs in a similar fashion.*

Response: The BLM's authority for managing lands to protect or enhance wilderness characteristics comes directly from FLPMA Section 202 (43 U.S.C. §1712). This section of BLM's organic statute gives the Secretary of the Interior authority to manage public lands for multiple use and sustained yield. Nothing in this section constrains the Secretary's authority to manage lands as necessary to "achieve integrated consideration of physical, biological, economic, and other sciences." (FLPMA, Section 202(c)(2) [43 U.S.C. §1712(c)(2)]) Further, FLPMA makes it clear that the term "multiple use" means that not every use is appropriate for every acre of public land and that the Secretary can "make the most judicious use of the land for some or all of these resources or related services over areas large enough to provide sufficient latitude for periodic adjustments in use…" (FLPMA, Section 103(c) [43 U.S.C. §1702(c)]) The FLPMA intended for the Secretary of the Interior to use land use planning as a mechanism for allocating resource use, including wilderness character management, among the various resources in a way that provides uses for current and future generations. In addition, the BLM's *Land Use Planning Handbook* (H-1601-1) directs BLM to "identify decisions to protect or preserve wilderness characteristics (naturalness, outstanding opportunities for solitude, and outstanding opportunities for primitive and unconfined recreation), including goals and objectives to protect the resource and management actions necessary to achieve these goals and objectives. For authorized activities, include conditions of use that would avoid or minimize impacts to wilderness characteristics." See IM 2003-275.

Comment: *Garfield County insists that the BLM perform a cumulative analysis across agency boundaries within the County, the Richfield Field Office, and region to analyze and compare outstanding opportunities for solitude and primitive recreation.*

Response: 40 CFR 1508.7 and 40 CFR 1508.8 require BLM to address cumulative impacts, but non-WSAs with wilderness characteristics are not compared one against each other, rather each against a scale.

Comment: *In addition to analysis required by the County's General Management Plan, Garfield County also calls upon BLM to provide a detailed explanation of the rationale and authority for management of lands solely because of wilderness characteristics, and why such management does not circumvent the provisions of the statutorily required wilderness review process. Further, the BLM must fully disclose the rationale and evidence which it believes supports a changed finding for those lands found not to have*

wilderness characteristics in the first survey in the late 1970s and early 1980s. Such rationale and evidence must contain a discussion of the detailed criteria used, nature and extent of the review, detailed field notes, and all other relevant evidence and legal reasoning. See 43 U.S.C. § 1701(1) and Utah Code § 63-38d-401(6)(b).

Response: See Utah v. Norton. Refer to IMs 2003-274 and 275 for guidance regarding interpretation of the Utah v. Norton wilderness lawsuit settlement. See the *Land Use Planning Handbook*, H-1601-1, Section II, "Land Use Plan Decision." See Section 201 of FLPMA. All background information is available for review in the RFO. All rationale for the findings is included in the appendix of the handbook. BLM is in compliance with Utah v. Norton for reasons stated above. FLPMA specifically identifies "scenic values," "outdoor recreation," and other resource values as resources for inventory and management. See also 43 CFR 1711.

Comment: *In particular, BLM should not exercise its authority under section 202 of FLPMA in a manner that establishes, manages or otherwise treats public lands as wilderness unless those lands were congressionally designated as wilderness or were previously designated as wilderness study areas pursuant to section 603 of FLPMA.*

Response: BLM's authority for managing lands to protect or enhance wilderness characteristics comes directly from FLPMA Section 202 (43 U.S.C. §1712). This section of BLM's organic statute gives the Secretary of the Interior authority to manage public lands for multiple use and sustained yield. Nothing in this section constrains the Secretary's authority to manage lands as necessary to "achieve integrated consideration of physical, biological, economic, and other sciences." FLPMA, Section 202(c)(2) (43 U.S.C. §1712(c)(2)). Further, FLPMA makes it clear that the term "multiple use" means that not every use is appropriate for every acre of public land and that the Secretary can "make the most judicious use of the land for some or all of these resources or related services over areas large enough to provide sufficient latitude for periodic adjustments in use…" FLPMA, Section 103(c) (43 U.S.C. §1702(c)). FLPMA intended for the Secretary of the Interior to use land use planning as a mechanism for allocating resource use, including wilderness character management, among the various resources in a way that provides uses for current and future generations. BLM has long acknowledged that FLPMA Section 603 (43 U.S.C. §1782) requiring a one-time wilderness review has expired. All current inventory of public lands is authorized by FLPMA Section 201 (43 U.S.C. §1711). In September 2006, the Utah District Court affirmed that the BLM retained authority to protect lands it determined to have wilderness characteristics in a manner substantially similar to the manner in which such lands are protected when protected as WSAs.

Comment: *Section 3.3.12 on page 3-58 states "… units that are contiguous with federal lands with wilderness characteristics were evaluated for naturalness alone. Opportunities for solitude and primitive recreation were assumed to be present in association with the larger contiguous area." In contrast the Utah BLM's Statewide Wilderness Final Environmental Impact Statement (a multiyear, detailed study) determined and documented that only 24% of the land in the Mt. Pennell WSA had outstanding opportunities for solitude and 24% had outstanding opportunities for primitive recreation. Fiddler Butte had values of 35% and 45% respectively. In spite of the BLM's own determinations, the Richfield RMP assumed wilderness characteristics were present when, in the case of Mt. Pennell, it was three times as likely that wilderness characteristics were absent.*

Response: The evaluations completed by the RFO document the quality of all wilderness characteristic values including naturalness and outstanding opportunities for solitude and primitive recreation. The text within Section 3.3.12 has been corrected.

Comment: *BLM's latest reinventory effort contradicts those findings based on assumption, proximity to WSAs, and speculative analysis.*

Response: As part of its wilderness characteristics inventory maintenance, BLM used a combination of field checks, Interdisciplinary Team review of data such as range files, county and BLM GIS data, and review of high- resolution aerial photographs. The BLM's findings are described in the 1999–2003 wilderness reinventory documentation as well as the wilderness characteristics review process (findings from this review are available on the RFO planning website, and in the administrative record). The BLM is satisfied that it has used a high-standard approach to public land inventory and it stands by its findings, particularly those findings that involve wilderness characteristics inventory maintenance.

Comment: *Wilderness inventory unit number UT - 050 - 252, Clay Point is substantially identical to the Bullfrog Creek area characterized as containing 33,700 acres of wilderness characteristics. The Clay Point Unit Evaluation states the area obviously and clearly does not have potential for wilderness, based on the following rationale: This unit is heavily intruded by penetrating roads and roadways used in connection with grazing activities. Extensive stock watering reservoir development has also detracted from the naturalness of the unit. While some of the larger canyons may provide some opportunity for solitude or a primitive, unconfined type of recreation, these opportunities would be limited and somewhat less than "outstanding." A map accompanies the evaluation and depicts numerous roads and reservoirs within the unit boundary. BLM's current analysis is inconsistent with and contradicts the Wilderness Inventory Situation Evaluation completed in February of 1979.*

Response: The Clay Point area was evaluated in 1979 and 1996 to 1999 and was found not to possess wilderness characteristics. As part of BLM's wilderness characteristics inventory maintenance, BLM performed a combination of data and onsite reviews. This included specific field inspections, Interdisciplinary Team review of data such as range files, county and BLM GIS data, and high-resolution aerial photographs. The BLM's findings are described in the 1999–2003 wilderness reinventory documentation, as well as the 2007 wilderness characteristics review process (findings from this review are available on the RFO planning website, and in the administrative record). The BLM is satisfied that it has used a high-standard approach to public land inventory and it stands by its findings, particularly those findings that involved wilderness characteristics inventory maintenance.

Comment: *Wilderness inventory unit number UT - 50 - 253, Long Canyon corresponds to the Long Canyon non-WSA lands with wilderness characteristics. Originally, the initial inventory identified that the area may contain wilderness characteristics. The lands were carried forward to the intense inventory phase of the analysis. During the intensive inventory phase of the analysis, it was determined that the Long Canyon area did not offer outstanding opportunities for solitude or primitive unconfined type of recreation. The final determination completed in November of 1980 stated, " The unit was not proposed as a WSA due to lack of outstanding opportunities. The area lacks topographic and vegetative screening and primitive recreation opportunities are limited. No information was provided to change this proposal. It is recommended that this unit be dropped from further study." Without any documentation or analysis, other than the assumptions that are described in the RMP, the area now suddenly contains wilderness characteristics.*

Response: The Long Canyon area was first inventoried in 1979 and reinventoried in 1996 and some of the area was found not to possess wilderness characteristics. The reinventory in 1996 to 1999 also found that some of the area has wilderness characteristics and BLM stands by this determination. Garfield County was a participant in the 1996 to 1999 reinventory effort. Documentation is found in the appendices and case files in the RFO.

Comment: *BLM also failed to provide opportunities for Cooperating Agencies to be a full partner in alternative preparation, analysis, review of environmental analysis, and other aspects relating to Cooperating Agency status. One meeting was held where the BLM described what it was going to do. However, no effort was made to engage cooperators, consider their input, or to be consistent with the cooperators' policy, program or General Management Plans. Garfield County finds that such actions*

violate the MOU establishing Cooperating Agency status and constitute a failure to consider all reasonable alternatives. Garfield County calls upon the BLM to work with cooperators to resolve these issues and to use cooperators' information, proposals, an analysis to the maximum extent possible, consistent with its responsibilities as Lead Agency.

Response: Cooperating agency status was extended to federal, state, and local agencies, including Garfield County. The BLM provided opportunities for the cooperating agencies input. The BLM RFO held regular meetings with Garfield County during the development of the Draft RMP/EIS. the BLM asserts that it has complied with the MOU and has met the intent of federal, state, and local law. BLM will continue to involve cooperating agencies during the planning process. However, BLM makes the final land use planning decisions based on a balance of input from cooperating agencies, stakeholders, public comments, and the limitations imposed by federal law.

Comment: *In order to assist the BLM in their analysis, Garfield County is providing the following: Exhibit 2. Wilderness Table 3. A summary of BLM's findings as presented in the Statewide Wilderness Final EIS. Exhibit 3. A photocopy composite of the original inventory areas and lands designated by the Richfield field office as non-WSA lands with wilderness characteristics. Exhibit 4. Organic Act Directive number 78 - 61, change 2 Exhibit 5. Organic Act Directive number 78 - 61, change 3 Exhibit 7. Wilderness Inventory Situation Evaluation for Clay Point Exhibit 8. Wilderness Inventory Summary Sheet and accompanying data for Long Canyon.*

Response: The BLM is aware of the following items submitted by the commenter: Exhibit 2. Wilderness Table 3. A summary of BLM's findings as presented in the Statewide Wilderness Final EIS. Exhibit 3. A photocopy composite of the original inventory areas and lands designated by the RFO as non-WSA lands with wilderness characteristics. Exhibit 4. Organic Act Directive number 78 - 61, change 2 Exhibit 5. Organic Act Directive number 78 - 61, change 3 Exhibit 7. Wilderness Inventory Situation Evaluation for Clay Point Exhibit 8. Wilderness Inventory Summary Sheet and accompanying data for Long Canyon. These items were received late in the planning process and were considered by the BLM in preparing the Proposed RMP/Final EIS.

Comment: *It is in the best interests of the United States as well as the State of Utah that the Final RMP create a robust and effective program for land tenure adjustments.*

Response: BLM's mandate is to retain lands in federal management unless the lands meet the criteria specified in FLPMA Section 203 for sale and other disposal actions as provided for under other authorities (such as exchange, R&PP) as discussed under the “Lands and Realty Common to All Alternatives” section in Chapter 2, Table 2-18 of the Draft RMP/EIS.

Comment: *Garfield County finds the Draft RMP fails to address adequately these two major issues: The impact of BLM management decisions on state trust lands, and the need for a substantially more robust program for land tenure adjustments between the BLM and the State of Utah. BLM has an obligation to include in its planning an effective and timely means of addressing the impact of federal land actions on in-held school trust lands.*

Response: Regarding the first issue, an analysis of impacts on state trust lands was included under the socioeconomics section of the Draft RMP/EIS (Section 4.6.1). Regarding the second issue raised, during processing of any proposed land tenure adjustment, BLM is required through the planning process to notify and coordinate with adjacent landowners and other interested parties. BLM's mandate is to retain lands in federal management unless the lands meet the criteria specified in FLPMA Section 203 for sale and other disposal actions as provided for under other authorities (such as exchange, R&PP) as discussed under the “Lands and Realty Common to All Alternatives” section in Chapter 2, Table 2-18 of the Draft RMP/EIS.

Comment: *As part of the planning process, Garfield County submitted detailed maps depicting County rights that required access and insisted BLM accommodate the County's right by identifying reasonable routes to the specified sections. The RMP does not comply with Garfield County's request and has deleted the County's rights and adjoining access from RMP maps. A photocopy of the original submittal is included as Exhibit 9.*

Response: As described in the Draft RMP/EIS, the BLM used a variety of methods to inventory existing routes/ways within the RFO for consideration in the planning process, including Global Positioning System data (when available), data provided by the counties, map and orthophoto data, and staff/cooperator knowledge. Based on this inventory, the BLM identified 4,380 miles of routes/ways (Map 3-10 of the Draft RMP/EIS) within the RFO. It should be noted that route designations are implementation decisions and that the resulting transportation network could change over time. Management direction for OHVs is provided in 43 CFR 8340, BLM Manual 8340, and the BLM National OHV Management Strategy. Nothing in this RMP extinguishes any valid ROW, or alters in any way the legal rights the State of Utah and Garfield, Piute, Sanpete, Sevier and Wayne counties have to assert and protect RS 2477 rights, and to challenge in Federal court or other appropriate venue any use restrictions imposed by the RMP that they believe are inconsistent with their rights.

Comment: *It should also be noted that Garfield County has been informed by BLM officials that route designations depicted in alternative C and were derived solely from Southern Utah Wilderness Alliance submittals and did not consider coordination with cooperating agencies. It should also be noted that alternative D was developed entirely by the BLM without cooperating agency coordination. Both of these actions are a violation of the Memorandum of Understanding between Garfield County and the BLM defining their relationship and duties in the development of the Richfield RMP. The MOU states the BLM will Include the Cooperating Agency as a full partner in alternative preparation, analysis, review of environmental analysis of the alternatives, and all other aspects relating to Cooperating Agency status for the RMP.*

Response: The counties participated in the creation of the draft alternatives. CEQ regulations (40 CFR 1502.1) require BLM to consider reasonable alternatives, which would avoid or minimize adverse impacts or enhance the quality of the human environment, based on the nature of the proposal and facts in the case (CEQ 40 Most Asked Questions 1b.). The counties interests were considered in the range of alternatives. While there are many possible management prescriptions or actions, the BLM used the scoping process to determine a reasonable range alternatives that best addressed the issues, concerns, and alternatives identified by the public.

An Interdisciplinary team of resource specialist, with on-the-ground knowledge of the planning area, analyzed the current management situation, desired conditions, the uses and activities to create a framework to resolve the issues raised through the development of the alternatives. A balanced approach consistent with FLPMA’s principles of “multiple use” was a key component of the analysis.

The BLM RFO held regular meetings with Garfield County during the development of the Draft RMP/EIS. the BLM asserts that it has complied with the MOU and has met the intent of federal, state, and local law. BLM will continue to involve cooperating agencies during the planning process. However, BLM makes the final land use planning decisions based on a balance of input from cooperating agencies, stakeholders, public comments, and the limitations imposed by federal law.

Comment: *It should be noted that the vast majority of roads in Garfield County crossing BLM lands are under Garfield County jurisdiction. On July 2, 1993, in a response to Garfield County's FOIA request, the BLM identified approximately 20 roads as all of the routes in the Richfield Field Office that BLM claimed to be under federal jurisdiction. Notwithstanding Garfield County's objection that many of the 20 roads*

identified by the BLM cross private and state lands over which the County has a right of way and BLM does not, Garfield County questions the ability of the BLM to implement travel management actions.

Response: As specified in the Draft RMP/EIS, page 1-10, addressing RS 2477 assertions is beyond the scope of this planning effort. However, nothing extinguishes any ROW or alters in any way the legal rights the state and counties have to assert and protect RS 2477 rights.

Comment: *Impacting the highways without County approval is a violation of State law.*

Response: As specified in the Draft RMP/EIS, page 1-10, addressing RS 2477 assertions is beyond the scope of this planning effort. However, nothing extinguishes any ROW or alters in any way the legal rights the state and counties have to assert and protect RS 2477 rights.

Comment: *Unilateral action to restrict, close or impact County roads is a failure to be subject to valid existing rights, is a violation of collaborative rights doctrine and is not consistent to the maximum extent allowed by law with Garfield County's General Management Plan.*

Response: The document has been changed to remove the decision under VRM that identifies VRM Class IV setbacks for roads.

Comment: *BLM should evaluate habitats on a case-by-case basis to identify those that would be suitable for other management scenarios.*

Response: The BLM considered a wide range of alternatives including open area. For example, under Alternative N (No Action Alternative), 77 percent of the decision area is open to OHV use.

Comment: *Garfield County has identified and designated an OHV route system by ordinance. The BLM must be consistent to the maximum extent allowed by law with the local ordinance.*

Response: The BLM RFO is aware that the counties have updated their general management plans in 2007. The revised general management plan was provided to BLM late in the planning process and may need to be reviewed further in development of the Proposed RMP/Final EIS. The BLM is aware that there are specific county and state plan decisions relevant to aspects of public land management that are discrete from, and independent of, federal law. However, BLM is bound by federal law. The FLPMA requires that the development of an RMP for public lands must be coordinated and consistent with county plans, to the maximum extent possible by law, and inconsistencies between federal and non-Federal Government plans be resolved to the extent practical (FLPMA, Title II Sec. 202 (c)(9)). As a consequence, where state and local plans conflict with federal law, there will be an inconsistency that cannot be resolved or reconciled. Thus, while county and federal planning processes, under FLPMA, are required to be as integrated and consistent as practical, the federal agency planning process is not bound by or subject to county plans, planning processes, or planning stipulations. The BLM will identify these conflicts in the Proposed RMP/Final EIS, so that the state and local governments have a complete understanding of the impacts of the Proposed RMP on state and local management options. A consistency review of the Proposed RMP with the state and county master plans is included in Chapter 5.

Comment: *While we recognize the field office's efforts to date, the DEIS does not address consistency between neighboring jurisdictions' management objectives. We encourage the BLM to analyze the management objectives applicable to adjacent lands. We also encourage the BLM to disclose, as part of the Final EIS, specific areas of management conflict and steps the Richfield Field Office will take to resolve conflicting management objectives.*

Response: RFO has coordinated with the neighboring field offices on developing consistent management objectives. The BLM analyzed the management objectives applicable to adjacent lands and considered them in the development of the Proposed RMP.

Comment: *These RFDSs and alternatives constitute reasonably foreseeable actions and must be considered in cumulative impact analysis. They indicate how much development is anticipated to occur over the lifetime of the plans. Other federal agencies within the region may have ongoing plans or projections for management actions on their lands. Reasonably foreseeable future actions should be identified and considered as part of the analysis.*

Response: Section 4.7.3 of the Draft RMP/EIS includes a list of reasonably foreseeable future actions that were considered in the cumulative impact analysis. Projections, which have been developed for analytical purposes only, are based on current conditions and trends and represent a best professional estimate.

Comment: *To the extent that management actions are inconsistent with Garfield County's General Management Plan, Garfield County objects to the development of alternatives and analysis without County participation and finds it to be a violation of the Memorandum of Understanding associated with cooperating agency status, FLPMA and NEPA.*

Response: Cooperating agency status was extended to federal, state, and local agencies, including Garfield County. The BLM RFO held regular meetings with Garfield County during the development of the Draft RMP/EIS. BLM asserts that it has complied with the MOU and has met the intent of federal, state, and local law. BLM will continue to involve cooperating agencies during the planning process. However, BLM makes the final land use planning decisions based on a balance of input from cooperating agencies, stakeholders, public comments, and the limitations imposed by federal law.

The BLM RFO is aware that the counties have updated their general management plans in 2007. The revised general management plan was provided to BLM late in the planning process and may need to be reviewed further in development of the Proposed RMP/Final EIS. The BLM is aware that there are specific county and state plan decisions relevant to aspects of public land management that are discrete from, and independent of, federal law. However, the BLM is bound by federal law. The FLPMA requires that the development of an RMP for public lands must be coordinated and consistent with county plans, to the maximum extent possible by law, and inconsistencies between federal and non-Federal Government plans be resolved to the extent practical (FLPMA, Title II Sec. 202 (c)(9)). As a consequence, where state and local plans conflict with federal law there will be an inconsistency that cannot be resolved or reconciled. Thus, while county and federal planning processes, under FLPMA, are required to be as integrated and consistent as practical, the federal agency planning process is not bound by or subject to county plans, planning processes, or planning stipulations. The BLM will identify these conflicts in the Proposed RMP/Final EIS, so that the state and local governments have a complete understanding of the impacts of the Proposed RMP on state and local management options. A consistency review of the Proposed RMP with the state and county master plans is included in Chapter 5.

Comment: *BLM asserts it will honor all valid, existing rights. However, it appears that this statement may only apply to oil and gas, minerals, and grazing; no mention is made of water rights. Under Utah law, approved and perfected water rights are considered real property. BLM actions may affect the value of this real property. Because of this, the State Engineer recommends that the BLM consider the impact its actions may have on water rights in general and non-BLM water rights in particular.*

Response: BLM is obligated by law to honor valid, existing rights. Similarly, holders of valid, existing rights are obligated to honor federal laws regarding the use of federal lands for the exercise of those rights. BLM does not foresee frequent situations in which BLM's obligations under federal law would cause the agency to take actions that would prevent the holders from fully exercising their valid existing rights. BLM works diligently with the owners of valid, existing rights to prevent such situations from occurring. If the holder of a valid, existing right believes the BLM has taken an action that prevents the

exercise of that right, the proper venue for determining equitable compensation or mitigation is in a court of valid jurisdiction, not within the context of a land use plan.

Comment: *Failure to evaluate valid existing / RS 2477 rights and adopting planning scenarios that impact those rights is a failure to comply with the plans basic assumption that it is subject to valid and existing rights. Garfield County calls upon the BLM to work cooperatively with potential stakeholders prior to adopting any management action that impacts potential valid existing rights.*

Response: As specified in the Draft RMP/EIS, page 1-10, addressing RS 2477 assertions is beyond the scope of this planning effort. However, nothing extinguishes any ROW or alters in any way the legal rights the state and counties have to assert and protect RS 2477 rights.

Comment: *The RMP is replete with examples where the BLM failed to consider all reasonable alternatives and where the BLM failed to provide adequate rationale for exclusion of alternatives.*

Response: The CEQ regulations (40 CFR 1502.1) require BLM to consider reasonable alternatives, which would avoid or minimize adverse impacts or enhance the quality of the human environment, based on the nature of the proposal and facts in the case (CEQ 40 Most Asked Questions 1b.). While there are many possible management prescriptions or actions, the BLM used the scoping process to determine a reasonable range alternative that best addressed the issues, concerns, and alternatives identified by the public. In addition, alternatives were considered but eliminated from detailed analysis. These alternatives are discussed in Section 2.5 of this document.

Comment: *Example 1. VRM Alternative D evaluates a scenario where the vast majority of lands in Garfield County would be managed under the most restrictive VRM classification, Class 1. Adoption of this alternative would be a radical change and would create significant negative socioeconomic impacts to Garfield County. No alternative is considered where VRM restrictions are significantly reduced from the existing levels. In addition, the BLM has failed to consider VRM classifications identified in Garfield County's general management plan, which were developed considering ROS analysis, Garfield County's goals and objectives, and consistency across agency boundaries (elements omitted in the RMP process).*

Response: The range of alternatives includes the commenter’s proposal.

Comment: *Alternative C&D consider closure of a portion of the South Hatch Canyon Road complex.*

Response: The South Hatch Canyon Road complex is open under the Proposed RMP and Draft Alternatives A and N. BLM has provided a reasonable range of alternatives. As required by NEPA, the Draft RMP/EIS analyzes the current management (Alternative N). Each alternative, except for Alternative N, represents an alternative means of satisfying the identified purpose and need, and of resolving issues. The range of alternatives began early in the RMP process, starting with the public scoping period (April 2004 through February 2005) and was further developed throughout the process in coordination with our cooperating agencies and during the public comment period.

Comment: *Example 3. During the initial wilderness inventory process for the Clay Point area, UT - 050 - 252 (now known as the Bullfrog Creek non-WSA lands with wilderness characteristics) numerous roads and roadways were identified. The presence of these roads and roadways constituted a significant intrusion on the land and served as the basis for disqualifying the area for additional wilderness study. These roads have been formally inventoried by the BLM and are depicted on original wilderness inventory maps, but they have been omitted from every alternative. Additionally, Garfield County has emphatically called upon the BLM to include all known and/or inventoried roads paths and ways on maps depicting the transportation system in the RMP. A detailed inventory of the existing routes provides the advantage of: 1) documenting baseline information from which future unauthorized routes can be evaluated, 2) limiting the network over which RS 2477 assertions / conflicts exist, 3) accurately*

identifying areas of potential resource damage, and 4) accurately depicting existing conditions. Omitting known and documented routes from the evaluation process is a failure to consider all reasonable alternatives.

Response: The BLM used a variety of data sources to provide the baseline for the route designation decisions. Disclosing new ways within WSAs is beyond the scope of this plan. The route inventory within WSAs is based on the initial wilderness inventory (1979–1990). In 1996–1999, this area was reinventoried and all existing information was reconsidered, including the routes in the Clay Point area. Substantial portions of the inventory area were found to lack wilderness characteristics because of the presence of these routes. These routes are included in the route inventory.

Comment: *If BLM excludes cooperating agencies from additional involvement in the RMP process, or if the BLM fails to consider and/or describe alternatives presented by cooperating agencies and depicted in local management plans, Garfield County considers it an intentional abrogation of federal responsibility to consider all reasonable alternatives.*

Response: The counties participated in the creation of the draft alternatives. CEQ regulations (40 CFR 1502.1) require BLM to consider reasonable alternatives, which would avoid or minimize adverse impacts or enhance the quality of the human environment, based on the nature of the proposal and facts in the case (CEQ 40 Most Asked Questions 1b.). The counties interests were considered in the range of alternatives. While there are many possible management prescriptions or actions, the BLM used the scoping process to determine a reasonable range alternatives that best addressed the issues, concerns, and alternatives identified by the public.

An Interdisciplinary team of resource specialist, with on-the-ground knowledge of the planning area, analyzed the current management situation, desired conditions, the uses and activities to create a framework to resolve the issues raised through the development of the alternatives. A balanced approach consistent with FLPMA's principles of "multiple use" was a key component of the analysis.

Comment: *The County has concerns that the BLM's identification of VRM inventory classes has led to a self effectuating class protection scheme, rather than a source of information to be considered within the proposed resource use allocation schemes within each of the Draft's alternatives.*

Response: The VRI is based on criteria that provide for the objective evaluation of a landscape. The VRI is not the on-the-ground management tool. It is used to develop the VRM classes, with consideration from other resource activities.

Comment: *In short, there is a "win-win" solution which the Counties would ask the BLM to consider as it fine tunes and finalizes the Factory Butte Recreation plan portion of the Richfield DRMP/EIS. This "win-win" compromise plan is within the parameters of the range of alternatives which have been scoped and studied in the Richfield EIS process.*

Response: BLM has considered the proposals submitted by several commenters. The commenters' proposal is included within the range of alternatives considered within the Draft RMP/EIS. The Proposed RMP/Final EIS has been revised to address the proposal and the commenters' concerns. Several surveys and clearances will be required to identify the location of specific trails. The exact location of any trails will be clearly marked. The general location of trails, kiosks, fences, and other facilities is identified in the Proposed RMP/Final EIS. The location of these facilities will be specified in activity-level planning. The area will be strictly monitored to include compliance with the plan. Following BLM policy, the RFO will take a cooperative management approach to implement the plan.

Comment: *BLM's duty under Kimball was to analyze the effects of current alternatives on any alleged wilderness characteristics that may be found in the Subject Lands, not to create a non-impairment*

management standard as to those characteristics. The DRMP/EIS would turn the Kimball decision on its head by purporting to so manage the Subject Lands.

Response: BLM's authority for managing lands to protect or enhance wilderness characteristics comes directly from FLPMA Section 202 (43 U.S.C. §1712). This section of BLM's organic statute gives the Secretary of the Interior authority to manage public lands for multiple use and sustained yield. Nothing in this section constrains the Secretary's authority to manage lands as necessary to "achieve integrated consideration of physical, biological, economic, and other sciences." FLPMA, Section 202(c)(2) (43 U.S.C. §1712(c)(2)). Further, FLPMA makes it clear that the term "multiple use" means that not every use is appropriate for every acre of public land and that the Secretary can "make the most judicious use of the land for some or all of these resources or related services over areas large enough to provide sufficient latitude for periodic adjustments in use…" FLPMA, Section 103(c) (43 U.S.C. §1702(c)). FLPMA intended for the Secretary of the Interior to use land use planning as a mechanism for allocating resource use, including wilderness character management, among the various resources in a way that provides uses for current and future generations. BLM has long acknowledged that FLPMA Section 603 (43 U.S.C. §1782) requiring a one-time wilderness review has expired. All current inventory of public lands is authorized by FLPMA Section 201 (43 U.S.C. §1711). In September 2006, the Utah District Court affirmed that the BLM retained authority to protect lands it determined to have wilderness characteristics in a manner substantially similar to the manner in which such lands are protected when protected as WSAs. Finally, the Utah v. Norton Settlement Agreement does not affect BLM's authority to manage public lands. This agreement merely remedied confusion by distinguishing between WSAs established under FLPMA § 603 and required to be managed under § 603's non-impairment standard, and other lands that fall within the discretionary FLMPA § 202 land management process. See also IM 2003-275.

Comment: *Thus the proposal to so manage the Subject Lands squarely contradicts the BLM's own IM 2003-275.*

Response: BLM's authority for managing lands to protect or enhance wilderness characteristics comes directly from FLPMA Section 202 (43 U.S.C. §1712). This section of BLM's organic statute gives the Secretary of the Interior authority to manage public lands for multiple use and sustained yield. Nothing in this section constrains the Secretary's authority to manage lands as necessary to "achieve integrated consideration of physical, biological, economic, and other sciences." FLPMA, Section 202(c)(2) (43 U.S.C. §1712(c)(2)). Further, FLPMA makes it clear that the term "multiple use" means that not every use is appropriate for every acre of public land and that the Secretary can "make the most judicious use of the land for some or all of these resources or related services over areas large enough to provide sufficient latitude for periodic adjustments in use…" FLPMA, Section 103(c) (43 U.S.C. §1702(c)). FLPMA intended for the Secretary of the Interior to use land use planning as a mechanism for allocating resource use, including wilderness character management, among the various resources in a way that provides uses for current and future generations. BLM has long acknowledged that FLPMA Section 603 (43 U.S.C. §1782) requiring a one-time wilderness review has expired. All current inventory of public lands is authorized by FLPMA Section 201 (43 U.S.C. §1711). In September 2006, the Utah District Court affirmed that the BLM retained authority to protect lands it determined to have wilderness characteristics in a manner substantially similar to the manner in which such lands are protected when protected as WSAs. Finally, the Utah v. Norton Settlement Agreement does not affect BLM's authority to manage public lands. This agreement merely remedied confusion by distinguishing between WSAs established under FLPMA § 603 and required to be managed under § 603's non-impairment standard, and other lands that fall within the discretionary FLMPA § 202 land management process. See also IM 2003-275.

Comment: *Managing the Subject Lands According to the Prescriptions Outlined in Alternative D Would Clash With State and Local Policies and Plans for Managing Those Lands, and Would Thus Violate the Consistency Requirement of FLPMA Section 202(c)(9).*

Response: Alternative D is within the range of alternatives considered in the Draft RMP/EIS as required by NEPA. Any of the alternatives would be implementable under federal law. FLPMA requires that the development of an RMP for public lands must be coordinated and consistent with county plans, to the maximum extent possible by law, and inconsistencies between federal and non-Federal Government plans be resolved to the extent practical (FLPMA, Title II Sec. 202 (c)(9)). As a consequence, where state and local plans conflict with federal law, there will be an inconsistency that cannot be resolved or reconciled.

Comment: *Managing the subject lands according to the prescriptions outlined in Alternative D would arbitrarily and capriciously ignore the documentation and information submitted by Garfield County, which shows the subject lands lack true wilderness character.*

Response: The BLM considered the County's inventory in developing the Proposed RMP, and based upon all available information BLM carried forward 78,600 acres (12 percent) of the 682,600 acres of non-WSA lands with wilderness characteristics identified in the Draft RMP Alternative D. The presence or absence of man-made intrusions does not mean that an area does not possess wilderness characteristics. It is the cumulative significance of these features that determines whether an area possesses wilderness characteristics. As part of its wilderness characteristics inventory maintenance, BLM used a combination of field checks, Interdisciplinary Team review of data such as range files, county and BLM GIS data, and review of high-resolution 2006 aerial photographs. Having reviewed the information submitted and determined that the information is not new and significant BLM stands by its determination.

Comment: *A proper baseline should be established that is based on average case scenarios as opposed to worse case scenarios.*

Response: The "Air Quality Impact Analysis" section of the Proposed RMP/Final EIS includes baseline emission calculations. BLM stands by the assumptions on page 4-7 of the Draft RMP/EIS: "The most conservative case assumptions for air quality were used for the qualitative analysis. When a range of activity factors was assumed, the upper limit of the range was used to complete calculations for future time frames."

Comment: *Garfield County opposes any statement in the DRMP/EIS which purports to continue to manage eligible river segments, or presumptively suitable segments, as if those segments may some day be included in the National Wild and Scenic River system. Congress conferred no such interim management authority on the BLM.*

Response: Management protection afforded rivers is found in Section 5(d) of the Wild and Scenic River Act and depends on whether the identified river segment is found eligible or suitable. River segments found eligible are managed at the discretion of the administering agency to protect free-flow, outstandingly remarkable values and tentative classification until a suitability determination is made; rivers found suitable are managed at the discretion of the administering agency for the same values and recommended classification pending congressional action or for the duration of the RMP, but not as a designated WSR, which is specified by Congress. Management prescriptions under both suitability and eligibility phases are subject to valid existing rights.

Comment: *Particularly offensive and antithetical to Utah State water law and water rights is any statement in the DRMP/EIS which purports to prohibit impoundments, diversions, channelizations and rip-rapping on any river segment in Garfield County. Garfield County grieves this provision as a frontal assault on state-administered water rights duly adjudicated under Utah's water law system and constitutes.*

Response: BLM is obligated by law to honor valid, existing rights. Similarly, holders of valid, existing rights are obligated to honor federal laws regarding the use of federal lands for the exercise of those

rights. These types of developments or improvements the commenter references are implementation-level actions that would be considered on a site-specific basis and assessed with site-specific NEPA analysis.

Comment: *Moreover, Garfield County believes that BLM's process by which it attempted to study Wild & Scenic River suitability is procedurally flawed by its failure to follow NEPA procedures and Wild and Scenic guidelines for determining suitability.*

Response: The Wild and Scenic Rivers Act of 1968 (16 U.S.C. 1271-1287) preserves "selected" rivers and their immediate environments that contain outstandingly remarkable scenic, recreational, geologic, fish and wildlife, historic, cultural, or other similar values "in their free-flowing condition" (16 U.S.C. 1271). The BLM evaluates identified river segments for their eligibility and suitability for designation under the Wild and Scenic Rivers Act through the RMP process; evaluations cannot be completed through the activity-level planning effort (BLM Manual 8351.06 (B). The RFO followed the Wild and Scenic Rivers Act, the Inter-agency Agreement, the Inter-agency Wild and Scenic Rivers Coordinating Council Guidelines (Wild and Scenic Rivers Reference Guide), and IM -2004-196 in determined eligibility and suitability.

Comment: *Of particular concern is any language in the DRMP/EIS that would accept whatever wildlife herd number objective which UDWR may give to BLM, if accepting that herd number means BLM has to place more active use livestock AUMs in suspension.*

Response: There is no decision in the Draft RMP/EIS that specifically links forage allocation levels to Utah Department of Wildlife Resources (UDWR) herd objectives. However, the decision in Chapter 2 of the Draft RMP/EIS does recognize DWR's responsibility to manage wildlife populations and directs future management to recognize and coordinate with UDWR on management plans.

Comment: *To the extent any alternative in the DRMP/EIS may propose to transfer those AUMs to wildlife or to watersheds, this would be counter to the aforementioned state statute, Garfield County's general plan, as well as BLM regulations that provide for non-use.*

Response: There is no decision in the Draft RMP/EIS that specifically links forage allocation levels to UDWR herd objectives.

Comment: *Any alternative in the DRMP/EIS that would purport to transfer grazing animal unit months (AUMs) to wildlife for supposed reasons of rangeland health is illogical and ignores BLM's direction for resolving such issues. There is already imputed, in each AUM, a reasonable amount of forage for the wildlife component.*

Response: There is no decision in the Draft RMP/EIS that specifically transfers AUMs to wildlife for reasons of rangeland health.

Comment: *Any grazing animal unit months that may have been reduced in the RFO planning area due to rangeland health concerns should be restored to livestock when rangeland conditions improve, not converted to wildlife use.*

Response: Per the 43 CFR 4100 regulation, suspended AUMs are restored to the operator to the amount of the suspension if conditions allow. Beyond this, AUMs are allocated to livestock or wildlife depending on the allotment objectives contained in the RMP and Rangeland Program Summary.

Comment: *Any transfer of AUMs to wildlife violates the Taylor Grazing Act, 43 U.S.C. § 315, FLPMA, 43 U.S.C. § 1742, and the terms of the Executive Orders No. 6910, 54 I.D. 539 (1934), and No. 6964 (Feb. 5, 1935), which withdrew public lands as chiefly valuable for grazing. Any such decision would also require amending the Presidential Executive Orders, which BLM cannot do, since authority to amend a withdrawal is limited to the Interior Secretary. The Tenth Circuit in Public Lands Council v.*

Babbitt, 167 F.3d 1287 (lOthCir.1999), aff'd on other grounds, 529 U.S. 728 (2000), held that BLM could not offer permits not to have domestic livestock graze public lands, since grazing permits are limited to domestic livestock. By the same token, BLM cannot purport to authorize wildlife grazing by retiring grazing permits in order to allocate the forage for wildlife. This action would also constitute a change in grazing use without following the procedures set out in the BLM grazing rules. 43 C.F.R. §§ 4110.3, 4110.4. It is also inconsistent with the grazing rules which provide for BLM to offer a vacant permit to other qualified permittees. 43 C.F.R. §4130.1-2.

Response: This Draft RMP/EIS does not authorize the retirement of grazing permits and their automatic reallocation to wildlife. If such an action were to be proposed in the future, a separate NEPA document would be prepared to analyze the impacts of an amendment to the land use plan. This process is described on page 2-40 of the Draft RMP/EIS.

Comment: *Where BLM has failed to consider resources / resource use in Garfield County and outside Richfield Field Office boundaries, Garfield County calls upon the BLM to defer to the County's General Management Plan as more detailed and accurate.*

Response: The RFO has coordinated with the neighboring field offices on developing consistent management across field office boundaries. The BLM field office boundaries are set by the Utah State office in cooperation with the Washington office. Therefore setting the boundaries would be beyond the scope of this RMP.

Comment: *Inasmuch as Alternative A moves from a open OHV use system to a designated OHV use system the statement that this alternative is the least restrictive is incorrect.*

Response: The text was updated to show that Alternative N is the least restrictive alternative.

Comment: *Garfield County is in the process of finalizing its Paleontological resource protection ordinance. The ordinance is patterned after the counties cultural resource protection ordinance and calls upon the BLM to conduct detailed inventories identifying Paleontological resources. The County is unsure how Paleontological inventories in Class I and Class II areas relate to the County's policy, program and intended General Management Plan. Garfield County calls upon the BLM to protect Paleontological resources while at the same time expanding opportunities for public use, enjoyment and interpretation.*

Response: No paleontological inventories in class I and class II areas have been proposed or required in Chapter 2 of the Draft RMP/EIS. BLM paleontological resource management policy is to identify, evaluate, and, where appropriate, protect scientifically significant paleontological resources, ensuring that proposed land uses, initiated or authorized by BLM, do not inadvertently damage or destroy these resources (BLM Manual 8270, *Paleontological Resource Management*).

Comment: *Garfield County has developed a detailed visual resource management plan and calls upon the BLM to be consistent to the maximum extent allowed by law with the County's plan. It is recognized that officially designated WSAs may need to be protected with overly restrictive management classifications until Congress acts. Garfield County's plan anticipates release of such units during the life of the plan and calls upon the BLM to be consistent to the maximum extent allowed by law with Garfield County's visual resource management plan.*

Response: The BLM RFO is aware that the counties have updated their general management plans in 2007. The revised general management plan was provided to BLM late in the planning process and was considered in development of the Proposed RMP/Final EIS.

Comment: *None of the alternatives provide increased AUMs.*

Response: It is BLM policy to monitor existing livestock use levels, forage utilization, and the trend of resource condition and make necessary adjustments on an allotment or watershed basis. These actions are activity-based actions and are part of the implementation of an RMP to ensure that Standards for Rangeland Health are met, as well the other objectives of the RMP. Regulations in 43 CFR 4130.3 require that the terms and conditions under which livestock are authorized "ensure conformance with the provisions of subpart 4180," the Standards for Rangeland Health and further 43 CFR 4130.3-1 requires that "livestock grazing use shall not exceed the livestock carrying capacity of the allotment."

It would be inappropriate and unfeasible to estimate variable levels of livestock and wildlife use and determine what specific changes to livestock and wildlife numbers and management are appropriate at the RMP planning level. Such changes would not be supportable and need to be made by considering the monitoring data on a site-specific basis. The BLM policy directs that monitoring and inventory data be evaluated on a periodic basis and that change to livestock numbers and management be made through a proposed decision under 43 CFR 4160. These implementation level decisions will be in conformance with the Goals and Objectives of the applicable RMP and must protect and enhance the conditions and uses of BLM lands.

Comment: *The County's policy, program and plan identified visitor goals and development associated with SRMA establishment. The County's plan also requires certain deliverables associated with development, infrastructure, financing, and visitation. None of the alternatives meet the County's criteria.*

Response: The Draft RMP/EIS Section 3.4.3.1, regarding RMAs, addresses the criteria that were used to identify the SRMAs. These criteria are based on BLM policies and regulations (43 CFR 8342.1). SRMAs were based on these criteria. Sahara Sands was analyzed for SRMA identification in Alternative A in conjunction with an open OHV area. The Sahara Sands area is not identified as an SRMA in the Proposed RMP.

Comment: *However, Garfield County insists the BLM has failed to fulfill its responsibility to provide for all types of recreation. Garfield County's General Management Plan has found that 3% to 5% of the County needs to be set aside for open OHV use.*

Response: The BLM considered a wide range of alternatives including open area. For example, under Alternative N, 77 percent of the decision area is open to OHV use.

Comment: *Consequently, the BLM should not identify routes for closure that are not under its jurisdiction. Furthermore, Garfield County asserts that the roads identified for closure are valid existing rights under local control. BLM's planning authority is subject to valid existing rights, and closures should not occur until final resolution of jurisdiction is complete.*

Response: As specified in the Draft RMP/EIS, page 1-10, addressing RS 2477 assertions is beyond the scope of this planning effort. However, nothing extinguishes any ROW or alters in any way the legal rights the state and counties have to assert and protect RS 2477 rights.

Comment: *Garfield County also questions the descriptions in the alternative and indicating the VRM class for all WSAs is currently Class I. The Utah BLM Statewide Wilderness Final EIS identifies many of the lands as being a different VRM class. Unless the BLM has gone through a formal planning process re-designating the VRM class, existing VRM classes should be described as contained in the BLM's wilderness document.*

Response: IM-2000-96 states "it is the Bureau position… that all WSAs should be classified as Class I, and managed according to VRM Class I management objectives until such time as the Congress decides to designate the area as wilderness or release it for other uses." The IM further explains "…the VRM management objectives are being used to support WSA management objectives. For WSAs, this is not

only about visual values as many WSAs do not necessarily contain exceptionally high scenic values. The primary objective of WSA management is to retain the WSA's natural character essentially unaltered by humans during the time it is being managed as a WSA." As the VRM I objective is to "preserve the existing character of the landscape" (BLM-H-8410), such a designation would complement WSA management as explained in the IMP.

Comment: *Garfield County also finds the BLM has failed to inventory, identifying and disclosed routes that are known to exist within WSAs and that are asserted as valid and existing rights by Garfield County.*

Response: Management of routes/ways within WSAs is limited to those routes/ways that were identified in the original FLPMA 603 wilderness review. Route inventories beyond those routes/ways is outside the scope of this RMP effort. As specified in the Draft RMP/EIS, addressing RS 2477 assertions is beyond the scope of this planning effort. However, nothing extinguishes any ROWs or alters in any way the legal rights the state and counties have to assert and protect RS 2477 rights. Data errors were noted on the maps within the DRMP/DEIS. Those errors have been corrected to reflect only inventoried ways within the WSAs.

Comment: *Garfield County submitted a detailed transportation plan identifying road repair, road rehabilitation, road construction, and maintenance standards appropriate to specific areas as identified in the BLM Land Use Planning Handbook. The draft RMP makes no reference to those proposals, and it appears that the BLM has failed to consider them.*

Response: Garfield County has been an active participant in developing the transportation plan and has provided information that was incorporated in the DRMP/EIS.

Comment: *Certain land tenure adjustments and Recreation & Public Purpose projects may transfer jurisdiction of the of existing federal lands to state or local authority. Garfield County opposes retention of riparian areas in federal control, when transfer to another level of government would provide greater public benefit.*

Response: Current federal laws and regulations govern the management and protection of riparian areas. Issues concerning site-specific riparian areas are addressed on a case-by-case basis.

Comment: *Garfield County has a detailed Protection of Cultural Resources Ordinance. Garfield County calls upon the BLM to be consistent to the maximum extent allowed by law with Garfield County's cultural resource ordinance.*

Response: BLM is aware that there are specific county and state plan decisions relevant to aspects of public land management that are discrete from, and independent of, federal law. However, BLM is bound by federal law. FLPMA requires that the development of resource management planning for public land must be coordinated with and consistent with county plans to the extent the Secretary finds practical by law, and resolve to the extent practicable, inconsistencies between federal and non-Federal Government plans (FLPMA, Title II Sec. 202 (c) (9)). As a consequence, where state and local plans conflict with federal law there will be an inconsistency that cannot be resolved or reconciled. Thus, while county and federal planning processes, under FLPMA, are required to be as integrated and consistent as practicable, the federal agency planning process is not bound by or subject to county plans, planning processes, or planning stipulations. BLM will identify these conflicts in the Proposed RMP/Final EIS so that the state and local governments have a complete understanding of the impacts of the Proposed RMP on state and local management options. A consistency review of the Proposed RMP with the state and county master plans has been included in Chapter 5.

Comment: *Garfield County's General Management Plan calls upon the BLM and other federal agencies to assist Garfield County in developing a local academic curational research facility to protect cultural*

and Paleontological resources. Targeting Paleontological resources for excavation and curation by outside facilities is inconsistent with Garfield County's no net loss of Paleontological resources policy.

Response: BLM paleontological resource management policy is to identify, evaluate, and, where appropriate, protect scientifically significant paleontological resources, ensuring that proposed land uses, initiated or authorized by BLM, do not inadvertently damage or destroy these resources (BLM Manual 8270, *Paleontological Resource Management*). BLM policy also requires the facilitation of appropriate scientific, educational, and recreational uses of paleontological resources, such as research and interpretation.

Comment: *See General Comments associated with visual resource management. In as much as visual resource management is largely a discretionary function, that designation of management classes and visual resource inventories are tempered with considerations for other land uses and that visual management classes may differ from inventory classes based on management priorities for land uses, Garfield County calls upon the BLM to strictly conform to Garfield County's visual resource management classes. Failure to conform to the County's VRM designation is inconsistent with the County plan to the maximum extent allowed by law.*

Response: BLM is required by FLPMA to manage for scenic resources. BLM meets this responsibility through the VRM program. Guidance regarding the VRI is included in BLM Handbook H-8410 and VRM in BLM Handbook H-8431. The BLM is aware that there are specific county and state plan decisions relevant to aspects of public land management that are discrete from, and independent of, federal law. However, the BLM is bound by federal law. The FLPMA requires that the development of an RMP for public lands must be coordinated and consistent with county plans, to the maximum extent possible by law, and inconsistencies between federal and non-Federal Government plans be resolved to the extent practical (FLPMA, Title II Sec. 202 (c)(9)). As a consequence, where state and local plans conflict with federal law, there will be an inconsistency that cannot be resolved or reconciled. Thus, while county and federal planning processes, under FLPMA, are required to be as integrated and consistent as practical, the federal agency planning process is not bound by or subject to county plans, planning processes, or planning stipulations. The BLM will identify these conflicts in the Proposed RMP/Final EIS, so that the state and local governments have a complete understanding of the impacts of the Proposed RMP on state and local management options.

Comment: *BLM has failed to analyze the cumulative effects of managing all WSAs as VRM Class I Alternatives considered in other RMPs being conducted throughout the state constitute a reasonably foreseeable action. Failure to consider the cumulative effects of all reasonably foreseeable actions violates NEPA.*

Response: The Draft RMP/EIS addresses the cumulative effects of managing WSAs as VRM Class I within the RFO and adjacent public lands as described in Section 4.7.4.1.6 in this document. The cumulative effects boundary includes the RFO and adjacent public lands and not the entire state.

Comment: *See Garfield County's General Comments associated with visual resource management. BLM failed to analyze a full range of alternatives considering visual resource management. The BLM failed to analyze a Class IV status for many non-WSA lands in Garfield County; the BLM failed to analyze the impacts of non-federal lands on VRM designations; and the BLM failed to include alternatives consistent with Garfield County's General Management Plan. The BLM also failed to analyze impacts associated with managing non-recommended WSA lands for Class I status.*

Response: The Draft RMP/EIS included a reasonable range of alternatives that considered various VRM alternatives. Alternative A of the Draft RMP/EIS analyzed a VRM Class IV for much of the non-WSA lands in Garfield County. The “Cumulative Impacts” section, 4.7.4.1.6 in this document, analyzes the

impacts to visual resources from past, present, and reasonably foreseeable future actions on non-federal lands.

Comment: *Application of the wilderness standard for roads traversing non-WSA lands is inconsistent with Garfield County's General Management Plan and applies wilderness standards without proper authority.*

Response: The BLM RFO is aware that the counties have updated their general management plans in 2007. The revised general management plan was provided to BLM late in the planning process and may need to be reviewed further in development of the Proposed RMP/Final EIS. BLM is aware that there are specific county and state plan decisions relevant to aspects of public land management that are discrete from, and independent of, federal law. However, BLM is bound by federal law. The FLPMA requires that the development of an RMP for public lands must be coordinated and consistent with county plans, to the maximum extent possible by law, and inconsistencies between federal and non-Federal Government plans be resolved to the extent practical (FLPMA, Title II Sec. 202 (c)(9)). As a consequence, where state and local plans conflict with federal law there will be an inconsistency that cannot be resolved or reconciled. Thus, while county and federal planning processes, under FLPMA, are required to be as integrated and consistent as practical, the federal agency planning process is not bound by or subject to county plans, planning processes, or planning stipulations. BLM will identify these conflicts in the Proposed RMP/Final EIS, so that the state and local governments have a complete understanding of the impacts of the Proposed RMP on state and local management options. A consistency review of the Proposed RMP with the state and county master plans is included in Chapter 5.

BLM's authority for managing lands to protect or enhance wilderness characteristics comes directly from FLPMA Section 202 (43 U.S.C. §1712). This section of BLM's organic statute gives the Secretary of the Interior authority to manage public lands for multiple use and sustained yield. Nothing in this section constrains the Secretary's authority to manage lands as necessary to "achieve integrated consideration of physical, biological, economic, and other sciences." FLPMA, Section 202(c)(2) (43 U.S.C. §1712(c)(2)). Further, FLPMA makes it clear that the term "multiple use" means that not every use is appropriate for every acre of public land and that the Secretary can "make the most judicious use of the land for some or all of these resources or related services over areas large enough to provide sufficient latitude for periodic adjustments in use…" FLPMA, Section 103(c) (43 U.S.C. §1702(c)). FLPMA intended for the Secretary of the Interior to use land use planning as a mechanism for allocating resource use, including wilderness character management, among the various resources in a way that provides uses for current and future generations. BLM has long acknowledged that FLPMA Section 603 (43 U.S.C. §1782) requiring a one-time wilderness review has expired. All current inventory of public lands is authorized by FLPMA Section 201 (43 U.S.C. §1711). In September 2006, the Utah District Court affirmed that the BLM retained authority to protect lands it determined to have wilderness characteristics in a manner substantially similar to the manner in which such lands are protected when protected as WSAs. Finally, the Utah v. Norton Settlement Agreement does not affect BLM's authority to manage public lands. This agreement merely remedied confusion by distinguishing between WSAs established under FLPMA § 603 and required to be managed under § 603's non-impairment standard, and other lands that fall within the discretionary FLMPA § 202 land management process. See also IM 2003-275.

Comment: *The BLM has asserted a disputed jurisdictional claim over a very small number of roads in Garfield County, and the BLM has made no attempt to identify the roads to which this criteria applies. Failing to identify roads to which the criteria applies, prohibits the BLM from accurately analyzing impacts.*

Response: As specified in the Draft RMP/EIS, page 1-10, addressing RS 2477 assertions is beyond the scope of this planning effort. However, nothing extinguishes any ROW or alters in any way the legal rights the state and counties have to assert and protect RS 2477 rights.

Comment: *It should also be noted that the vast majority of roads managed, owned and/or maintained by Garfield County fall outside of the criteria. The roads are classified as High Standard Dirt roads, Low Standard Gravel roads and Low Standard Paved roads. If BLM intends to classify roads by maintenance level and surface types, it needs to allow highway management entities the opportunity to evaluate classification standards and applications.*

Response: The document has been changed to remove the decision under VRM that identifies VRM Class IV setbacks for roads.

Comment: *Garfield County does not believe the Sahara Sands area meets criteria established in Garfield County's General Management Plan associated with SRMA development.*

Response: The Draft RMP/EIS Section 3.4.3.1, regarding RMAs, addresses the criteria that were used to identify the SRMAs. These criteria are based on BLM policies and regulations (43 CFR 8342.1). SRMAs were based on these criteria. Sahara Sands was analyzed for SRMA identification in Alternative A in conjunction with an open OHV area. The Sahara Sands area is not identified as an SRMA in the Proposed RMP.

Comment: *Garfield County recognizes the need to control large groups and individuals. However, the limits placed in this alternative-are such that large families, use groups, classes, and Scout troops would be required to have special use permits. Garfield County is willing to consider such permits. However, at this point, the complexity of the permits and the difficulty in obtaining the permits has not been determined. Therefore, Garfield County opposes as alternative.*

Response: 43 CFR 2932 authorizes Special Recreation Permits (SRPs) for organized group activities and event. The RMP establishes thresholds by which organized groups would need to file an application to obtain an SRP for their proposed activities. The proposed activities would then be reviewed to determine if an SRP would be required or if the activities would constitute casual use. Resource impacts and conflicts have occurred from large groups such as those listed within the comment.

Comment: *A detailed inventory needs to be completed identifying all routes. Cooperative efforts need to be it initiated to evaluate motorized use in WSAs on a case-by-case basis, all subject to valid existing rights.*

Response: Designation of WSAs and additions to current vehicle route inventories in WSAs is beyond the scope of this plan. Valid, existing rights are recognized in WSAs.

Comment: *BLM should also take note that more than 1,000 mining claims have been filed in Garfield County in recent weeks. The BLM must incorporate appropriate management actions in the RMP to address these mining claims.*

Response: The BLM does not have discretion as to entry and location of mining claims on open, unappropriated, public lands and does not have the discretion to determine mitigations for mining claims at the time of location. However, the BLM does have discretion to make public lands open to entry or to close lands (e.g., withdraw certain public lands from the operations of the mining laws). The BLM also has authority through FLPMA, the federal regulations in 43 CFR 3809, and other federal laws and regulations as applicable to regulate mining-related operations and the surface disturbances that would be incident to those operations. The BLM regulates mining-related operations on public lands to prevent unnecessary or undue degradation and to ensure the operation is reasonably incident to mining.

Comment: *In as much as Garfield County has developed a detailed transportation management plan, and the BLM has failed to perform similar planning functions during the RMP process, Garfield County calls upon the BLM to be consistent with Garfield County's Transportation Plan and OHV Ordinance.*

Response: The BLM RFO is aware that the counties have updated their general management plans in 2007. The revised general management plan was provided to BLM late in the planning process and may need to be reviewed further in development of the Proposed RMP/Final EIS. The BLM is aware that there are specific county and state plan decisions relevant to aspects of public land management that are discrete from, and independent of, federal law. However, the BLM is bound by federal law. The FLPMA requires that the development of an RMP for public lands must be coordinated and consistent with county plans, to the maximum extent possible by law, and inconsistencies between federal and non-Federal Government plans be resolve to the extent practical (FLPMA, Title II Sec. 202 (c)(9)). As a consequence, where state and local plans conflict with federal law, there will be an inconsistency that cannot be resolved or reconciled. Thus, while county and federal planning processes, under FLPMA, are required to be as integrated and consistent as practical, the federal agency planning process is not bound by or subject to county plans, planning processes, or planning stipulations. The BLM will identify these conflicts in the Proposed RMP/Final EIS, so that the state and local governments have a complete understanding of the impacts of the Proposed RMP on state and local management options. A consistency review of the Proposed RMP with the state and county master plans is included in Chapter 5.

Comment: *If BLM does have a detailed analysis has misled cooperating agencies and the public by indicating and non-WSA lands with wilderness characteristics are described in Utah Wilderness Inventory, 1999. Garfield County calls upon the BLM to remove any analysis, which is not based on detailed inventories.*

Response: As part of its wilderness characteristics inventory maintenance, BLM used a combination of field checks, Interdisciplinary Team review of data such as range files, county and BLM GIS data, and review of high- resolution aerial photographs. The BLM's findings are described in the 1999–2003 wilderness reinventory documentation as well as the wilderness characteristics review process (findings from this review are available on the RFO planning website, and in the administrative record). The BLM is satisfied that it has used a high-standard approach to public land inventory and it stands by its findings, particularly those findings involving wilderness characteristics inventory maintenance.

Comment: *It should be noted that during the working phase of the RMP numerous routes for identified by BLM and cooperating agencies that have not been included on the route inventory. Some of these routes were missed in previous inventories, and some of the routes constitute a complicated transportation network could not be accurately mapped. Garfield County calls upon the BLM to continue working with cooperating agencies in completing the inventory process and documenting all existing roads, paths, ways and trails in the field office. Garfield County also calls upon the BLM to be consistent with Garfield County's OHV Ordinance.*

Response: As described in the Draft RMP/EIS, the BLM used a variety of methods to inventory existing routes/ways within the RFO for consideration in the planning process, including Global Positioning System data (when available), data provided by the counties, map and orthophoto data, and staff/cooperator knowledge. Based on this inventory, the BLM identified 4,380 miles of routes/ways (Map 3-10 of the Draft RMP/EIS) within the RFO. It should be noted that route designations are implementation decisions and that the resulting transportation network could change over time. In the PROPOSED RMP/FINAL EIS, Appendix 9 has been included which addresses the process for future additions of designated routes to the transportation network. Management direction for OHVs is provided in 43 CFR 8340, BLM Manual 8340, and the BLM National OHV Management Strategy. Nothing in this RMP extinguishes any valid ROW, or alters in any way the legal rights the State of Utah and Garfield, Piute, Sanpete, Sevier, and Wayne counties have to assert and protect RS 2477 rights, and to challenge in federal court or other appropriate venue any use restrictions imposed by the RMP that they believe are inconsistent with their rights.

Emery County

Comment: *The practice of "cherry stemming" routes, roads and trails has always been a practice which stretches credibility, but the use of this vague and arbitrary tool has been taken to new heights in this WC inventory. Emery County doesn't recognize the validity of cherry-stemming features that are on the ground.*

Response: "Cherry stemming" is a land management technique that facilitates better land management by allowing ingress and egress without compromising a special designation. This technique was often applied to WSAs and carried subsequently into the 1996–99 wilderness inventory. However, the RFO Proposed RMP/Final EIS proposed alternative generally excluded the practice of cherry stemming in managing for non-WSA lands with wilderness characteristics.

Comment: *We suggest setting back the boundary of a proposed WC from these features to a reasonable distance of between one and one half mile.*

Response: Inventories conducted post-2004 applied current policy, which is based on IM 275-2003, Change 1. The suggestion of setting back the boundary of a proposed non-WSA with wilderness characteristics area does not follow this policy.

Comment: *Where the wilderness proponents "suggest" that there is a "reasonable probability" that an area "may have" wilderness character, our documentation simply shows evidence that people have been actively altering the land surface in a number of ways for over a century, and that the proper and reasonable decision will be to not manage most of these areas to preserve wilderness characteristics.*

Response: BLM followed the criteria outlined in the Wilderness Act and IM 2003-274 and IM 2003-275 to define whether an area has wilderness characteristics. On-the-ground inventories were conducted to verify these areas. BLM stands by its inventory.

Comment: *Flat Tops A well site and active mining claims in the southeastern portion of the area eliminate a large portion from legitimate wilderness characteristic management. The Flat Tops ACEC currently provides for special management of part of this area. Creating another layer of management is redundant since the ACEC prescriptions effectively manage for wilderness characteristics. Active gas and oil leases within this area indicate that PFO has made management decisions for this area, and they are not conducive to protection of wilderness characteristics. PFO has permitted Emery County a free use permit for clay on the northeastern boundary of this area.*

Response: The Flat Tops ACEC falls within the boundary of the Price Field Office and is outside the scope of the Richfield RMP.

Comment: *Labyrinth Canyon The extreme northern end of the proposed areas is bisected by a motorized route. More than half the route is a designated route in the 2003 travel plan. At the end of the route there is a prominent dugway as well as excavation sites (probably test holds for gravel). This site should be considered for future source of gravel. A cattle trail has been constructed down the face of the cliff, allowing access to the river. Some fencing has been placed around the top of the trail. Point #362. A designated route runs east-west from Road #1010 to near the mouth of Three Canyon. This route again bisects the area. An extension of the route continues north, but is not included in the 2003 plan. Two motorized routes run north-south on the east side of Three Canyon but were not designated in the 2003 plan. They converge and provide access to Junes Bottom, the location of an historic homestead/moonshine location. Stone dwellings and remnants of a steam powered tractor are still at the location. A dugway has been constructed down the Slickrock face near the location, at the terminus of the route, 372,373. Active gas and oil leases within this area indicate that PFO has made management decisions for this area, and they are not conducive to protection of wilderness characteristics. County*

Road #1026 bisects another segment of this proposed area. A complex of roads, including a BLM system road and an historic air strip slice up "The Spur" portion of this proposed area. The roads, especially the BLM road, are highly visible for miles. A high use road on the east side of the Green River is visible from much of eastern edge of "The Spur." This road accesses the boat ramp at Mineral Bottom as well as an active airstrip in the vicinity.

Response: In the Proposed RMP/Final EIS, the BLM chose to manage 2,800 acres (within Wayne County) of the 12,300 acres identified in the Draft RMP/EIS for the Labyrinth Canyon area. As part of BLM's wilderness characteristics inventory maintenance, BLM performed a combination of data and onsite reviews. This included specific field inspections, Interdisciplinary Team review of data such as range files, county and BLM GIS data, and high-resolution 2006 aerial photographs. The BLM's findings are described in the 1999–2003 wilderness reinventory documentation, as well as the 2007 wilderness characteristics review process (findings from this review are available on the RFO planning website, and in the administrative record). The BLM is satisfied that it has used a high-standard approach to public land inventory and it stands by its findings, particularly those findings that involved wilderness characteristics inventory maintenance.

Comment: *PFO should coordinate with the Richfield Field Office to develop consistent management. The Emery County/ Wayne County boundary should not be used for a management boundary.*

Response: The RFO has coordinated with the neighboring field offices on developing consistent management across field office boundaries. The BLM field office boundaries are set by the Utah State office in cooperation with the Washington office. Therefore setting the boundaries would be beyond the scope of this RMP.

Comment: *Section 11. Managing part or all of the Flat Tops Region for so-called wilderness characteristics would violate FLPMA, contradict the state's public land policy and contradict the foregoing plans of Emery County for managing the Flat Tops Region.*

Response: The BLM's authority for managing lands to protect or enhance wilderness characteristics comes directly from FLPMA Section 202 (43 U.S.C. §1712). This section of BLM's organic statute gives the Secretary of the Interior authority to manage public lands for multiple use and sustained yield. Nothing in this section constrains the Secretary's authority to manage lands as necessary to "achieve integrated consideration of physical, biological, economic, and other sciences." (FLPMA, Section 202(c)(2) [43 U.S.C. §1712(c)(2)]) Further, FLPMA makes it clear that the term "multiple use" means that not every use is appropriate for every acre of public land and that the Secretary can "make the most judicious use of the land for some or all of these resources or related services over areas large enough to provide sufficient latitude for periodic adjustments in use…" (FLPMA, Section 103(c) [43 U.S.C. §1702(c)]) The FLPMA intended for the Secretary of the Interior to use land use planning as a mechanism for allocating resource use, including wilderness character management, among the various resources in a way that provides uses for current and future generations.

In addition, the BLM's *Land Use Planning Handbook* (H-1601-1) directs BLM to "identify decisions to protect or preserve wilderness characteristics (naturalness, outstanding opportunities for solitude, and outstanding opportunities for primitive and unconfined recreation) including goals and objectives to protect the resource and management actions necessary to achieve these goals and objectives. For authorized activities, include conditions of use that would avoid or minimize impacts to wilderness characteristics."

Comment: *Muddy Creek—Crack Canyon. This area is massive and appears to be a "fill-in-the-blank spaces with wilderness" exercise. There doesn't appear to have been an effort to inventory resources within these areas at all, just an attempt to fill in the gaps between WSAs. T23, 24 S, R&E and vicinity: There is interest in the Gypsum resources in this area, hence the mining claims. A motorized route*

between Kimball Draw and Hebe's Arch bisects the northern most segment of this area. Remnants of extensive mining activity is clustered at the Lucky Strike mine. BLM system roads, designated trails and other motorized routes significantly chop up the Baptiste Draw, Horse Valley, Bell Canyon area. The Behind-the-Reef OHV trail and Chute Canyon Road (County Road #1016) borders the southern part of this area. This route, along with the other designated routes attached to it accommodates major motorized recreation. BLM recently developed two camping areas near Temple Mountain specifically to accommodate this use. Active mining claims are present in the Hidden Splendor, Little Susan areas. Again, the historic remnants of mining activity is abundant and visible in these areas, as well as along the historic routes which uranium exploration created. Roads were also dozed into the Segar's Hole area for exploration purposes and remain visually noticeable. The vicinity of Oil Well Dome is pockmarked with gas wells and is a known reservoir for gas. Active gas and oil leases within this area indicate that PFO has made management decisions for this area which are not consistent with management for wilderness characteristics. A motorized route bisects the Wild Horse Mesa area. The Mesa east and west of County Road #1013 in Little Wild Horse Creek has been crisscrossed with many exploration routes. A BLM system road near the head of Chimney Canyon is routinely used to access a Bighorn Sheep trap staging area. Emery County has performed road maintenance there to accommodate the helicopter support crew for the trapping procedure. Finally, with respect to the Penitentiary Canyon vicinity of this WC area, bounded by County Road #1012, #1019 and the Muddy Creek WSA, Emery County believes it possesses characteristics of naturalness which may at times provide opportunities for solitude and/or a primitive type of recreation. However, Emery County insists that management prescriptions respect and uphold the other values and preferred management standards identified for this area in the above-referenced addendum to Emery County's general plan, including but not limited to the following: - PFO should complete a thorough inventory of the area to document and preserve relevant assets within the area such as fence lines, water resources, etc. - PFO should provide for reasonable access to SITLA properties, and reasonable ingress and egress for other holders of valid and existing rights. - PFO should develop management prescriptions which will not affect current users or alter current use. - PFO should guard against the elimination of diminishment of structures, routes and developments that are recognizable and manageable on the ground."

Response: The BLM chose not to manage the Muddy Creek—Crack Canyon area for wilderness characteristics in the Proposed RMP/Final EIS due to the reasons listed by the commentor and through internal BLM review. As part of BLM's wilderness characteristics inventory maintenance, BLM performed a combination of data and onsite reviews. This included specific field inspections, Interdisciplinary Team review of data such as range files, county and BLM GIS data, and high-resolution 2006 aerial photographs. The BLM's findings are described in the 1999–2003 wilderness reinventory documentation, as well as the 2007 wilderness characteristics review process (findings from this review are available on the RFO planning website, and in the administrative record). The BLM is satisfied that it has used a high-standard approach to public land inventory and it stands by its findings, particularly those findings that involved wilderness characteristics inventory maintenance.

Comment: *Mussentuchit Badland This re-inventory area is not overwhelmed with routes or other evidence of human activity but there are certainly enough routes, ponds and other evidences to eliminate most of the area from management for wilderness characteristics. Two County Roads penetrate the interior of the area. Road #922 provides access to a clay mining operation. In fact a large part of the proposed area has active mine claims in place. There are several other routes which access ponds and grazing amenities such as fence lines and troughs. Emery County once held a free use permit at the intersection of County Road #925 and #920. This site is a rare source for sand and gravel materials in this area.*

Response: The BLM chose not to manage the Mussentuchit Badland area for wilderness characteristics in the Proposed RMP/Final EIS. As part of BLM's wilderness characteristics inventory maintenance, BLM performed a combination of data and onsite reviews. This included specific field inspections,

Interdisciplinary Team review of data such as range files, county and BLM GIS data, and high-resolution 2006 aerial photographs. The BLM's findings are described in the 1999–2003 wilderness reinventory documentation, as well as the 2007 wilderness characteristics review process (findings from this review are available on the RFO planning website, and in the administrative record). The BLM is satisfied that it has used a high-standard approach to public land inventory and it stands by its findings, particularly those findings that involved wilderness characteristics inventory maintenance.

Comment: *SWEETWATER REEF. A large portion of this unit is designated "open" by the 2003 Route Designation Plan. Although the "open" designation allows for cross country travel, users have transitioned well to a "designated trail" mentality. Although there is some off-trail use, it seems to be manageable at this time. Closure of routes currently in use could well result in unmanageable non-compliance. Many of the motorized trails and roads within this area follow decades old seismic exploration lines. Although wilderness proponents will claim that these lines are being naturally reclaimed, and becoming substantially unnoticeable, we believe they are better described as faint, but definitely noticeable. Grazing is currently the dominant use of the area. The many range projects include fence lines, stock ponds and developed springs and well. The wells typically require motorized pumping systems, troughs and storage tanks. These wells are visually and audibly noticeable from a couple of miles away. The statement that PFO makes that these isolated developments do not affect naturalness is false. The supplemental values mentioned should not be included as criteria supporting management for wilderness characteristics, especially historic structures and early petroleum exploration which are evidence of activity diametrically opposed to wilderness characteristics. Active gas and oil leases within this area indicate that PFO has made management decisions for this area which are not consistent with management for wilderness characteristics. Free use permits issued by the PFO within or adjacent to this area includes Spire Point, Dugout Springs and Saucer Basin.*

Response: The BLM chose not to manage the Sweetwater Reef area for wilderness characteristics in the Proposed RMP/Final EIS due to the reasons listed by the commentor and through internal BLM review. As part of BLM's wilderness characteristics inventory maintenance, BLM performed a combination of data and onsite reviews. This included specific field inspections, Interdisciplinary Team review of data such as range files, county and BLM GIS data, and high-resolution 2006 aerial photographs. The BLM's findings are described in the 1999–2003 wilderness reinventory documentation, as well as the 2007 wilderness characteristics review process (findings from this review are available on the RFO planning website, and in the administrative record). The BLM is satisfied that it has used a high-standard approach to public lands inventory and it stands by its findings, particularly the findings that involved wilderness characteristics inventory maintenance.

Comment: *WILD HORSE MESA Wild Horse Mesa reinventory area is bisected by a road which follows Wild Horse Creek. The road begins at Emery County Road #1013 and terminated on East Wild Horse Mesa in Wayne County. SR-24 is the eastern boundary to this area. This is a two lane highway which serves as a major north-south route and a major access to Lake Powell. Emery County Road #1012 is a northeastern boundary which is currently being realigned, widened and paved. 1012 is the major access route to Goblin Valley State Park, Temple Mountain Area, Bell and Little Wild Horse Canyon Trails and other recreation areas on the San Rafael Swell. These areas adjoining the Wild Horse Mesa area have required several road upgrades to handle the increasing visitation. Emery County has a permitted free use permit in the Little Wild Horse Wash. This is a very important material source and will be needed for future road projects. A number of springs have been filed on with the state for water rights. Livestock grazing is a major resource of the area. Several fence lines are found within the bounds of this area. Finally, with respect to the interior portion of this area, Emery County believes it possesses characteristics of naturalness which may at times provide opportunities for solitude and/or a primitive type of recreation. However, Emery County insists that management prescriptions respect and uphold the other values and preferred management standards identified for this area in the above-referenced*

addendum to Emery County's general plan, including but not limited to the following: - PFO should complete a thorough inventory of the area to document and preserve relevant assets within the area such as fence lines, water resources, etc. - PFO should provide for reasonable access to SITLA properties, and reasonable ingress and egress for other holders of valid and existing rights. - PFO should develop management prescriptions which will not affect current users or alter current use. - PFO should guard against the elimination or diminishment of structures, routes and developments that are recognizable and manageable on the ground. -PFO should coordinate with the Richfield Field Office to develop consistent management. The Emery County/ Wayne County boundary should not be used for a management boundary.

Response: In the Proposed RMP/Final EIS, the BLM chose to manage 8,700 acres of the 49,700 acres identified in the Draft RMP/EIS for the Wild Horse Mesa area. As part of BLM's wilderness characteristics inventory maintenance, BLM performed a combination of data and onsite reviews. This included specific field inspections, Interdisciplinary Team review of data such as range files, county and BLM GIS data, and high-resolution 2006 aerial photographs. The BLM's findings are described in the 1999–2003 wilderness reinventory documentation, as well as the 2007 wilderness characteristics review process (findings from this review are available on the RFO planning website, and in the administrative record). The BLM is satisfied that it has used a high-standard approach to public land inventory and it stands by its findings, particularly the findings that involved wilderness characteristics inventory maintenance.

Comment: *Rock Canyon Several routes penetrate this area from the west, mostly for the purpose of accessing livestock associated features, including ponds and troughs. The area is immediately adjacent to the four lane interstate freeway on the north. The Mancos badlands near 1-70 and County Road #912 are heavily used for motorized recreation. Active mining claims are present in the north, west and south portions of the area.*

Response: The BLM chose not to manage the Rock Canyon area for wilderness characteristics in the Proposed RMP/Final EIS due to the reasons listed by the commentor and through internal BLM review. As part of BLM's wilderness characteristics inventory maintenance, BLM performed a combination of data and onsite reviews. This included specific field inspections, Interdisciplinary Team review of data such as range files, county and BLM GIS data, and high-resolution 2006 aerial photographs. The BLM's findings are described in the 1999–2003 wilderness reinventory documentation, as well as the 2007 wilderness characteristics review process (findings from this review are available on the RFO planning website, and in the administrative record). The BLM is satisfied that it has used a high-standard approach to public land inventory and it stands by its findings, particularly the findings that involved wilderness characteristics inventory maintenance.

Sevier County

Comment: *We respectfully expect the BLM to "consider" Sevier County's Land Use Plan and ordinance, in implementing your "multiple use" mandate from congress on the majority of the land in the Richfield Field Office while managing resources and finally assure the "RMP is consistent with Sevier Counties Land Use Plan.*

Response: The BLM considered the county's land use plan and ordinance in the crafting of the Proposed RMP**.** The BLM RFO is aware that the counties have updated their general management plans in 2007. The revised general management plan was provided to BLM late in the planning process and was reviewed further in development of the Proposed RMP/Final EIS. The BLM is aware that there are specific county and state plan decisions relevant to aspects of public land management that are discrete from, and independent of, federal law. Chapter 5 of this document includes a consistency review with the Sevier County Plan.

Comment: *Because of the nature of this collaborative process, and its importance to the future of Sevier County, we ask the BLM to review the County General Plan as amended in this planning process before a final RMP is adopted.*

Response: The BLM RFO is aware that the counties have updated their general management plans in 2007. The revised general management plan was provided to BLM late in the planning process and may need to be reviewed further in development of the Proposed RMP/Final EIS. The BLM is aware that there are specific county and state plan decisions relevant to aspects of public land management that are discrete from, and independent of, federal law. However, the BLM is bound by federal law. The FLPMA requires that the development of an RMP for public lands must be coordinated and consistent with county plans, to the maximum extent possible by law, and inconsistencies between federal and non-Federal Government plans be resolved to the extent practical (FLPMA, Title II Sec. 202 (c)(9)). As a consequence, where state and local plans conflict with federal law, there will be an inconsistency that cannot be resolved or reconciled. Thus, while county and federal planning processes, under FLPMA, are required to be as integrated and consistent as practical, the federal agency planning process is not bound by or subject to county plans, planning processes, or planning stipulations. The BLM will identify these conflicts in the Proposed RMP/Final EIS, so that the state and local governments have a complete understanding of the impacts of the Proposed RMP on state and local management options. A consistency review of the Proposed RMP with the state and county master plans is included in Chapter 5.

Comment: *Sevier County has spent thousands of hours and tens of thousands of dollars compiling geographical data, including photographs and other evidence of proof which proves these areas do not meet wilderness characteristics. This document is entitled "Sevier County, Utah-Proposed Wilderness Characteristics Lands" and is attached. This data is Sevier County's position concerning Wilderness Inventoried Areas (WIA). See attachment A.*

Response: The BLM considered the county's inventory in developing the Proposed RMP, and based upon all available information BLM carried forward 78,600 acres (12 percent) of the 682,600 acres of non-WSA lands with wilderness characteristics identified in the Draft RMP Alternative D. The presence or absence of man-made intrusions does not mean that an area does not possess wilderness characteristics. It is the cumulative significance of these features that determines whether an area possesses wilderness characteristics. As part of its wilderness characteristics inventory maintenance, BLM used a combination of field checks, Interdisciplinary Team review of such data as range files, county and BLM GIS data, and review of high resolution 2006 aerial photographs. BLM stands by its determination. BLM has reviewed the information submitted and determined that the information is not new and significant.

Comment: *Sevier County has been very involved in the discussion about the Factory Butte area and we are submitting a document that proposes what we believe is a reasonable and workable solution for consideration for the final RMP. We have spent numerous hours on the ground with a large group of stake holders including representatives of U.S. Fish and Wildlife and believe that this compromise position is an excellent way to protect the resource and still allow meaningful access. This attachment is included as Attachment B.*

Response: BLM has considered the proposals submitted by several commenters. The commenters' proposal is included within the range of alternatives considered within the Draft RMP/EIS. The Proposed RMP/Final EIS has been revised to address the proposal and the commenters' concerns. Several surveys and clearances will be required to identify the location of specific trails. The exact location of any trails will be clearly marked. The general location of trails, kiosks, fences, and other facilities is identified in the Proposed RMP/Final EIS. The location of these facilities will be specified in activity-level planning. The area will be strictly monitored to include compliance with the plan. Following BLM policy, the RFO will take a cooperative management approach to implement the plan.

Comment: *The socioeconomic section of Chapter 4 was very incomplete with several concerns unaddressed. As a result, the Six County Association of Governments contracted with Utah State University (USU) to conduct a review of the Chapter 4 for the Six County area, which includes Sevier County.*

Response: BLM has reviewed the USU, October 2006, Review of the Socioeconomic Analysis in the Draft EIS prepared by the USDI—BLM RFO (also known as the AOG study). It expressed concerns with analyses of livestock grazing, oil and gas production, socioeconomic groups (or "neighborhoods"), and OHV use in the counties.

The AOG study was a critique of the original Draft EIS; the current, public Draft EIS has been modified considerably and has taken into account, directly or indirectly, many of the concerns expressed in the original AOG critique.

Based on CEQ Sec. 1502.2 BLM's policies and guidelines require the BLM to analyze the impacts of significant differences from the current situation (i.e., the Alternative N: No Action). Given that the percent change in AUMs across alternatives is only 0.7 percent, there is no need to do the depth of livestock grazing analysis suggested by the AOG. Furthermore, the Proposed RMP shows no significant difference from the current situation, and therefore no impact from BLM decisions reached in the plan.

The BLM acknowledges the planning area contains distinct socioeconomic "neighborhoods" that likely have differential ties to the BLM lands, and would likely experience differential impacts from BLM management changes. A land use plan is a landscape-level plan addressing BLM actions on the entire planning area. This focus is not intended to deny that real differences exist among the various communities and groups within the planning area. The plan takes a broader view. The BLM is unaware of any data suggesting that a "neighborhood" level analysis would have affected the decisions reached in the plan.

In developing land use plans, the BLM is mandated by FLPMA to observe the principles of multiple use and sustained yield. FLPMA defines multiple use as "the management of the public lands and their various resource values so that they are utilized in the combination that will best meet the present and future needs of the American people…the use of some land for less than all of the resources, a combination of balanced and diverse resource uses that takes into account the long-term needs of future generations for renewable and nonrenewable resources….with consideration given to the relative values of the resources and not necessarily to the combination of uses that will give the greatest economic return or the greatest unit output."

The BLM used the scoping process to explore and objectively determine a reasonable range of alternatives that best addressed the issues, concerns, and alternatives identified by the public. As a result, five alternatives were identified (including the No Action Alternative) for further analysis. Each alternative considers various levels or degree of resource use or resource protection to give the public the ability to fully compare the consequences of each management prescription or action.

Alternative A favors mineral development over protection of resources. Alternative C of the Draft RMP/EIS favors the protection of resources over the extraction of mineral development. Alternative D is the same as Alternative C except it includes management of lands with wilderness characteristics to preserve those characteristics. Alternative B is designed to be a balance between mineral development and protection of resources. Table 2.1 in the Richfield Draft RMP/EIS provides in comparative form the management actions associated with each alternative.

Comment: *The County does not believe BLM has the authority to create a special management criteria based solely on wilderness characteristics. We believe that the authority governing the inventory and*

management of lands with wilderness characteristics was passed to BLM through section 603 of the Federal Land Policy and Management Act, and that section 603 has now expired. And, while BLM may have authority to inventory their lands for various purposes, they still require Congressional authorization to manage for wilderness.

Response: BLM's authority for managing lands to protect or enhance wilderness characteristics comes directly from FLPMA Section 202 (43 U.S.C. §1712). This section of BLM's organic statute gives the Secretary of the Interior authority to manage public lands for multiple use and sustained yield. Nothing in this section constrains the Secretary's authority to manage lands as necessary to "achieve integrated consideration of physical, biological, economic, and other sciences." FLPMA, Section 202(c)(2) (43 U.S.C. §1712(c)(2)). Further, FLPMA makes it clear that the term "multiple use" means that not every use is appropriate for every acre of public land and that the Secretary can "make the most judicious use of the land for some or all of these resources or related services over areas large enough to provide sufficient latitude for periodic adjustments in use…" FLPMA, Section 103(c) (43 U.S.C. §1702(c)). FLPMA intended for the Secretary of the Interior to use land use planning as a mechanism for allocating resource use, including wilderness character management, among the various resources in a way that provides uses for current and future generations. BLM has long acknowledged that FLPMA Section 603 (43 U.S.C. §1782) requiring a one-time wilderness review has expired. All current inventory of public lands is authorized by FLPMA Section 201 (43 U.S.C. §1711). In September 2006, the Utah District Court affirmed that the BLM retained authority to protect lands it determined to have wilderness characteristics in a manner substantially similar to the manner in which such lands are protected when protected as WSAs. Finally, the Utah v. Norton Settlement Agreement does not affect BLM's authority to manage public lands. This agreement merely remedied confusion by distinguishing between WSAs established under FLPMA § 603 and required to be managed under § 603's non-impairment standard, and other lands that fall within the discretionary FLMPA § 202 land management process. See also IM 2003-275.

Comment: *The conclusion that we have made, based on this information, is that while there are some small areas that remain relatively undisturbed by man, the BLM has failed to demonstrate the necessary standard on size, naturalness, and outstanding nature. Further, in most areas, the BLM fails to demonstrate the necessary standard on isolation and opportunity for solitude.*

Response: The presence or absence of man-made intrusions does not mean that an area does not possess wilderness characteristics. It is the cumulative significance of these features that determines whether an area possesses wilderness characteristics. As part of its wilderness characteristics inventory maintenance, BLM used a combination of field checks, Interdisciplinary Team review of data such as range files, county and BLM GIS data, and review of high-resolution 2006 aerial photographs. BLM stands by its determination. BLM has reviewed the information submitted and determined that the information is not new and significant.

Comment: *The correct standard for rangeland health management is not whether BLM may permanently close an entire grazing allotment. The correct standard is whether BLM may diminish a single grazing AUM for any reason other than rangeland conditions. The "close an entire grazing allotment" standard misses the mark of House Bill 264 and local county plans by a serious margin.*

Response: The Draft RMP/EIS does not include any alternatives that consider decreases in livestock grazing; therefore, this comment does not apply to this document.

Comment: *However, BLM-imposed suspensions of use or other reductions in domestic livestock animal unit months should be temporary and scientifically based on rangeland conditions.*

Response: Per the 43 CFR 4100 regulations, suspended AUMs are restored to the operator to the amount of the suspension, if conditions allow. The regulations also address temporary increases or decreases to permitted use based on supporting monitoring, field observations, ecological site inventories, or other data

acceptable to the authorized officer (43 CFR 4110.3). Beyond this, AUMs are allocated to livestock or wildlife depending on the allotment objectives contained in the RMP and Rangeland Program Summary.

Comment: *Accordingly, animal unit months in the RFO planning area should not be relinquished or retired in favor of conservation, wildlife, or other uses.*

Response: Per IM-2006-098 (change 1), it is BLM policy to maintain livestock grazing on BLM lands in conformance with all governing laws and regulations. It would be inconsistent with these and other laws to eliminate livestock grazing on a field office basis. However, the land use planning process can close lands to grazing as provided for in the Taylor Grazing Act and FLPMA but only with a rational basis to resolve identified issues.

Comment: *The transfer of grazing animal unit months (AUMs) to wildlife for supposed reasons of rangeland health is illogical. There is already imputed in each AUM a reasonable amount of forage for wildlife component.*

Response: There is no decision in the Draft RMP/EIS that specifically transfers AUMs to wildlife for reasons of rangeland health.

Comment: *Any grazing animal unit months that may have been reduced in the RFO planning area due to rangeland health concerns should be restored to livestock when rangeland conditions improve not converted to wildlife use.*

Response: Per the 43 CFR 4100 regulation, suspended AUMs are restored to the operator to the amount of the suspension, if conditions allow. Beyond this, AUMs are allocated to livestock or wildlife depending on the allotment objectives contained in the RMP and Rangeland Program Summary.

Comment: *The RMP may not unilaterally amend a grazing permit without monitoring data or other information. 43 C.F.R. §4130.2-1 (changes in grazing use). Dictating changes in the seasons of use from the RMP also violates the requirement that BLM coordinate, consult and cooperate with individual permittees before amending an allotment management plan. 43 U.S.C. §1752(d); 43 C.F.R. §4110.3-2.*

Response: The Draft RMP/EIS does not change any seasons of use. It does present criteria by which changes to seasons of use would be considered. Changes in seasons of use are implementation actions. It is mandatory that the BLM involve the permittee in any changes that are made to the season of use. These changes are made only after proper NEPA documentation has been completed. The intent of the change and NEPA documentation is also listed on the BLM's NEPA Electronic Bulletin Board, which the public has access to.

Comment: *First, the maps provided at open houses and in the DRMP are not accurate or detailed enough to adequately evaluate the boundaries of remaining OHV open areas or to closely examine road closures.*

Response: BLM has provided detailed maps within the document. Maps of finer detail can be accessed at the RFO reading room. Maps were created to differentiate the designation of the route, not the route classification.

Comment: *We also note that the County has a travel map showing all our roads and trails, and the BLM's travel plan should be consistent with the County's information.*

Response: As described in the Draft RMP/EIS, the BLM used a variety of methods to inventory existing routes/ways within the RFO for consideration in the planning process, including Global Positioning System data (when available), data provided by the counties, map and orthophoto data, and staff/cooperator knowledge. Based on this inventory, the BLM identified 4,380 miles of routes/ways

(Map 3-10 of the Draft RMP/EIS) within the RFO. It should be noted that route designations are implementation decisions and that the resulting transportation network could change over time. Management direction for OHV is provided in 43 CFR 8340, BLM Manual 8340, and the BLM National OHV Management Strategy.

Comment: *Sevier County is not comfortable with the BLM's RFD, or the manner in which the BLM determines the potential future economic viability of certain minerals. It does not match county planning or the County's assessment of potential value.*

Response: The RFD predicts a reasonable development scenario for oil and gas activity. The commenter does not substantiate deficiencies in the analysis or RFD. The mineral potential report addressed the likelihood of mineral development. Chapter 3 of the Draft RMP/EIS updated the mineral potential report. The commenter does not substantiate deficiencies in the analysis. The coal resource reports identified areas with mineable resources. The unsuitability criteria were applied to determine areas suitable for consideration of coal leasing. The commenter does not substantiate deficiencies in the analysis.

Comment: *Valid and existing rights must be recognized for the continued economic viability of our County. We expect that any alternative should recognize these rights.*

Response: As required by regulations and policies, valid existing rights would be recognized by BLM.

Comment: *Valid and existing rights must be recognized and protected, water for culinary use, irrigation, recreation, and all other uses must be protected.*

Response: The Federal Government has delegated the authority to allocate water within state boundaries to state governments. This means that even though BLM is a federal agency, it must seek water rights from state governments to obtain and provide water for BLM uses. These uses include, but are not limited to, irrigation, wildlife water and habitat, livestock watering, recreation, fisheries, and riparian/wetlands.

Comment: *The County is concerned about the BLM's suitability findings given the level to which this water is appropriated, and given its historic and current use. Designation of any segments as wild and scenic would unnecessarily restrict the ability of the water users to carry on the daily management of their water. Wild and scenic designation almost always carries with it some form of water flow requirements, and any such influence on the use and management of the current water resource could be ruinous to the water users.*

Response: Barring congressional action, there is no effect on water rights or in-stream flows related to suitability findings made in a land use plan decision. Even if Congress were to designate rivers into the National Wild and Scenic Rivers System, any such designation would have no effect on existing water rights. Section 13(b) of the Wild and Scenic River Act states that jurisdiction over waters is determined by established principles of law. In Utah, the State has jurisdiction over water. Although the Wild and Scenic Rivers Act implies a Federal reserved water right for designated rivers, it does not require or specify any amount, and as noted above, confirms that Utah has jurisdiction over water rights. The BLM would be required to adjudicate the water right, in the same manner as any other entity, by application through State processes. Thus, for congressionally designated rivers, the BLM may assert a Federal reserved water right for appurtenant and unappropriated water with a priority date as of the date of designation (junior to all existing rights), but only in the minimum amount necessary to fulfill the primary purpose of the reservation.

Comment: *The county believes that the creation of any new ACECs should follow very specific standards as defined in federal law and should not be used as an alternative to, or interim management leading to, wilderness designation or managing for wilderness characteristics.*

Response: The BLM has separate policies and guidelines as well as criteria for establishing ACECs and WSAs. The differing criteria make it possible that the same acreages will quality as both an ACEC and a WSA but for different reasons. The BLM is required to consider these different policies. The values protected by the WSA do not necessarily protect those values found relevant and important for the ACEC process and vice versa.

Comment: *We believe that all alternatives considered should comply with all federal law, BLM policy, the State of Utah Law, and the interior settlement of 2003.*

Response: The BLM considered federal law, BLM policy, State of Utah law, and the interior settlement of 2003 in developing the alternatives. The BLM's authority for managing lands to protect or enhance wilderness characteristics comes directly from FLPMA Section 202 (43 U.S.C. §1712). This section of BLM's organic statute gives the Secretary of the Interior authority to manage public lands for multiple use and sustained yield. Nothing in this section constrains the Secretary's authority to manage lands as necessary to "achieve integrated consideration of physical, biological, economic, and other sciences." (FLPMA, Section 202(c)(2) [43 U.S.C. §1712(c)(2)]) Further, FLPMA makes it clear that the term "multiple use" means that not every use is appropriate for every acre of public land and that the Secretary can "make the most judicious use of the land for some or all of these resources or related services over areas large enough to provide sufficient latitude for periodic adjustments in use…" (FLPMA, Section 103(c) [43 U.S.C. §1702(c)]) The FLPMA intended for the Secretary of the Interior to use land use planning as a mechanism for allocating resource use, including wilderness character management, among the various resources in a way that provides uses for current and future generations.

In addition, the BLM's *Land Use Planning Handbook* (H-1601-1) directs BLM to "identify decisions to protect or preserve wilderness characteristics (naturalness, outstanding opportunities for solitude, and outstanding opportunities for primitive and unconfined recreation, including goals and objectives to protect the resource and management actions necessary to achieve these goals and objectives. For authorized activities, include conditions of use that would avoid or minimize impacts to wilderness characteristics."

State of Utah

Comment: *The BLM is obligated to examine the state and local plans and policies concept by concept, criteria by criteria, and line by line, if necessary, to determine the extent to which the plans and policies of state and local governments represent a consistent statement of the shared stewardship of the land.*

Response: A consistency review of the Proposed RMP with the state and county master plans is included in Chapter 5.

Comment: *Because of the value of grazing, state policy discourages permanent closure of grazing allotments and encourages the reinstatement of suspended AUMs when range conditions permit somewhere within the Richfield FO.*

Response: Per the 43 CFR 4100 regulation, suspended AUMs are restored to the operator to the amount of the suspension if conditions allow. Beyond this, AUMs are allocated to livestock or wildlife depending on the allotment objectives contained in the RMP and Rangeland Program Summary.

Comment: *The state strongly suggests that BLM support flexibility within the management provisions for livestock grazing time (duration) and timing (season of use) in the Final Plan.*

Response: The BLM's grazing regulations (43 CFR 4100) require each grazing permit to have mandatory terms and conditions, including a specified season of use, kind of livestock, and other terms and

conditions as necessary. The Draft RMP/EIS has been modified to include an alternative that provides for using livestock grazing for site-specific fuels management outside the season of use.

Comment: *In addition, the state encourages the BLM to cooperate with the state grazing permittees and conservation organizations to actively monitor and record grazing use data, wildlife populations and range conditions. The Final RMP should contain and rely on a robust monitoring program so that resource managers and users can communicate, learn, assign responsibilities, and use adaptive management to meet land health objectives.*

Response: Monitoring is an ongoing effort in the grazing program. Monitoring is done on an allotment-specific basis, based on set monitoring procedures established for Bureau-wide consistency. There is already a program to invite permittees and other interested public to assist in monitoring and allotment management (43 CFR 4100). Requests from permit holders to cooperate with monitoring allotments with more issues "I Category Allotments" receive more monitoring than Custodial allotments. Monitoring is required prior to making any allotment changes. Current BLM policy and regulation support the continuation of the existing monitoring program.

Comment: *On a related note, the state believes the BLM should only employ the term "critical habitat" when referring to the legal habitat designations for endangered and threatened species under the Endangered Species Act. The state requests that the BLM use the "crucial habitat" designations mapped by the Division of Wildlife Resources solely as descriptive wildlife habitat designations, not as automatic exclusion zones for other multiple uses.*

Response: As noted in the comment, the term "designated critical habitat" should be used only in reference to species listed as threatened or endangered under the Endangered Species Act. Designated crucial habitat is a DWR designation and should consistent for all alternatives because BLM does not have authority to change them. The Final RMP/EIS has been changed to correct the issues discussed above.

Comment: *As an interim measure, the state encourages the Richfield FO to request that oil and gas operators apply best available control technology. We also encourage the Richfield FO to adopt emission standards for compressor engines consistent with the Four Corners Air Quality Task Force Report of Mitigation Options, DRAFT: Version 7, June 22,2007 (Task Force Report).*

Response: The air quality management actions in the Proposed RMP/Final EIS have been revised to include the following: "The BLM will work cooperatively to encourage industry to adopt measures to reduce potential emissions. Examples of these types of measures can be found in the Four Corners Air Quality Task Force Report of Mitigation Measures, such as a requirement of a 2g/bhp-hr limit on engines less than 300HP and 1g/bhp-hr limit on engines larger than 300HP."

Comment: *Pending completion of comprehensive air quality analyses and region-wide air quality modeling, we encourage the BLM to work with stakeholders to research additional interim measures, such as those presented by the Four Comers Air Quality Task Force, to determine which emission mitigation strategies should be required as future lease and application for permit to drill (APD) conditions.*

Response: The air quality management actions in the Proposed RMP/Final EIS have been revised to include the following: "The BLM will work cooperatively to encourage industry to adopt measures to reduce potential emissions. Examples of these types of measures can be found in the Four Corners Air Quality Task Force Report of Mitigation Measures, such as a requirement of a 2g/bhp-hr limit on engines less than 300HP and 1g/bhp-hr limit on engines larger than 300HP."

Comment: *The law indicates, among other things, that river segments proposed for inclusion in the NWSRS should contain water at all times and possess an outstandingly remarkable value which is significant within a physiographic regional context, and that studies of the effects of designation on uses within the river corridor, as well as upstream and downstream from the corridor, are analyzed and disclosed.*

Response: Federal law takes precedence over others: Section 16(b) of the Wild and Scenic River Act defines a river as "a flowing body of water or estuary, or a section, portions, or tributary thereof, including rivers, streams, creeks, runs, rills, kills, and small lakes." For purposes of evaluation, the volume of water flow need only be sufficient to sustain or complement the identified resource values. Rivers with intermittent or non-perennial flows already exist within the national river system.

Comment: *The state is also concerned about suitability findings for those streams where there are significant water diversions upstream of the subject reach, most of which are for irrigation. This is particularly true for the Dirty Devil River and the Fremont Gorge.*

Response: Federal law takes precedence over others: Section 16(b) of the Wild and Scenic River Act defines a river as "a flowing body of water or estuary, or a section, portions, or tributary thereof, including rivers, streams, creeks, runs, rills, kills, and small lakes." For purposes of evaluation, the volume of water flow need only be sufficient to sustain or complement the identified resource values. Rivers with intermittent or non-perennial flows already exist within the national river system.

Comment: *As a minimum, the State Engineer requests the BLM to catalog all valid, existing water rights that may be affected by designation as part of the Final EIS.*

Response: A catalog of all valid existing water rights along the Fremont River include, but are not limited to, Monte Elliot, Torrey Canal, Mills Ditch, Garkane Power Ditch, Capitol Reef National Park, Forest Sims, Caineville Canal, Hanksville Canal per the Bates decree and subsequent filings for high water. However, there are no water rights or in-stream flows related to suitability findings made in a land use plan decision, barring congressional action. Even if Congress were to designate rivers into the National WSR System, any such designation would have no effect on existing valid water rights. Section 13 (b) of the Wild and Scenic River Act states that jurisdiction over waters is determined by established principles of law. In Utah, the state has jurisdiction over water. Although the Wild and Scenic River Act implies a federal reserved water right for designated rivers, it does not require or specify any amount, and instead establishes that only the minimum amount for purposes of the act can be acquired. Because the State of Utah has jurisdiction over water, BLM would be required to adjudicate the right as would any other entity, by application through state processes. Thus, for congressionally designated rivers, BLM may assert a federal reserved water right to appurtenant and unappropriated water with a priority date as of the date of designation (junior to all existing rights), but only in the minimum amount necessary to fulfill the primary purpose of the reservation. In practice, however, federal reserved water rights have not always been claimed if alternative means of ensuring sufficient flows are adequate to sustain the outstandingly remarkable values. The RFO Proposed RMP would designate only 5 miles of Fremont River, known as the Fremont Gorge (located between Torrey and Capitol Reef National Park) as suitable for inclusion in the WSR System.

Comment: *The state finds the discussion regarding potential recommendations for additions to the NWSRS in the Draft RMP and EIS does not fully satisfy the requirements of federal or state law, or BLM policy and direction. The state believes it is imperative that the BLM properly disclose the reasons and rationale for determinations of suitability for proposed additions to the NWSRS, and to fully meet the requirements of state and federal law in doing so.*

Response: The rationale for suitability for determinations are contained in the Draft RMP/EIS Appendix 3 and comply with applicable Federal laws.

Comment: *The State of Utah has reviewed BLM's inventory of and proposed management for lands identified as possessing wilderness characteristics. The state does not believe that BLM has authority to create a category of management based solely on the characteristics of wilderness.*

Response: BLM's authority for managing lands to protect or enhance wilderness characteristics comes directly from FLPMA Section 202 (43 U.S.C. §1712). This section of BLM's organic statute gives the Secretary of the Interior authority to manage public lands for multiple use and sustained yield. Nothing in this section constrains the Secretary's authority to manage lands as necessary to "achieve integrated consideration of physical, biological, economic, and other sciences." FLPMA, Section 202(c)(2) (43 U.S.C. §1712(c)(2)). Further, FLPMA makes it clear that the term "multiple use" means that not every use is appropriate for every acre of public land and that the Secretary can "make the most judicious use of the land for some or all of these resources or related services over areas large enough to provide sufficient latitude for periodic adjustments in use…" FLPMA, Section 103(c) (43 U.S.C. §1702(c)). FLPMA intended for the Secretary of the Interior to use land use planning as a mechanism for allocating resource use, including wilderness character management, amongst the various resources in a way that provides uses for current and future generations. BLM has long acknowledged that FLPMA Section 603 (43 U.S.C. §1782) requiring a one-time wilderness review has expired. All current inventory of public lands is authorized by FLPMA Section 201 (43 U.S.C. §1711). In September 2006, the Utah District Court affirmed that the BLM retained authority to protect lands it determined to have wilderness characteristics in a manner substantially similar to the manner in which such lands are protected when protected as WSAs. Finally, the Utah v. Norton Settlement Agreement does not affect BLM's authority to manage public lands. This Agreement merely remedied confusion by distinguishing between wilderness study areas established under FLPMA § 603 and required to be managed under § 603's non-impairment standard, and other lands that fall within the discretionary FLMPA § 202 land management process. See also IM 2003-275.

Comment: *Thus, the state asks BLM to provide a detailed explanation of the rationale and authority for managing lands solely because of wilderness characteristics.*

Response: BLM's authority for managing lands to protect or enhance wilderness characteristics comes directly from FLPMA Section 202 (43 U.S.C. §1712). This section of BLM's organic statute gives the Secretary of the Interior authority to manage public lands for multiple use and sustained yield. Nothing in this section constrains the Secretary's authority to manage lands as necessary to "achieve integrated consideration of physical, biological, economic, and other sciences." FLPMA, Section 202(c)(2) (43 U.S.C. §1712(c)(2)). Further, FLPMA makes it clear that the term "multiple use" means that not every use is appropriate for every acre of public land and that the Secretary can "make the most judicious use of the land for some or all of these resources or related services over areas large enough to provide sufficient latitude for periodic adjustments in use…" FLPMA, Section 103(c) (43 U.S.C. §1702(c)). FLPMA intended for the Secretary of the Interior to use land use planning as a mechanism for allocating resource use, including wilderness character management, among the various resources in a way that provides uses for current and future generations. BLM has long acknowledged that FLPMA Section 603 (43 U.S.C. §1782) requiring a one-time wilderness review has expired. All current inventory of public lands is authorized by FLPMA Section 201 (43 U.S.C. §1711). In September 2006, the Utah District Court affirmed that the BLM retained authority to protect lands it determined to have wilderness characteristics in a manner substantially similar to the manner in which such lands are protected when protected as WSAs. Finally, the Utah v. Norton Settlement Agreement does not affect BLM's authority to manage public lands. This agreement merely remedied confusion by distinguishing between WSAs established under FLPMA § 603 and required to be managed under § 603's non-impairment standard, and other lands that fall within the discretionary FLMPA § 202 land management process. See also IM 2003-275.

Comment: *In addition to these cautions, the state requests that, in weighing management options for the Final RMP, BLM carefully consider recommendations submitted by local government and not manage*

lands to protect wilderness character where such management would, in the opinion of local governments, be contrary to the interests of local residents.

Response: BLM is aware that there are specific state laws relevant to aspects of public land management that are discrete from, and independent of, federal law. However, BLM is bound by federal law. As a consequence, there may be inconsistencies that cannot be reconciled. FLPMA requires that BLM's land use plans be consistent with state and local plans "to the extent practical" where state and local plans conflict with federal law, there will be an inconsistency that cannot be resolved. BLM will identify these conflicts in the Proposed RMP/Final EIS so that the state and local governments have a complete understanding of the impacts of the Proposed RMP on state and local management options.

Comment: *BLM's decisions on how to manage its lands directly affect Utah's ability to manage state trust lands to provide revenue for public schools and other beneficiary institutions.*

Response: The BLM acknowledges that the closure of adjoining public lands to oil and gas leasing may have a potentially negative impact on SITLA's mineral revenue. In Alternatives C and D, the closure of the 379,100 acres managed as WSA or wilderness area is nondiscretionary and beyond the scope of this plan.

In Alternatives N, A, B, and C, there are no SITLA lands affected by discretionary closure. Chapter 4 of the Proposed RMP/Final EIS has been revised to reflect the impacts of Alternative D on SITLA inholdings for the discretionary closures of 244,058 acres of public land. It should be noted that under any alternative, the proposed ACECs are not managed as closed to mineral leasing. Areas with wilderness characteristics are recommended as closed under Alternative D.

Comment: *The state believes the Draft RMP fails to address adequately these two major issues: The impact of BLM management decisions on state trust lands, and the need for a substantially more robust program for land tenure adjustments between the BLM and the State of Utah.*

Response: Regarding the first issue, an analysis of impacts on state trust lands was included under the socioeconomics section of the DRMP/DEIS (Section 4.6.1). Regarding the second issue raised, during processing of any proposed land tenure adjustment, BLM is required through the planning process to notify and coordinate with adjacent landowners and other interested parties. BLM's mandate is to retain lands in federal management unless the lands meet the criteria specified in FLPMA Section 203 for sale and other disposal actions as provided for under other authorities (such as exchange, R&PP) as discussed under "Lands and Realty Common to All Alternatives" section in Chapter 2, Table 2-18 of the Draft RMP/EIS.

Comment: *The RMP should specifically state that: (1) continued motorized administrative access on non-designated routes providing access to trust lands will be permitted to SITLA, its permittees, grantees and successors, notwithstanding any closure to the general public, to the extent such motorized access is currently available; (2) SITLA, its permittees and grantees may undertake reasonable maintenance activities to preserve and improve existing access across BLM lands, after consultation and appropriate environmental review by BLM and consultation with local governments as necessary; and (3) existing routes that are the sole access to state trust lands will not be closed and/or reclaimed without full BLM consultation with and approval by SITLA and the State.*

Response: The travel plan provides restrictions to the public for recreational purposes but does not restrict uses permitted or authorized by the BLM. State inholdings may or may not currently have access, depending on whether existing vehicle routes lead to them. Under different alternative scenarios, existing routes may be proposed for closure. BLM policy, as required by the Cotter decision (State of Utah v Andrus, 10/1/79), is that "the state must be allowed access to the state school trust lands so that those lands can be developed in a manner that will provide funds for the common school…" This decision

confined the issue of access to situations directly involving economic revenues generated for the school trust.

Comment: *We encourage the Richfield Field Office to continue meeting with Park Service, Forest Service, local government, and tribal government partners and to use these meetings as an opportunity to harmonize management across jurisdictional lines.*

Response: The RFO has coordinated in developing the Draft RMP/EIS with other federal agencies, local government, and tribal partners. The field office will continue to coordinate and develop these relationships with our partners through the Proposed RMP/Final EIS.

Comment: *The scope of activities anticipated under the Reasonably Foreseeable Development scenario (RFD) for fluid minerals needs clarification. The RFD does not clearly state whether its projections are limited to exploration, or include possible subsequent development based on likely economically recoverable discoveries.*

Response: The projection included in the RFD is not limited to exploration. The RFD also considers the production of oil and gas in the Sevier Frontal Play.

Comment: *Under Utah law, approved and perfected water rights are real property. BLM actions may affect the value of this real property. Because of this, the State Engineer recommends that the BLM consider the impact its actions may have on water rights in general and non-BLM water rights in particular.*

Response: BLM is obligated by law to honor valid, existing rights. Similarly, holders of valid, existing rights are obligated to honor federal laws regarding the use of federal lands for the exercise of those rights. BLM does not foresee frequent situations in which BLM's obligations under federal law would cause the agency to take actions that would prevent the holders from fully exercising their valid existing rights. BLM works diligently with the owners of valid, existing rights to prevent such situations from occurring. If the holder of a valid, existing right believes the BLM has taken an action that prevents the exercise of that right, the proper venue for determining equitable compensation or mitigation is in a court of valid jurisdiction, not within the context of a land use plan.

Comment: *Given the oil and gas leasing efforts by the BLM and others in the Richfield FO, and the recent discoveries of oil and gas in Sevier County, the state requests that the BLM consider and adopt a reasonable program for seismic and other exploratory work in the Richfield FO, but especially in Sanpete, Wayne, and Piute Counties.*

Response: The Draft RMP/EIS allows for seismic and other exploratory activities.

Comment: *According to Table 4-10, the Preferred Alternative would include significantly more miles of designated routes within non-WSA lands with wilderness characteristics than any other alternative. This is unusual given that two other alternatives propose significantly more miles of designated routes. See RMP/DEIS at Table 2-1. Please confirm and clarify that the disclosures contained in Table 4-10 are accurate.*

Response: A range of alternatives was considered in the Draft RMP/EIS to manage areas with wilderness characteristics. This range of alternatives is consistent with FLPMA. Table 4-10 is correct with respect to OHV management.

Comment: *In the 2007 review form for "A total of 76 individual site-specific comments were addressed" (76 comments), BLM references a number of SUWA comments that are identified by letter. These comments are not provided or explained. Please include or discuss SUWA's comments and BLM's response.*

Response: The review form was completed in 2004. The comments identified by letter correspond to areas evaluated for wilderness characteristics. The results are available in the RFO.

Comment: *The 2007 review forms do not include maps, greatly complicating any attempt to determine locations of the proposed areas. The Richfield Field Office is the only field office reviewed to date that has not provided maps. The absence of maps could be especially problematic if BLM concluded that some but not all of an area possesses wilderness character. Please make maps of these areas available.*

Response: The original review forms are signed. The review forms and maps are available for review in the RFO.

Comment: *The 2007 review forms posted on the Richfield Office's web page are not signed. Please confirm whether the Field Manager has made a final decision with respect to these forms and the evaluation they contain.*

Response: The original review forms are signed. The review forms and maps are available for review in the RFO.

Comment: *Several of the determinations conclude that parcels were previously determined to possess wilderness characteristics. It is counterintuitive that petitioners would renominate an area already determined to possess wilderness characteristics. Please clarify whether the boundary of the renominated areas are identical the boundaries of the previously analyzed areas. If so, please explain the basis for the renomination and reevaluation.*

Response: Some of the areas renominated had different boundaries than when originally inventoried in 1979. The areas were first found to not possess wilderness characteristics because of impacts. The boundaries of the renominated areas excluded impacts identified in the 1979 inventory and were thus found to possess wilderness characteristics.

Comment: *The 2007 review form indicates "BLM has not done a wilderness inventory of this area previously" and the list of reference material does not indicate that BLM conducted a site visit or reviewed aerial photographs of the area. However, determination appears based in part on "documentation from prior BLM resource inventories, aerial photographs, field observations, maps, etc." Please clarify whether BLM visited the area as part of the most recent review and what other information it considered.*

Response: As referenced in the Phonolite Hill review form, BLM conducted a field observation visit.

Comment: *Kingston Ridge. The 2007 review form mentions the "casual use" of mining claims. Please explain what this means.*

Response: Mining claims are present in the Kingston Ridge area but are not developed.

Comment: *Flat Tops. The 2007 review form states: "Based on the information SUWA provides, the BLM concludes there is a reasonable probability the Flat Tops proposed wilderness unit 'may have' wilderness character." A reasonable probability determination of wilderness character is an insufficient basis from which to impose management stipulations.*

Response: BLM stands by its determination. The BLM chose not to manage the Flat Tops area for wilderness characteristics in the Proposed RMP/Final EIS.

Comment: *76 comments / Fremont Gorge: BLM concluded that the lands identified in SUWA's "comment I" are "likely to have wilderness characteristics." The state objects to any planning decision that include*

measures to protect wilderness character without first definitively determining that the area in question does in fact possess wilderness character.

Response: BLM stands by its determination. The BLM chose not to manage the Fremont Gorge area for wilderness characteristics in the Proposed RMP/Final EIS.

Comment: *76 comments / Limestone Cliffs: BLM concluded that the lands "may to have wilderness characteristics." BLM also notes that the areas "have opportunities for both solitude and primitive recreation." The state objects to any planning decision that includes measures to protect wilderness character without first definitively determining that the area in question does in fact possess wilderness character. Likewise, the state objects to identification of wilderness characteristics without establishing the requisite "outstanding opportunities for solitude or a primitive and unconfined type of recreation."*

Response: BLM stands by its determination. The BLM chose not to manage the Limestone Cliffs area for wilderness characteristics in the Proposed RMP/Final EIS.

Comment: *76 comments / Mount Pennell and 76 comments / Ragged Mountain: BLM concluded that the lands covered by SUWA Comment A are "likely to have wilderness characteristics." Utah objects to any planning decision that includes measures to protect wilderness character without first definitively determining that the area in question does in fact possess wilderness character.*

Response: BLM stands by its determination.

Comment: *Labyrinth Canyon Extensions: The 2007 review form states both that the area was previously found "not to possess wilderness characteristics and dropped from further study," and that the "parcel has been already found to possess wilderness characteristics." Please reconcile these apparently contradictory statements.*

Response: Labyrinth Canyon was originally inventoried in 1979. A portion of this area was established as the North Horseshoe Canyon WSA, South Horseshoe Canyon WSA, and Labyrinth Canyon WSA. A portion of the area that was dropped from further study in 1990 was reinventoried in 1996 to 1999 and the remainder of the area was evaluated as the Labyrinth Canyon Extension.

Comment: *Phonolite Hill: BLM recognizes a "difference of opinion between BLM and SUWA regarding the significance of the intrusions and how they affect the appearance of naturalness." While BLM concurs that a "significant portion of the area is likely to have the appearance of naturalness," it does not otherwise attempt to resolve the difference. Please clarify whether the determination that the area has wilderness characteristics applies to the entire area or not. Please also clarify what steps BLM undertook to conclude that the areas "likely" to possess naturalness are in fact natural in appearance. Please explain how BLM proceeded to conclude that the area possesses wilderness character despite concluding, "primitive recreation potential exists at some level, not just at an outstanding level." We understand a wilderness characteristics determination to require outstanding opportunities for a primitive and unconfined type of recreation.*

Response: The determination applies to the entire Phonolite Hill area. The BLM used the Interdisciplinary Review Team to determine wilderness characteristics. As part of its wilderness characteristics inventory maintenance, BLM used a combination of field checks, Interdisciplinary Team review of data such as range files, county and BLM GIS data, and review of high-resolution 2006 aerial photographs. BLM evaluates an area for all of the wilderness characteristics including naturalness and outstanding primitive recreation opportunities and solitude. All of the wilderness values do not have to be present.

Comment: *Pole Canyon: The 2007 review form indicates, "the area(s) in question (or a significant portion of) is likely to have wilderness characteristics." However, the explanation appears to conclude*

otherwise. Please clarify BLM's conclusion and the standard applied to determine existence of wilderness characteristics. The 2007 review form also notes that this area is 4,700 acres in size and concludes that adjacency to an inventoried RARE II area is sufficient to satisfy the minimum size requirement. The 2007 review form for the Wildcat Mesa Extension appears to apply a different standard, noting that BLM considers only adjacent lands "administratively endorsed for wilderness management." Please clarify whether adjacent National Forest System lands are administratively endorsed for wilderness management. If not, please explain the apparent difference in standards.

Response: BLM stands by its determination. It does not conclude that adjacent to the U.S. Forest Service area is a factor (see Section 2(c) of the Wilderness Act for size consideration.) In some cases, some adjacent U.S. Forest Service lands are recommended for wilderness endorsement.

Comment: *Rock Canyon & Sweetwater Reef The 2007 review form indicates, "there is a reasonable probability that the area(s) in question (or a significant portion of) is likely to have wilderness characteristics." The form also notes that BLM believes that further consideration of the wilderness character of these areas is warranted. Please explain the conclusion that this area does possess wilderness character in light of the apparently incomplete information.*

Response: BLM stands by its determination. The BLM chose not to manage the Rock Canyon and Sweetwater Reef areas for wilderness characteristics in the Proposed RMP/Final EIS.

Comment: *Rocky Ford: The 2007 review form discusses SUWA's proposal but does not meaningfully discuss BLM's review of the proposal. The list of referenced material does not include aerial photos and the text does not mention site visits. Please clarify the steps taken by BLM to determine the existence of wilderness character in this area.*

Response: BLM stands by its determination. The BLM chose not to manage the Rocky Ford area for wilderness characteristics in the Proposed RMP/Final EIS.

Comment: *Wild Horse Mesa: The 2007 review form indicates, "there is a reasonable probability that the area(s) in question (or a significant portion of) is likely to have wilderness characteristics." Please clarify the process for determining what portions of the proposed area actually have wilderness character.*

Response: BLM stands by its determination. In Proposed RMP/Final EIS, the BLM chose to manage 8,700 acres of the 49,700 acres identified in the DRMP/DEIS for the Wild Horse Mesa area. As part of BLM's wilderness characteristics inventory maintenance, BLM performed a combination of data and on-site reviews. This included specific field inspections, Interdisciplinary team review of data such as range files, County and BLM GIS data, and high-resolution 2006 aerial photographs. The BLM's findings are described in the 1999-2003 wilderness reinventory documentation, as well as the 2007 wilderness characteristics review process (findings from this review are available on the Richfield Field Office planning website, and in the Administrative Record). The BLM is confident of high-standard approach used to inventory the public lands and stands by its findings, particularly the findings, which involved wilderness characteristics inventory maintenance.

Comment: *Wildcat Mesa Extension: The 2007 review form does not include the acreage for the subunits considered, precluding verification that the proposed units satisfy the 5,000-acre size requirement. Please provide this information. BLM discusses mineral claims and oil and gas leases. Please clarify the extent to which the Richfield Field Office considered the existence of undeveloped valid and existing rights with respect to wilderness characteristics. Units Band C are described as possessing opportunities for solitude as well as opportunities for primitive and unconfined recreation. Please clarify whether these opportunities rise to the requisite "outstanding" level. It appears that a previously approved ore road*

will bisect Unit C. It also appears that the BLM is deferring its determination of wilderness character to the RMP EIS. This would result in a management decision absent the prerequisite inventory.

Response: BLM stands by its determination.

Comment: *Consistent with this recognition, we encourage the BLM to revise management around natural springs and riparian areas to allow disturbance or occupancy within a buffer only when: (1) no practicable alternative is available AND all long-term impacts will be fully mitigated, or (2) the activity will benefit and enhance the spring/riparian area.*

Response: Managing the springs and riparian areas as described by the commenter would be contrary to the Utah Riparian Policy (IM-UT-2005-091). The buffer zones are not the only protection available for riparian zones. Mitigations for each riparian area would be developed on a case-by-case basis to best meet the conditions at the point of impact to implement the policies and procedures of the riparian program and other resources and land uses.

Comment: *The state objects if the Draft RMP does not make information supporting the VRM inventory class determinations proposed by the BLM available for review. The state also objects if the rationale for each VRM management class is not presented, or if the impact on resource uses in not fully disclosed in the analysis of impacts. The state has concerns that the BLM's identification of VRM inventory classes has led to a self-effectuating class protection scheme, rather than a source of information considered within the proposed resource use allocation schemes within each of the Draft's alternatives.*

Response: The VRI is based on criteria that provide for the objective evaluation of a landscape. The VRI is not the on-the-ground management tool. It is used to develop the VRM classes, with consideration from other resource activities.

Comment: *With this in mind, it appears the disclosure of VRM classification under the No Action Alternative is misleading. The No Action alternative reflects no change in current management direction. See Forty Most Asked Questions on CEQ NEPA Regulations, 46 Fed. Reg. 18026, 18027 (Mar. 23, 1981). As BLM notes on pages 3-28 and 4-96, current management direction is to manage WSAs as VRM Class 1. BLM should revise the EIS to reflect current management direction. As written, the RMP/DEIS under-represents current Visual Quality Objective (VQO) Class I management by 446,900 acres.*

Response: VRM is a land use planning decision. While IM-2000-096 directed the BLM to manage WSAs as VRM Class I, this change had to be made in an RMP, with appropriate NEPA documentation.

Comment: *Table 2-5, comparing vegetation related management decisions across alternatives, states that under alternatives C or D, BLM would not act to control insect pests. We understand that these two alternatives emphasize conservation values over commodity production. However, as forests throughout the west suffer from bark beetle and other insect pests, a decision to turn a blind eye to potential insect threats appears misplaced.*

Response: The Draft RMP/EIS considered a range of alternatives to control insect pests. Chapter 4 describes the impacts from this range of alternatives.

Comment: *Alternatives C and D anticipate treating 26,000 acres annually while alternatives A and B anticipate treating 73,600 acres annually. See RMP/DEIS at 2-5. Please clarify whether the acreage disclosed on page 2-5 is limited to mechanical treatments, and if not, the estimated percent of treatments that will be mechanical in nature.*

Response: Alternatives A and B would allow for a full range of vegetation treatment types, including prescribed fire and wildland fire use, mechanical, biological, manual, and chemical. The type of treatment

will be determined based on site-specific conditions and analysis. Alternatives C and D would use natural process and prescribed fire.

Comment: *Table 2-12a proposes to treat a significant amount of Ponderosa Pine forest - up to 171,140 acres under alternatives A and B. Please clarify what treatments BLM would utilize for Ponderosa Pine, and the need for this level of treatment.*

Response: The treatment acres proposal does not include a one-time treatment of all the acres of ponderosa forest type (43,000). Because of a frequent fire return interval, some areas could be treated several times, such as underburning to reduce understory. The treatment type would be determined on a case-by-case basis to best meet the conditions of the stand at the time of treatment. These acres were developed to allow for treatments that more closely mimic the historic fire return intervals.

Comment: *Page 4–458 provides a per-acre cost estimate for mechanical vegetative treatment. Please provide a per-acre cost estimate for wildland fire suppression.*

Response: The Proposed RMP/Final EIS has been revised to include a per-acre cost estimate of fire suppression in Chapter 4.

Comment: *Alternative B contains some issues needing clarification. The "Adaptive Management" section (2.4) states: "Land use plan level decisions are not subject to Adaptive Management." In general, this is accurate; however, the proposition may establish limits that could be important to timely management decisions. Please consider alternative language.*

Response: The Adaptive Management language on page 2-9 of the Draft RMP/EIS has been revised to read: "Land use plan-level decisions would not be immediately adaptable. These include the goals and objectives, allowable uses, management actions, and special designations."

Comment: *In section 2.6.1.9., BLM provides a description of using grazing to improve wildlife habitat.*

Response: The commenter's recommendation can be implemented by adjusting the terms and conditions associated with a livestock grazing permit. Making these decisions on a permit-by-permit basis ensures flexibility in management and that prescriptions are targeted to meet the conditions of a given site, rather than at a landscape level in the RMP.

Comment: *Section 2-10 specifically deals with the management of the Henry Mountain Bison and Mule Deer. Alternative B states, "[d]evelop a habitat management plan (HMP) for bison, mule deer and other big game species within the Henry Mountain area in consultation with UDWR." It is the state's expectation that the Utah Department of Agriculture and Food's Grazing Improvement Program (UDAF/UGIP) and the Public Lands Policy Coordination Office will also be involved as a cooperating agency in this planning.*

Response: The BLM is required to work closely with the State of Utah and its various departments. The identification of cooperating agencies for future NEPA projects is outside the scope of the NEPA document.

Comment: *In section 2-12, "Hazardous Fuels Reduction," grazing should be specifically listed as a tool to accomplish this goal.*

Response: The Draft RMP/EIS has been modified to include an alternative that provides for using livestock grazing for site-specific fuels management outside the season of use.

Comment: *The RMP/DEIS discloses total AUMs within the field office, but not the number of AUMs associated with each allotment. As written, it is not clear whether alternatives B, C, and D would hold*

permitted use constant for each allotment, or whether reallocation of AUMs between allotments would occur without changing the overall number of AUMs.

Response: The Draft RMP/EIS includes allocations by allotment in Appendix 7.

Comment: *Chapter three of the RMP/DEIS, p. 3-65, indicates that an interdisciplinary team made up of BLM employees conducts watershed assessments and that these watershed assessments determine whether the Standards for Rangeland Health are being met. Please clarify how many watersheds were assessed and their condition with respect to the four identified standards.*

Response: Approximately 50 percent of the allotments have had a final determination made. The remaining 50 percent is being assessed. Of the 50 percent with a final determination, 100 percent are at properly functioning condition, 50 percent have met upland, 50 percent have met riparian, 50 percent have met species maintenance, and 50 percent have met water quality.

Comment: *We feel that the effects analysis for cultural resources within the DEIS could be significantly enhanced and strengthened by additional analysis techniques. Areas to be examined could include: Bull Creek Archaeological District, Horseshoe Canyon South WSA, the Trough Hollow area, the Dirty Devil River area, the Fremont Gorge/Cockscomb area, the Horseshoe Canyon area, the Quitchupah archaeological district area, the No Man's Canyon area, the Robbers' Roost Canyon area, the Fish Creek area, the Maidenwater Creek area, Poison Springs Canyon, and other areas specified as potential National Register nomination areas. In addition, the state recommends the BLM check to ensure that other potential areas of high cultural resource densities or values are identified and examined prior to ground-disturbing activities.*

Response: As noted in 40 CFR 1503.3, a cooperating agency's comments on an EIS are required to include a level of specificity. Specifically, "when a commenting agency criticizes a lead agency's predictive methodology, the commenting agency should describe the alternative methodology which it prefers and why." In addition to the general cultural impacts, the Draft RMP/EIS includes additional analysis of each of the areas noted by the commenter in the ACEC section, all of which included cultural resources as a relevance and importance (R&I) value. Given the general nature of RMP-level decisions, further site-specific analysis on specific areas/cultural sites is best addressed at the implementation level. In addition, on page 2-17 the Draft RMP/EIS specifically requires that cultural resource inventories be completed "prior to allowing permitted surface disturbing activities…" These inventories would be required throughout the RFO, not just in "areas of high cultural resource densities or values" as recommended by the commenter.

Comment: *We have concerns about the designation of cultural resource site use allocations in the proposed alternatives. Although we recognize that such designations are required of the BLM, our concern is with stipulating a particular designation for an entire class of sites (e.g., assigning all "Temporary Camps" to "public use" or "scientific use") without consideration of the nature of each individual site. Such designation fails to consider the individual characteristics of sites within each class, and it is very easy to visualize situations where one or more of the stipulated designations would be either inappropriate for a given site or potentially harmful. Furthermore, under the preferred alternative, the vast majority of sites are allocated to scientific use, with little opportunity to designate sites appropriately for public use. This appears to cut the public out of the enjoyment and use of archaeological and cultural sites in the Richfield FO area. No other BLM office has attempted such a designation. Instead, most have simply stipulated general goals for percentages of sites assigned to each category. We recommend that the Richfield FO adopt the allocation technique (assigning percentages) used by other BLM offices. Additionally, Table 2.6a identifies various resource site use allocations that would apply to different site types. This table does not provide any explanation of the terms used or what would be allowed under*

"public use," "scientific," "discharged," or any other allocation. Please explain what these allocations provide and how they would be implemented.

Response: Scientific use does not eliminate opportunities for public use of a cultural site. In addition, the Draft RMP/EIS Chapter 2 (page 2-18) includes language that provides for adjustments in specific sites or site types as conditions change. Such changes could include making individual sites available for public use, after appropriate scientific studies have been completed. As for the explanation of the terms used and allowable uses under each, the Draft RMP/EIS includes a reference to the BLM Manual 8110 (*Identifying and Evaluating Cultural Resources*), which is readily available to the public and describes the information requested by the commenter.

Comment: *We note that the area around the Bull Creek Archaeological District is shown as open to fluid minerals leasing under all or nearly all of the alternatives. However, in the cultural resources section this area is listed as closed to surface disturbance for all alternatives. Leasing carries the strong implication that the BLM will allow some development (i.e., surface disturbance) of the lease, even if only a single well, in a leased area. Thus, allowing leasing in the Bull Creek Archaeological District appears to create inconsistency between the alternatives. We recommend that the final plan resolve this discrepancy.*

Response: The Draft RMP/EIS was revised to eliminate the inconsistencies with the Bull Creek Archaeological District and minerals leasing.

Comment: *The impacts analysis for leasing Minerals and Energy in the cultural resource section of Chapter 4 discusses potential impacts only from seismic operations. We recommend that the discussion be made parallel to all the other BLM RMPs and discuss the other potential impacts from leasing, such as drilling or well development.*

Response: The Draft RMP/EIS impact analysis was revised to clarify the impacts from oil and gas leasing to cultural resources.

Comment: *Under the section for Recreation Decisions, Table 2-16, page 2-63, the DEIS addresses issues with "Criteria for Vending." We were unable to find a definition of vending and would like to know what constitutes vending with respect to this plan. Vendors and concessionaires are important to the success of State Parks. We do not understand why the BLM in alternatives B, C, and D wishes to restrict vending. For instance, Alternatives C and D disallow vending at organized events, does this mean an event could not sell a T-Shirt memorializing it? Please clarify. The state recommends the BLM define vending and remove the proposed restrictions, but keep the proposed action statement of authorizing vending on a case-by-case basis.*

Response: Criteria for vending is found in 43 CFR 2930 and BLM Handbook 2930-1. These sources also define what vending entails. The BLM is considering a range of alternatives to address vending in response to issues raised through scoping. The presence of unregulated vending may be inappropriate in some locations.

Comment: *3. North Hatch Canyon The Big Ridge Area: (Township 31 South, Range 15 East, Sections 14 & 23). The road across Big Ridge is currently open to OHVs, but only via roads through the Glen Canyon Recreation Area, which is closed to non-street legal vehicles. The existing route from North Hatch Canyon through Sections 14 and 21 should be left open to provide OHV access to the 19.1 miles of open routes on Big Ridge. While heavy maintenance will be needed before this route can be used, we think it may be worth it.*

Response: This route is physically closed due to a rock fall. There are also safety concerns with the steep slope and condition of the route up to the rock fall. The route has been identified as an open designated route. However, maintenance and/or reconstruction would be required to physically reopen this route.

More specific details of the maintenance project would need to be developed and analyzed in a site specific NEPA analysis following completion of the RMP.

Comment: *4. Poison Spring Canyon/Burt Mesa Area: (Township 31 South, Range 14 East, Sections 18 &19). The route overlooking the Dirty Devil River should remain open for OHV use to the point where it becomes impassable, approximately 1.2 miles north from the point where it is closed in Alternative B. This section of the road provides outstanding viewing of the Dirty Devil River and adjacent canyons.*

Response: Several routes were analyzed in this area and designated for consistency with other resource decisions of the RMP. Routes were identified using a variety of data sources and route length determined based on that data. This route has been reassessed by BLM staff specialists. Further ground-truthing would be required to extend the route beyond what has been indicated on the route data. This would need to be completed along with site-specific NEPA analysis following completion of the RMP.

Comment: *5. Goat Water Point Area: (Townships 30 & 31 South, Ranges 12 & 13 East). A short access route between existing routes on Goat Water Point and the east/west route north of the point is needed to complete a large OHV loop on the north end of the Henry Mountains. The attached map (Attachment H) shows routes that should be considered for this connection.*

Response: This proposed route was not analyzed. Although existing routes have been identified north and south of the private property, new construction would be required to connect these routes, avoiding the private property and a reservoir development. Since new construction is needed, site-specific NEPA analysis would need to be completed.

Comment: *On page 1-6, BLM states that the RMP will apply only to public lands and, where appropriate, split-estate lands where the subsurface mineral estate is managed by the BLM. BLM should re-consider whether it can impose its standards on split estate lands where it does not own the surface. This action diminishes the rights of the surface owner, whether fee or trust lands, to exploit its lands in the manner it sees fit. So long as the operator of an oil and gas well has obtained a satisfactory surface use agreement that can be included in its Application for Permit to Drill to the BLM, BLM should not unilaterally limit mineral development.*

Response: As stated in Table 2-19 of the Draft RMP/EIS: BLM would lease split-estate lands according to BLM RMP stipulations for adjacent or nearby public lands or plans of other surface management agencies as consistent with Federal laws, 43 CFR 3101, and the surface owner's rights.

Comment: *Page 1-13 contains a discussion of the BLM's direction under EPCA. Paragraph 3 states that the BLM will "weigh the relative resource values, consistent with FLPMA." None of the alternatives adequately analyze the loss of revenue from formally or effectively eliminating mineral development in many of the lands subject to Special Designations and restrictive viewsheds. There are references to number of wells to be allowed under the alternatives, but no indication what that means in terms of lost revenue to the United States, the State of Utah, local governments, and Utah's school trust, and the effect of that revenue loss under EPCA.*

Response: Section 4.4.6.1.1.1 of the Draft RMP/EIS includes an Energy Policy and Conservation Act (EPCA) evaluation by alternative. The dollar value ranges are too broad to determine any cost losses from EPCA quantitatively. The Reasonably Foreseeable Development (RFD), Appendix 12, foresees a certain level of oil and gas development in the study area as a whole. Constraints in the various alternatives could impact exactly where development occurs. However, nearly 80 percent of the oil and gas wells projected in the RMP are located along the west side of the planning area where public lands are either open to leasing under standard terms or open to leasing with controlled surface use or timing stipulations, as stated in the RMP Chapter 4 section "Alternative N Leasable Minerals—Oil and Gas." Thus, restrictions to oil and gas development on BLM-managed lands would likely have minimal revenue impacts to the

United States, the State of Utah, local governments, and Utah's school trust. Revenue impacts under EPCA would likely be minimal, too.

The BLM acknowledges that the closure of adjoining public lands to oil and gas leasing may have a potentially negative impact on SITLA's mineral revenue. In alternatives C and D, the closure of the 379,100 acres managed as WSA or Wilderness Areas is nondiscretionary and beyond the scope of this plan.

In alternatives N, A, B, and C, there are no SITLA lands affected by discretionary closure. Chapter 4 of the Proposed RMP/Final EIS has been revised to reflect the impacts of Alternative D on SITLA inholdings for the discretionary closures of 244,058 acres of public land. It should be noted that under any alternative, the proposed ACECs are not managed as closed to mineral leasing. Areas with wilderness characteristics are recommended as closed under Alternative D.

Comment: *Page 2-139 should specifically reference the need for federal acquisition of state school trust lands that are captured by federal reservations and withdrawals such as wilderness study areas, and that all land tenure adjustments necessary to accomplish this goal will be a priority, in accordance with applicable BLM policy guidance (the BLM Manual provisions re: state exchanges).*

Response: The Draft RMP-EIS Table 2-18 (page 2-77) states "Give exchanges with the State of Utah priority consideration." Appendix 5 addresses criteria for all other land tenure adjustments.

Comment: *BLM should substantially increase the areas identified as available for disposition by exchange with the State of Utah, in order to fully permit the elimination of state inholdings in withdrawn areas.*

Response: The Draft RMP-EIS Table 2-18 (page 2-77) states "Give exchanges with the State of Utah priority consideration." Appendix 5 addresses criteria for all other land tenure adjustments.

Comment: *In addition, state selection (i.e., quantity grants under the Utah Enabling Act, indemnity selections under the Utah Enabling Act, 43 U.S.C §§ 870-871, and other applicable statutes) should be mentioned as an equally preferred method of land disposition as land exchanges. On page 3-72, paragraph 3.4.5.1.1 (Disposals) should be modified to indicate that the preferred method of disposal is land exchange and that facilitating acquisition of state trust lands inholdings in wilderness study areas and other sensitive areas through land exchange is considered an important public objective, and will be given priority.*

Response: The Draft RMP-EIS Table 2-18 (page 2-77) states "Give exchanges with the State of Utah priority consideration." Appendix 5 addresses criteria for all other land tenure adjustments.

Comment: *Non-BLM mineral lands are directly impacted by RMP decisions. This is not recognized as an impact within the RMP. The largest source of revenue for the Utah school trust is from oil and gas bonuses and royalties. In much of Utah, in order to establish an economic oil and gas resource play, the exploration company needs a large geographic area.*

Response: The BLM acknowledges that the closure of adjoining public lands to oil and gas leasing may have a potentially negative impact on SITLA's mineral revenue. The "Socioeconomics" section in Chapter 4 of the Proposed RMP/Final EIS has been revised to include further analysis of the impacts on SITLA lands.

Comment: *BLM decisions to withdraw mineral lands from leasing in WSAs, areas with wilderness characteristics, ACECs, and other areas directly affects the economic viability of state trust lands inholdings in those areas, particularly for oil & gas. Restrictive designations additionally increase the*

cost of access to trust lands, may impair marketability, and require the expenditure of trust resources in pursuing land exchanges with BLM. These facts should be acknowledged appropriately in the discussion of social and economic impacts. See RMP/DEIS at p. 3-97.

Response: The BLM acknowledges that the closure of adjoining public lands to oil and gas leasing may have a potentially negative impact on SITLA's mineral revenue. In alternatives C and D, the closure of the 379,100 acres managed as WSA or Wilderness Areas is nondiscretionary and beyond the scope of this plan.

In alternatives N, A, B, and C, there are no SITLA lands affected by discretionary closure. Chapter 4 of the Proposed RMP/Final EIS has been revised to reflect the impacts of Alternative D on SITLA inholdings for the discretionary closures of 244,058 acres of public land. It should be noted that under any alternative, the proposed ACECs are not managed as closed to mineral leasing. Areas with wilderness characteristics are recommended as closed under Alternative D.

Comment: *Appendix 5, page 5-1. We also encourage BLM to delete numbered paragraph 2. It may hinder necessary exchanges to acquire state inholdings. FLPMA does not require that there be no net loss of public lands.*

Response: The Draft RMP-EIS Table 2-18 (page 2-77) states "Give exchanges with the State of Utah priority consideration." Appendix 5 addresses criteria for all other land tenure adjustments. Appendix 5, land tenure adjustment criteria 2 allows for "a net gain of important and manageable resource values on public lands" and not a net gain or loss of public land. Proposed disposal actions must meet one or more of the criteria in Appendix 5 before they can be considered for any form of land tenure adjustment.

Comment: *Because of this process, the state strongly recommends the BLM preserve the seven potential reservoir sites listed below. Due to time and budget constraints an on-site investigation, which will evaluate construction issues, has not yet been completed. As soon as practicable, on-site evaluations will be completed. Aldrich Reservoir, supplied by the Fremont River and located on Sandy Creek in T29S R08E section 22, would impound 2,000 acre-feet of irrigation water. Antimony Reservoir would be located one and a half miles to the south east of the town of Antimony in T31 S R02W section 26. Caineville Wash would be an off-stream site, west of the town of Caineville in T28S R08E section 35. Road Creek (upper) originally proposed in the state engineers report to the Governor in 1943 is located just west of Loa in T28S R02E section 3 on Road Creek. Thurber dam (Bicknell Bottoms) would be located two miles southeast of the town of Bicknell in T29S R04E section 7. Torrey (poverty Flat). The Bureau of Reclamation and the Wayne County Water Conservancy District are presently studying this site. Torrey (Upper) is near the larger site and would store 2,000 acre-feet of exchange irrigation water, for water rights upstream of the reservoir.*

Response: Under FLPMA Title V and 43 CFR 2800, the state could apply to obtain reservoir ROWs for these areas. However, until such action occurs, the areas will be managed as multiple use by BLM. Should BLM receive an application to purchase one of the parcels, the state would have an opportunity to comment at that time. If a patent is issued and the state has an existing reservoir ROW, the patent document would be issued subject to that prior existing right.

Comment: *Under the preferred alternative, there is a potential problem with the transportation of coal produced from the Henry Mountains coalfield, should such development occur. The route designations map (2-18 for Alternative B) shows two networks of routes providing access to the central part of the coalfield in T. 32 S., R. 8-10 E.; one route heads south from Highway 24 along the Notom road, and the other heads west from Highway 95 in the area between the Mount Ellen-Blue Hills and Mount Pennell (spelled incorrectly as "Pennel" on map 3-14) WSAs. While there are two alternative routes where a paved road could be constructed to truck coal out of the Henry Mountains coalfield, the route to the east, which is the most favorable for coal development from the standpoint of proximity to distant rail access at*

Green River, appears to be the least favored by the BLM because it is deemed an area of right-of-way avoidance in alternative B (Map 2-31).

Response: At the time of coal leasing, if a mine is proposed for development, access and haul routes would be considered at that time.

Comment: *The UDWR strongly encourages the BLM to mandate off-site mitigation for surface disturbing actions on projects that are expected to have long-term impacts to crucial wildlife habitats. Further, the BLM should include an index (for example, 1 acre impacted: 4 acres mechanically restored) in the RMP for all future development in crucial wildlife habitat.*

Response: Table 2-10, page 2-26 includes a decision under common to all alternatives that states "Where appropriate, require onsite mitigation when surface disturbance cannot be avoided on a site-specific basis, and consider offsite (compensatory) mitigation where onsite mitigation is impractical." The compensatory mitigation is better determined on a site-specific/species-specific basis as projects are proposed.

Comment: *Previously, the UDWR submitted a comment suggesting that specific protection and management of special status species should be discussed in the RMP. At that time, the draft RMP stated that BLM actions would be consistent with guidelines provided by the U.S. Fish and Wildlife Service or other agencies. However, no mention was made in other sections of how that may affect oil and gas leasing, surface mining, off-road vehicle travel, or other land uses. This draft also fails to include that information.*

Response: The Draft RMP/EIS includes management actions under Fish and Wildlife Common to All Alternatives (Table 2-10, page 2-26) that support UDWR management plans and objectives. The specific conservation actions are specified in UDWR management plans, such as the *Utah Comprehensive Wildlife Conservation Strategy* (UDWR 2005c). Impacts from RMP management actions for special status species to oil and gas leasing, surface mining, OHV travel, or other land uses are discussed generally in Chapter 4.

Comment: *The Richfield RMP should be consistent with the newly developed Utah Wildlife Action Plan (UWAP). The UWAP describes how species of concern will be managed in the State of Utah. These species should be included in the RMP where special status species are discussed.*

Response: The Draft RMP/EIS includes management actions under Fish and Wildlife Common to All Alternatives (Table 2-10, page 2-26) that support UDWR management plans and objectives. The specific conservation actions are specified in UDWR management plans, such as the *Utah Comprehensive Wildlife Conservation Strategy* (UDWR 2005c). Impacts to wildlife habitat from oil and gas leasing management actions are discussed generally in Section 4.3.9, page 4-164. As leases are proposed, site-specific NEPA analysis, including impacts to fish and wildlife habitat, will be conducted.

Comment: *On behalf of the state, UDWR personnel from our Southern and Southeastern regional offices served as interdisciplinary team members and contributed a significant amount of time to development of initial drafts of the RMP. Many of the preliminary agreements that came out of this process are not reflected in the DEIS. Potential transplants of wildlife were addressed during this process, as were issues affecting management of bison, mule deer, sage-grouse, and bighorn sheep. Rather than tackle these issues now, the Draft RMP states that a Habitat Management Plan (HMP) will be developed later. Much work has been invested in this cooperative process over the past three years, and the state prefers to see these issues resolved within the scope of this RMP if possible.*

Response: This detailed information is outside the scope of the RMP; however, BLM included appropriate management actions that would allow for the implementation actions to occur. Reintroductions are discussed in the Draft RMP/EIS Table 2-9, page 2-25. BLM appreciates the efforts

put forth by UDWR personnel, and BLM plans to use the information generated in implementation planning, such as HMPs.

Comment: *On page 4-466, the RMP/DEIS states that under Alternative A, BLM would reallocate AUMs dedicated to wildlife back to livestock grazers and that the Utah Department of Wildlife Resources would "forfeit" the investment it made in purchasing "AUMs from livestock permit holders for the purpose of increasing available forage for wildlife." These AUMS were allocated to wildlife through purchase and an associated resource management planning amendment executed in the late 1980s. To the extent state rights are involved, the state does not agree to "forfeit" any of its rights.*

Response: The BLM is responsible for managing wildlife habitat in coordination with the UDWR, which is responsible for managing wildlife populations. The BLM is also responsible for managing livestock grazing according to the legal requirements of the Taylor Grazing Act and FLPMA. The allocation of forage is a discretionary action and does not involve the granting of any legal "rights."

Comment: *Several years ago, the BLM requested that conservation groups identify willing sellers and acquire grazing permits where conflicts with bison existed. This was done, and a conservation group acquired a grazing permit in order to help resolve conflicts between bison and domestic livestock. BLM officials have stated that some of these conflicts existed because forage was originally over-allocated on some allotments. If this is the case, the RMP should address the issue of forage over-allocation.*

Response: Forage allocations are contained in the Draft RMP/EIS in Appendix 7. If future monitoring indicates that the forage resource is being over utilized, the Utah Guidelines for Grazing #12 specify, "Where it can be determined that more than one kind of grazing animal is responsible for failure to achieve a standard, and adjustments in management are required, those adjustments will be made to each kind of animal, based on interagency cooperation as needed, in proportion to their degree of responsibility."

Comment: *Also, in desert bighorn sheep habitat, the UDWR requests that forage that is not allocated to cattle because of terrain be considered for allocation to wildlife (for bighorn sheep).*

Response: Terrain was considered in the initial livestock forage allocation process. No forage was allocated to livestock in areas too steep and/or rugged for livestock.

Comment: *UDWR is concerned with the general language describing impacts to fish and wildlife from leasable minerals beginning on page 4-164. It states that impacts to wildlife will be dealt with on a case-by-case basis. We recommend that the BLM develop a long-term plan for mineral extraction and wildlife mitigation within the area covered by this RMP.*

Response: The Draft RMP/EIS includes seasonal and distance restrictions on oil and gas leasing where appropriate under the multiple-use analysis.

Comment: *The UDWR recommends that the RMP require active motorized vehicle management, monitoring and cooperation with local communities that may potentially restore OHV use in currently closed areas or preclude OHV use on currently open routes/areas if evidence derived from future surveys or research indicate that OHV use has deleterious or negligible impacts, respectively, to crucial wildlife habitat.*

Response: The RMP includes a range of alternatives that consider OHV area and route designations. Implementation planning requires active OHV management, which would address these issues. BLM administers OHV management under EO 11646 and EO 11989 as well as 43 CFR 8340. Draft RMP/EIS Table 2-17, page 2-63, states "Coordinate OHV management with other agencies where possible (U.S. Forest Service, National Park Service, State of Utah, counties, and communities)."

Comment: *The draft RMP discusses several options for dealing with public lands that have the potential for disposal or transfer. Maps 2-22 and 2-23 identify several of these parcels in Sanpete and Sevier counties that are either located within, or lie adjacent to, State Wildlife Management Areas. We strongly encourage the BLM to withdraw the following parcels from the list of potential disposals: SA01, SA06, SA09, SA10, SA11, SA12, SA13, SA14, SA25, SA29, and SV05.*

Response: BLM's mandate is to retain lands in federal management unless the lands meet the criteria specified in FLPMA Section 203 for sale and other disposal actions as provided for under other authorities (such as exchange, Recreation and Public Purposes [Act][R&PP]) as discussed under the "Lands and Realty Common to All Alternatives" section in Chapter 2, Table 2-18, of the Draft RMP/EIS. The local governments were given the opportunity to identify isolated and/or uneconomical parcels that they may have interest in as part of the RMP process. Table A5-1 in the Final RMP/EIS will be modified to identify these parcels as having DWR interest associated with the adjacent state wildlife management areas. Local, county, or state governments may apply for any of the parcels identified in the tables for FLPMA Section 203 sale or other public land under other current authorities for public purposes. Preference is generally given to applicants that would provide a public benefit.

Comment: *Map 2-24 illustrates several proposed disposal parcels in Wayne County that are identified as crucial mule deer winter range. Specifically, the UDWR is concerned that parcels WN03, WN03, and WN04, if converted to agriculture, could greatly increase depredation issues in this area. The UDWR hopes the BLM will consider these issues and consult with the UDWR prior to disposal of these parcels.*

Response: In Table 2-18 of the Draft RMP/EIS, the last bullet of the desired outcomes identifies the initial criteria used to identify the parcels for sale. This bullet has been modified in the Final EIS to further clarify BLM's preliminary review process. Additional site-specific inventories would be completed in the NEPA analysis and decision-making process, at which time resources may be identified that would preclude disposal suitability. If determined suitable for disposal, publication notices would be sent to federal, state, local governments, and interested parties to provide opportunity for coordination regarding land tenure adjustment actions.

Comment: *Domestic sheep diseases are a significant threat to desert bighorn sheep. We recommend that the BLM convert all allotments identified in the Henry Mountains Desert Bighorn HMP to cattle. Further, because of the potential threat of transmission of malignant cataharral fever to bison, we recommend conversion of all allotments east of Capitol Reef National Park to cattle (specified on p. 2-43).*

Response: BLM acknowledges that domestic sheep may pose a threat (e.g., cataharral fever) to Desert bighorn sheep and bison. However, the RFO has no active sheep allotments in the Henry Mountains Desert Bighorn HMP or in any of the allotments east of Capitol Reef National Park.

Comment: *Stipulations implemented by some BLM Field Offices restrict surface disturbing activities in desert bighorn sheep habitat during the rut (October 15 to December 15).*

Response: The Final RMP/EIS has been modified to include this stipulation in Appendix 11, page A11-15.

Comment: *The preferred alternative offers only seasonal protection within 0.5 miles of Sage Grouse leks and provides no buffer around brooding habitat. See RMP/DEIS at p. 2-31. The buffer used for protection of sage-grouse habitat from development should be 2 miles, following the currently accepted management guidelines set forth by Connelly et at. (2000) and the* 2002 Utah Strategic Management Plan for Sage-Grouse *(two documents that should be cited and referenced to provide guidance in sage-grouse management issues).*

Response: The Proposed RMP has been revised to include a seasonal restriction of 2 miles around sage grouse leks from March 15 through June 1 and a seasonal restriction around brooding/nesting habitat from April 1 through July 15.

Comment: *There are no alternatives or reparations known to suitably replace a sage-grouse lek. As such, the UDWR recommends the BLM adopt appropriate avoidance measures for sage-grouse habitat, i.e., preclude new ROWs with high-profile structures (such as buildings, storage tanks, overhead powerlines, wind turbines, towers, and windmills) within 2 miles of a greater sage-grouse lek and/or in crucial brood rearing and winter habitats.*

Response: The Proposed RMP has been revised to prohibit aboveground structures within 2 miles of leks from March 15 through June 1.

Comment: *All Alternatives "prohibit long-term surface disturbing activities" within important sage-grouse habitats. The RMP should define (i.e., quantify) "long-term" activities. Three weeks of disruptive activity in close proximity to a lek or brooding habitat may be considered short-term, but still result in significant disruptions to sage grouse breeding habits. Again, as stated above, these stipulations should be based on guidelines detailed in Connelly et at. (2000) and the* 2002 Utah Strategic Management Plan for Sage-Grouse.

Response: Long-term is defined on page 4-2 of the Draft RMP/EIS as lasting beyond 5 years. The Proposed RMP has been revised to include a seasonal restriction of 2 miles around sage- grouse leks from March 15 through June 1 and a seasonal restriction around brooding/nesting habitat from April 1 through July 15.

Comment: *The Larry Canyon, Sam's Mesa Box Canyon, Twin Corral Box Canyon, and Maidenwater Springs areas provide important habitat for desert bighorn sheep and bison. The discussion on page 2-91 and associated analysis should be revised to reflect this.*

Response: The discussion of outstandingly remarkable values for Wild and Scenic Rivers is included in Appendix 2, *Wild and Scenic River Eligibility and Tentative Classification Report*. Supporting information for this report is in the administrative record. Impacts to fish and wildlife from the wild and scenic river management actions is discussed generally in Section 4.3.9.

Utah Department of Education

Comment: *As more specifically set forth below, the State Board of Education believes that the Draft RMP fails to address adequately these two major issues: the financial impact, including economic opportunities lost, of BLM management decisions on school trust lands, and the need for a substantially more robust program for land tenure adjustments between the BLM and SITLA.*

Response: The BLM acknowledges that there are important fiscal impacts from oil and gas (including coalbed methane) activities on school trust lands, and these have been incorporated in the Proposed RMP/Final EIS in the socioeconomic analysis in Chapter 4. The potential fiscal impacts, and the potential economic impact from loss of spending in the local economy because of SITLA oil and gas wells foregone have also been calculated for Alternative D and added to the socioeconomic analysis in Chapter 4. The comment regarding a program for land tenure adjustments between BLM and SITLA is addressed in the "Lands and Realty" section of the comments and responses.

Comment: *For this reason, the State Board of Education strongly disagrees with the BLM's assumption that non-BLM lands would be minimally directly impacted by RMP decisions, since BLM does not make land decisions on non-BLM lands.*

Response: The BLM acknowledges that the closure of adjoining public lands to oil and gas leasing may have a potentially negative impact on SITLA's mineral revenue. In alternatives C and D, the closure of the 379,100 acres managed as WSA or Wilderness Areas is nondiscretionary and beyond the scope of this plan.

In alternatives N, A, B, and C, there are no SITLA lands affected by discretionary closure. Chapter 4 of the Proposed RMP/Final EIS has been revised to reflect the impacts of Alternative D on SITLA inholdings for the discretionary closures of 244,058 acres of public land. It should be noted that under any alternative, the proposed ACECs are not managed as closed to mineral leasing. Areas with wilderness characteristics are recommended as closed under Alternative D.

Comment: *The BLM's decisions on how to manage its lands directly affect the ability of the Utah public schools to receive the revenue from profitable management of school lands, as intended by Congress when they were granted. We suggest an analytical assumption sentence be included which says "The BLM appreciates that our decisions on how to manage our lands directly affect the ability of the Utah public schools to receive the revenue from profitable management of these lands, as intended by Congress when they were granted."*

Response: The BLM acknowledges that the closure of adjoining public lands to oil and gas leasing may have a potentially negative impact on SITLA's mineral revenue. In alternatives C and D, the closure of the 379,100 acres managed as WSA or Wilderness Areas is nondiscretionary and beyond the scope of this plan.

In alternatives N, A, B, and C, there are no SITLA lands affected by discretionary closure. Chapter 4 of the Proposed RMP/Final EIS has been revised to reflect the impacts of Alternative D on SITLA inholdings for the discretionary closures of 244,058 acres of public land. It should be noted that under any alternative, the proposed ACECs are not managed as closed to mineral leasing. Areas with wilderness characteristics are recommended as closed under Alternative D.

Comment: *Specifically, the BLM does not consider multiple use or sustained use mandates required by FLPMA in the "Lands and Realty Objectives" section. None of the alternatives adequately analyze the loss of revenue from formally or effectively limiting or eliminating the mineral development in many of the lands subject to special designations and restrictive viewsheds. There are references to number of wells to be allowed in Appendix 1, Reasonable Foreseeable Development Scenario, but no indication what that means in terms of lost revenue to the United States, the State of Utah, local governments.*

Response: The BLM acknowledges that there are important fiscal impacts from oil and gas (including coalbed methane) activities on school trust lands, and these have been incorporated in the Proposed RMP/Final EIS in the socioeconomic analysis in Chapter 4. The potential fiscal impacts, and the potential economic impact from loss of spending in the local economy because of SITLA oil and gas wells foregone have also been calculated for Alternative D and added to the socioeconomic analysis in Chapter 4. The comment regarding a program for land tenure adjustments between BLM and SITLA is addressed in the "Lands and Realty" section of the comments and responses.

Comment: *Utah's school trust, and the effect of that revenue loss under EPCA. The discussion of coal development and the effect, should the BLM not lease its available coal in the RPA, is also very limited.*

Response: The BLM acknowledges that there are important fiscal impacts from coal activities, and these are addressed in the Proposed RMP/Final EIS in the socioeconomic analysis in Chapter 4. The management actions in the Proposed RMP are to consider coal leasing on areas suitable. Under the Proposed RMP, the Wasatch and Emery coal fields would remain largely available. The Proposed RMP includes policies and decisions that are designed to balance extractive industries such as coal mining with needs to protect, restore, and enhance natural values. Whether additional coal development takes place

largely depends on energy prices, the relative economics of coal production in the RFO versus other regions, and site-specific environmental review.

Comment: *At the current time, approximately 73,862 surface acres are inheld in Wilderness Study Areas (WSAs) in the RPA. When these lands are added to the 88,822 acres included in the proposed non-WSA lands in the Alternative D, Utah's school trust will be left with approximately 162,684 surface acres within the RPA that cannot produce revenue or have reduced revenue potential. In this respect, the Resource Management Plan includes an unconstitutional taking of approximately 43% of the school children's lands within the RPA, and the BLM must include specific provisions in the RMP to adequately compensate the school trust, through exchanges or purchase.*

Response: The BLM acknowledges that the closure of adjoining public lands to oil and gas leasing may have a potentially negative impact on SITLA's mineral revenue. In alternatives C and D, the closure of the 379,100 acres managed as WSA or Wilderness Areas is nondiscretionary and beyond the scope of this plan.

In alternatives N, A, B, and C, there are no SITLA lands affected by discretionary closure. Chapter 4 of the Proposed RMP/Final EIS has been revised to reflect the impacts of Alternative D on SITLA inholdings for the discretionary closures of 244,058 acres of public land. It should be noted that under any alternative, the proposed ACECs are not managed as closed to mineral leasing. Areas with wilderness characteristics are recommended as closed under Alternative D.

Comment: *The section on Land Tenure Adjustments should specifically reference the need for federal acquisition of school trust lands that are captured by federal reservations and withdrawals, such as wilderness study areas, and the balancing need to provide other productive lands for the school trust to acquire. The RMP should specifically address lands more appropriately managed by the school trust and non-federal lands that could be more appropriately managed by the BLM, and identify potentially productive lands that could be used to facilitate the exchange.*

Response: In the Draft RMP/EIS, Table 2-18, pages 2-76 and 2-77, under "Common to All Alternatives for Lands and Realty" as well as Land Tenure Adjustment criteria 1 in Appendix 5 address this concern.

Comment: *Reasonable access to school trust lands, across the BLM lands, should be provided for under all alternatives. This can be done as a "Management Common to All Alternatives" notation, with a notation that access to school trust lands will be granted, even if an area is otherwise an avoidance or exclusion area for right-of-ways. Under the law, as laid out in Andrus v. Utah, the BLM is obligated to provide reasonable access to all school trust lands, including such lands located within wilderness study areas. Failure to do so would frustrate the very purpose of which Congress granted the lands.*

Response: BLM Utah IM UT 83-130 and BLM WO IM 85-579 provide access to non-federally owned land surrounded by public land managed under the authority of FLPMA. In accordance with the Cotter decision, BLM must also provide access to SITLA lands.

Comment: *Specifically, the "Planning Issues Identified" section "should include discussion and detailed reference to the issue of inheld school lands in special designation categories, particularly WSAs, ACECs, and areas to be managed for 'wilderness characteristics,' and the need to give priority to resolution of the issue."*

Response: In the Draft RMP/EIS, Table 2-18, pages 2-76 and 2-77, under "Common to All Alternatives for Lands and Realty" as well as Land Tenure Adjustment criteria 1 in Appendix 5 address this concern.

Comment: *In the Reasonably Foreseeable Development Scenario section 11, it should again be noted that BLM withdrawals and special designations directly affect development of oil and gas on school trust*

lands. The BLM should assume that, in addition to the loss of oil and gas wells on BLM lands, the school trust lands will suffer a proportionally equal loss according to the proposed special designations under each alternative. Such loss is a taking of trust resources incident to BLM's plans.

Response: The BLM acknowledges that the closure of adjoining public lands to oil and gas leasing may have a potentially negative impact on SITLA's mineral revenue. In alternatives C and D, the closure of the 379,100 acres managed as WSA or Wilderness Areas is nondiscretionary and beyond the scope of this plan.

In alternatives N, A, B, and C, there are no SITLA lands affected by discretionary closure. Chapter 4 of the Proposed RMP/Final EIS has been revised to reflect the impacts of Alternative D on SITLA inholdings for the discretionary closures of 244,058 acres of public land. It should be noted that under any alternative, the proposed ACECs are not managed as closed to mineral leasing. Areas with wilderness characteristics are recommended as closed under Alternative D.

Comment: *In the "Impacts to Physical, Biological, and cultural Resources," section 12, it should be stated that to the extent the BLM creates new areas managed for preservation, such as ACECs or areas managed for "wilderness characteristics," such designation has a direct economic impact on the Utah school trust.*

Response: The BLM acknowledges that there are important fiscal impacts from oil and gas (including coalbed methane) activities on school trust lands, and these have been incorporated in the Proposed RMP/Final EIS in the socioeconomic analysis in Chapter 4. The potential fiscal impacts, and the potential economic impact from loss of spending in the local economy because of SITLA oil and gas wells foregone have been calculated for Alternative D and added to the socioeconomic analysis in Chapter 4.

Comment: *The BLM must do an economic study of the value of the minerals in each of those areas so that the RMP clearly sets forth the economic impact of the decision to set these lands aside. Restrictive designations additionally increase the cost of access to school trust lands, they may impair marketability, and they do require the expenditure of trust resources in pursuing land exchanges with the BLM. These facts should be acknowledged appropriately in the discussion of socioeconomic impacts.*

Response: The BLM acknowledges that there are important fiscal impacts from oil and gas (including coalbed methane) activities on school trust lands, and these have been incorporated in the Proposed RMP/Final EIS in the socioeconomic analysis in Chapter 4. The potential fiscal impacts, and the potential economic impact from loss of spending in the local economy because of SITLA oil and gas wells foregone have been calculated for Alternative D and added to the socioeconomic analysis in Chapter 4.

Comment: *The BLM should re-consider whether it can impose its standards on split estate lands where it does not own the surface. This action diminishes the rights of the surface owners, whether fee or trust lands, to develop the land in the manner the owner sees fit. So long as the operator of an oil and gas well, for example, has obtained a satisfactory surface use agreement that can be included in the Application for Permit to Drill to the BLM, the BLM should not unilaterally limit mineral development.*

Response: Information regarding leasing and development on split-estate lands is found at the following Washington office website: www.blm.gov/bmp/Split_Estate.htm.

IM No. 2003-202 outlines the policy, procedures, and conditions for approving oil and gas operations on split-estate lands. In particular, the BLM will not consider an APD or a Sundry Notice administratively or technically complete until the federal lessee or its operator certifies that an agreement with the surface owner exists, or until the lessee or its operator complies with Onshore Oil and Gas Order No. 1. Compliance with Onshore Oil and Gas Order No. 1 requires the federal mineral lessee or its operator to enter into good-faith negotiations with the private surface owner to reach an agreement for the protection

of surface resources and reclamation of the disturbed areas, or payment in lieu thereof, to compensate the surface owner for loss of crops and damages to tangible improvements, if any. In addition, the BLM will invite the surface owner to participate in the onsite inspection and will take into consideration the needs of the surface owner when reviewing the APD. BLM will offer the surface owner the same level of surface protection BLM provides on federal surface (IM No. 89-201).

Comment: *The Draft RMP fails to address the impact of these closures on the economic value of the affected school trust lands in either this section or its section on socioeconomic impacts of the preferred alternative.*

Response: The BLM recognizes that under Utah v. Andrus, the state is entitled to reasonable access across public lands to school trust lands, including those located within WSAs and other areas where management prescriptions would restrict general public access. Any restrictions such as route closures within these management areas pertain to general public access. Public access to OHV routes on public lands is accomplished through travel management planning. We make a distinction between closures to the public, and state access entitlements and access needs of others that can be addressed as specific needs arise. Land tenure adjustment efforts including pending and anticipated land exchanges between the BLM and the state should properly focus on SITLA lands located within WSAs and other special management areas identified in RMPs. Therefore, the BLM does not believe it is necessary or prudent to globally grant ROWs or designated routes to school trust lands for public use. The BLM is happy to work with the state to process any FLPMA Title V ROW application the state feels is necessary to protect ingress and egress to state property. The concern about Draft RMP/EIS access restrictions other than those for general public access, such as the designation of ROW avoidance or exclusion areas, can be clarified with specific mention in the Proposed RMP/Final EIS that these designations are subject to state access entitlements under Utah v. Andrus, as described above.

Comment: *Under the Takings Clause of the United States Constitution, no road that accesses a school trust land section, within the RMP, should be closed without trustee consent. It is anticipated that SITLA would take the necessary legal action, on behalf of the beneficiary, to prevent such a closure.*

Response: The BLM recognizes that under Utah v. Andrus, the state is entitled to reasonable access across public lands to school trust lands, including those located within WSAs and other areas where management prescriptions would restrict general public access. Any restrictions such as route closures within these management areas pertain to general public access. Public access to OHV routes on public lands is accomplished through travel management planning. We make a distinction between closures to the public, and state access entitlements and access needs of others that can be addressed as specific needs arise. Land tenure adjustment efforts including pending and anticipated land exchanges between the BLM and the state should properly focus on SITLA lands located within WSAs and other special management areas identified in RMPs. Therefore, the BLM does not believe it is necessary or prudent to globally grant ROWs or designated routes to school trust lands for public use. The BLM is happy to work with the state to process any FLPMA Title V ROW application the state feels is necessary to protect ingress and egress to state property. The concern about Draft RMP/EIS access restrictions other than those for general public access, such as the designation of ROW avoidance or exclusion areas, can be clarified with specific mention in the Proposed RMP/Final EIS that these designations are subject to state access entitlements under Utah v. Andrus, as described above.

Comment: *At the very least, the Draft RMP should be amended to specifically state that: (1) Continued motorized administrative access on "non-designated" routes providing access to school trust lands will be permitted to the State of Utah, SITLA, and its permittees and grantees, notwithstanding any closure to the general public; (2) The State of Utah, SITLA, and its permittees and grantees may undertake reasonable maintenance activities to preserve and improve existing access across the BLM lands, after consultation and appropriate environmental review by the BLM; and (3) Existing routes that are the sole*

access to school trust lands will not be reclaimed without full BLM consultation with, and written approval by, SITLA, after consultation with the State Board of Education and its designated representatives.

Response: BLM Utah IM UT 83-130 and BLM WO IM 85-579 provide access to non-federally owned land surrounded by public land managed under the authority of FLPMA. In accordance with the Cotter decision, BLM must also provide access to SITLA lands.

Comment: *These alternatives have significant potential to cause loss of jobs. The document contains no economic analysis on the loss of income tax revenue to the uniform school fund, which comprises all of the State of Utah's contribution to public education.*

Response: The BLM acknowledges that there are important fiscal impacts from oil and gas (including coalbed methane) activities on school trust lands, and these have been incorporated in the Proposed RMP/Final EIS in the socioeconomic analysis in Chapter 4. The potential fiscal impacts, and the potential economic impact from loss of spending in the local economy because of SITLA oil and gas wells foregone have been calculated for Alternative D and added to the socioeconomic analysis in Chapter 4.

5.6 RECORD OF DECISION

Following publication by the EPA and BLM of an NOA of the Proposed RMP/Final EIS in the *Federal Register* and distribution of the Proposed RMP/Final EIS, a 30-day protest period runs. In addition, a 60-day Governor's Consistency Review period runs concurrently with the first half of the protest period.

The State Director will approve the Proposed RMP/Final EIS by issuing a public ROD, which is a concise document summarizing the findings and decisions brought forth from the Proposed RMP. However, approval shall be withheld on any portion of a plan being protested until final action has been completed on such protest. Before such approval is given, there shall be public notice and opportunity for public comment on any significant change made to the Proposed RMP. Among other decisions, the proposed ACEC designations and OHV categories (limitations and closures) will be approved when the ROD is signed.

5.7 DISTRIBUTION LIST

Copies of the Richfield Draft RMP/EIS were made available to the following:

Tribal Governments

- Navajo Nation
- Paiute Indian Tribe of Utah
- Uintah and Ouray Ute Indian Tribe
- Hopi Tribe

Local Governments (Counties)

- Emery County
- Garfield County
- Piute County
- Sanpete County

- Sevier County
- Wayne County

Utah State Agencies

- Governor's Office of Planning and Budget
- School and Institutional Trust Land Administration
- Utah Department of Environmental Quality
- Utah Department of Agriculture
- Utah Department of Transportation
- Utah Department of Natural Resources
- Utah State Engineer's Office
- Utah State Historic Preservation Office
- Utah State Legislature, Government Affairs Committee

Members of Congress

- Senator Orrin Hatch
- Senator Robert Bennett
- Representative Jim Matheson
- Representative Rob Bishop
- Representative Chris Cannon

Department of the Interior Agencies

- National Park Service
  - Capitol Reef National Park
  - Glen Canyon National Recreation Area
  - Canyonlands National Park
- Office of Environmental Policy and Compliance
- U.S. Fish and Wildlife Service
- U.S. Geological Survey

Department of Agriculture Agencies

- U.S. Department of Agriculture Forest Service
  - Intermountain Regional Office
  - Dixie National Forest
  - Fishlake National Forest
  - Manti-LaSal National Forest
- Natural Resources Conservation Service

Other Non-DOI Federal Agencies

- Environmental Protection Agency
- Federal Highway Administration
- U.S. Army Corps of Engineers
- Department of Energy

5.8 LIST OF PREPARERS

As required by NEPA regulations (40 CFR § 1502.17), Table 5-14 lists the people responsible for preparing this Proposed RMP/Final EIS.

Table 5-14. List of Preparers

Name	Education/Experience	Resource Specialty
Bureau of Land Management		
Stan Adams	BS, Range Science	Recreation, OHV, Hazardous Materials
Jason Anderson	BS, Geography	GIS Analysis
Lori Armstrong	BS, Botany	Former Associate Field Manager
Dona Bastian	BLM experience, 15 years	Wild Horses and Burros
Doug Bauer	BS, Geology	Minerals
Ron Bolander	BS, MS, Botany	Special Status Species
Sandra Borthwick	BS, in Wildlife Science MS, in Wildlife Biology	Fish and Wildlife, Special Status Species
Laurie Bryant	BLM experience, 30 years	Paleontology
Lisa Bryant	BS, Agriculture and Soils MS, Soil Science	Air, Soils, Watershed, Invasive Species
Susan Caplan	BS, Meteorology MS, Watershed Science	Air Quality
Douglas Cook	BA, History and Journalism BS, Petroleum Geology and Mathematics	Fluid Minerals
Linda Chappell	BS, Range Management BS, Forest Management	Wildland Fire Management
Cornell Christensen	BS, Range Management	Field Manager
Lorraine Christian	BS, Wildlife and Fisheries Biology	WO Planner; Project Oversight
Vearl Christiansen	BS, Range Science	Vegetation, Livestock Grazing
Chris Colton	BS, Range Management	Wildland Fire Management, Livestock Grazing, Vegetation
Michael Dekeyrel	BS, Wildlife and Range Management	Lands and Realty
Nancy DeMille	BLM experience, 17 years	Lands and Realty
Frank Erickson	BS, Journalism	Project Management, Wild and Scenic Rivers, ACECs, Wilderness Characteristics
Robin Fehlau	BS, Physical Geography MS, Outdoor Recreation	Recreation, OHV

Name	Education/Experience	Resource Specialty
Timothy Finger	BS, Zoology BS, Wildlife Management	Recreation, Wilderness Study Areas, Wild and Scenic Rivers, ACECs, Wilderness Characteristics
Sue Fivecoat	BLM experience, 16 years	VRM, Forestry and Woodland Products, Recreation, Wild and Scenic Rivers, Travel Management
Suzanne Grayson	BS, Environmental Science	Fish and Wildlife
Larry Greenwood	BS, Wildlife MS, Botany/Range	Soil, Water and Riparian, Fish and Wildlife, Special Status Species
Gary Hall	BS, Range Management	ACEC Sub-team Leader, VRM, Recreation, OHV, Lands and Realty, Minerals, Wilderness Study Areas
Brant Hallows	BS, Range Management Masters Natural Resources	Soil, Water and Riparian
Craig Harmon	BA, Anthropology and Archaeology MA, Anthropology and Archaeology	Cultural Resources
Bert Hart	BS, Range Management	Assistant Planner, Travel Management
Gregg Hudson	BS, Geology	Minerals
Michael Jackson	BS, Geology MS, Geology	Minerals, Paleontology
Chris Keefe	BS, Wildlife Biology and Fisheries Management	Special Status Species, Biological Assessment, Technical Review
Margaret Kelsey	BS, Natural Resource Management	Wilderness, ACECs, Wild and Scenic Rivers
Steve Knox	BS, Watershed Management, Forestry option	State Planner; Document Reviewer
Larry Lichthardt	BS, Range Management	Livestock Grazing
Steve Madsen	BS, Wildlife and Fisheries Sciences	Wildlife, Raptors, and Migratory Birds
Jeanette Matovich	MA, Anthropology	Document Reviewer
Tom Mendenhall	BS, Fisheries Science	Fish
Dave Mermejo	BS, Recreation	Wilderness, Wilderness Characteristics
Lauren Mermejo	BS, Zoology Graduate Certificate, Environmental Impact Studies	Wilderness Characteristics
Doug Page	MS, Forestry	Forestry and Woodland Products
Jolie Pollet	BA, Geography MS, Forestry and Fire Science	Wildland Fire Management
Garth Portillo	BS, Anthropology	Cultural Resources

Name	Education/Experience	Resource Specialty
Buzz Rakow	BS, Earth Science	Minerals
John Russell	MS, Social Sciences BS, Outdoor Recreation AS, Natural Resources	Planning Specialist
Justin Seastrand	BS, Geography	GIS Analysis
Leroy Smalley	BS, Zoology and Chemistry	Vegetation, Livestock Grazing
Bill Stevens	Ph.D. Socioeconomics	Socioeconomics
Gus Warr	BS, Range Science	Wild Horses and Burros
Wayne Wetzel	BS, Earth Science MS, PhD, Geography	Associate Field Manager
Burke Williams	BS, Wildlife Science	Vegetation, Livestock Grazing, OHV
Phil Zieg	BS, Range and Forest Management	Air Quality, Soil, Water and Riparian
Booz Allen and Hamilton		
Erik Anderson	BS, Civil and Environmental Engineering MAS, (In progress) Environmental Policy and Management	Project Management, Soil, Water and Riparian, Minerals
Gary Armstrong	BA, Political Science MA, Public Policy Analysis	Project Management, Wild and Scenic Rivers, ACECs
Quincy Bahr	BS, Natural Resources Management and Planning MS, (In progress) Natural Resources Management and Planning	Cultural Resources, Paleontology, Wild Horses and Burros, Wildland Fire Management, Livestock Grazing, Wilderness Study Areas
Sean Dougherty	BS, Geography	GIS Analysis
Michael Ghazizadeh	BS, Geology MS, Geology MS, Natural Science PhD, Geology	Minerals
Melanie Martin	BS, Agriculture (Environmental Protection major) MEPM, Natural Resource Management	NEPA Support, Technical Reviewer, Special Status Species, ACECs, Cumulative Impacts Analysis
Jim May	A.B, Zoology MS, Water Resources Management	Technical Reviewer
Lisa McDonald	BS, Earth Science MS, Mineral Economics PhD, Mineral Economics	Socioeconomics
Pamela Middleton	MAS, Environmental Policy and Management	NEPA Support, Technical Reviewer

Name	Education/Experience	Resource Specialty
Dan Morse	BS, Natural Resource Recreation MS, Forestry	VRM, Wildland Fire Management, Forestry and Woodland Products, Recreation, Wilderness Study Areas
Al Pierson	BS, Wildlife Science	Public Lands Advisor
Richard Pinkham	BA, Geography MS, Natural Resource Policy and Management	Socioeconomics
Dana Purrone	BA, Environmental Policy BA, Spanish Pursuing MS, Environmental Policy and Natural Resource Management	Fish and Wildlife
Warner Reeser	BA, Mathematics MS, Atmospheric Science PhD, Earth Resources	Air Quality

Richfield Field Office
Proposed Resource Management Plan & Final Environmental Impact Statement

Volume 3 of 3

BUREAU OF LAND MANAGEMENT | UTAH

Richfield Field Office

U.S. DEPARTMENT OF THE INTERIOR
BUREAU OF LAND MANAGEMENT

August 2008

BLM Mission

To sustain the health, diversity, and productivity of the public lands for the use and enjoyment of present and future generations.

BLM-UT-PL-08-004-1610
UT-050-2007-090 EIS
FES 08-25

United States Department of the Interior
BUREAU OF LAND MANAGEMENT

Utah State Office
P.O. Box 45155
Salt Lake City, UT 84145-0155
http://www.blm.gov

IN REPLY REFER TO:

UT-050-1610-012J

Dear Reader:

Enclosed is the Proposed Resource Management Plan (PRMP) and Final Environmental Impact Statement (FEIS) for the Richfield Field Office. The Bureau of Land Management (BLM) prepared the PRMP/FEIS in consultation with cooperating agencies, taking into account public comments received during this planning effort. This PRMP/FEIS provides a framework for the future management direction and appropriate use of BLM-administered lands and resources located in Sanpete, Sevier, Piute, Wayne, and Garfield counties, Utah. The document contains both land use planning decisions and implementation decisions to guide the BLM's management of the Richfield Field Office. The PRMP/FEIS is open for a 30-day review and protest period beginning the date the U.S. Environmental Protection Agency (EPA) publishes the Notice of Availability of the FEIS in the *Federal Register*.

This PRMP/FEIS has been developed in accordance with the National Environmental Policy Act of 1969 (NEPA) and the Federal Land Policy and Management Act of 1976 (FLPMA). The PRMP/FEIS is largely based on Alternative B, the Preferred Alternative in the Draft RMP and EIS, which was released in October 2007. This PRMP/FEIS contains the proposed plan and potential impacts of the proposed plan. The alternatives presented in the Draft RMP/EIS are also provided for comparative purposes. Major comments received during the public review period of the Draft RMP/EIS and responses to these comments are provided on an attached CD. To aid the reader, substantive changes made between the Draft RMP/EIS and the PRMP/FEIS are described in Chapter 1 and are detailed in Appendix 20.

Pursuant to BLM's planning regulations at 43 CFR 1610.5-2, any person who participated in the planning process for this PRMP and has an interest which is or may be adversely affected by the planning decisions may protest approval of the planning decisions within 30 days from date the Environmental Protection Agency publishes the Notice of Availability in the *Federal Register*. For further information on filing a protest, please see the accompanying protest regulations in the pages that follow (labeled as Attachment 1). The regulations specify the required elements of your protest. Take care to document all relevant facts. As much as possible, reference or cite the planning documents or available planning records (e.g. meeting minutes or summaries, correspondence, etc.). To aid in ensuring the completeness of your protest, a protest check list is attached to this letter (labeled as Attachment 2). If your protest does not include all of the elements outlined in 43 CFR 1610.5-2 the BLM will not respond to your protest.

E-mailed and faxed protests will not be accepted as valid protests unless the protesting party also provides the original letter by either regular or overnight mail postmarked by the close of the protest period.

Under these conditions, the BLM will consider the e-mailed or faxed protest as an advance copy and will afford it full consideration. If you wish to provide the BLM with such advance notification, please direct faxed protests to the attention of Brenda Hudgens-Williams- BLM protest coordinator at 202-452-5112, and e-mailed protests to: Brenda_Hudgens-Williams@blm.gov.

All protests, including the follow-up letter (if e-mailing or faxing) must be in writing and mailed to the following address:

Regular Mail:	Overnight Mail:
Director (210)	Director (210)
Attention: Brenda Williams	Attention: Brenda Williams
P.O. Box 66538	1620 L Street, N.W., Suite 1075
Washington, D.C. 20035	Washington, D.C. 20036

Before including your address, phone number, e-mail address, or other personal identifying information in your protest, be advised that your entire protest – including your personal identifying information – may be made publicly available at any time. While you can ask us in your protest to withhold from public review your personal identifying information, we cannot guarantee that we will be able to do so.

The BLM Director will make every attempt to promptly render a decision on each protest. The decision will be in writing and will be sent to the protesting party by certified mail, return receipt requested. The decision of the BLM Director shall be the final decision of the Department of the Interior.

Upon resolution of all land use plan protests, the BLM will issue an Approved RMP and Record of Decision (ROD). The Approved RMP and ROD will be mailed or made available electronically to all who participated in the planning process and will be available to all parties through the "Planning" page of the BLM national website (*http://www.blm.gov/planning*), or by mail upon request.

Unlike land use planning decisions, implementation decisions are not subject to protest under the BLM planning regulations, but are subject to an administrative review process, through appeals to the Office of Hearings and Appeals (OHA), Interior Board of Land Appeals (IBLA) pursuant to 43 CFR, Part 4 Subpart E. Implementation decisions generally constitute the BLM's final approval allowing on-the ground actions to proceed. Where implementation decisions are made as part of the land use planning process, they are still subject to the appeals process or other administrative review as prescribed by specific resource program regulations once the BLM resolves the protests to land use planning decisions and issues an Approved RMP and ROD. Implementation-level decisions in the PRMP/FEIS are indicated by *italic text* and an asterisk (*) in Chapter 2. The Approved RMP and ROD will also clearly identify the implementation decisions made in the plan that may be appealed to the Office of Hearing and Appeals.

Sincerely,

Selma Sierra
Utah State Director

Attachment 1

[Code of Federal Regulations]
[Title 43, Volume 2]
[Revised as of October 1, 2002]

[CITE: 43CFR1610.5-2]

TITLE 43--PUBLIC LANDS: INTERIOR

CHAPTER II--BUREAU OF LAND MANAGEMENT, DEPARTMENT OF THE INTERIOR

PART 1600--PLANNING, PROGRAMMING, BUDGETING--Table of Contents

Subpart 1610--Resource Management Planning

Sec. 1610.5-2 Protest procedures.

(a) Any person who participated in the planning process and has an interest which is or may be adversely affected by the approval or amendment of a resource management plan may protest such approval or amendment. A protest may raise only those issues which were submitted for the record during the planning process.

(1) The protest shall be in writing and shall be filed with the Director. The protest shall be filed within 30 days of the date the Environmental Protection Agency published the notice of receipt of the final environmental impact statement containing the plan or amendment in the Federal Register. For an amendment not requiring the preparation of an environmental impact statement, the protest shall be filed within 30 days of the publication of the notice of its effective date.

(2) The protest shall contain:

(i) The name, mailing address, telephone number and interest of the person filing the protest;

(ii) A statement of the issue or issues being protested;

(iii) A statement of the part or parts of the plan or amendment being protested;

(iv) A copy of all documents addressing the issue or issues that were submitted during the planning process by the protesting party or an indication of the date the issue or issues were discussed for the record; and

(v) A concise statement explaining why the State Director's decision is believed to be wrong.

(3) The Director shall promptly render a decision on the protest. The decision shall be in writing and shall set forth the reasons for the decision. The decision shall be sent to the protesting party by certified mail, return receipt requested.

(b) The decision of the Director shall be the final decision of the Department of the Interior.

Attachment 2

Resource Management Plan Protest
Critical Item Checklist

The following items *must* be included to constitute a valid protest whether using this optional format, or a narrative letter.
(43 CFR 1610.5-2)

Before including your address, phone number, e-mail address, or other personal identifying information in your **protest**, be advised that your entire **protest**--including your personal identifying information--may be made publicly available at any time. While you can ask us in your **protest** to withhold from public review your personal identifying information, we cannot guarantee that we will be able to do so. All submissions from organizations and businesses, and from individuals identifying themselves as representatives or officials of organizations and businesses, will be available for public inspection in their entirety.

Resource Management Plan (RMP) or Amendment (RMPA) being protested:

Name:
Address:

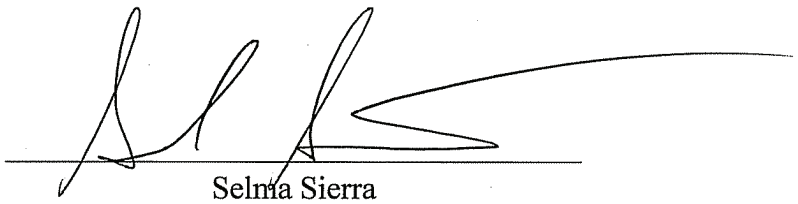
U.S. DEPARTMENT OF THE INTERIOR
BUREAU OF LAND MANAGEMENT

THE RICHFIELD FIELD OFFICE PROPOSED RESOURCE MANAGEMENT PLAN AND FINAL ENVIRONMENTAL IMPACT STATEMENT

Bureau of Land Management
Utah State Office
Salt Lake City, Utah

Prepared by the
Richfield Field Office
August 2008



Selma Sierra
Utah State Director

This page intentionally left blank

Richfield Field Office Planning Area
Proposed Resource Management Plan and Final Environmental Impact Statement

Lead Agency: U.S. Department of the Interior, Bureau of Land Management
Type of Action: Final, Administrative
Jurisdiction: Comprising all of Sanpete, Sevier, Wayne, Piute, and portions of Garfield and Kane Counties, Utah.

Abstract: The Richfield Proposed Resource Management Plan and Final Environmental Impact Statement (PRMP/FEIS) describes and analyzes the Proposed RMP and other alternatives presented in the Draft RMP and EIS (DRMP/DEIS) for the planning and management of public lands and resources administered by the Bureau of Land Management (BLM), Richfield Field Office in Utah. The Proposed RMP is open for a 30-day review and protest period beginning, August 8, 2008, the date the U.S. Environmental Protection Agency (EPA) publishes the Notice of Availability (NOA) of the Final EIS in the Federal Register.

The Proposed RMP was crafted primarily from the Preferred Alternative presented in the DRMP/DEIS (Alternative B) and includes other decisions within the range of alternatives (Alternatives N, A, C, and D) in response to public comments and internal review. The No Action Alternative (Alternative N) reflects current management. The BLM has removed the DRMP/DEIS Alternative B (Preferred Alternative) from the PRMP/FEIS. The other DRMP/DEIS Alternatives (Alternatives N, A, C, and D) and analyses are carried forward in the PRMP/FEIS only for comparative purposes and to correct some mistakes that were identified during the public comment period.

Protest: Protests must be postmarked or received no later than 30 days after publication of the NOA by the EPA in the *Federal Register*. The 30-day protest period (identified above) will not be extended. Refer to the instructions in the dear reader letter for additional information on how to protest. The close of the protest period will be announced in news releases, newsletters, and on the Richfield RMP website at http://www.blm.gov/ut/st/en/fo/richfield/planning.html.

TABLE OF CONTENTS

VOLUME I

VOLUME II

VOLUME III

VOLUME III TABLE OF CONTENTS

APPENDICES

MAPS

GLOSSARY

ACQUISITION. The Bureau of Land Management (BLM) acquires land, easements, and other real property rights when it is in the public interest and consistent with approved land use plans (LUP). The BLM's land acquisition program is designed to (1) improve management of natural resources through consolidation of federal, state, and private lands; (2) increase recreational opportunities, preserve open space, and/or ensure accessibility of public land; (3) secure key property necessary to protect endangered species and promote biological diversity; (4) preserve archaeological and historical resources; and (5) implement specific acquisitions authorized by Acts of Congress.

ACTIVE USE. Livestock grazing term meaning the current authorized use, including livestock grazing and conservation use. Active use may constitute a portion, or all, of permitted use. Active use does not include temporary non-use or suspended use of forage within all or a portion of an allotment. (43 *Code of Federal Regulations* [CFR] 4100.0-5)

ACTIVITY PLAN. A type of implementation plan (see *Implementation Plan*); an activity plan usually describes multiple projects and applies best management practices to meet LUP objectives. Examples of activity plans include interdisciplinary management plans, habitat management plans (HMP), recreation area management plans, and allotment management plans (AMP). (H-1601-1, *BLM Land Use Planning Handbook*)

ACTUAL USE. Livestock grazing term meaning where, how many, what kind or class of livestock, and how long livestock graze on an allotment, or on a portion or pasture of an allotment. (43 CFR 4100.0-5)

ADMINISTRATIVE USE. Official use related to management and resources of the public lands by federal, state, or local governments or nonofficial use sanctioned by an appropriate authorization instrument, such as right-of-way (ROW), permit, lease, or maintenance agreement.

ADMINISTRATIVE PURPOSES. Administrative use functions involving regular maintenance or operation of facilities or programs.

AIR QUALITY. A measure of the health-related and visual characteristics of the air, often derived from quantitative measurements of the concentrations of specific injurious or contaminating substances. Refers to standards for various classes of land as designated by the Air Pollution Control Act of 1955; Clean Air Act of 1963, as amended; and Air Quality Act of 1967.

ALLOTMENT. An area of land designated and managed for livestock grazing. (43 CFR § 4100.0-5) (H-4180-1, *Standards for Rangeland Health*)

ALLOTMENT MANAGEMENT PLAN (AMP). A document prepared in consultation with the grazing lessees or permittees involved, which applies to livestock operations on the public lands and which (1) prescribes the manner in, and extent to, which livestock operations will be conducted in order to meet the multiple-use, sustained-yield, economic and other needs and objectives as determined for the lands by the Secretary concerned; and (2) describes the type, location, ownership, and general specifications for the range improvements to be installed and maintained on the lands to meet the livestock grazing and other objectives of land management; and (3) contains such other provisions relating to livestock grazing and other objectives found by the Secretary concerned to be consistent with the provisions of this Act and other applicable law (from Federal Lands Policy and Management Act [of 1976] [FLPMA], Title 43 Chapter 35, Subchapter I 1702[k]).

AMENDMENT. The process for considering or making changes in the terms, conditions, and decisions of approved resource management plans (RMP) or management framework plans (MFP). Usually only one or two issues are considered that involve only a portion of the planning area. (H-1601-1, *BLM Land Use Planning Handbook*)

ANIMAL UNIT MONTH (AUM). The amount of forage necessary for the sustenance of one cow or its equivalent for a 1-month period. (43 CFR 4100.0-5)

APPROPRIATE MANAGEMENT RESPONSE (AMR). Any specific action suitable for meeting Fire Management Unit (FMU) objectives. Typically, the AMR ranges across a spectrum of tactical options (from monitoring to intensive management actions). The AMR is developed by using FMU strategies and objectives that the Fire Management Plan identifies.

AREAS OF CRITICAL ENVIRONMENTAL CONCERN (ACEC). Areas within the public lands in which special management attention is required (when such areas are developed or used or where no development is required) to protect and prevent irreparable damage to important historic, cultural, or scenic values, fish and wildlife resources, or other natural systems or processes, or to protect life and safety from natural hazards. (FLPMA Section 103 (a))

ASSESSMENT. The act of evaluating and interpreting data and information for a defined purpose (H-1601-1, *BLM Land Use Planning Handbook*).

ATTAINMENT AREA. A geographic area in which criteria air pollutant levels meet the health-based primary standard (national ambient air quality standard (NAAQS) for the pollutant. An area may have on acceptable level for one criteria air pollutant but may have unacceptable levels for others. Thus, an area could be attainment and nonattainment simultaneously. Attainment areas are defined using federal pollutant limits set by EPA.

AUTHORIZED OFFICER. The federal employee who has the delegated authority to make a specific decision.

AVOIDANCE AREA. Areas determined to be less suitable for an ROW because of (1) important and/or valued resources or resources assigned a special status, or (2) a substantive potential conflict with use. These areas exhibit constraints to siting facilities and are less desirable for a ROW but could be mitigated to reduce potential effects the ROW might have on the environment.

BACK COUNTRY BYWAYS. Vehicle routes that traverse scenic corridors using secondary or back-country road systems. National back-country byways are designated by the type of road and vehicle needed to travel the byway.

BEST MANAGEMENT PRACTICES (BMP). A suite of techniques that guide, or may be applied to, management actions to aid in achieving desired outcomes. Best management practices are often developed in conjunction with LUPs, but they are not considered a LUP decision unless the LUP specifies that they are mandatory. They may be updated or modified without a plan amendment if they are not mandatory. (H-1601-1, *BLM Land Use Planning Handbook*).

BIG GAME. Indigenous ungulate wildlife species that are hunted (e.g., elk, deer, bison, bighorn sheep, and pronghorn antelope).

BIOLOGICAL ASSESSMENT (BA). The document prepared by or under the direction of BLM concerning listed and proposed species and designated and proposed critical habitat that may be present

in the action area and contains the BLM's determination of potential effects of the action on such species and habitat. Biological assessments are required for formal consultations and conferences on "major construction projects." They are recommended for all formal consultations and formal conferences and many informal consultations where a written evaluation of the effects of an action on listed or proposed species and on designated or proposed critical habitat is needed. (M-6840, *Special Status Species Manual*).

BIOLOGICAL OPINION (BO). The document which includes: (1) the opinion of the FWS and/or National Marine Fisheries Service (NMFS) as to whether or not a federal action is likely to jeopardize the continued existence of listed species or result in the destruction or adverse modification of designated critical habitat, (2) a summary of the information on which the opinion is based, and (3) a detailed discussion of the effects of the action on listed species or designated critical habitat. Depending upon the determination of jeopardy or non-jeopardy, the BO may contain reasonable and prudent alternatives, a statement of anticipated take of listed animals, and conservation recommendations for listed plants. (M-6840, *Special Status Species Manual*).

CANDIDATE SPECIES. Taxa for which the U.S. Fish and Wildlife Service (USFWS) has sufficient information on its status and threats to support proposing the species for listing as endangered or threatened under the Endangered Species Act of 1973 (ESA) but for which issuance of a proposed rule is currently precluded by higher priority listing actions. (M6840, *Special Status Species Manual*) (M6840, *Special Status Species Manual*).

CASUAL USE. Means activities that involve practices that do not ordinarily cause any appreciable disturbance or damage to the public lands, resources, or improvements and, therefore, do not require a ROW grant or temporary use permit (43 CFR 2800). Also means any short-term noncommercial activity that does not cause appreciable damage or disturbance to the public lands, their resources, or improvements and that is not prohibited by closure of the lands to such activities. (43 CFR 2920)

CLOSED. Generally denotes that an area is not available for a particular use or uses. For example, 43 CFR 8340.0-5 sets forth the specific meaning of "closed" as it relates to off-highway vehicle (OHV) use, and 43 CFR 8364 defines "closed" as it relates to closure and restriction orders. (H-1601-1, *BLM Land Use Planning Handbook*)

***CODE OF FEDERAL REGULATIONS* (CFR).** The official, legal tabulation or regulations directing Federal Government activities. (*BLM National Management Strategy for OHV Use on Public Lands*)

COLLABORATION. A cooperative process in which interested parties, often with widely varied interests, work together to seek solutions with broad support for managing public and other lands. (H-1601-1, *BLM Land Use Planning Handbook*)

CONDITION CLASS (Fire Regimes). Fire Regime Condition Classes are a measure describing the degree of departure from historical fire regimes, possibly resulting in alterations of key ecosystem components such as species composition, structural stage, stand age, canopy closure, and fuel loadings. One or more of the following activities might have caused this departure: fire suppression, timber harvesting, livestock grazing, introduction and establishment of exotic plant species, introduced insects or disease, or other management activities.

CONDITION CLASS 1. Fire regimes are within a historical range, and the risk of losing key ecosystem components from fire is low. Vegetation attributes (species composition and structure) are intact and functioning within an historical range.

CONDITION CLASS 2. Fire regimes have been moderately altered from their historical range. The risk of losing key ecosystem components from fire is moderate. Fire frequencies have departed from historical frequencies by one or more return intervals (increased or decreased). This results in moderate changes to one or more of the following: fire size, frequency, intensity, severity, and landscape patterns. Vegetation attributes have been moderately altered from their historical range.

CONDITION CLASS 3. Fire regimes have been altered significantly from their historical ranges. The risk of losing key ecosystem components from fire is high. Fire frequencies have departed from historical frequencies by multiple return intervals. This action results in dramatic changes to one or more of the following: fire size, frequency, intensity, severity, and landscape patterns. Vegetation attributes have been altered significantly from their historical range.

CONFORMANCE. Means that a proposed action shall be specifically provided for in the LUP or, if not specifically mentioned, shall be clearly consistent with the goals, objectives, or standards of the approved LUP. (H-1601-1, *BLM Land Use Planning Handbook*)

CONSERVATION AGREEMENT. A formal written document agreed to by USFWS and/or NMFS and another federal agency, state agency, local government, or the private sector to achieve the conservation of candidate species or other special status species (SSS) through voluntary cooperation. It documents the specific actions and responsibilities for which each party agrees to be accountable. The objective of a conservation agreement is to reduce threats to a SSS or its habitat. An effective conservation agreement may lower species' listing priority or eliminate the need for listing. (M6840, *Special Status Species Manual*)

COOPERATING AGENCY. The Council on Environmental Quality (CEQ) regulations implementing National Environmental Policy Act (NEPA) define a cooperating agency as any agency that has jurisdiction by law or special expertise for proposals covered by NEPA (40 CFR 1501.6). Any federal, state, or local government jurisdiction with such qualifications may become a cooperating agency by agreement with the lead agency. (H-1601-1, *BLM Land Use Planning Handbook*)

CRITICAL HABITAT. (1) The specific areas within the geographical area currently occupied by a species, at the time it is listed in accordance with the ESA, on which are found those physical or biological features (i) essential to the conservation of the species and (ii) that may require special management considerations or protection, and (2) specific areas outside the geographical area occupied by a species at the time it is listed on determination by the USFWS and/or NMFS that such areas are essential for the conservation of the species. Critical habitats are designated in 50 CFR Parts 17 and 226. The constituent elements of critical habitat are those physical and biological features of designated or proposed critical habitat essential to the conservation of the species, including, but not limited to: (1) space for individual and population growth, and for normal behavior; (2) food, water, air, light, minerals, or other nutritional or physiological requirements; (3) cover or shelter; (4) sites for breeding, reproduction, rearing of offspring, germination, or seed dispersal; and (5) habitats that are protected from disturbance or are representative of the historic geographic and ecological distributions of a species. (M6840, *Special Status Species Manual*)

CRUCIAL VALUE HABITAT. Any particular range or habitat component that directly limits a community, population, or subpopulation to reproduce and maintain itself at a certain level over the long-term. Those sensitive use areas that, because of limited abundance and/or unique qualities, constitute irreplaceable critical requirements for high interest wildlife. This may also include highly sensitive habitats, including fragile soils that have little or no reclamation potential. Restoration or replacement of these habitats may not be possible. Examples include the most crucial (critical) summer and/or winter range or concentration areas; critical movement corridors; breeding and rearing

complexes; spawning areas; developed wetlands; Class 1 and 2 streams, lake, ponds or reservoirs; and riparian habitats critical to high interest wildlife. (Utah Division of Wildlife Resources)

CRYPTOBIOTIC CRUSTS. A biological community that forms a surface layer or crust on some soils. Generally includes algae, microfungi, mosses, lichens, and bacteria. Important in soil protection and nutrient supply. (*Standards for Rangeland Health and Guidelines for Grazing Management for BLM Lands in Utah*)

CULTURAL RESOURCES OR CULTURAL PROPERTY. A definite location of human activity, occupation, or use identifiable through field inventory (survey), historical documentation, or oral evidence. The term includes archaeological, historic, or architectural sites, structures, or places with important public and scientific uses and may include definite locations (sites or places) of traditional cultural or religious importance to specified social and/or cultural groups. (Cf. "traditional lifeway value"; see "definite location.") Cultural resources are concrete, material places and things that are located, classified, ranked, and managed through the system of identifying, protecting, and utilizing for public benefit described in this Manual series. (M-8100-1, *BLM Cultural Resources Management*)

CULTURAL RESOURCE INVENTORY CLASSES. Class I—existing data inventory. A study of published and unpublished documents, records, files, registers, and other sources, resulting in analysis and synthesis of all reasonably available data. Class I inventories encompass prehistoric, historic, and ethnological/sociological elements and are in large part chronicles of past land uses. They may have major relevance to current land use decisions. 2. Class II—sampling field inventory. A statistically based sample survey designed to help characterize the probable density, diversity, and distribution of archaeological properties in a large area by interpreting the results of surveying limited and discontinuous portions of the target area. 3. Class III—intensive field inventory. A continuous, intensive survey of an entire target area, aimed at locating and recording all archaeological properties that have surface indications, by walking close-interval parallel transects until the area has been thoroughly examined. Class III methods vary geographically, conforming to the prevailing standards for the region involved. (M-8100-1, *BLM Cultural Resources Management*)

CUMULATIVE IMPACT. The impact on the environment resulting from the impact of one action added to other past, present, and reasonable foreseeable future actions regardless of what agency (federal or nonfederal) or person undertakes such other actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over time. (H-1790-1, *BLM NEPA Handbook*)

DENDROGLYPH. Refers to a tree with historic or prehistoric designs, often geometric, cut into the bark.

DESIGNATED ROADS AND TRAILS. Specific roads and trails identified by the BLM where some type of motorized vehicle use is appropriate and allowed either seasonally or year long. (H-1601-1, *BLM Land Use Planning Handbook*)

DESIRED CONDITION. Description of those factors that should exist within ecosystems to maintain their survival and to meet social and economic needs.

DISPERSED RECREATION. Recreation activities of an unstructured type that are not confined to specific locations or dependent on recreation sites. Example of these activities may be hunting, fishing, off-road vehicle use, hiking, and sightseeing.

DISPOSAL. Transfer of public land out of federal ownership to another party through sale, exchange, Recreation and Public Purposes Act, Desert Land Entry, or other land law statutes.

EASEMENT. An interest in land entitling the owner or holder, as a matter or right, to enter upon land owned by another party for a particular purpose.

ECOLOGICAL SITE. A kind of land with a specific potential natural community and specific physical site characteristics, differing from other kinds of land in their ability to produce distinctive kinds and amounts of vegetation and to respond to management. Ecological sites are defined and described with information about soil, species composition, and annual production. (BLM 2001a)

ECOLOGICAL SITE DESCRIPTION. Description of the soils, uses, and potential of a kind of land with specific physical characteristics to produce distinctive kinds and amounts of vegetation. (*Interpreting Indicators of Rangeland Health*)

ECOSYSTEM. Organisms together with their abiotic environment, forming an interacting system, inhabiting an identifiable space. (Society for Range Management)

ELIGIBLE RIVER. A river or river segment found eligible for inclusion into the National Wild and Scenic Rivers System through the determination that it is free-flowing and, with its adjacent land area, possesses one or more river-related outstandingly remarkable values. (Wild and Scenic Rivers Act)

ENDANGERED SPECIES. Any species that is in danger of extinction throughout all or a significant portion of its range. (Endangered Species Act of 1973)

ENVIRONMENTAL ASSESSMENT (EA). A concise public document for which a federal agency is responsible that serves to (1) briefly provide sufficient evidence and analysis for determining whether to prepare an environmental impact statement or a finding of no significant impact, (2) aid an agency's compliance with the NEPA when no environmental impact statement is necessary, and (3) facilitate preparation of an environmental impact statement when one is necessary. (40 CFR 1508.9)

ENVIRONMENTAL IMPACT STATEMENT (EIS). A detailed written statement as required by Section 102 (2) of the NEPA, which states that all agencies of the Federal Government shall include in every…major federal action significantly affecting the quality of the environment, a detailed statement prepared by the responsible official on (1) the environmental impacts of the proposed action, (2) any adverse environmental effects that cannot be avoided should the proposal be implemented, (3) alternatives to the proposed action, (4) the relationship between local short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and (5) any irreversible and irretrievable commitments of resources that would be involved in the proposed action, should it be implemented. (40 CFR 1508.11 and the NEPA of 1969)

EPHEMERAL STREAM. A stream that flows only in direct response to precipitation, and whose channel is at all times above the water table. Generally, ephemeral streams do not flow continuously for more than 30 days and have more robust upland vegetation than found outside the ephemeral riparian wetland area.

EXCLUSION AREA. Areas determined unsuitable for a ROW because of (1) unique, highly valued, complex, or legally protected resources; (2) potentially significant environmental impact resulting from conflict with current land uses; or (3) areas posing substantial hazard to construction and/or operation of a linear facility (e.g., electric transmission line, pipeline, telephone line, fiber optic line). In these areas, ROWs would be granted only in cases where there is a legal requirement to provide such access.

EXECUTIVE ORDER. A presidential directive with the force of law. It does not need congressional approval. The Supreme Court has upheld executive orders as valid either under the general constitutional grant of executive powers to the President or if authority for it was expressly granted to the President by the Congress. Congress can repeal or modify an executive order by passing a new law; however, it must be signed by the President or his veto overridden.

EXTENSIVE RECREATION MANAGEMENT AREA (ERMA). A public lands unit identified in LUPs containing all acreage not identified as an SRMA. Recreation management actions within an ERMA are limited to only those of a custodial nature.

FEDERAL LANDS. As used in this document, lands owned by the United States, without reference to how the lands were acquired or what federal agency administers the lands. The term includes mineral estates and coal estates underlying private surface but excludes lands held by the United States in trust for Indians, Aleuts, or Eskimos. (See also Public Land.)

FEDERAL LANDS POLICY AND MANAGEMENT ACT (FLPMA) (OF 1976). Public law 94-579. An Act to establish public land policy; to establish guidelines for its administration; to provide for the management, protection, development, and enhancement of the public lands; and for other purposes.

FEDERAL REGISTER. A daily publication that reports Presidential and federal agency documents. (BLM National Management Strategy for OHV Use on Public Lands)

FIRE MANAGEMENT PLAN. Strategic implementation-level plans that define a program to manage wildland fires, fuel reduction, and fire rehabilitation based on an area's approved RMP. Fire management plans must address a full range of fire management activities that support ecosystem sustainability, values to be protected, protection of firefighter and public safety, and public health and environmental issues and must be consistent with resource management objectives and activities of the area.

FLUID MINERALS. Oil, gas, coal bed natural gas, and geothermal resources.

FORAGE. Vegetation of all forms available and of a type used for animal consumption.

FREE-FLOWING. "Free-flowing," as applied to any river or section of a river, means existing or flowing in a natural condition without impoundment, diversion, straightening, rip-rapping, or other modifications of the waterway. (Wild and Scenic Rivers Act)

FUNCTIONING AT RISK. (1) A condition in which vegetation and soil are susceptible to losing their ability to sustain naturally functioning biotic communities. Human activities, past or present, may increase the risks. (Rangeland Reform Final Environmental Impact Statement [FEIS] at 26.) (2) Uplands or riparian-wetland areas that are properly functioning, but a soil, water, or vegetation attribute makes them susceptible to degradation and lessens their ability to sustain natural biotic communities. Uplands are particularly at risk if their soils are susceptible to degradation. Human activities, past or present, may increase the risks. (Rangeland Reform Draft Environmental Impact Statement [DEIS] Glossary). See also Properly Functioning Condition and Nonfunctioning Condition (H-4180-1, BLM Rangeland Health Standards Manual)

GEOGRAPHIC INFORMATION SYSTEM (GIS). A system of computer hardware, software, data, people and applications that capture, store, edit, analyze, and graphically display a potentially wide array of geospatial information. (H-1601-1, *BLM Land Use Planning Handbook*)

GOAL. A broad statement of a desired outcome; usually not quantifiable and may not have established time frames for achievement. (H-1601-1, *BLM Land Use Planning Handbook*)

GRAZING PREFERENCE. A superior or priority position against others for the purpose of receiving a grazing permit or lease. This priority is attached to base property owned or controlled by the permittee or lessee. (43 CFR 4100.0-5)

GUIDELINE. A practice, method or technique determined to be appropriate to ensure that standards can be met or that significant progress can be made toward meeting the standard. Guidelines are tools such as grazing systems, vegetative treatments, or improvement projects that help managers and permittees achieve standards. Guidelines may be adapted or modified when monitoring or other information indicates the guideline is not effective, or a better means of achieving the applicable standard becomes appropriate. (H-4180-1, BLM Rangeland Health Standards Manual)

HABITAT. An environment that meets a specific set of physical, biological, temporal, or spatial characteristics that satisfy the requirements of a plant or animal species or group of species for part or all of their life cycle. There are four major divisions of habitat, namely, terrestrial, freshwater, estuarine, and marine (M6840, *Special Status Species Manual*).

HABITAT MANAGEMENT PLAN (HMP). An officially approved activity plan for a specific geographic area of public land. An HMP identifies wildlife habitat and related objectives, defines the sequence of actions to be implemented to achieve the objectives, and outlines procedures for evaluating accomplishments.

HERD MANAGEMENT AREA (HMA). Public land under the jurisdiction of the BLM where a decision has been made that wild horses and/or burros can be managed for the long term within that habitat. (H-4710-1)

HERD MANAGEMENT AREA PLAN (HMAP). An action plan that prescribes measures for the protection, management, and control of wild horses and burros and their habitat on one or more herd management areas, in conformance with decisions made in approved management framework or RMPs.

HISTORIC RESOURCES OR HISTORIC PROPERTY. Any prehistoric or historic district, site, building, structure, or object included in, or eligible for inclusion in, the National Register. The term includes, for purposes of these regulations, artifacts, records, and remains that are related to and located within such properties. The term "eligible for inclusion in the National Register" includes both properties formally determined as such by the Secretary of the Interior and all other properties that meet National Register listing criteria (quoted from 36 CFR 800.2(e); compare National Historic Preservation Act, Section 301, Appendix 5). (See also "cultural resource-cultural property." "Cultural property" is an analogous BLM term not limited by National Register status.) (M-8100-1, BLM Cultural Resources Management) The term can also refer to cultural properties that have a period of use between Euro-American settlement to present.

IMPACTS (OR EFFECTS). Environmental consequences (the scientific and analytical basis for comparison of alternatives) as a result of a proposed action. Effects may be either direct, which are caused by the action and occur at the same time and place, or indirect, which are caused by the action and are later in time or farther removed in distance, but are still reasonably foreseeable, or cumulative. (BLM National Management Strategy for OHV Use on Public Lands)

IMPLEMENTATION DECISIONS. Decisions that take action to implement LUP decisions; generally appealable to the Interior Board of Land Appeals under 43 CFR 4.410. (H-1601-1, *BLM Land Use Planning Handbook*).

IMPLEMENTATION PLAN. A subgeographic or site-specific plan written to implement decisions made in a LUP. Implementation plans include activity plans and project plans. (They are types of implementation plans.) (H-1601-1, *BLM Land Use Planning Handbook*)

IMPORTANT VALUE. As related to ACECs, a relevant value, resource, system, process, or hazard that has substantial significance and values. This generally requires qualities of more than local significance and special worth, consequence, meaning, distinctiveness, or cause for concern. A natural hazard can be important if it is a significant threat to human life or property. (43 CFR 1610.7-2 (a) (2))

NATIVE AMERICAN TRIBE. Any Native American group in the conterminous United States that the Secretary of the Interior recognizes as possessing tribal status (listed periodically in the *Federal Register*). (H-1601-1, *BLM Land Use Planning Handbook*)

INDICATORS. Components of a system whose characteristics (presence or absence, quantity, distribution) are used as an index of an attribute (e.g., rangeland health attribute) that are too difficult, inconvenient, or expensive to measure. (Interagency Technical Reference 1734-8, 2000) (H-4180-1, *BLM Rangeland Health Standards Manual*)

INHOLDING. A nonfederal parcel of land that is completely surrounded by federal land.

INTERDISCIPLINARY TEAM. Staff specialists representing identified skill and knowledge needs working together to resolve issues and provide recommendations to an authorized officer (H-4180-1, *BLM Rangeland Health Standards Manual*).

INTERIM MANAGEMENT POLICY. An interim measure governing lands under wilderness review. This policy (H-8550-1) protects wilderness study areas from impairment of their suitability as wilderness.

INTERMITTENT STREAM. A stream that flows only at certain times of the year when it receives water from springs or from some surface source such as melting snow in mountainous areas. Generally, intermittent streams flow continuously for periods of at least 30 days and usually have visible vegetation or physical characteristics reflective of permanent water influences, such as the presence of cottonwoods.

INVASIVE SPECIES. An invasive plant species is one that displays rapid growth and spread, allowing it to establish over large areas.

JURISDICTION. The legal right to control or regulate use. Jurisdiction requires authority, but not necessarily ownership.

LAND TENURE ADJUSTMENTS. Ownership or jurisdictional changes are referred as "Land Tenure Adjustments." To improve the manageability of the BLM lands and their usefulness to the public, BLM has numerous authorities for "repositioning" lands into a more consolidated pattern, disposing of lands, and entering into cooperative management agreements. These land pattern improvements are completed primarily through the use of land exchanges, but also through land sales, by jurisdictional transfers to other agencies, and through the use of cooperative management agreements and leases.

LAND USE ALLOCATION. The identification in a LUP of the activities and foreseeable development that are allowed, restricted, or excluded for all or part of the planning area, based on desired conditions. (H-1601-1, *BLM Land Use Planning Handbook*)

LAND USE PLAN. A set of decisions that establish management direction for land within an administrative area, as prescribed under the planning provisions of FLPMA; an assimilation of land use-plan-level decisions developed through the planning process outlined in 43 CFR 1600, regardless of the scale at which the decisions were developed. The term includes both RMPs and MFPs. (H-1601-1, *BLM Land Use Planning Handbook*).

LEASE. Authorization to possess and use public lands for a fixed time period for any use not specifically authorized under other laws or regulations and not specifically forbidden by law.

LEASE STIPULATION. A modification of the terms and conditions on a lease form at the time of the lease sale.

LEASEABLE MINERALS. Those minerals or materials designated as leasable under the Mineral Leasing Act of 1920, *as amended*. They include coal, phosphate, asphalt, sulphur, potassium, sodium minerals, and oil and gas.

LEK. An assembly area where birds, especially sage grouse, carry on display and courtship behavior.

LIMITED AREAS. Designated areas where the use of OHVs is subject to restrictions, such as limiting the number or types or vehicles allowed, dates and times of use (seasonal restrictions), limiting use to existing roads and trails, or limiting use to designated roads and trails where use would be allowed only on roads and trails that are signed for use. Combinations of restrictions are possible, such as limiting use to certain types of vehicles during certain times of the year. (BLM National Management Strategy for OHV Use on Public Lands)

LOCATABLE MINERALS. Minerals subject to exploration, development, and disposal by staking mining claims as authorized by the Mining Law of 1872, as amended. This includes deposits of gold, silver, and other uncommon minerals not subject to lease or sale.

MANAGEMENT SITUATION ANALYSIS (MSA). Assessment of existing resource conditions and current management direction, prepared in advance of a LUP revision.

MINERAL. Any naturally formed inorganic material. Under federal laws, considered as locatable (subject to the general mining laws), leasable (subject to the Mineral Leasing Act of 1920, and salable (subject to the Materials Act of 1947).

MINERAL ESTATE. The ownership of minerals, including rights necessary for access, exploration, development, mining, ore dressing, and transportation operations.

MINERAL MATERIALS. Materials such as sand and gravel and common varieties of stone, pumice, pumicite, and clay that are not obtainable under the mining or leasing laws. Mineral materials are considered salable minerals that can be acquired under the Materials Act of 1947, as amended.

MINERAL RESERVES. Identified resources that meet specified minimum physical and chemical criteria related to current mining and production practices, including those for grade, quality, thickness, and depth, and that can be economically extracted or produced at the time of determination. Includes only recoverable materials.

MINIMIZE. To reduce the adverse impact of an operation to the lowest practical level.

MINING CLAIM. A parcel of land that a miner takes and holds for mining purposes, having acquired the right of possession by complying with the Mining Law and local laws and rules. A mining claim may contain as many adjoining locations as the locator may make or buy. There are four categories of mining claims: lode, placer, mill site, and tunnel site.

MITIGATION. A measure that will result in a physical change to the proposed action that will actually reduce or eliminate impacts. CEQ NEPA regulations identify five types of measures to deal with significant environmental effects: (1) avoiding the impact altogether by not taking a certain action or parts of an action; (2) minimizing an impact by limiting the degree or magnitude of the action and its implementation; (3) rectifying the impact by repairing, rehabilitating, or restoring the affected environment; (4) reducing or eliminating the impact over time by preservation and maintenance; or (5) compensating for the impact by replacing or providing substitute resources or environments.

MONITORING. Observations, data collection, and studies that evaluate compliance of on-the ground management with the RMP direction, or the effectiveness of RMP-prescribed management direction, in meeting broader goals objectives. Monitoring evaluates whether actions (1) comply with NEPA decisions that have been implemented; (2) achieve the desired objectives (e.g. effectiveness); and (3) are based on accurate assumptions (e.g., validation).

MULTIPLE USE. The management of public lands and their various resource values so that they are used in a combination that will best meet the present and future needs of the American people; making the most judicious use of the land for some or all of these resources or related services over areas large enough to provide sufficient latitude for periodic adjustments in use to changing needs and conditions; the use of some land for less than all of the resources; a combination of balanced and diverse resource uses that takes into account the long-term needs of future generations for renewable and nonrenewable resources, including recreation, range, timber, minerals, watershed, wildlife and fish, and natural scenic, scientific and historical values; and harmonious and coordinated management of the various resources without permanent impairment of the productivity of the land and the quality of the environment with consideration being given to the relative values of the resources and not necessarily to the combination of uses that will give the greatest economic return or the greatest unit output (FLPMA).

NATIONAL ENVIRONMENTAL POLICY ACT (NEPA) OF 1969, AS AMENDED. An Act which encourages productive and enjoyable harmony between man and his environment; promotes efforts to prevent or eliminate damage to the environment and biosphere and stimulate the health and welfare of man; enriches the understanding of the ecological systems and natural resources important to the Nation; and establishes a CEQ (BLM *National Management Strategy for OHV Use on Public Lands*)

NATIONAL REGISTER. The National Register of Historic Places, expanded and maintained by the Secretary of the Interior, as authorized by Section 2(b) of the Historic Sites Act and Section 101(a)(1)(A) of the National Historic Preservation Act. The National Register lists cultural properties found to qualify for inclusion because of their local, state, or national significance. Eligibility criteria and nomination procedures are found in 36 CFR Part 60. The Secretary's administrative responsibility for the National Register is delegated to the National Park Service. (M-8100-1, *BLM Cultural Resources Management*)

NATIONAL WILD AND SCENIC RIVERS SYSTEM. A system of nationally designated rivers and their immediate environments that have outstanding scenic, recreational, geologic, fish and wildlife, historic, cultural, and other similar values and are preserved in a free-flowing condition. The system consists of three river classifications: (1) *recreational*—rivers or sections of rivers that are readily

accessible by road or railroad and that may have some development along their shorelines and may have undergone some impoundments or diversion in the past, (2) *scenic*—rivers or sections of rivers free of impoundments with shorelines or watersheds still largely undeveloped but accessible in places by roads, and (3) *wild*—rivers or sections of rivers free of impoundments and generally inaccessible except by trails, with watersheds or shorelines essentially primitive and waters unpolluted.

NATURALNESS. Lands and resources affected primarily by the forces of nature where the imprint of human activity is substantially unnoticeable in an area of 5,000 acres or greater. BLM has authority to inventory, assess, and/or monitor the attributes of the lands and resources on public lands, which, taken together, are an indication of an area's naturalness. These attributes may include the presence or absence of roads and trails, fences and other improvements; the nature and extent of landscape modifications; the presence of native vegetation communities; and the connectivity of habitats (from IM-2003-275, Change 1, *Considerations of Wilderness Characteristics in LUP*, Attachment 1).

NEOTROPICAL MIGRATORY BIRDS. Birds that winter in Central America, South America, the Caribbean, and Mexico and then return to the United States and Canada during spring to breed. Includes almost half of the bird species that breed in the United States and Canada.

NO SURFACE OCCUPANCY. A fluid minerals leasing constraint that prohibits occupancy or disturbance on all or part of the lease surface to protect special values or uses. Lessees may exploit the fluid mineral resources under the leases granted with this stipulation through use of directional drilling from sites outside the area. Leasing with "no surface occupancy" means that there will be no development or disturbance whatsoever of the land surface, including establishment of wells or well pads, and construction of roads, pipelines, or power lines.

NONFUNCTIONING CONDITION. (1) Condition in which vegetation and ground cover are not maintaining soil conditions that can sustain natural biotic communities. (2) Riparian-wetland areas are considered to be in nonfunctioning condition when they do not provide adequate vegetation, landform, or large woody debris to dissipate stream energy associated with high flows and thus are not reducing erosion, improving water quality, or other normal characteristics of riparian areas. The absence of a floodplain may be an indicator of nonfunctioning condition. (H-4180-1, *BLM Rangeland Health Standards Manual*)

NOXIOUS WEEDS. A plant species designated by federal or state law as generally possessing one or more of the following characteristics: aggressive and difficult to manage; parasitic; a carrier or host of serious insects or disease; or non-native, new, or not common to the United States.

OBJECTIVE. A description of a desired condition for a resource. Objectives can be quantified and measured and, where possible, have established time frames for achievement. (H-1601-1, *BLM Land Use Planning Handbook*)

OFF-HIGHWAY VEHICLE (OFF-ROAD VEHICLE). Any motorized vehicle capable of, or designed for, travel on or immediately over land, water, or other natural terrain, excluding (1) any nonamphibious registered motorboat; (2) any military, fire, emergency, or law enforcement vehicle while being used for emergency purposes; (3) any vehicle whose use is expressly authorized by the authorized officer, or otherwise officially approved; (4) vehicles in official use; and (5) any combat or combat support vehicle when used for national defense. (H-1601-1, *BLM Land Use Planning Handbook*)

OFFICIAL USE. Use by an employee, agent, or designated representative of the Federal Government or one of its contractors, in the course of his employment, agency, or representation. (*BLM National Management Strategy for OHV Use on Public Lands*)

OPEN AREA. Generally denotes that an area is available for a particular use or uses. Refer to specific program definitions found in law, regulations, or policy guidance for application to individual programs. For example, 43 CFR 8340.0-5 defines the specific meaning of "open" as it relates to OHV use. (H-1601-1, *BLM Land Use Planning Handbook*)

OPERATOR. An operator is one who has authorization from the BLM to conduct activity on public land.

OUTSTANDINGLY REMARKABLE VALUES. Values among those listed in Section 1(b) of the Wild and Scenic Rivers Act of 1968: "scenic, recreation, geologic, fish and wildlife, historic, cultural, or other similar values...." Other similar values that may be considered include ecological, biological or botanical, paleontological, hydrological, scientific, or research values. (M-8351, BLM WSR Policy and Program)

PALEONTOLOGICAL RESOURCES. Remains and traces of once-living organisms preserved in geologic formations that form the Earth's crust. They constitute a fragile and nonrenewable scientific record of the history of life on earth.

PERENNIAL STREAM. A stream that flows continuously. Perennial streams are generally associated with a water table in the localities through which they flow.

PERMIT. A short-term, revocable authorization to use public lands for specific purposes, Section 302 of FLPMA provides BLM's authority to issue permits for the use, occupancy, and development of the public lands. Permits are issued for purposes such as commercial or noncommercial filming, advertising displays, commercial or noncommercial croplands, apiaries, harvesting of native or introduced species, temporary or permanent facilities for commercial purposes (excludes mining claims), residential occupancy, construction equipment storage sites, assembly yards, oil rig stacking sites, mining claim occupancy if the residential structures are not incidental to the mining operation, and water pipelines and well pumps related to irrigation and nonirrigation facilities. The regulations establishing procedures for the processing of these permits are found in 43 CFR 2920.

PERMITTED USE. The forage allocated by, or under the guidance of, an applicable LUP for livestock grazing in an allotment under a permit or lease, and is expressed in AUMs. (43 CFR § 4100.0-5) (H-4180-1, *BLM Rangeland Health Standards Manual*)

PLANNING AREA. A geographical area for which LUPs and RMPs are developed and maintained.

PLANNING CRITERIA. The standards, rules, and other factors developed by managers and interdisciplinary teams for their use in forming judgments about decision-making, analysis, and data collection during planning. Planning criteria streamline and simplify the resource management planning actions. (H-1601-1, *BLM Land Use Planning Handbook*)

PREFERENCE. A superior or priority position against others for the purpose of receiving a grazing permit or lease. This priority is attached to base property owned or controlled by the permittee or lessee. (43 CFR 4100.0-5). Active preference and suspended preference together make up the total grazing preference.

PRESCRIBED FIRE. Any fire ignited by management action to meet specific objectives. A written approved prescribed fire plan must exist, and NEPA requirements must be met, prior to ignition. (H-9214-1, *BLM Prescribed Fire Management Handbook*)

PRIMITIVE RECREATION. As defined in the Recreation Opportunity Spectrum (ROS), primitive recreation is managed to be essentially free from evidence of humans and onsite controls. Motor vehicle use is not permitted. Means of access include hiking, cross-country skiing, snowshoeing, nonmotorized boating, and horseback riding.

PROPERLY FUNCTIONING CONDITION (PFC). (1) An element of the *Fundamental of Rangeland Health* for watersheds and therefore a required element of state or regional standard and guidelines under 43 CFR § 4180.2(b). (2) Condition in which vegetation and ground cover maintain soil conditions that can sustain natural biotic communities. For riparian areas, the process of determining that function is described in BLM Technical Reference (TR) 1737-9. Final Environmental Impact Statement at 26, 72. (3) Riparian-wetland areas are functioning properly when adequate vegetation, landform, or large woody debris are present to dissipate stream energy associated with high-water flows, thereby reducing erosion and improving water quality; filter sediment, capture bed load, and aid floodplain development; improve floodwater retention and groundwater recharge; develop root masses that stabilize streambanks against cutting action; develop diverse ponding and channel characteristics to provide the habitat and the water depth, duration, and temperature necessary for fish production, waterfowl breeding, and other uses; and support greater biodiversity. The functioning condition of riparian-wetland areas is influenced by geomorphic features, soil, water, and vegetation. (4) Uplands function properly when the existing vegetation and ground cover maintain soil conditions capable of sustaining natural biotic communities. The functioning condition of uplands is influenced by geomorphic features, soil, water, and vegetation. See also "Nonfunctioning Condition and Functioning at Risk" (H-4180-1, *BLM Rangeland Health Standards Manual*).

PROPOSED SPECIES. Species that have been officially proposed for listing as threatened or endangered by the Secretary of the Interior. A proposed rule has been published in the *Federal Register*. (M-6840, *Special Status Species Manual*)

PUBLIC LAND. Any land and interest that the United States has owned within the several states and administered by the Secretary of the Interior through the BLM, without regard to how the United States acquired ownership, except lands located on the outer continental shelf; lands held in trust for the benefit of Native Americans, Aleuts, and Eskimos; and lands in which the United States retains the mineral estate but the surface is private. (H-8550-1)

RANGE IMPROVEMENT. An authorized physical modification or treatment that is designed to improve production of forage; change vegetation composition; control patterns of use; provide water; stabilize soil and water conditions; restore, protect and improve the condition of rangeland ecosystems to benefit livestock, wild horses and burros, and fish and wildlife. The term includes structures, treatment projects and use of mechanical devices or modifications achieved through mechanical means. (43 CFR § 4100.0-5) (H-4180-1, *BLM Rangeland Health Standards Manual)*

RANGELAND. A kind of land on which the native vegetation, climax or natural potential consists predominantly of grasses, grass like plants, forbs, or shrubs. Rangeland includes lands revegetated naturally or artificially to provide a noncrop plant cover that is managed like native vegetation. Rangeland may consist of natural grasslands, savannahs, shrublands, most deserts, tundra, alpine communities, coastal marshes, and wet meadows. (H-4180-1, *BLM Rangeland Health Standards Manual*)

RANGELAND DRILL: A heavy-duty, side-wheel drill developed for seeding rough terrain in semi-arid regions.

RAPTOR. A group of predatory avian species (e.g., hawks, eagles, falcons, and owls) also referred to as birds of prey, which share various physical characteristics (e.g., sharp talons, strongly curved bill).

REASONABLE FORESEEABLE DEVELOPMENT (RFD) SCENARIO. The prediction of the type and amount of oil and gas activity that would occur in a given area. This prediction is based on geologic factors, past history of drilling, projected demand for oil and gas, and industry interest.

RECORD OF DECISION (ROD). A document signed by a responsible official recording a decision that was preceded by the preparing of an EIS.

RECREATION AND PUBLIC PURPOSES (R&PP) ACT (of 1926). Recreation and Public Purposes Act authorizes the lease or sale of public lands for public purposes to state and local government agencies and nonprofit organizations.

RECREATION OPPORTUNITY SPECTRUM (ROS). A framework for inventorying, planning, and managing recreational opportunities. ROS is divided into six classes: primitive, semiprimitive nonmotorized, semiprimitive motorized, roaded natural, rural, and urban. (See definitions of each class.)

RECREATION RIVER. Wild and Scenic River classification that identifies those rivers or sections of rivers that are readily accessible by road or railroad, that may have some development along their shorelines and that may have undergone some impoundment or diversion in the past.

RELEVANT VALUE. As related to ACECs, a relevant value is a significant historic, cultural, or scenic value; a fish or wildlife resource or other natural system or process; or natural hazard. (43 CFR 1610.7-2 (a) (1))

RELICT PLANT COMMUNITY. A remnant or fragment of vegetation remaining from a former period when the vegetation was more widely distributed.

RESOURCE ADVISORY COUNCIL. A council established by the Secretary of the Interior to provide advice or recommendations to BLM management. (H-1601-1, *BLM Land Use Planning Handbook*)

RESOURCE MANAGEMENT PLAN (RMP). A LUP as described the Federal Land Policy and Management Act. The RMP generally establishes in a written document: (1) land uses for limited, restricted or exclusive use; designations, including ACEC designation; and transfer from BLM administration; (2) allowable resource uses (either singly or in combination) and related levels of production or use to be maintained; (3) resource condition goals and objectives to be attained; (4) program constraints and general management practices needed to achieve the above items; (5) need for an area to be covered by more detailed and specific plans; (6) support action, including such measures as resource protection, access, development, realty action, cadastral survey, etc., as necessary to meet the above; (7) general implementation sequences in which carrying out a planned action is dependent upon prior accomplishment of another planned action; and (8) intervals and standards for monitoring and evaluating the plan to determine the effectiveness of the plan and the need for amendment or revision. (43 CFR 1601.0-5(k))

RIGHT-OF-WAY (ROW). The public lands authorized to be used or occupied for the construction, operation, maintenance, and termination of a project, pursuant to a ROW authorization.

RIGHT-OF-WAY CORRIDOR. A parcel of land that has been identified by law, Secretarial order, through a LUP or by other management decision as being the preferred location for existing and future ROW grants and suitable to accommodate one type of ROW or one or more ROWs that are similar, identical or compatible.

RIPARIAN AREA. A form of wetland transition between permanently saturated wetlands and upland areas. A riparian area is defined as an area of land directly influenced by permanent (surface or subsurface) water. Riparian areas exhibit vegetation or physical characteristics that reflect the influence of permanent surface or subsurface water. Typical riparian areas include lands along, adjacent to, or contiguous with perennially and intermittently flowing rivers and streams, hanging gardens, and areas surrounding seeps and springs. Excluded are ephemeral streams or washes that lack vegetation and depend on free water in the soil.

RIVER. As defined in the Wild and Scenic Rivers Act, "river" means a flowing body of water or estuary or section, portion or tributary thereof, including rivers, streams, creeks, runs, kills, rills, and small lakes.

ROADED NATURAL. As defined in the Recreation Opportunity Spectrum, roaded natural recreation is managed to provide a natural-appearing environment with moderate evidence of humans. Motor vehicle use is permitted and facilities for this use are provided. Activities include wood gathering, downhill skiing, fishing, OHV driving, interpretive uses, picnicking, and vehicle camping.

RURAL. As defined in the Recreation Opportunity Spectrum, rural recreation is managed to provide a setting that is substantially modified with moderate to high evidence of civilization. Motor vehicle use is permitted and visitor conveniences may be provided. Activities are facility/vehicle dependent and include sightseeing, horseback riding, road biking, golf, swimming, picnicking, and outdoor games.

SALABLE MINERALS. Common variety mineral materials on public lands, such as sand and gravel, that are used mainly for construction and are disposed of by sales or special permits.

SCENIC BYWAYS. Highway routes, which have roadsides or corridors of special aesthetic, cultural, or historic value. An essential part of the highway is its scenic corridor. The corridor may contain outstanding scenic vistas, unusual geologic features, or other natural elements.

SCENIC QUALITY RATINGS. The relative scenic quality (A, B, or C) assigned a landscape by applying the scenic quality evaluation key factors; scenic quality A being the highest rating, B a moderate rating, and C the lowest rating. The evaluation factors are landform, vegetation, water, color, adjacent scenery, scarcity, and cultural modifications. (M-8400, *Visual Resource Management*)

SCENIC RIVER. Wild and Scenic River classification that identifies a river or section of a river that is free of impoundments and whose shorelines are largely undeveloped but accessible in places by roads.

SCOPING. An early and open process for determining the scope of issues to be addressed and for identifying the significant issues related to a proposed action. This effort involves the participation of affected federal, state, and local agencies, and any affected Native American tribe, the proponent of the action, and other interested persons, unless there is a limited exception under 40 CFR 1507.3I.

SECTION 7 CONSULTATION. The requirement of Section 7 of the Endangered Species Act that all federal agencies consult with the USFWS or the National Marine Fisheries Service if a proposed action might affect a federally listed species or its critical habitat.

SECTION 106 COMPLIANCE. The requirement of Section 106 of the National Historic Preservation Act that any project that the Federal Government funds, licenses, permits, or assists be reviewed for impacts on significant historic properties and that the State Historic Preservation Officer and the Advisory Council on Historic Preservation be allowed to comment on a project.

SEMIPRIMITIVE MOTORIZED. As defined in the Recreation Opportunity Spectrum, semiprimitive motorized recreation is managed to provide a natural-appearing environment with evidence of humans and management controls present, but subtle. Means of access include motorized vehicles and mountain bicycles.

SEMIPRIMITIVE NONMOTORIZED. As defined in the Recreation Opportunity Spectrum, semiprimitive nonmotorized recreation is managed to be largely free from evidence of humans and on-site controls. Motor vehicle use is not permitted (except as authorized). Facilities for the administration of livestock and for visitor use are allowed but limited. Means of access include hiking, cross-country skiing, snow shoeing, nonmotorized boating, and horseback riding.

SENSITIVE SPECIES. Those species designated by a State Director, usually in cooperation with the state agency responsible for managing the species and State Natural heritage programs, as sensitive. They are those species that (1) could become endangered in or extirpated from a state, or within a significant portion of its distribution; (2) are under status review by the FWS and/or NMFS; (3) are undergoing significant current or predicted downward trends in habitat capability that would reduce a species' existing distribution; (4) are undergoing significant current or predicted downward trends in population or density such that federal listed, proposed, candidate, or state-listed status may become necessary; (5) typically have small and widely dispersed populations; (6) inhabit ecological refugia or other specialized or unique habitats; or (7) are state listed but that may be better conserved through application of BLM-sensitive species status (M6840, *Special Status Species Manual*).

SERAL. A seral community is an intermediate stage found in ecological succession in an ecosystem advancing toward its climax community, usually referred to by the name of its dominant vegetation species, which may be the largest or the most common.

SIGNIFICANT. An effect that is analyzed in the context of the proposed action to determine the degree or magnitude of importance of the effect, whether beneficial or adverse. The degree of significance can be related to other actions with individually insignificant but cumulatively significant impacts.

SOCIOECONOMIC STUDY AREA. The geographic area used for estimation and analysis of economic and social impacts.

SOLITUDE. Visitors may have outstanding opportunities for solitude, or primitive and unconfined types of recreation when the sights, sounds, and evidence of other people are rare or infrequent, where visitors can be isolated, alone, or secluded from others, where the use of the area is through nonmotorized, nonmechanical means, and where no or minimal developed recreation facilities are encountered in area of 5,000 acres or greater (from IM-2003-275, Change 1, *Considerations of Wilderness Characteristics in LUP*, Attachment 1).

SPECIAL RECREATION MANAGEMENT AREA (SRMA). A public land unit identified in LUPs to direct recreation funding and personnel to fulfill commitments made to provide specific, structured recreation opportunities (e.g., activity, experience, and benefit opportunities). (H-1601-1, *BLM Land Use Planning Handbook*)

SPECIAL STATUS SPECIES. Includes proposed species, listed species, and candidate species under the Endangered Species Act; state-listed species; and BLM state director-designated sensitive species (see BLM Manual 6840, Special Status Species Policy). (H-1601-1, *BLM Land Use Planning Handbook*)

SPLIT ESTATE. Surface land and mineral estate of a given area under different ownerships. Frequently, the surface will be privately owned and the minerals federally owned.

STANDARD. A description of the physical and biological conditions or degree of function required for healthy, sustainable lands (e.g., Land Health Standards). To be expressed as a desired outcome (goal). (H-1601-1, *BLM Land Use Planning Handbook*).

STANDARDS FOR RANGELAND HEALTH. Descriptions of the desired condition of the biological and physical components and characteristics of rangeland. The four standards deal with upland soils, riparian and wetland areas, desired species, and water quality.

STATE LISTED SPECIES. Species listed by a state in a category implying but not limited to potential endangerment or extinction. Listing is either by legislation or regulation. (M-6840, *Special Status Species Manual*)

STIPULATIONS. Requirements that are part of the terms of various types of leases. Some stipulations are standard on all federal leases. Other stipulations may be applied to the lease at the discretion of the surface management agency to protect valuable surface resources and uses.

SUITABLE RIVER. A Wild and Scenic River determination where a river or river segment is evaluated in the land use planning process and recommended for inclusion in the National Wild and Scenic River System. Suitability may vary by alternative based on the theme of the alternative.

SUPPRESSION. All the work of extinguishing or containing a fire, beginning with its discovery.

SURFACE DISTURBANCE. The alteration or removal of soil or vegetation, usually caused by motorized or mechanical actions, that results in more than negligible disturbance to public lands and resources. Surface disturbance accelerates the natural erosive process. Surface disturbance may result from activities using earth-moving and drilling equipment; geophysical exploration; OHV travel; vegetation treatments; prescribed fire; herbicide applications; and construction of facilities like power lines, pipelines, oil and gas wells, recreation sites, livestock facilities, wildlife waters, or new roads. Surface disturbance may but does not always require reclamation. Surface disturbance is not normally caused by casual use. Activities that are not typically surface disturbing include proper livestock grazing, cross-country hiking, and vehicle travel on designated routes.

SURFACE OCCUPANCY. Placement or construction on the land surface (temporary or permanent) for more than 14 days requiring continual service or maintenance. Casual use is excluded.

SUSTAINABILITY. Long-term management of ecosystems to meet the needs of present human populations without interruption, weakening, or loss of the resource base for future generations. (EPA)

SUSTAINED YIELD. The achievement and maintenance in perpetuity of a high-level annual or regular periodic output of the various renewable resources of the public lands consistent with multiple use.

TAKE. For the purposes of the endangered species act, the term "take" means to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct. (Endangered Species Act of 1973)

THREATENED SPECIES. Any species that is likely to become an endangered species within the foreseeable future throughout all or a significant portion of its range. (Endangered Species Act of 1973)

TIMING LIMITATION (SEASONAL RESTRICTION). A fluid minerals leasing constraint that prohibits surface use during specified time periods to protect identified resource values. The constraint does not apply to the operation and maintenance of production facilities unless analysis demonstrates that such constraints are needed and that less stringent, project-specific constraints would be insufficient.

TOTAL MAXIMUM DAILY LOAD (TMDL). An estimate of the total quantity of pollutants (from all sources: point, nonpoint, and natural) that may be allowed into waters without exceeding applicable water quality criteria. (H-1601-1, *BLM Land Use Planning Handbook*)

TOTAL PREFERENCE. The total number of animal units of livestock grazing on public lands, apportioned and attached to base property owned or controlled by a permittee or lessee. The active preference and suspended preference are combined to make up the total grazing preference.

UNALLOTTED LANDS. Public lands available for grazing that currently have no livestock grazing authorized.

UNDERTAKING. A project, activity, or program funded in whole or in part under the direct or indirect jurisdiction of a federal agency, including those carried out by or on behalf of a federal agency; those carried out with federal financial assistance; those requiring a federal permit, license, or approval; and those subject to state or local regulation administered pursuant to a delegation or approval by a federal agency.

UNSUITABILITY CRITERIA. Criteria of the federal coal management program by which lands may be assessed as unsuitable for all or certain stipulated methods of coal mining. (43 CFR 4300.)

URBAN. As defined in the Recreation Opportunity Spectrum, urban recreation is managed to provide a setting that is largely modified. Large numbers of users can be expected, and vegetation cover is often exotic and manicured. Facilities for highly intensified motor vehicle use and parking are available, with mass transit often included to carry people throughout the site.

USER DAY. Any calendar day, or portion thereof, for each individual accompanied or serviced by an operator or permittee on the public lands or related waters; synonymous with passenger day or participant day.

UTILITY. A service that a public utility provides (e.g., electricity, telephone, or water).

UTILITY CORRIDOR. A parcel of land, linear or aerial in character, that has been identified by law, Secretarial Order, the land-use planning process, or by other management decision, as being a preferred location for existing and future ROW grants and suitable to accommodate more than one type of ROW or one or more ROW that are similar, identical, or compatible.

VALID EXISTING RIGHTS. Legal "rights" or interest that are associated with a land or mineral estate and that cannot be divested from the estate until that interest expires or is relinquished. Lands within the

RFO are subject to various authorizations, some giving "rights" to the holders and some of which could be construed as providing valid, but lesser, interests. Various laws, leases, and filings under federal law establish valid existing rights.

Mineral: Valid existing rights govern authorizations for activities on existing mineral leases and mining claims. Valid existing rights vary from case to case with respect to oil and gas leases, mineral leases, and mining claims, but they generally involve rights to explore, develop, and produce within the constraints of laws, regulations, and policies at the time the lease/claim was established or authorized.

Nonmineral: There are other situations, unrelated to minerals, in which BLM has authorized some use of public land or has conveyed some limited interest in public land. The authorization may be valid and existing and may convey some "right" or interest. Many ROWs, easements, and leases granted on public land are this type of valid existing right. These types vary from case to case, but the details of each one are specified in the authorizing document. Valid and existing authorizations of this type would continue to be allowed subject to the terms and conditions of the authorizing document.

RS-2477: Some government entities may have a valid existing right to an access route under Revised Statutes (R.S.) 2477, Act of June 26, 1866, ch. 262, § 8, 14 Stat. 251 [codified as amended at 43 U.S.C. § 932 until repealed in 1976 by the FLPMA, Public Law 94-579, Section 706(a), Stat. 2744, 2793 (1976)], which granted "[the right-of-way for the construction of highways over public lands, not reserved for public uses.]" The validity of individual claims would have to be determined on a case-by-case basis. If claims are determined to be valid R.S. 2477 highways, the RMP would respect those as valid existing rights.

Access: The presence of nonfederal land within the decision area has implications for valid existing rights because owners of nonfederal land surrounded by public land are entitled to reasonable access to their land. Reasonable access is defined as access that the Secretary of the Interior deems adequate to secure the owner reasonable use and enjoyment of the nonfederal land. Such access is subject to rules and regulations governing the administration of public land. In determining reasonable access, the BLM has discretion to evaluate and would consider such things as proposed construction methods and location, reasonable alternatives, and reasonable terms and conditions as are necessary to protect the public interest and resources of the RFO.

Other: Various other land use authorizations do not involve the granting of legal "rights" or interests. For example, outfitter and guide permits authorize certain uses of public land for a specified time, under certain conditions, without conveying a right, title, or interest in the land or resources used. At any time, if it is determined that an outfitter and guide permit, other such permit, or any activities under those permits, are not consistent with the approved RMP, then the authorization would be adjusted, mitigated, or revoked where legally possible. Grazing permits also are in this category. Grazing permits or leases convey no right, title, or interest in the land or resources used. Other applicable laws and regulations govern changes to existing grazing permits and levels of livestock grazing.

VEGETATION TYPE. A plant community with distinguishable characteristics described by the dominant vegetation present.

VISUAL RESOURCE MANAGEMENT (VRM). A system by which BLM inventories and manages scenic values and visual quality of public lands. The system is based on research that has produced ways of assessing aesthetic qualities of the landscape in objective terms. In RMPs, lands are assigned management classes), which determine the amount of modification allowed for the basic elements of the landscape. (See also Scenic Quality Ratings.)

VISUAL RESOURCE MANAGEMENT (VRM) CLASSES. Categories assigned to public lands based on scenic quality, sensitivity level, and distance zones. There are four classes. Each class has an objective which prescribes the amount of change allowed in the characteristic landscape. (H-1601-1, *BLM Land Use Planning Handbook*)

- **VRM Class I:** Preserve the existing character of the landscape. The level of change to the characteristic landscape should be very low and must not attract visitor attention.

- **VRM Class II**: Retain the existing character of the landscape. The level of change to the landscape should be low. Management activities may be seen but should not attract the attention of the casual observer.

- **VRM Class III:** Partially retain the existing character of the landscape. The level of change to the landscape should be moderate. Management activities may attract attention but should not dominate the view of the casual observer.

- **VRM Class IV:** Provide for management activities that require major modification of the existing character of the landscape. The level of change to landscape can be high.

WAIVER. Permanent exemption from a lease stipulation. The stipulation no longer applies anywhere within the leasehold.

WATER QUALITY. The chemical, physical, and biological characteristics of water with respect to its suitability for a particular use.

WATERSHED. All lands and water that drain to a given point. Watersheds are often defined in terms of topographic divides (e.g., ridge lines).

WAY. A vehicle route within a WSA that was in existence and identified during the FLPMA Section 603-mandated wilderness inventory. Interim Management Policy for Lands under Wilderness Review (H-8550-1) defines a way as "a track maintained solely by the passage of vehicles, which has not been improved and/or maintained by mechanical means to ensure relatively regular and continuous use." The term is also used during wilderness inventory to identify routes that are not roads. The term is developed from the definition of the term "roadless" provided in the *Wilderness Inventory Handbook* (September 27, 1978), as follows: "roadless: refers to the absence of roads which have been improved and maintained by mechanical means to insure relatively regular and continuous use. A way maintained solely by the passage of vehicles does not constitute a road."

WETLANDS. Areas that are inundated or saturated by surface or ground water often and long enough to support, and under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions.

WILD HORSES AND BURROS. Unbranded and unclaimed horses and burros that use public lands as all or part of their habitat or that have been removed from these lands by the authorized officer but have not lost their status under Section 3 of the Act. (H-4750-2, *BLM Wild Horse and Burro Adoption Handbook*)

WILD RIVER. Wild and Scenic River classification that identifies those rivers or sections of rivers that are free of impoundments and generally inaccessible except by trail, with watersheds or shorelines essentially primitive and waters unpolluted. These represent vestiges of primitive America.

WILDERNESS. A congressionally designated area of undeveloped federal land retaining its primeval character and influence, without permanent improvements or human habitation, that is protected and managed to preserve its natural conditions as described in Section 2A of the Wilderness Act of 1964 and that (1) generally appears to have been affected mainly by the forces of nature, with human imprints substantially unnoticeable; (2) has outstanding opportunities for solitude or a primitive and unconfined type of recreation; (3) has at least 5,000 acres or is large enough to make practical its preservation and use in an unimpaired condition; and (4) may also contain ecological, geological, or other features of scientific, educational, scenic, or historic value.

WILDERNESS CHARACTERISTICS. Features of the land associated with the concept of wilderness that specifically deal with naturalness and opportunities for solitude and primitive and unconfined recreation. These characteristics may be considered in land use planning when BLM determines that those characteristics are reasonably present, of sufficient value (condition, uniqueness, relevance, importance), and need (trend, risk), and are practical to manage (from IM-2003-275, Change 1, Considerations of Wilderness Characteristics in LUP, Attachment 1).

WILDERNESS STUDY AREA (WSA). An area identified pursuant to Section 603 of the Federal Land Policy and Management Act as having wilderness characteristics as described in the Wilderness Act of 1964—that is, an area that (1) generally appears to have been affected primarily by the forces of nature, with the imprint of man substantially unnoticeable; (2) has outstanding opportunities for solitude or a primitive and unconfined type of recreation; (3) is at least 5,000 acres or is of sufficient size to make practicable its preservation and use in an unimpaired condition; and (4) may also contain ecological, geological, or other features of scientific, educational, scenic or historical value.

WILDLAND FIRE. Any fire, regardless of ignition source, that is burning outside of a prescribed fire and any fire burning on public lands or threatening public land resources, where no fire prescription standards have been prepared. (H-1742-1, *BLM Emergency Fire Rehabilitation Handbook*)

WILDLAND FIRE USE. The management of naturally ignited wildland fires to accomplish specific pre-stated resource management objectives in predefined geographic areas outlined in Fire Management Plans.

WILDLAND URBAN INTERFACE (WUI). The line, area, or zone in which structures and other human development meet or intermingle with undeveloped wildland or vegetative fuels.

WINTER RANGE. Range that is grazed by livestock or wildlife during winter.

WITHDRAWAL. An action that restricts the use of public lands by removing them from the operation of some or all of the public land laws (e.g., mineral entry laws).

WOODLAND. A forest community occupied primarily by noncommercial species such as juniper, pinyon pine, mountain mahogany, or quaking aspen groves; all western juniper forestlands are considered woodlands because juniper is classified as a noncommercial species.

ACRONYMS AND ABBREVIATIONS

AAP	Average Annual Precipitation
ACEC	Area of Critical Environmental Concern
ACHP	Advisory Council on Historic Preservation
ADC	Animal Damage Control
AGRC	The State of Utah's Automated Geographic Reference Center
AML	Appropriate Management Level/Abandoned Mine Lands

PRIA	Public Rangelands Improvement Act
PRMP/FEIS	Proposed Resource Management Plan/Final Environmental Impact Statement
PSD	Prevention of Significant Deterioration
PWR	Public Water Reserve
R&I	Relevance and Importance
R&PP	Recreation and Public Purposes (Act of 1926)
RARE II	Roadless Area Review and Evaluation (1979 USFS Roadless Inventory)
RCRA	Resource Conservation and Recovery Act (1976)
RDCC	(Utah) Resource Development and Coordinating Committee
REA	Rural Electric Association
RFA	Reasonably Foreseeable Action (or Activity)
RFD	Reasonably Foreseeable Development

RFO	Richfield Field Office
RHS	Rangeland Health Standards
RIFC	Richfield Interagency Fire Center
RMA	Recreation Management Area
RMIS	Recreation Management Information System
RMP	Resource Management Plan (BLM land use plan under FLPMA)
RMZ	Recreation Management Zone
RNA	Research Natural Area
ROD	Record of Decision
ROS	Recreation Opportunity Spectrum
ROW	Right-of-Way
RS	Revised Statute
RUP	Recreation Use Permits
S&G	Standards and Guidelines
SCORP	Statewide Comprehensive Outdoor Recreation Plan
SHPO	State Historic Preservation Officer
SIP	State Implementation Plan
SITLA	(Utah) School and Institutional Trust Lands Administration
SO_2	Sulfur Dioxide
SRH	Standards for Rangeland Health
SRMA	Special Recreation Management Area
SRP	Special Recreation Permit
SSS	Special Status Species
STSA	Special Tar Sand Area
SUFCO	Southern Utah Fuel Company
SUV	Sport Utility Vehicle

SUWA	Southern Utah Wilderness Alliance
T&E	Threatened and/or Endangered (species as per ESA of 1973)
Tcf	Trillion Cubic Feet
TCP	Traditional Cultural Property
TDS	Total Dissolved Solids
TL	Timing Limitation
TMDL	Total Maximum Daily Load
TNC	The Nature Conservancy
UDAQ	Utah Department of Air Quality
UDEQ	Utah Division of Environmental Quality
UDNR	Utah Department of Natural Resources
UDOGM	Utah Division of Oil, Gas, and Mining
UDOT	Utah Department of Transportation
UDWaR	Utah Division of Water Resources
UDWQ	Utah Division of Water Quality
UDWR	Utah Division of Wildlife Resources
UEO	Utah Energy Office
UGS	Utah Geological Survey
URA	Unit Resource Analysis
URC	Utah Rivers Council
USA-ALL	Utah Shared Access Alliance
U.S.C.	United States Code
USDA	United States Department of Agriculture
USDI	United States Department of the Interior
USDOE	United States Department of Energy
USFS	United States Forest Service

USFWS	United States Fish and Wildlife Service
USGS	United States Geological Survey
USU	Utah State University
VOC	Volatile Organic Compound
VQO	Visual Quality Objective
VRI	Visual Resource Inventory
VRM	Visual Resource Management
WAFWA	Western Association for Fish and Wildlife Agencies
WIA	Wilderness Inventory Area
WMA	Wildlife Management Area
WO	Washington Office (of BLM)
WSA	Wilderness Study Area
WSR	Wild and Scenic River
WUG	Western Utility Group
WUI	Wildland Urban Interface

APPENDIX 1—SUMMARY OF THE AREAS OF CRITICAL ENVIRONMENTAL CONCERN REPORT

Appendix 1 summarizes the process used for evaluating nominations for areas of critical environmental concern (ACEC) that the Bureau of Land Management (BLM) considered in developing the Richfield Resource Management Plan (RMP). The ACEC Evaluation Report, Richfield Resource Management Plan, January 2005, includes full documentation of the process. This report can be viewed at the Richfield Field Office.

In brief, BLM staff and cooperators evaluated 26 nominations for ACECs, totaling 1.6 million acres within the Richfield Field Office (RFO) and portions of the Price Field Office. Of these, 16 areas totaling 886,810 acres within the RFO, plus additional acreage within the Price Field Office, met the criteria for relevant and important values and were identified as potential ACECs.

Management actions under the Proposed RMP include designating and managing the North Caineville Mesa ACEC and the Old Woman Front ACEC. Three of the four existing ACECs (South Caineville Mesa ACEC, Gilbert Badlands ACEC, and Beaver Wash ACEC) would not be designated. These three existing ACECs are mostly within Wilderness Study Areas (WSA), and the relevant and important values would be protected under the provisions of the Interim Management Policy (IMP). Resource decisions under the Proposed RMP and existing laws, rules, and regulations would protect the relevant and important values of the other potential ACECs.

BACKGROUND

BLM is directed by law, regulation, and policy to consider designating and protecting ACECs when developing land use plans (LUP).

The Law: Federal Land Policy and Management Act (FLPMA) of 1976

> *In the development and revision of land use plans, the Secretary shall…give priority to the designation and protection of areas of critical environmental concern.*
>
> —Federal Land Policy and Management Act (FLPMA), Title II, Sec 202(c) 3

> *The term "areas of critical environmental concern" (often referred to as "ACECs") means areas within the public lands where special management attention is required (when such areas are developed or used or where no development is required) to protect and prevent irreparable damage to important historic, cultural, or scenic values, fish and wildlife resources or other natural systems or processes, or to protect life and safety from natural hazards."*
>
> —FLPMA, Title I, Sec 103(a)

The Regulation: 43 Code of Federal Regulations (CFR) 1610.7-2

To be a potential ACEC, both of the following criteria shall be met:

Relevance: There shall be present a significant historic, cultural, or scenic value; a fish or wildlife resource or other natural system or process; or a natural hazard.

Importance: The above described value, resource, system, process, or hazard shall have substantial significance and values. This generally requires qualities of more than local significance and special worth, consequence, meaning, distinctiveness, or cause for concern.

The Policy: BLM Manual 1613

BLM Manual 1613 provides direction for identifying, analyzing, designating, monitoring, and managing ACECs. Key points are as follows:

- The ACEC designation indicates to the public that the BLM recognizes that an area has significant values and has established special management measures to protect those values.
- Designation of ACECs is made only through the resource management planning process, either in an RMP itself or in a plan amendment.
- To be designated as an ACEC, an area must require special management attention to protect the important and relevant values.
- Potential ACECs are identified as early as possible in the planning process.
- Existing ACECs are subject to reconsideration when plans are revised.
- Members of the public or other agencies may nominate an area for consideration as a potential ACEC. BLM personnel are encouraged to recommend areas for consideration as ACECs.
- No formal or special procedures are associated with nomination.
- An interdisciplinary team evaluates each resource or hazard to determine if it meets the relevance and importance criteria. The field manager approves the relevance and importance criteria.
- If an area is found not to meet the relevance and importance criteria, the analysis supporting that conclusion must be included in the RMP and associated environmental impact statement (EIS).

EVALUATION PROCESS

Existing ACECs

Four ACECs total 14,780 acres within the RFO: Beaver Wash, North Caineville Mesa, and South Caineville Mesa ACECs, which were established in 1982, and the Gilbert Badlands ACEC, which was established in 1986 (see Table A1-1 below). As required by BLM policy, evaluations for the existing ACECs were reviewed in developing the new RMP. All were found to meet the criteria for relevance and importance.

Table A1-1. Existing ACECs Within the Richfield Field Office

	ACEC Name	Public Land Acres	County
1	Beaver Wash	4,800	Wayne
2	Gilbert Badlands	3,680	Wayne
3	North Caineville Mesa	2,200	Wayne
4	South Caineville Mesa	4,100	Wayne
	Total	**14,780**	

ACEC Nominations

Thirty ACECs were nominated during scoping for the Richfield RMP. The Southern Utah Wilderness Alliance (SUWA), the Nature Conservancy (TNC), the U.S. Fish and Wildlife Service (USFWS), three Utah residents, and a BLM employee submitted nominations. Of these, RFO staff evaluated 26 areas totaling 1.6 million acres (shown below in Table A1-2 and the Nominated ACEC Map). The remaining four—Antelope Valley/Sweetwater Reef, Cedar Mountain, Molen Reef, and Mussentuchit Badlands—are primarily within the Price Field Office, with small acreages within the RFO. Price BLM staff evaluated them during development of the Price RMP. Some nominations overlap other nominations, and some nominations overlap the existing ACECs. Nominations were evaluated in accordance with BLM Manual 1613, Areas of Critical Environmental Concern. Values meeting the relevance and importance criteria were carried forward into the potential ACECs. See Nominated ACEC Map below.

During the public comment period on the Draft Resource Management Plan/Draft Environmental Impact Statement (DRMP/DEIS), the RFO received suggestions for additional ACECs. The nominated Wild Horse and Burro ACEC was considered but not found to possess relevance and importance values. In addition, other ACECs were suggested, but not enough information was supplied to assess the proposals for their relevant and important values.

Table A1-2. Nominated ACECs

	Nominated Area	Public Land Acres	County(ies)
1	Bull Creek Archaeological ACEC	67,809	Wayne and Garfield
2	Bullfrog Creek Drainage	149,370	Garfield
3	Caineville Wash	55,552	Wayne
4	Dirty Devil Drainage	371,257	Emery, Wayne, Garfield

Potential ACECs

Following the evaluation of relevant and important values, 16 areas totaling 886,810 acres were identified as potential ACECs. (See Table A1-3 and Potential ACEC map below.) Potential ACECs were determined in three ways:

- The potential ACEC is the same as the nominated ACEC because some or all of the values determined relevant and important are found throughout the nominated area.
- The potential ACEC is smaller than the nominated ACEC because the values determined relevant and important are found in only parts of the nominated area.
- The potential ACEC is composed of all or parts of several nominated ACECs because values determined relevant and important were found in adjoining nominated areas.

Table A1-3. Potential ACECs

	Area Name	Acreage	County(ies)
1	Badlands Scenic and Natural Processes ACEC. Includes: • Gilbert Badlands ACEC, 3,680 acres • North Caineville Mesa ACEC, 2,200 acres • South Caineville Mesa ACEC, 4,100 acres	88,900	Wayne
2	Bull Creek Archaeological ACEC	4,800	Wayne
3	Dirty Devil Scenic Cultural and Wildlife ACEC. Includes: • Beaver Wash ACEC, 4,800 acres	205,300	Wayne and Garfield
4	Fremont Gorge/Cockscomb Cultural and Scenic ACEC	34,300	Wayne
5	Henry Mountains Scenic and Wildlife ACEC. Includes: • No Man Mesa Potential ACEC, 315 acres	288,200	Wayne and Garfield

EXISTING AND POTENTIAL ACECS SUMMARY STATEMENTS

The following is a summary of the existing and potential ACECs in the Proposed Resource Management Plan (PRMP)/Final Environmental Impact Statement (FEIS).

North Caineville Mesa ACEC

The North Caineville Mesa ACEC encompassing 2,200 acres would continue to be managed as an ACEC for the relevant and important value of relict vegetation.

South Caineville Mesa ACEC

The South Caineville Mesa ACEC encompasses 4,100 acres, located entirely within the Mount Ellen/Blue Hills WSA. The relevant and important value is the relict vegetation found on top of the mesa. The South Caineville Mesa ACEC would not be designated. The management of the Mount Ellen/Blue Hills WSA pursuant to the IMP would provide adequate protection for the relevant and important value of relict vegetation.

Beaver Wash Canyon ACEC

The Beaver Wash Canyon ACEC encompasses 4,800 acres, 99 percent of which is located within the Dirty Devil WSA. The relevant and important value is its desert riparian ecosystem. The Beaver Wash Canyon ACEC would not be designated. The management of the Dirty Devil WSA pursuant to the IMP, along with other decisions for the protection of riparian values and travel management, would provide adequate protection for the relevant and important value of its desert riparian ecosystem.

Gilbert Badlands Research Natural Area ACEC

The Gilbert Badlands Research Natural Area (RNA) ACEC encompasses 3,680 acres located entirely within the Mount Ellen/Blue Hills WSA. The relevant and important value is the badlands geology. The Gilbert Badlands RNA ACEC would not be designated. The management of the Mount Ellen/Blue Hills WSA pursuant to the IMP would provide adequate protection for the relevant and important value of badlands geology.

Badlands Potential RNA ACEC

The Badlands Potential RNA ACEC, which encompasses 88,900 acres of public lands in the Caineville area of eastern Wayne County, includes the existing North and South Caineville Mesa ACECs and Factory Butte. The relevant and important values of the area are scenic, special status plant species, natural processes (wind erosion), riparian, and relict vegetation values. The Badlands Potential RNA ACEC would not be designated. The existing North Caineville Mesa ACEC (2,200 acres) would continue to be designated to protect the relict vegetation relevant and important value. The management of the Mount Ellen/Blue Hills WSA (46 percent of the ACEC) pursuant to the IMP would provide adequate protection for the relevant and important values within that area. Resource decisions related to riparian protection zones, special status species (SSS), and restricting off-highway vehicle (OHV) use to designated routes and a small managed open area would also provide protection to relevant and important values. Cross-country OHV use would continue to be allowed within a portion of the potential ACEC. Although some impact may occur on the relevant and important values of scenery and natural processes (wind erosion) within the OHV open area, the potential for impacts is within a very small portion of the

total ACEC acreage. The demand for the specialized OHV recreation opportunities available at this site and the historic use were considered when making this decision.

Bull Creek Potential ACEC

The Bull Creek Potential ACEC encompasses 4,800 acres of public lands located in Wayne County several miles south of Hanksville. The relevant and important value is cultural resources (archaeological). The Bull Creek Potential ACEC would not be designated. Existing laws, rules, and regulations, as well as management decisions for cultural and travel management, would adequately protect the relevant and important cultural values without designating the area as an ACEC.

Dirty Devil/North Wash Potential ACEC

The Dirty Devil/North Wash Potential ACEC includes the Dirty Devil River and side canyons and totals 205,300 acres. It is located southeast of Hanksville in Wayne and Garfield counties. Relevant and important values are scenic, cultural, paleontological, wildlife (bighorn sheep), and SSS (plant species and the Mexican spotted owl). The Dirty Devil/North Wash Potential ACEC would not be designated. Sixty-four percent of the potential ACEC is within WSAs where management under the IMP would protect all relevant and important values from surface disturbing activities. Existing laws, rules, and regulations, as well as other resource decisions within the Proposed RMP for Visual Resource Management (VRM), fish and wildlife, and travel and minerals management would adequately protect and/or mitigate potential impacts to relevant and important values. The proposed RMP decisions would provide adequate protection to the relevant and important values without designating the area as an ACEC.

Fremont Gorge/Cockscomb Potential ACEC

The Fremont Gorge/Cockscomb Potential ACEC is located on public lands west of Capitol Reef National Park in the Torrey-Teasdale-Grover area of central Wayne County. The potential ACEC totals 34,300 acres. Relevant and important values are cultural, scenic, riparian, plant, and wildlife (mule deer). The Fremont Gorge/Cockscomb Potential ACEC would not be designated. The Fremont Gorge WSA and Fremont Gorge suitable wild and scenic rivers would provide protection within 13 percent of the area. Existing laws, rules, and regulations, and other resource decisions within the Proposed RMP, such as VRM designations, protection of crucial deer habitat from cross-country OHV use and surface disturbance, would provide protection for relevant and important values, reducing or eliminating potential impacts to the potential ACEC. Resource decision included in the proposed RMP would provide adequate protection to the relevant and important values without designation of the area as an ACEC.

Henry Mountains Potential ACEC

The Henry Mountains Potential ACEC is located in the Henry Mountains south of Hanksville and totals 288,200 acres. Relevant and important values are scenic, wildlife (bison and mule deer), SSS (Townsend's big-eared bat, ferruginous hawk, burrowing owl, hole-in-the-rock prairie clover, Dana's milkvetch, Barneby milkvetch), and ecological values (riparian areas and relict vegetation). Forty-five percent of the potential ACEC is within the Mount Hillers, Mount Pennell, and Bull Mountain WSAs, as well as the southern portion of the Mount Ellen/Blue Hills WSA where management under the IMP would protect all relevant and important values from surface disturbing activities. Other resource decisions under the Proposed RMP such as VRM Class I and II, limiting OHV use to designated routes and seasonal/spatial restrictions, would provide adequate protection the relevant and important values of the potential ACEC without designation of the area as an ACEC.

Horseshoe Canyon Potential ACEC

The Horseshoe Canyon Potential ACEC includes Horseshoe Canyon, a tributary to the Green River, and totals 40,900 acres. It is located in northeastern Wayne County. Relevant and important values are scenic, cultural (Cowboy Cave), SSS (Townsend's big-eared bat), and riparian. Ninety-two percent of the potential ACEC is within the Horseshoe Canyon North and Horseshoe Canyon South WSAs where management under the IMP would protect all relevant and important values. Other resource decisions under the Proposed RMP such as VRM Class I and II, travel, and minerals management would provide adequate protection for the relevant and important values of the potential ACEC without designation of the area as an ACEC.

Kingston Canyon Potential ACEC

The Kingston Canyon Potential ACEC encompasses 22,100 total acres of public lands located in the side canyons north and south of the Sevier River between the towns of Kingston and Antimony in Sevier County. Relevant and important values are mule deer, mule deer habitat, and riparian areas. Existing laws, rules, and regulations, as well as management decisions for riparian protection zones, seasonal/spatial restrictions on surface disturbances, and travel management would adequately protect the relevant and important values of the potential ACEC without designation of the area as an ACEC.

Little Rockies Potential ACEC

The Little Rockies Potential ACEC totals 49,200 acres located in the southeast corner of Garfield County. It includes the entire Little Rockies National Natural Landmark—a National Park Service designation. Relevant and important values are scenic, wildlife (bighorn sheep), SSS (Townsend's big-eared bat and hole-in-the-rock prairie clover), and ecological (riparian) values. Seventy-six percent of the potential ACEC is within the Little Rockies WSA. Existing laws, rules, and regulations, as well as management decisions for riparian protection zones, seasonal and spatial restrictions on surface disturbances, non-WSA lands with wilderness characteristics, and travel management, would protect adequately the relevant and important values of the potential ACEC without designation of the area as an ACEC.

Lower Muddy Creek Potential ACEC

The Lower Muddy Creek Potential ACEC, located along Muddy Creek north of Hanksville, totals 16,200 acres of the RFO, with additional acreage to the north in the lands that the Price Field Office manages. The discussion here is limited to the RFO portion. Relevant and important values of this potential ACEC are scenic, SSS (Wright fishhook cactus and Heil's beavertail cactus), and riparian. Existing laws, rules, and regulations, as well as resource decisions within the Proposed RMP for travel and minerals management that limit surface disturbance, would provide adequate protection to the relevant and important values of the potential ACEC without designation of the area as an ACEC.

Old Woman Front Research Natural Area Potential ACEC

The Old Woman Front Research Natural Area Potential ACEC is located in eastern Sevier County, adjacent to the Old Woman Plateau Research Natural Area on the Fishlake National Forest. It encompasses 330 acres. Designating this area as an ACEC would complement the adjacent Forest Service RNA and provide a logical topographical boundary for the area. The relevant and important value of the area is its relict vegetation.

Parker Mountain Potential ACEC

The Parker Mountain Potential ACEC, which totals 107,900 acres, is located in western Wayne County on the Awapa Plateau. Relevant and important values are sagebrush-steppe habitat and SSS (greater sage grouse, Utah prairie dog, and pygmy rabbit). Existing laws, rules, and regulations, as well as management decisions for fish and wildlife, travel, and leasable minerals management, would adequately protect the relevant and important values of the potential ACEC without designation of the area as an ACEC.

Quitchupah Potential ACEC

The Quitchupah Potential ACEC is located in eastern Sevier County along Quitchupah Creek and totals 180 acres. Relevant and important values are cultural resources and riparian values. Existing laws, rules, and regulations, as well as management decisions for riparian protection zones and travel management under the Proposed RMP, would adequately protect the relevant and important values of the potential ACEC without designation of the area as an ACEC.

Rainbow Hills Potential ACEC

The Rainbow Hills Potential ACEC, located just east of Richfield, encompasses the colorful Arapien Shale outcropping. It totals 4,000 acres of public lands. Relevant and important values are mule deer, mule deer habitat, special status plants (Utah phacelia, Arapien stickleaf, Wards penstemon, rainbow rabbitbrush, Sigurd townsendia, and Glenwood milkvetch), and the naturally functioning ecosystem. Existing laws, rules, and regulations, as well as management decisions for fish and wildlife, fire and fuels, and travel management under the Proposed RMP, would provide protection for the relevant and important values of the potential ACEC without designation of the area as an ACEC.

Sevier Canyon Potential ACEC

The Sevier Canyon Potential ACEC, totaling 8,900 acres of public land, encompasses the gorge bordering the Sevier River located between the towns of Marysvale and Sevier. Relevant and important values are mule deer, mule deer habitat, SSS, and riparian areas. Existing laws, rules, and regulations, as well as management decisions for riparian protection zones, fish and wildlife, fire and fuels, and travel management under the Proposed RMP, would provide protection for the relevant and important values of the potential ACEC without designation of the area as an ACEC.

Special Status Species Potential ACEC

The SSS Potential ACEC encompasses documented locations of SSS identified in the evaluations of the various ACEC proposals. In total, this represents 15,100 acres of public lands. Relevant and important values are the following SSS: Winkler pincushion cactus, Wright fishhook cactus, last chance townsendia, Rabbit Valley gilia, Cronquist wild buckwheat, Creutzfeldt flower, Wards penstemon, Basalt milkvetch, Bicknell milkvetch, hole-in-the rock prairie clover, Dana's milkvetch, Barneby milkvetch, Psoralea globemallow, Heil's beavertail, Jane's globemallow, flat-top wild buckwheat, Townsend's big eared bat, Allen's big eared bat, big free-tailed bat, fringed miotis, ferruginous hawk, bald eagle, burrowing owl, long-billed curlew, southwestern willow flycatcher, Williamsons sapsucker, northern goshawk, greater sage grouse, bluehead sucker, flannelmouth sucker, round-tail sucker, leatherside chub, and desert night lizard. Existing laws, rules, and regulations, as well as management decisions for SSS, travel, and minerals management under the Proposed RMP, would provide protection for the relevant and important values of the potential ACEC without designation of the area as an ACEC.

Thousand Lake Bench Potential ACEC

The Thousand Lake Bench ACEC is located in southeastern Sevier County, south of Interstate 70 and east of Thousand Lake Mountain. It is 500 acres, located in several small areas. Relevant and important values are cultural resources, SSS (bald eagle, last chance townsendia, and Wright fishhook cactus), and riparian areas. Existing laws, rules, and regulations, as well as management decisions for riparian protection zones and travel management under the Proposed RMP, would provide protection for the relevant and important values of the potential ACEC without designation of the area as an ACEC.

RELEVANCE AND IMPORTANCE CRITERIA—AREA OF CRITICAL ENVIRONMENTAL CONCERN NOMINATIONS

The Task

The task of evaluating the ACEC nominations was assigned to a subteam of the land use planning interdisciplinary team. The subteam's job was as follows:

1. Identify the potentially relevant values in the nominations.
2. Evaluate the potentially relevant values to determine which, if any, are truly relevant, based on criteria.
3. Evaluate the relevant values to determine if they are important, based on criteria.
4. Identify suggested special management needed to protect relevant and important values.
5. Map the area(s) of relevance and importance. These maps define the potential ACECs that will be considered in the draft environmental impact statement (DEIS).
6. Evaluate existing ACECs to determine if they should be retained, dropped, or modified in the new RMP.

The evaluation was conducted based on guidance in BLM Manual 1613, Areas of Critical Environmental Concern.

1) Identifying Potentially-Relevant Values

The subteam reviewed each of the 26 ACEC nominations to identify potentially relevant values. Only the values identified in the nominations were evaluated for relevance.

2) Determining Relevance

Potentially relevant values were evaluated based on guidance in 43 CFR 1610.7-2, "Designation of Areas of Critical Environmental Concern," and BLM Manual 1613, "Areas of Critical Environmental Concern."

Historical, Cultural, and Scenic Values

A historic or cultural value was determined relevant if the staff archaeologist determined it to be significant.

A scenic value was determined relevant if it was:

- Inventoried as Class A Scenery by the BLM.
- Otherwise judged relevant by the staff visual resource specialist (rationale provided).

Fish and Wildlife Values

The nominated fish and wildlife resource was judged relevant if it or its habitat was documented as present within the nominated area.

Sources of information:

- Utah Natural Heritage Program Database, operated and maintained by the Utah Division of Wildlife Resources (UDWR)
- UDWR habitat maps for game species
- USFWS habitat data maps, recovery plans, and other information
- Staff specialist knowledge (rationale provided).

Natural Processes or Systems

Nominated natural processes or systems (e.g., plants, riparian areas, geologic processes) were considered relevant if they were present within the nominated area and included the following:

- Endangered, sensitive, or threatened plant species (documented occurrences within nominated area)
- Rare, endemic, or relict terrestrial, aquatic or riparian plants, or plants communities (documented occurrences within nominated area)
- Rare geological features.

Sources of information included the following:

- Utah Natural Heritage Program Database, operated and maintained by the UDWR.
- UDWR habitat maps for game species
- USFWS habitat data maps
- Riparian area inventory
- Existing management plans
- Wilderness inventory information
- National Natural Landmark Areas Survey (1980)
- U.S. Geological Survey (USGS) data
- Staff specialist knowledge (rationale provided).

Natural Hazards

Nominations were considered on a case-by-case basis.

3) Determining Importance

Only values determined relevant were evaluated for importance. The value, resource, system, process, or hazard described as relevant usually had to have substantial significance and values to meet the importance criteria.

Significant Qualities

For a relevant resource (or value, system, process, or hazard) to be judged important, it had to have more than locally significant qualities, which gave it special worth, consequence, meaning, distinctiveness, or cause for concern, especially compared with any similar resource.

Historic and cultural—A relevant historic or cultural resource was determined more than locally significant if it was:

- Listed on the National Register of Historic Places
- Eligible for listing on the National Register of Historic Places
- Otherwise judged more locally significant as a result of federal laws, regulations, and national BLM policies that mandate consideration and protection of cultural resources.

Scenic—A relevant scenic resource was determined more than locally significant if it was:

- A national, state, or local scenic designation such as state scenic highways, federal scenic highways, and All-American Roads and BLM backcountry byways
- Otherwise judged more locally significant by the staff recreation specialist (rationale provided).

Fish, wildlife, and plant resources—A relevant fish, wildlife, or plant resource was determined more than locally significant if it was a species that was protected under federal law, regulation, and BLM national policy that mandates the consideration and protection of species:

- Special status species, including:
  - Federally listed threatened or endangered species
  - BLM sensitive species
  - State of Utah species of concern
- Endemic to nominated area
- Otherwise judged more than locally significant by staff wildlife biologist (rationale provided).

Riparian resources—All riparian areas were judged more than locally significant by National BLM policy.

Natural hazard—A relevant natural hazard was more than locally significant if staff specialists so determined (rationale provided).

Special Values and Threats

The relevant resource (value, system, process or hazard) was important if it had qualities or circumstances in the nominated area that made it:

- Fragile
- Sensitive
- Rare
- Irreplaceable
- Exemplary
- Unique
- Endangered
- Threatened, or
- Vulnerable to adverse change.

Determinations of special values, threats, and vulnerability to adverse change were made by staff specialists, case-by-case, based on professional knowledge and supporting documentation.

National Priority

The relevant resource (or value, system, process, or hazard) was determined important if it warranted special protection to:

- Satisfy national priority concerns
- Carry out the mandates of FLMPA.

Historic and cultural—Protection of cultural resources is a national priority; therefore, any cultural resource identified as relevant was also determined to be important.

Scenic—A relevant scenic resource that also carried national designations such as federal scenic highways and All-American Roads and BLM backcountry byways was determined important.

Fish, wildlife, and plants—A relevant federally listed threatened or endangered species was also determined important (because of the Endangered Species Act).

Riparian resources—All riparian areas are considered more than locally significant by BLM policy; hence, they meet the importance criteria.

Safety and Public Welfare

A relevant resource (or value, system, process, or hazard) was considered important if it had qualities that warranted highlighting it to satisfy public or management concerns about safety and public welfare.

Threat to Life and Property

The resource (or value, system, process, or hazard) poses a significant threat to human life and safety or property.

4) Special Management

Suggested special management was developed to address, mitigate, or prevent identified threats.

5) Mapping Potential ACECs

Values identified as relevant and important provided a basis for the potential ACECs. Occasionally, the potential ACEC's boundary was the same as the nominated area. In other cases, the boundary of the potential area was somewhat smaller than the nominated area. Yet, in other cases, an identified relevant and important value (e.g., Class A Scenery or crucial bison or mule deer habitat) crossed the boundaries of several nominated ACECs and the potential ACEC then took a new shape and a new name. The potential ACECs will be carried into Alternative C in the DEIS of the RMP. Other alternatives will consider lesser or no acreages for ACEC protection. All will be evaluated in the DEIS.

6) Evaluation of Existing ACECS

Evaluations of the four existing ACECs—Beaver Wash Canyon, Gilbert Badlands, North Caineville Mesa, and South Caineville Mesa—were reconsidered. The relevance and importance values of all were determined to still be valid.

APPENDIX 2—WILD AND SCENIC RIVER ELIGIBILITY AND TENTATIVE CLASSIFICATION REPORT

On March 1, 2004, the Bureau of Land Management (BLM) released a Wild and Scenic River (WSR) Preliminary Eligibility and Tentative Classification Report for the Richfield Field Office (RFO) for 60 days of public comment. That report identified 13 river segments totaling 155.5 miles as free-flowing and possessing one or more outstandingly remarkable values, making them eligible for further consideration as suitable wild, scenic, or recreational rivers in the Draft Resource Management Plan/Draft Environmental Impact Statement (DRMP/DEIS). The eligibility determinations of two drainages and the determination of the cultural values in seven other drainages were deferred at that time.

The evaluation process began with a BLM interdisciplinary (ID) team inventorying all named drainages crossing public lands within the RFO as depicted on the BLM 1:100,000 scale topographic maps to determine if they were (1) free-flowing[1] and (2) contained any potential outstandingly remarkable values as defined in the WSR Act. The team identified 304 drainages, including multiple segments of the Fremont and Sevier rivers. Also considered were nominations for WSRs submitted as part of scoping for the Richfield Resource Management Plan (RMP) and the earlier—but never completed—Henry Mountain RMP. Thirty-three rivers or river segments were identified as potentially possessing one or more outstandingly remarkable values. The Preliminary Report provides documentation of the process that the ID team used in evaluating the 33 rivers.

Following consideration of the comments on the Preliminary Report and other new information, including field reviews and revised policy guidance, the BLM determined that 12 river segments, totaling 135 miles, have one or more outstandingly remarkable values and are eligible for further consideration in the RMP. Table A2-1 lists the eligible rivers, along with their outstandingly remarkable values. In addition, all river segments and outstandingly remarkable values deferred in the preliminary report are now resolved.

This document tracks changes between the preliminary report and this report. Considerable information exists about the evaluation process in the preliminary report, but it is not repeated here. Copies of the *Wild and Scenic River Preliminary Eligibility and Tentative Classification Report* for the RFO are available online at http://www.blm.gov/ut/st/en/fo/richfield/planning/rmp.html or from the BLM.

Table A2-1. Wild and Scenic River Eligibility and Classification

River or River Segment		Outstandingly Remarkable Value(s)	Tentative Classification	BLM Miles	Total Miles
Dirty Devil Complex	Dirty Devil River	Scenic, recreation, geologic, fish and wildlife, and cultural	Wild	54	57
	Beaver Wash Canyon	Scenic and ecological	Wild	6.8	6.9
	Larry Canyon	Scenic, recreation, wildlife, and ecological	Wild	4	4
Dirty Devil Complex	No Mans Canyon	Scenic, recreation, and cultural	Wild	7.1	7.1

1 "Free-flowing"…means existing or flowing in a natural condition without impoundment, diversion, straightening, rip-rapping, or other modifications of the waterway. The existence, however, of low dams, diversion works, or other minor structures at the time any river is proposed for inclusion in the national WSR system shall not bar its consideration for such inclusion.

River or River Segment		Outstandingly Remarkable Value(s)	Tentative Classification	BLM Miles	Total Miles
	Robbers Roost Canyon	Scenic, recreation, historic, and cultural	Wild	31	33
	Sams Mesa Box Canyon	Scenic and wildlife	Wild	9.5	9.5
	Twin Corral Box Canyon	Scenic and wildlife	Wild	9	10
Fish Creek	Fish Creek	Cultural	Scenic	0.25	0.25
Fremont River	Fremont Gorge	Scenic	Wild	5	6
	Capitol Reef National Park to Caineville Ditch Diversion	Scenic and geologic	Recreational	4	6
Maidenwater Creek	Maidenwater Creek	Scenic, recreation, geologic, fish and wildlife, and ecological	Scenic	3	4
Quitchupah Creek	Quitchupah Creek	Cultural	Recreational	1.4	1.4
Total				**135.05**	**145.15**

COMMENTS ON PRELIMINARY REPORT

Seventy-six comments were received on the preliminary report, categorized as follows:

- **Cooperators:** Comments were received from Emery, Garfield, Sevier, and Wayne counties; Governor's Office of Planning and Budget; State Institutional Trust Lands Administration; and the National Park Service (Capitol Reef National Park).
- **Groups:** Four groups commented: Coloradans for Utah Wilderness, Great Old Broads for Wilderness, Southern Utah Wilderness Alliance (SUWA), and Utah Rivers Council (URC).
- **Individuals:** 63 individuals commented, including guidebook author Steve Allen, geomorphologist Dr. John Dohrenwend, and George and Frances Alderson, a couple from Maryland who specifically traveled to Utah to explore and comment on rivers mentioned in the preliminary report.
- **BLM:** Two RFO employees provided comments on the preliminary report. Several others reviewed the submitted comments and helped develop the BLM position, reflected in the discussion and determinations shown below.

Copies of the comments are available for review at the RFO.

Other New Information

- On June 21, 2004, the Director of the National Landscape Conservation System issued an Instruction Memorandum (IM-2004-196, attached) clarifying BLM's policy with respect to the eligibility criteria for potential WSRs and protective management of identified segments. The IM addressed ephemeral drainages and other issues, including the requirement for outstandingly remarkable values to be river related. It advised caution in applying the free-flowing criteria to

water courses that flow only during flash floods or other circumstances caused by unpredictable events and stated that eligible segments should generally not be ephemeral.
- Following the release of the preliminary report, BLM staff and cooperators field-checked several potentially eligible river segments. Results of those field visits are reflected in this final report.
- BLM management accepted the RFO archaeologist's recommendations for cultural outstandingly remarkable values. These values had been "deferred" in the Preliminary Report over concern they did not rise to the level of being regionally significant.

EVALUATION OF NEW INFORMATION AND ELIGIBILITY DETERMINATION

Note: If no new information was received during the comment period regarding a previously considered river, it is not shown below but is carried forward with no change from the Preliminary Report. As part of their comments, SUWA included a list of drainages they wanted reconsidered as eligible. However, they provided no supporting information by which to evaluate their nominations; hence, eligibility findings regarding those drainages were not reconsidered unless specific comments were provided by others.

Big Hollow

- **Preliminary Report Recommendation:** Deferred (ephemeral).
- **New Information:** IM-2004-196 and statement from BLM Natural Resource Specialist Doug Thurman, "There is only ephemeral flow in this hollow."
- **Discussion:** The interdisciplinary team identified Big Hollow on Parker Mountain as a potentially eligible WSR because of its importance as a raptor migratory route and foraging and nesting area; however, it was deferred because it is an ephemeral drainage.
- **Determination:** Not eligible because it is ephemeral, per IM-2004-196.

Bullfrog Creek and North Fork Bullfrog Creek (including Muley Creek)

- **Preliminary Report Recommendation:** Both creeks were nominated for scenic, recreation, geologic, cultural, and ecological outstandingly remarkable values but found not eligible.
- **New Information:** John Dohrenwend: "In its lower reaches, Bullfrog Creek has carved a narrow canyon nearly 1,000 feet deep into surrounding high plateaus. This canyon is overlooked by the Stratton Road (part of the Burr Trail) that affords continuous opportunities to view and enjoy the heart of the plateau. I would rank this road as one of the most breathtaking (yet easily accessible) touring opportunities in the United States. From a geologic perspective, it is difficult to name an area having better examples of the landforms that distinguish the canyon country of the [Colorado] Plateau… In summary, I find the assessment of 'not eligible, no outstanding value' to be completely unsupportable."
- **Discussion:** The landforms discussed are not part of the Bullfrog Creek drainage, nor were they formed by the same. The road is well away from the drainage and has nothing to do with it. Bullfrog Creek Canyon is narrow and deep, but this is not rare within the region. Although the Stratton Road overlooks Bullfrog Creek in places, the recreational activity is not within the river corridor, and it is not river related. Very little recreational activity occurs within the canyon itself, other than some hiking activity originating within Glen Canyon National Recreation Area (NRA) and possibly extending onto the BLM portions of the canyon. Bullfrog Canyon and Upper Muley/Bullfrog were both given Class B Scenery ratings as part of the Visual Resource Management (VRM) Inventory.
- **Final Decision:** Not eligible. No values were determined to be outstandingly remarkable.

Dirty Devil Complex

Dirty Devil River

- **Preliminary Report Recommendation:** Eligible for scenic, recreation, geologic, and fish and wildlife values.
- **New Information:** More comments were received about the Dirty Devil River and its tributaries than all other rivers within the RFO boundary combined. Emery, Wayne, and Garfield counties questioned the determination of several "outstandingly remarkable values," notably scenery and recreation. Garfield County stated, "Scenery in the drainage was similar to cliffs and rock stands throughout the area"; Emery County wrote, "Considering the region of comparison is the Colorado Plateau, neither contrast of sandstones nor vegetative diversity are unique or outstandingly remarkable"; and Wayne County stated that it "does not agree that the Dirty Devil Complex meets the standard for scenic outstandingly remarkable values." However, people who had visited the canyon wrote about it in glowing terms. John Cederquist stated, "This resource is an amazing one, offering very unique opportunities for scenic value, personal reflection, healthy physical activities, challenge, and connection with very rare cultural values." Curtis Anderson said, "The Dirty Devil offers outstanding beauty and wilderness. The geology is magnificent." These comments were typical of those who support the eligibility determination. BLM staff from the state and field offices hiked the Dirty Devil and several of its side canyons in April 2004 and agreed with the interdisciplinary team that the river has many outstandingly remarkable values.
- **Discussion:** No evidence was brought forth that convinced us to change our determinations from the preliminary eligibility report. The interdisciplinary team continues to believe that this river is outstandingly remarkable for all the values identified, even when compared with other rivers within the Colorado Plateau.
- **Determination:** Eligible for scenic, recreation, geologic, fish and wildlife, and cultural outstandingly remarkable values.

Beaver Wash Canyon

- **Preliminary Report Recommendation:** Eligible for scenic and ecological outstandingly remarkable values.
- **New Information:** George and Frances Alderson said, "We visited this river May 10. We believe that wildlife values of Beaver Wash should be considered 'outstanding' in your study, reflecting the presence of beaver, bighorn sheep, and Mallard ducks…" In the arid Colorado Plateau, a breeding population of Mallards is unusual. BLM Natural Resource Specialist Doug Thurman stated, "I checked color infrared air photos, which clearly show riparian vegetation the entire length of the canyon."
- **Discussion:** The values mentioned by the Aldersons are best addressed by the ecological outstandingly remarkable value.
- **Determination:** Eligible for scenic and ecological outstandingly remarkable values.

Buck and Pasture Canyons

- **Preliminary Report Recommendation:** Not Eligible.
- **New Information:** Steve Allen said, "The BLM flat missed the boat with not recommending these canyons for Wild and Scenic designation. With the comment that there are outstanding values, it becomes apparent the BLM personnel either never walked the canyons or did so with blinders on…" Allen comments support scenic, ecological, and recreation outstandingly remarkable values.

- **Discussion:** These canyons are ephemeral drainages.
- **Determination:** Not eligible because they are ephemeral, per IM-2004-196.

Fiddler Cove Canyon

- **Preliminary Report Recommendation:** Deferred (ephemeral).
- **Discussion:** The interdisciplinary team identified multiple outstandingly remarkable values: scenic, geologic, wildlife, cultural, and ecological. However it is an ephemeral drainage.
- **Determination:** Not eligible because it is ephemeral, per IM-2004-196.

Happy Canyon

- **Preliminary Report Recommendation:** Eligible for scenic and recreation outstandingly remarkable values.
- **New Information:** Doug Thurman, BLM Natural Resource Specialist noted, "…flows are ephemeral in this canyon. There may be a few small seeps but in no way is the flow intermittent. I have talked with a member of our staff who has been up Happy Canyon several miles from the bottom and saw no evidence of riparian vegetation or intermittent flow. I have studied our color and color infrared aerial photographs, which show a very dry canyon with no riparian vegetation."
- **Discussion:** Happy Canyon is ephemeral.
- **Determination:** Not eligible because it is ephemeral, per IM-2004-196.

Hatch Canyon

- **Preliminary Report Recommendation:** Not eligible.
- **New Information:** Steve Allen said, "The BLM write-up reminds me of a famous quote, 'if you've seen one redwood tree, you've seen them all…. This canyon is part of the famous and oft-used 'Outlaw Trail'…. Zane Grey wrote about the area in his novel, *Robbers Roost,* as did Louis L'Amour in…*Sunset Pass*. One reason to designate this canyon as Wild and Scenic is to truncate illegal off-road vehicle use.… … there are only a couple of other canyons that the bighorn frequent in this area…. With such a small area being used by bighorn … I would think that any canyon and water source they use or could use would be critical."
- **Discussion:** In response to Mr. Allen's comments, BLM specialists wrote, "…when looking at this as regionally significant or outstanding, we have better. There is very little variation or rarity. It is not biologically diverse." The off-highway vehicle (OHV) use is a compliance issue rather than a designation issue as the area is already part of a wilderness study area (WSA).
- **Determination:** Not eligible. No values were determined to be outstandingly remarkable.

Larry Canyon

- **Preliminary Report Recommendation:** Eligible for scenic, recreation, wildlife, and ecological outstandingly remarkable values.
- **New Information:** Steve Allen said, "BLM did an excellent evaluation of Larry Canyon."
- **Discussion:** Thanks, Steve.
- **Determination:** Eligible for scenic, recreation, wildlife, and ecological outstandingly remarkable values.

No Mans Canyon

- **Preliminary Report Recommendation:** Eligible for scenic and recreation outstandingly remarkable values; deferred cultural outstandingly remarkable value.
- **New Information:** Steve Allen said, "A constructed stock trail dating back to the early days takes one out of the canyon and to Robbers Roost country."
- **Discussion:** The new information supports the preliminary eligibility determination.
- **Determination:** Eligible for scenic, recreation, and cultural outstandingly remarkable values.

Robbers Roost Canyon

- **Preliminary Report Recommendation:** Eligible for scenic, recreation, and historic outstandingly remarkable values; deferred cultural outstandingly remarkable value.
- **New Information:** Steve Allen stated, "Over the past 10 years canyoneers have come to recognize that the upper ends of each of the Robbers Roost tributaries contain superb opportunities for technical slot canyoneering…"
- **Discussion:** The new information supports the preliminary eligibility determination. The cultural value is no longer "deferred" and is accepted.
- **Determination:** Eligible for scenic, recreation, historic, and cultural outstandingly remarkable values.

Sams Mesa Box Canyon

- **Preliminary Report Recommendation:** Eligible for scenic and wildlife outstandingly remarkable values.
- **New Information:** Steve Allen said, "High walls, a variety of sandstones and formations, and an intermingling of colors from the brown/red/purple/grays of the Chinle to the sweep of the Wingate make this canyon a textbook example of the formations that make up the Glen Canyon group…."
- **Discussion:** BLM's geologist responded, "The Chinle and Wingate are by no means rare in the region, nor are the Navajo Sandstone and Kayenta formations."
- **Determination:** Eligible for scenic and wildlife outstandingly remarkable values.

Twin Corral Box Canyon

- **Preliminary Report Recommendation:** Eligible for scenic and wildlife outstandingly remarkable values.
- **New Information:** Steve Allen: "…the upper part of the canyon, which forms a deep, narrow slot or defile, is now a popular goal for canyoneers. It has been written up in at least one BLM guidebook and on several websites."
- **Discussion:** Although some recreation activity is occurring, it is low compared with other locations in the area, or even other canyons in the upper part of the Dirty Devil drainage. Access is difficult and mostly of a technical nature.
- **Determination:** Eligible for scenic and wildlife outstandingly remarkable values.

Fish Creek

- **Preliminary Report Recommendation:** Deferred for cultural outstandingly remarkable value.
- **Discussion:** The cultural values are no longer "deferred" and are now accepted as outstandingly remarkable.
- **Determination:** Eligible for cultural outstandingly remarkable values.

Fremont River Segments

Below Mill Meadow Dam

- **Preliminary Report Recommendation:** Eligible for recreation and fish and wildlife outstandingly remarkable values.
- **Discussion:** Comments reflected that this segment below the Mill Meadow Dam is all but dewatered from October through May each year and again for a 2-week period each summer, thus not meeting the definition of "free-flowing"—that is, flowing in natural condition.
- **Determination:** Not eligible (not free-flowing).

Fremont Narrows

- **Preliminary Report Recommendation:** Not eligible.
- **New Information:** BLM Hydrologist Phil Zieg noted that the channel in this segment has been restored and rehabilitated—including gabions, potholes, and protective fencing—and that it provides substantial wildlife and waterfowl habitat. However, irrigation practices completely dewater the segment during June, July, and August each year.
- **Discussion:** Because the stream course has been significantly modified and the stream is dewatered annually for upstream irrigation, this segment does not meet the definition of "free-flowing"—that is, flowing in natural condition.
- **Determination:** Not eligible (not free-flowing).

Fremont Gorge

- **Preliminary Report Recommendation:** Eligible for scenic and fish and wildlife outstandingly remarkable values.
- **New Information:** Wayne County disagreed that this segment was any more outstandingly remarkable than numerous similar landscapes throughout the Colorado Plateau and that the fish and wildlife outstandingly remarkable value should not be based on "potential habitat." The National Park Service (NPS) noted that geology was not identified as an outstandingly remarkable value and stated, "We disagree with the latter assessment. First, it is the exposed geology that creates the scenic appeal of the gorge. Second, the Permian and Triassic layers exposed in the gorge span nearly 100 million years of geologic time. And third, the Cutler Formation and Kaibab Limestone that are exposed in the gorge are relatively rare in the region…" The Aldersons said, "We visited this river on May 11 and we agree with BLM's conclusion that is has outstanding…values. It forms a corridor contiguous to Capitol Reef National Park and is a valuable route for recreational hiking between the park and Route 12 near Torrey."
- **Discussion:** The BLM inventoried the Fremont Gorge as Class A Scenery, so we stand by the scenic outstandingly remarkable value. "Potential" habitat appears insufficient to stand as an outstandingly remarkable value, so that is dropped. A BLM geologist disagrees with NPS that the geology in the Fremont Gorge is an outstandingly remarkable value, stating, "In terms of geologic time, 100 million years is not a long time and many canyons within the region will span as much or more time. BLM also disagrees that Permian Cutler Group rocks crop out extensively just to the southeast of the RFO and by no stretch of the imagination are the Kaibab Formation and Cutler Group rare. They may form less than 1 percent of the exposed rocks in the RFO, but they are found in the subsurface throughout the region."
- **Determination:** Eligible for scenic—but not geologic or fish and wildlife outstandingly remarkable values.

Below Capitol Reef NP to Caineville Ditch Diversion

- **Preliminary Report Recommendation:** Not eligible.
- **New Information:** Wayne County agrees with the preliminary determination that this stream segment is not eligible. The NPS commented that it disagreed with the determination that scenic and recreational values were not outstanding: "A significant length of this river segment parallels Utah 24, the main east-west route through the county and the access route to Capitol Reef National Park by visitors traveling from the east. The Class A scenery that is viewed by travelers view on this route is notable, scarce, and exemplary simply by virtue of its free-flowing and perennial character. Similar opportunities are rare in the high desert of Southern Utah. In the neighborhood of 700,000 visitors travel to Capitol Reef National Park each year, many of whom enter or leave the park along this stretch of the river…To say that this segment of river attracts little recreational use imposes a narrow and inaccurate definition of what the public perceives as recreation.…" NPS also took exception to the statement in the Preliminary Report that the Flannelmouth sucker, bluehead sucker, and speckled [dace]—all candidate threatened and endangered species—are prevalent throughout the Western United States. Said NPS, "…if they're threatened and endangered here, they aren't likely to be prevalent anywhere. Therefore, the analysis that the fish and wildlife values are not outstanding needs revision." Geomorphologist Dr. Dohrenwend wrote, "Geomorphologically speaking, the canyon of the Fremont River between Capitol Reef National Park and Caineville Mesas is one of the most unusual canyons on the Colorado Plateau, indeed one of the most unusual canyons in all of North America. Along this entire reach, the canyon is constrained between high, multiple terraces that are capped by thick boulder gravels of early to middle Pleistocene age … what is unusual … about these terraces is that they cap the highest land (ridges, buttes, and mesas) between Capitol Reef National Park and the Caineville Mesas. That is to say, the high mesas and ridges of this area were not so long ago the lowest valley bottom in this rapidly evolving landscape. In geomorphological parlance, this situation is termed an absolute topographic inversion, and such extreme examples of this situation are very rare…. Moreover, the scenery in this region is rated as Class A. Much of the canyon is cut into the highly photogenic Brushy Basin member of the Morrison formation and numerous examples of large balanced rocks are perched along the canyon walls. For these reasons, it is clear that this reach of the Fremont River should be classified as highly scenic and unusual."
- **Discussion:** In response to the Park Service comments, BLM specialists replied, "We acknowledge that the scenery along this reach is Class A; however, we respectfully disagree with the Park Service that it is notable, scarce, or exemplary in the region. Traveling Highway 24 to and from Capitol Reef National Park is not a river-related recreational activity. These visitors are not being drawn by the river but simply traveling through to other destinations (notably Capitol Reef National Park itself)." The statement that the listed fish species are "prevalent throughout the West" [Western United States] was documented in a conversation between BLM's wildlife biologist and a U.S. Fish and Wildlife Service (USFWS) fisheries biologist. The BLM geologist did not respond to Dr. Dohrenwend's comments. Given the disparity in professional opinion and in the interest of continuing the dialogue, BLM acknowledges that the scenery, which is inventoried as Class A, and the geology meet the criteria for outstandingly remarkable.
- **Determination:** Eligible for scenic and geologic outstandingly remarkable values.

Horseshoe Canyon

- **Preliminary Report Recommendation:** Eligible for scenic and geologic outstandingly remarkable values.
- **New Information:** Wayne County "disagrees that this area is any more outstandingly remarkable than numerous similar landscapes found throughout the [Colorado] Plateau." In regard to geologic outstandingly remarkable value, Wayne County is "unconvinced that the length of the

canyon…elevates the canyon to outstandingly remarkable value status." Regarding BLM's claim in the Preliminary Report that Horseshoe Canyon is the "…longest and most extensive side canyon of the Green River," Dr. Dohrenwend wrote, "Actually, this is not a correct statement. Many tributaries of the Green River are much longer and much more extensive. This statement only applies to those tributaries within the Richfield District." BLM Natural Resource Specialist Doug Thurman wrote, "I know there is some intermittent flow in Horseshoe Canyon, but that is within the National Park… I know of no intermittent or perennial flow in this canyon outside the Park unless there is some in the very lower end in Emery County… I have personally walked several miles of the dry canyon bottom and saw no riparian vegetation along the canyon bottom. I also talked with a staff member who has been in other parts of the canyon, and he says it has only ephemeral flow. I have studied the recent color and color infrared aerial photographs, and they do not show evidence of riparian vegetation except at the heads of some canyons where there are springs and seeps. These springs and seeps do not flow down the canyon." (The aerial photos were included as part of the comments.)

- **Discussion:** The stream is ephemeral.
- **Determination:** Not eligible because it is ephemeral, per IM-2004-196.

Maidenwater Creek

- **Preliminary Report Recommendation:** Eligible for scenic, recreation, geologic, fish and wildlife, and cultural outstandingly remarkable values.
- **New Information:** Garfield County disagreed with the preliminary eligibility finding, noting that the vegetation (hanging gardens) is not dependent on a "river" but on a water source that is several feet above the canyon floor. Garfield County concluded, "Maidenwater Canyon was completely dry and appeared to be totally dependent on irregular precipitation events, failed to demonstrate outstandingly remarkable values, and failed to demonstrate any more than locally significant value…."
- **Discussion:** Of the side canyons along State Highway 276, Maidenwater is the most visited by recreationists and used by several commercial permittees. It is not unusual to frequently see vehicles parked at the trailhead for this canyon in both spring and fall. Although the upper drainage was dry during the drought, most years there is water in both the upper and lower sections and the stream is considered intermittent. The water flow is dependable enough that ID team members have observed fish in the lower part of the canyon for over a decade. It is within an area inventoried as Class A Scenery. Maidenwater was one of few creeks that the ID team unanimously supported as "outstandingly remarkable."
- **Determination:** Eligible for scenic, recreation, geologic, fish and wildlife, and cultural outstandingly remarkable values.

Muddy Creek

- **Preliminary Report Recommendation:** Not eligible.
- **New Information:** Several commenters, including the Utah Rivers Council, provided information purportedly supporting outstandingly remarkable values of Muddy Creek. However, in conversations and e-mail exchanges, it became clear that all were referencing portions of Muddy Creek in the San Rafael Swell upstream from the portion that the RFO was considering.
- **Discussion:** We uncovered no new information supporting any outstandingly remarkable value along the Muddy Creek segment within the RFO.
- **Determination:** Not eligible.

North Wash

- **Preliminary Report Recommendation:** Listed but not nominated as eligible.
- **New Information:** Steve Allen stated, "This is an incredible opportunity for the BLM to bring more attention to a great canyon to the many thousands of visitors who drive through the canyon every year… this canyon really does have it all. It could be a BLM poster child for a new type of Recreational River that is not just available to river runners." Nominated for recreation, cultural, historic, and geologic values.
- **Discussion:** Although North Wash has been neither dammed nor impounded, the section along Highway 24 has been straightened, rip-rapped, and heavily manipulated to accommodate a major highway. Blasting of sidewalls occurred in many places, and the canyon does not exist in its natural conditions. Given this, it does not meet the definition of "free-flowing" and cannot be considered eligible as a WSR.
- **Determination:** Not eligible.

Pine Creek

- **Preliminary Report Recommendation:** Eligible for fish and wildlife (Colorado cutthroat trout) and ecological (relict vegetation) outstandingly remarkable values.
- **New Information:** BLM and Forest Service specialists and state and county cooperators field hiked portions of Pine Creek in June 2004. Observations did not support the earlier determination of either ecological (relict vegetation) or fish (Colorado cutthroat) outstandingly remarkable values. The stream banks have been logged in the past and grazed recently, belying the claim of relict vegetation, and there were no indications of fish of any kind.
- **Discussion:** Although certainly a scenic and pleasant creek, none of Pine Creek's values rose to the level of outstandingly remarkable.
- **Determination:** Not eligible.

Pleasant Creek

- **Preliminary Report Recommendation:** Deferred (cultural outstandingly remarkable value).
- **New Information:** The portion of Pleasant Creek considered in the Preliminary Report constitutes 1.4 miles immediately downstream from Capitol Reef National Park. The National Park Service had determined the segment of Pleasant Creek within the Park was eligible as a WSR, and in the Preliminary Report the BLM presumed its section was similar in character to the Park's section. However, recent discussions with the Park Service revealed that the entire flow of the creek is seasonally diverted into an irrigation ditch that predates the Park and serves private land, leaving the BLM portion bone dry throughout the summer.
- **Discussion:** Because the BLM section of Pleasant Creek is dewatered by a man-made diversion, it does not meet the definition of free-flowing and cannot be considered eligible.
- **Determination:** Not eligible.

Poison Springs Canyon

- **Preliminary Report Recommendation:** Listed but not nominated as eligible.
- **New Information:** Nominated for cultural, historic, geologic, ecological, and recreation values by Steve Allen: "Cultural: This canyon has a host of rock art panels, with at least one dating from the Desert Culture era. Fremont Native Americans left behind extensive rock panels, cave sites, lithic scatters, and other evidence of their passage. I do not know if an archaeological survey of this canyon has been done. Historic: Poison Spring Canyon, along with nearby Hatch Canyon,

was part of the famous and historic 'Outlaw Trail' that cut across the Dirty Devil River and was in use from the 1870s to early 1900s. Cowboys use the canyon for grazing and for water and several constructed stock trails across the canyon…Cowboys over the years have left their inscriptions in many places along the canyon walls… Geologic: At Highway 95, Poison Spring Canyon starts its slow descent to the Dirty Devil River [and] at one point is in the Carmel Formation with occasional Entrada Sandstone exposures. As the creek descends, it goes through the Carmel, Navajo, Kayenta, Wingate, Moenkopi, and enters the Chinle formation at the river. These formations and sandstones provide a colorful backdrop to the small stream and attendant riparian area that is found throughout the canyon. Ecological: Green. Green. Green. This well watered canyon hosts a large variety of trees, shrubs. A healthy riparian area runs through most of the canyon, attracting everything from mammals such as deer, coyotes, and ringtail cats (in Adobe Swale) to a large variety of bird life. Recreation: The BLM is aware of the high (for this area) numbers of people going down Poison Spring Canyon. Most are there for day trips and, from my experience, they tend to just poke around looking for rock art, picnicking by the stream, or otherwise simply driving down the canyon and viewing scenery from their vehicles. The more adventurous go as close to the Dirty Devil as their vehicles allow and then hike up Happy Canyon and its superlative narrows… Hikers visit the several large side canyons…it seems there are always footprints in these canyons."

- **Discussion:** The ID team discussed this canyon at length and although it is interesting, it is not eligible for two reasons: (1) Only a small portion of the canyon has reliable water flow and the upper and lower portions of the canyon are ephemeral, and (2) the road down the canyon is in the streambed for large sections and crosses the wash numerous times in areas where it is out of the streambed. The road does not parallel the streambed or crosses it only occasionally. The road is the streambed. This seems inconsistent with WSR values. Also, the geological values are not outstandingly remarkable because many canyons are within the region where down-cutting has exposed several formations. The exposures in Poison Springs Canyon are not rare for the region, nor are they particularly outstanding from a geological standpoint.
- **Decision:** Not eligible because of the road in the drainage and much of the drainage being ephemeral.

Quitchupah Creek

- **Preliminary Report Recommendation:** Deferred (cultural).
- **New Information:** Sevier County: "We strongly believe this small creek should not receive any further consideration as a WSR for several reasons. This small waterway also has several developments near it, including a county road, electricity power line, fencing, and a ranching operation. Other than a very small amount of winter snow runoff, the water in this creek is pumped from an underground coalmine operation, thus making it a man-made waterway… There is existing water diversions for irrigation and other man-made structures… …there is virtually no way this creek will ever meet the eligibility and suitability standards. We feel this proposal was nominated solely to delay a proposed road project and try to discourage the applicants of that road project. If we are right, this is a gross misuse of the process." Emery County: "Cultural values as described are not directly attributable nor exclusively dependent upon existence of the creek and therefore do not make the segment eligible for wild and scenic river designation. Emery County does not think this segment qualifies as eligible."
- **Discussion:** Most of the counties' concerns are "suitability" rather than "eligibility" issues. Regarding Emery County's comments on cultural resources, BLM's archaeologist responded: "That people are dependent on water for their existence is an obvious and oft demonstrated keystone of the human experience. To imply that such is not true for Quitchupah is an unfounded and groundless position. Were there no water in Quitchupah, the cultural values would

undoubtedly not be present." There is probably no other stream within the RFO boundary where the evidence for cultural and Native American values is stronger than Quitchupah Creek.
- **Determination:** Eligible for cultural outstandingly remarkable value.

Salt Wash

- **Preliminary Report Recommendation:** Nominated for scenic, recreation, fish and wildlife and geologic outstandingly remarkable values; found not eligible.
- **New Information:** Nominated for geologic values by Dr. Dohrenwend: "The valley of Salt Wash is a classic example of a curvilinear strike valley; and this particular example wraps around the southern margin of an even more classic and unusual doubly plunging anticline (locally and internationally known as the San Rafael Swell—unquestionably the most scenic and spectacular structural dome in the United States). The upstream two-thirds of this valley is floored in Entrada Formation, flanked on the north by a classic dip slope formed on strata of the Carmel Formation, and flanked on the south by cliffs and scarp slopes of the Entrada, Curtis, and Summerville formations. This part of the valley is transversely cut by several NW-SE trending igneous dikes of probable late Tertiary age. These dikes are closely related to similar features (located just east of Cathedral Valley) that have been dated at about 4 [million years]; in addition to being highly photogenic, they are geologically important because they establish the extremely young erosional age of the entire region. The downstream third of the Salt Wash valley is closely confined between (dare I say, classic examples of?) the continuous hogbacks that mark the transition between the San Rafael Swell and Caineville Reef. And by the way, the Salt Wash valley is one of the few locations where large subsequent drainage ways have developed along either structure."
- **Discussion:** None of the features alluded to are river related or within one-quarter mile of the ordinary high water mark on either side of the drainage on the upstream two-thirds of the valley, and this segment may also be ephemeral. The hogbacks on the downstream portion are not river related and subsequent drainage ways along the Caineville Reef and San Rafael Swell are not rare. The majority of the landscape that is mentioned in the new information is well outside the wild and scenic corridor and once in the wash bottom, visitors cannot see these landmarks.
- **Final Decision:** Not eligible, based on evaluation in Preliminary Report and consideration of new information regarding geology.

Trachyte Creek

- **Preliminary Report Recommendation:** Listed but not nominated for eligibility.
- **New Information:** Nominated for ecological, recreation, cultural, historic, and geologic outstandingly remarkable values by Steve Allen: "Trachyte Creek is both beauty and history. Starting high on the flanks of Mount Pennell in the Henry Mountains several small creeks…join near Farmers Knob to become Trachyte Creek. Over its 10-mile run, Trachyte Creek wanders through a beautiful Navajo-walled canyon on its way to Lake Powell. Trachyte is one of the few creeks that actually has a flow all year around on all but the driest years. Because of this, a healthy riparian area has started to develop… Trachyte is slowly becoming a destination for recreationists… Trachyte was an old Fremont Native American route that took them from the Henry Mountains into Glen Canyon… The Native American route was slowly turned into a wagon route by the first non-Native American settlers in the 1870s… This canyon is primarily in Navajo Sandstone… Trachyte is one of the most historically significant creeks in this part of southern Utah."
- **Discussion:** There is no record of any cultural resource inventories or recorded archaeological sites anywhere along Trachyte Creek. Neither the BLM nor the State of Utah has any record of a

historic wagon route in Trachyte. Both prehistoric and historic transportation routes leave some kind of evidence. We know of none. From the standpoint of geology, Navajo-walled canyons are neither rare nor distinctive in this region. Trachyte Creek is not free flowing in the upper section and can be totally dewatered by diversion for private property. Flow would be intermittent at best. The new information states that Trachyte is slowly becoming a destination for recreationists. This statement could be made for almost any canyon on the Colorado Plateau. BLM gets very few inquiries regarding Trachyte Creek. The majority of the use in Trachyte is as a connecting route for loop hikes taking place in the side canyons, primarily Maidenwater Canyon and Swett Creek.

- **Decision:** Not eligible. Values identified are not outstandingly remarkable.

Woodruff Canyon (Little Rockies, Tributary of Trachyte Creek)

- **Preliminary Report Recommendation:** Not identified in Preliminary Report.
- **New Information:** Nominated for ecological, recreation, and cultural values by Steve Allen: "Woodruff Canyon is a forgotten masterpiece. Tucked into a non-descript corner of the Little Rockies area, the canyon deserves attention for its future potential as a prolifically watered canyon that supports a vibrant riparian habitat throughout its length… Ecological: …Access to cattle has now been limited [and] because of this, an abundant riparian habitat has developed throughout much of the canyon… Recreation: This is a canyon that is waiting to be discovered. A gorgeous canyon with good water is not a common find in canyon country. One that is truly lush is also rare… This area, with its big view and great camping, will become popular… Cultural: …With many Fremont and Desert Culture sites in nearby Trachyte Creek and Swett Canyon, it is most likely that this well-watered canyon was also inhabited by the ancients…[The canyon] was used by ranchers, most likely starting in the 1880s when Woodruff started mining in the Henry Mountains at the head of Woodruff Canyon…"
- **Discussion:** There is no record of any cultural resource inventories or archaeological sites in Woodruff Canyon. While habitation here may be likely, there is no record of any at this time. The ranchers have used almost every side canyon in this area and had early ranching headquartered at many of the springs on the south side of Mt. Hillers (e.g., Starr Spring, along Copper Creek). Woodruff is no different from many other areas in this respect. Access for cattle has not been limited except possibly below Highway 276 by natural obstacles (e.g., choke stones, flash flood activity). These natural obstacles can change again through time, opening the area back up. Depending on the water year, Woodruff can be completely dry below Highway 276, except in pools where some water may remain year around. The statement, "This is a canyon that is waiting to be discovered" may or may not prove to be true. Currently, it is not receiving much use because of obstacles and technical aspects in the lower section. BLM gets few inquiries about hiking this canyon.
- **Decision:** Not eligible. Values identified are not outstandingly remarkable.

Classification

The Wild and Scenic River Act identifies three classes of rivers:

- **Wild Rivers:** Rivers or river sections free of impoundments and generally inaccessible except by trail, with watersheds or shorelines essentially primitive and waters unpolluted. These represent vestiges of primitive America.
- **Scenic Rivers:** Rivers or river sections free of impoundments with watersheds still largely primitive and shorelines largely undeveloped but accessible in place by roads.

- **Recreational Rivers:** Rivers or river sections readily accessible by road or railroad that may have some development along their shorelines and that may have undergone some impoundment or diversion in the past.

Each of the 12 eligible river segments was assigned a tentative classification based on the amount of development in the river corridor (see Table A2-1). Congress can change the classifications if and when it adds these rivers to the national system.

COORDINATION WITH OTHER GOVERNMENTS AND AGENCIES

The State of Utah and Garfield, Piute, Sanpete, Sevier, and Wayne counties are all formal cooperating agencies with the BLM in developing the Richfield Resource Management Plan. Emery County, which is a cooperating agency with the Price Field Office, shares a long, common boundary with the Richfield Office and occasionally shares its views regarding cross-boundary issues. In addition, the RFO is coordinating its WSR review with the BLM Price Field Office, the Dixie, Fishlake and Manti-LaSal national forests, and the National Park Service. During scoping, the planning team traveled to the headquarters of the Hopi, Paiute, and Ute tribes and briefed their representatives on the RMP process. This legislation addresses eligibility and suitability concerns.

State Position

The State of Utah position on WSRs is reflected in the Utah Code Section 63-38d-401, adopted in 2004:

- …The state's support for the addition of a river segment to the National Wild and Scenic Rivers System…will be withheld until—
- It is clearly demonstrated that water is present and flowing at all times.
- It is clearly demonstrated that the required water-related value is considered outstandingly remarkable within a region of comparison consisting of one of the three physiographic provinces in the state and that the rationale and justification for the conclusions are disclosed.
- The effects of the addition upon local and state economies, agricultural and industrial operations and interests, tourism, water rights, water quality, water resource planning, and access to and across river corridors in both upstream and downstream directions from the proposed river segment have been evaluated in detail by the relevant federal agencies.
- The rationale and justification for the proposed addition, including a comparison with protections offered by other management tools, is clearly analyzed within the multiple-use mandate, and the results disclosed.
- The conclusions of all studies related to potential additions to the National Wild and Scenic River System…are submitted to the state for review and action by the Legislature and governor, and the results, in support of or in opposition to, are included in any planning documents or other proposals for addition and are forwarded to the United States Congress.

County Coordination

The BLM has identified preliminary eligible WSRs in Garfield, Sevier, and Wayne counties but none in Piute or Sanpete counties (see Table 3, Evaluation of Outstandingly Remarkable Values in the Wild and Scenic River Preliminary Eligibility Report). BLM representatives have discussed the WSR process with all five county commissions. Garfield and Wayne counties include the following language regarding WSRs in their county general plans:

- Garfield County: "Garfield County will, if it deems appropriate, comment on and may develop and submit proposals for Wild and Scenic River designations to the appropriate federal land management agencies." Garfield County also submitted comments on the preliminary evaluation report, which are addressed in the new information section, above.
- Wayne County: "We feel that Wayne County does not have any rivers or streams that qualify for Wild and Scenic River designation. We feel this designation is too restrictive and would interfere with water rights upstream. We do not feel the Fremont River meets the criteria as a Wild and Scenic River because the eastern portion of the river, where it joins the Dirty Devil, has been dry in some summer months." Wayne County also submitted comments on the preliminary evaluation report, which are addressed in the new information section, above. Other county plans are silent on WSRs. Cooperation with the counties will continue. Emery County submitted comments on specific river segments, which are addressed above under new information.

Price Field Office Coordination

The Price and Richfield Field Offices share management of three river corridors nominated as WSRs:

- Horseshoe Canyon: The Price Field Office determined its section of Horseshoe Canyon was tentatively eligible as a WSR; the RFO determined its segment was not. (The Park Service also shares management of this drainage. See below.)
- Quitchupah Creek: The RFO determined its segment of Quitchupah Creek tentatively eligible; the Price Field Office determined its segment not eligible. The two segments are separated by several miles of private land.
- Muddy Creek: The Price Field Office determined its segment eligible; the RFO found no outstandingly remarkable values in its segment. The character of the river changes dramatically between the two field offices.

Forest Service Coordination

- Dixie and Fishlake National Forests: Richfield BLM shares many miles of common boundary with the Dixie and Fishlake national forests. The Dixie and Fishlake are currently revising their forest plans. As part of that effort, they are conducting a WSR evaluation.
- Manti-LaSal National Forest: Richfield BLM and the Manti-LaSal National Forest share common boundaries in parts of Sanpete County. However, neither agency identified segments of eligible (or potentially eligible) rivers crossing that boundary.

Park Service Coordination

As part of its Nationwide Rivers Inventory (NRI), the National Park Service identified free-flowing rivers in Utah with one or more outstandingly remarkable values. NRI rivers in the vicinity of the RFO are as follows:

- Dirty Devil River—Highway 24 bridge to Lake Powell
- Fremont River—Capitol Reef NP segment
- Horseshoe Canyon—Canyonlands NP segment
- Pleasant Creek—Capitol Reef NP segment
- Trachyte Creek—Glen Canyon NRA segment.

The Dirty Devil was the only NRI-identified river segment managed by the Richfield BLM. Other segments identified on national park lands are adjacent to public lands administered by the RFO.

The Park Service provided input on stream segments within and adjacent to national park units. Their input is reflected in the discussions, above.

Tribal Coordination

Discussions with the Hopi, Paiute, and Ute tribes about the RMP disclosed no specific WSR issues. However, the Hopi and Paiute identified cultural resource and other concerns about a proposed coal haul road in Quitchupah Canyon now being analyzed by the Forest Service and BLM.

UNITED STATES DEPARTMENT OF THE INTERIOR
BUREAU OF LAND MANAGEMENT
WASHINGTON, D.C. 20240

June 21, 2004

EMS TRANSMISSION 06/22/2004 In Reply Refer To:
Instruction Memorandum No. 2004-196 1610, 8351 (172) P
Expires: 09/30/2005 Ref. MS 8351

To: AFOs
From: Director, National Landscape Conservation System
Subject: Clarification of Policy in the BLM Manual Section 8351, Wild and Scenic Rivers, with Respect to Eligibility Criteria and Protective Management

Program Area: National Landscape Conservation System and Land Use Planning.

Purpose: This Instruction Memorandum (IM) clarifies policy contained in the BLM Manual Section 8351 with respect to the eligibility criteria for potential wild and scenic rivers and protective management of identified river segments.

Background: The Utah State Director requested and received guidance on five issues raised in developing a resource management plan. A summary of those issues is as follows:

1. Interpretation of the Wild and Scenic Rivers Act with respect to whether intermittent or seasonal water courses qualify for designation as WSRs.

2. Incorporation of Washington Office Solicitor's memorandum (11/12/97) and IM 98-129 (6/28/98) into the BLM Manual Section 8351.

3. The dependency of outstanding remarkable values on water flows.

4. Evaluation of outstandingly remarkable values within a region of comparison substantiating why outstandingly remarkable values may be worthy of designation in the National WSR System.

5. Evaluation of the size or length of a segment on the determination of eligibility.

Policy Clarification/Action: This guidance clarifies policy contained in the BLM Manual 8351 and until incorporated into the Manual is applicable to all river segments determined eligible and/or suitable.
As to the first issue, judgment is required in determining eligibility of water courses that are free-flowing and have associated outstandingly remarkable values. As a general rule, the segment should contain regular and predictable flows (even though intermittent, seasonal, or interrupted). This flow should derive from naturally occurring circumstances (e.g., aquifer recharge, seasonal melting from snow or ice, normal precipitation, instream flow from spillways or upstream facilities). Caution is advised in applying the free-flow criterion to water courses that flow only during flash floods or unpredictable events. The segment should not be ephemeral (flow lasting only few days out of a year). Evaluation of flows should focus on normal water years, with consideration of drought or wet years during the inventory.

As to the second issue, the BLM's policy is to protect any outstandingly remarkable values identified in the eligibility determination process to assure a decision on suitability can be made. The Bureau has broad discretionary authority to not impact rivers values or make decisions that might lead to a determination of eligibility. The BLM's policy is to manage and protect the free-flowing character, tentative classification, and identified outstandingly remarkable values of eligible rivers according to the decisions in the associated Resource Management Plan. This protection occurs at the point of eligibility determination so

as not to adversely constrain the suitability assessment or subsequent recommendation to Congress. The BLM may protect river values using the National Environmental Policy Act (NEPA) and the Federal Land Policy and Management Act. WSR issues involving NEPA supplementation are the same as for other resource values. When the BLM considers a proposal that could constitute a major federal action that significantly affects the quality of the human environment, the Council on Environmental Quality regulations requires NEPA compliance before the BLM can act on the proposal (40 CFR 1506.l). Eligible river segments determined to be nonsuitable through a land use plan (LUP) decision are subject to the direction and management decisions contained in the LUP.

As to the third issue, qualifying outstandingly remarkable values should be limited to those that are directly river related. That is, they should be located in the river or on its immediate shorelands, contribute substantially to the functioning of the river ecosystem, and/or owe their location or existence to the presence of the river. Again, judgment is required in applying this criterion. Additional guidance regarding this issue is contained in a technical report of the Interagency WSR Council, at www.nps.gov/rivers/publications entitled, *The Wild and Scenic River Study Process*, December 1999.

As to the fourth issue, qualifying outstandingly remarkable values should be located in the river or on its immediate shorelands, contribute substantially to the functioning of the river ecosystem, and/or owe their location or existence to the presence of the river. The publication referenced above provides additional information on page 12.

The Director addressed the fifth issue on December 3, 1993. Jurisdictional and management constraints are not a consideration in determination of a river's eligibility for designation as WSRs. These types of issues are addressed in the suitability phase of WSR studies (Manual Sections 8351.24A and 8351.33A.1-8).

State Directors should review and update any existing State and Field Office policies and make necessary modifications to comply with the terms of this IM. In addition, based on experience with resolving protest, appeals, and litigation, any interagency agreements and memorandums of understanding which amend or supplement the BLM Manual Section 8351 need concurrence of the Director to assure consistent application of the criteria and process as outlined in this IM.

Time Frame: This policy is effective immediately.

Budget Impact: It is not anticipated that implementation of this policy would result in any significant increase in cost to field offices. Any costs will be covered within existing State Office base allocations.

Manual Section Affected: Bureau Manual 8351—Wild and Scenic Rivers—Policy and Program Direction for Identification, Evaluation, and Management—Releases 8-61 and 8-62, dtd 5/19/92 and 12/22/93; Sections 8351.06D; 8351.31B; 8351.32C; 8351.33A.

Coordination: This policy has been coordinated with the Interagency WSR Coordinating Council, Departmental Solicitor, BLM's Directorate, WO-200 and WO-300.

Contact: Please address any questions and concerns regarding this policy to Gary G. Marsh, National Rivers Coordinator, National Landscape Conservation System Office, Wilderness, Rivers, and National Trails Group, WO-172, (202) 452-7795.

APPENDIX 3—WILD AND SCENIC RIVER SUITABILITY RECOMMENDATIONS

This Proposed Resource Management Plan (RMP) makes Wild and Scenic River (WSR) suitability recommendations pursuant to Section 5(d)(1) of the WSR Act. WSR designations are made by Congress or by the Secretary of the Interior upon application of a state governor.

Suitability was the process of determining which if any of the 12 river segments found to be free-flowing and having outstandingly remarkable values in the Wild and Scenic River Eligibility and Tentative Classification Report, Richfield Field Office, March 2005, should be recommended to Congress as additions to the National Wild and Scenic Rivers System (NWSRS). Suitability took into account factors not considered in the eligibility evaluation, such as threats to a river or the need to develop the water for municipal, agricultural, or industrial uses. In addressing these considerations, the benefits and impacts of WSR designation have been evaluated and alternative protection methods considered. Eligibility was based on criteria; suitability was based on judgment.

INTERIM MANAGEMENT

Until a Record of Decision (ROD) is signed for the approved plan, protection of segments found eligible (regardless of suitability finding) would be addressed on a case-by-case basis. This means that whenever any proposed action would affect these outstandingly remarkable values, impacts would be analyzed through the National Environmental Protection Act (NEPA) process, and mitigation and alternatives would be considered to avoid such impacts.

Once a ROD is signed, segments recommended as non-suitable would be dropped from special management and would be managed under the provisions of the RMP. Segments recommended as suitable would be managed for the preservation of outstandingly remarkable values, tentative classifications, and their free-flowing status.

SUITABILITY RECOMMENDATIONS FOR THE PROPOSED RMP/FEIS

The 5 miles of the Fremont Gorge segment (the Fremont River above Capitol Reef National Park) identified in the Preferred Alternative of the DRMP/Environment Impact Statement (EIS) would be considered suitable for inclusion into the NWSRS. The following segments are recommended as non-suitable and would be released from further WSR consideration: Dirty Devil, Beaver Wash Canyon, Larry Canyon, No Mans Canyon, Robbers Roost Canyon, Sams Mesa Box Canyon, Twin Corral Box Canyon, Fish Creek, Fremont River below Capitol Reef National Park to Caineville Ditch Diversion, Maidenwater Creek, and Quitchupah Creek.

SUITABILITY FACTORS ADDRESSED FOR EACH ELIGIBLE RIVER

In addition to resource uses, conflicts, and tradeoffs identified in the analysis of the alternatives, several suitability factors were addressed for each eligible river in this appendix, including:

- The characteristics that do or do not make the area a worthy addition to the NWSRS
- Current status of land ownership and human use of the area

- Uses, including the reasonably foreseeable potential uses of land and water, that would be enhanced, foreclosed, or curtailed if the river were designated into the NWSRS by Congress, and the values that could be lost or diminished if the area is not protected as part of the national system
- Interest by local, state, or federal agencies; Native American tribes; and other public entities in congressional designation or non-designation of the river, and the extent to which river administration, including costs thereof, may be shared by state and local agencies or other potential partners
- The estimated cost to the government of acquiring lands and interests in lands and administering the area if the river is designated into the NWSRS by Congress
- Bureau of Land Management's (BLM) ability to manage and protect the values of the river segment as part of the NWSRS if designated by Congress, and other mechanisms to protect identified values or alternative ways to protect rivers other than through Congressional designation under the WSR Act
- Existing rights that may be adversely affected because of designation into the NWSRS, or other issues or concerns.

Fremont Gorge (Fremont River Above Capitol Reef National Park)

The Fremont Gorge is considered a worthy addition to the NWSRS based on an outstandingly remarkable value of outstanding scenery and is being recommended as suitable with the tentative classification of wild. It is the deepest gorge cutting across the Waterpocket Fold. The scenery is highly diverse and not common to other rivers in the region. There are no human developments, and land use impacts on public lands do not detract from the natural qualities found in the rugged and primitive stretches of the gorge.

This is a free-flowing, perennial segment, although water flows in Fremont Gorge can vary considerably from year to year based on upstream precipitation and upstream water diversions.

Current status of land ownership and human use of the area

The river segment is 5.0 miles in length, all public lands administered by BLM. Public lands within the river corridor support livestock grazing and dispersed activity including hiking, hunting, sightseeing, photography, and other types of primitive recreation. Use levels are low. The only access to the area is along a single, non-maintained vehicle way.

Uses, including the reasonably foreseeable potential uses of land and water, that would be enhanced, foreclosed, or curtailed if the river was designated into the NWSRS by Congress, and the values that could be lost or diminished if the area is not protected as part of the national system

WSR designation would be compatible with BLM proposals to maintain riparian values and protect the watershed and high quality of water. It would help to maintain the important scenic values of the area.

Inclusion into the NWSRS could preclude dams or other water developments within the designated stretch, but no such developments are currently planned. Wayne County interests have proposed water diversion and storage projects for the Fremont River in a variety of locations, including sites upstream and downstream from this location. To date, none of the proposals have moved beyond the idea stage.

Designation would complement management of the eligible river segment within Capitol Reef National Park.

Interest by local, state, or federal agencies; Native American tribes; and other public entities in congressional designation or non-designation of the river, and the extent to which river administration, including costs thereof, may be shared by state and local agencies or other potential partners

Some private citizens and regional and national conservation groups have promoted designation as a means of preserving the free-flowing character and other values of this nationally significant river. No state, tribal, or local government has expressed support for inclusion of the river in the NWSRS. Local and state agencies, water users, and municipalities oppose designation due to perceptions that existing water rights could be affected and opportunities for water development could be foreclosed, not only within the eligible river segment, but also upstream and downstream. In actuality, there is no likely development identified within the eligible segment, and any upstream or downstream development would be affected only if federal money was involved, and even then only if the development would invade or unreasonably diminish fish, wildlife, recreation, or scenic values identified within the designated segment at the time of designation.

Congressional designation of this eligible segment would not preclude consideration of this water diversion and storage project in the future, as long as it would not exceed the "invade or unreasonably diminish" standard discussed above. Although the WSR Act infers a federal reserved water right upon designation, rather than establishing an amount it actually imposes a limit, expressing that any such right is to be the minimum necessary for the purposes of the Act. Such right would have to be adjudicated through the state and would be junior to any existing rights.

Although none of the above entities would share costs, because Capitol Reef National Park has determined the contiguous portion of the river that it manages to be eligible, costs and administration of the river area could be shared with it if Congress were to also designate the portion of the river within its boundaries.

The estimated cost to the government of acquiring lands and interests in lands and administering the area if the river is designated into the NWSRS by Congress

No funding for acquisition would be needed because there is no private land within the river corridor. The initial costs of administration for the first 3 years would involve management plan preparation and implementation. Yearly administration costs thereafter could involve additional studies and monitoring.

The BLM's ability to manage and protect the values of the river segment as part of the NWSRS if designated by Congress, and other mechanisms to protect identified values or alternative ways to protect rivers other than through Congressional designation under the WSR Act

BLM is capable of managing this segment as wild and scenic. Designation of this segment would not significantly elevate management costs above current levels nor require substantial increases in appropriations or diversion of resources from critical ongoing programs. Also, BLM could partner with the National Park Service (NPS) in administering the river.

Alternatives to congressional WSR designation are contained in the Richfield PRMP/FEIS and include land use prescriptions to manage riparian systems, watershed, water quality, and habitats for sensitive and listed fish and wildlife species, including potential Special Recreation Management Area (SRMA) or area of critical environmental concern (ACEC) designations and limiting off-road motorized travel, mining and mineral leasing, and rights-of-way (ROW) development. New costs could be incurred to implement any of these management schemes.

Existing rights that may be adversely affected because of designation into the NWSRS, or other issues or concerns

The lands within the river corridor are public lands administered by BLM. There are no valid mining claims, mineral leases, private lands, or other existing rights within the eligible segment that would be affected by congressional designation.

The WSR Act infers a federal reserved water right upon designation. Any such right would be the minimum necessary for the purposes of the Act, would have to be adjudicated through the state, and would be junior to any existing rights.

Local and state agencies, water users, and municipalities have expressed concern that opportunities for water development could be foreclosed, not only within the eligible river segment, but also upstream and downstream.

The WSR Act infers a federal reserved water right upon designation. However, it does not quantify the right other than to place limitations on it. The Act states that it shall not be construed as a reservation for purposes other than those specified in the Act, or in quantities greater than necessary to accomplish these purposes. The amount of the federal right will therefore depend upon the river's flow, the values for which the river is being protected, and the unappropriated quantities in the river. It would be adjudicated through the state and would be junior to any rights existing prior to the date of designation.

Dirty Devil River Excluding Its Tributaries

Dirty Devil River

This section is recommended non-suitable because the values identified would be protected by alternative protection methods. The entire Dirty Devil segment is within the Dirty Devil and Fiddler Butte Wilderness Study Areas (WSA) or the Dirty Devil SRMA. Approximately 35 miles of this segment are in the Dirty Devil and Fiddler Butte WSAs and 48 miles are in the Dirty Devil SRMA. WSA management through the Interim Management Plan (IMP) and management prescriptions associated with the Dirty Devil SRMA would provide protection to the segment's outstandingly remarkable values. In addition, the BLM land within this segment is Visual Resource Management (VRM) Class I (35 miles) or II (19 miles), which would protect the scenic and other outstandingly remarkable values. The BLM believed that the quality of river characteristics in this segment would not significantly enhance nor contribute to the NWSRS.

Characteristics that do or do not make the area a worthy addition to the NWSRS

Scenery is rated Class A with extremely rugged topography and contrasting variety and color of exposed sandstone layers and vegetation. The Dirty Devil River and its surrounding landscape has been the subject of professional photographers.

Recreational opportunities, including hiking, backpacking, and, on those rare occasions when conditions are right, boating, attract visitors from outside the region. Several guidebooks describe opportunities for backpacking and hiking. The river and surrounding lands provide for commercial use, with trips conducted annually. People are willing to travel long distances to recreate here as indicated by repeat users, commercial operations, and increasing visitation levels despite the area's remoteness and the difficult access.

The Dirty Devil River has exposed eight geologic formations, some of which contain rare paleontological resources within the river corridor.

Habitat for several special status species, including the Mexican spotted owl (MSO), Southwestern willow flycatcher, and yellow-billed cuckoo, is found within the canyon created by the river. There are active Peregrine falcon aeries in cliff habitat above the river. The river corridor provides crucial habitat for big game, neo-tropical migratory birds, non-game mammals, bats, and small rodents.

The river corridor contains multiple sites with evidence of occupation and use by both Desert Archaic and Fremont peoples. Sites span a very long time period, from 5000 BC to 1300 A.D.

This river segment is free-flowing in character and free of impoundments and other intrusions.

Current status of land ownership and human use of the area

The eligible segment totals 57 miles: 54 miles of BLM-administered land and 3 miles of state and private land. There are no plans for acquisition of the private land. The river corridor is undeveloped and primitive and mostly within the Dirty Devil and Fiddler Butte WSAs.

Uses, including the reasonably foreseeable potential uses of land and water, that would be enhanced, foreclosed, or curtailed if the river was designated into the NWSRS by Congress, and the values that could be lost or diminished if the area is not protected as part of the national system

Designation would be compatible with BLM proposals to maintain riparian values, protect the watershed, protect potential habitat for the MSO, and manage the lands for primitive recreation opportunities. However, congressional designation into the national system is not necessary for these goals to be achieved.

Inclusion in the NWSRS could preclude dams or other development including roads, pipelines, or other structures on federal lands within this stretch of river if classified as "wild," but no such developments are proposed.

The Dirty Devil drainage is almost exclusively within the Dirty Devil and Fiddler Butte WSAs. BLM has recommended these lands to Congress for wilderness designation. Adjacent NPS lands are also administratively recommended for wilderness.

Failure to include the Dirty Devil River in the NWSRS would not necessarily diminish the values for which the river was determined eligible inasmuch as the area's WSA status would continue, and many of the other land use prescriptions being considered within the Richfield PRMP/FEIS would also preserve and enhance such values if implemented.

Interest by local, state, or federal agencies; Native American tribes; and other public entities in congressional designation or non-designation of the river, and the extent to which river administration, including costs thereof, may be shared by state and local agencies or other potential partners

Some private citizens and regional and national conservation groups have promoted WSR designation as a means of preserving the free-flowing character of this nationally significant river, and NPS has determined to be eligible the contiguous portion of the river that it manages. No state, tribal, or local governments have expressed support for inclusion of the river in the NWSRS. Local and state agencies, water users, and municipalities oppose designation due to perceptions that upstream water rights and water projects could be adversely affected. No water developments are proposed or likely to be proposed within the eligible segment given that it is immediately upstream from Lake Powell with its huge, and currently underutilized, water storage capacity.

NPS has determined the portion of the river that it manages within the Glen Canyon National Recreation Area (NRA) to be an eligible WSR, so costs and administration of the river area could be shared between BLM and NPS if Congress added the entire Dirty Devil to the NWSRS.

The estimated cost to the government of acquiring lands and interests in lands and administering the area if the river is designated into the NWSRS by Congress

No funding for acquisition is needed because no private land acquisitions are anticipated. State lands could be acquired through exchange. The initial costs of administration would include preparing and implementing a management plan and ongoing recreation permitting. Yearly administration costs thereafter could involve additional studies, monitoring, and ongoing recreation permitting.

The BLM's ability to manage and protect the values of the river segment as part of the NWSRS if designated by Congress, and other mechanisms to protect identified values or alternative ways to protect rivers other than through Congressional designation under the WSR Act

Failure to include Dirty Devil in the NWSRS would not necessarily diminish the values for which the river was determined eligible. BLM currently has little administrative presence on this river. To date, remoteness and difficult access have kept visitation light throughout a significant portion of the year. In addition, the entire Dirty Devil segment is within the Dirty Devil and Fiddler Butte WSAs or the Dirty Devil SRMA. Further, 35 miles of this segment are in the Dirty Devil and Fiddler Butte WSAs and 48 miles are in Dirty Devil SRMA. WSA management through the IMP and the Dirty Devil SRMA management prescriptions would provide protection to the segment's outstandingly remarkable values. BLM land within this segment is also VRM Class I (35 miles) or II (19 miles), which would protect the scenic and other outstandingly remarkable values.

Existing rights that may be adversely affected because of designation into the NWSRS, or other issues or concerns

There are no valid mining claims, mineral leases, or private lands within the public lands portion of the eligible segment. Wayne County and Emery County interests have expressed concern that designation of the Dirty Devil into the NWSRS could affect upstream water rights and water uses on the Fremont River and Muddy Creek, tributaries of the Dirty Devil.

The WSR Act infers a federal reserved water right upon designation. However, it does not quantify the right other than to place limitations on it. The Act states that it shall not be construed as a reservation for purposes other than those specified in the Act, or in quantities greater than necessary to accomplish these purposes. The amount of the federal right will therefore depend upon the river's flow, the values for which the river is being protected, and the unappropriated quantities in the river. It would be adjudicated through the state and would be junior to any rights existing prior to the date of designation.

Dirty Devil Tributaries

Beaver Wash Canyon

This section is recommended non-suitable because the values identified would be protected by alternative protection methods. The segment is located within the Dirty Devil WSA. WSA management through the IMP would provide protection to the segment's outstandingly remarkable values. BLM believed that the quality of river characteristics in this segment would not significantly enhance nor contribute to the NWSRS.

Characteristics that do or do not make the area a worthy addition to the NWSRS

Beaver Wash Canyon is a side canyon and tributary to the Dirty Devil River. The canyon was designated as an ACEC for its high biological and ecological values. Grazing and mineral extraction is not allowed in the river corridor below the canyon rim for resource concerns. The lands are also entirely within the Dirty Devil WSA.

The amount of water present can vary considerably seasonally and from year to year.

Current status of land ownership and human use of the area

The river segment is 6.9 miles in length, including 6.8 miles of public lands administered by BLM and 0.1 mile state land. Grazing is not allowed in the river corridor below the canyon rim. The area has an established hiking trail crossing it from Angel Point Trail head, which provides access into the main Dirty Devil drainage and side canyons. Recreational use includes primitive hiking, canyoneering, camping, and sightseeing for day and extended use trips. Use levels are moderate and increasing.

Uses, including the reasonably foreseeable potential uses of land and water, that would be enhanced, foreclosed, or curtailed if the river were designated into the NWSRS by Congress, and the values that could be lost or diminished if the area is not protected as part of the national system

Designation would be compatible with BLM proposals to maintain riparian values and protect the watershed and high quality of water. However, congressional designation into the national system is not necessary for these goals to be achieved.

Non-designation would leave open the possibility of future water developments that could alter the free-flowing nature of the stream, thus diminishing natural values within public lands and limiting options for habitat enhancements. No such developments or uses are currently proposed, however.

Interest by local, state, or federal agencies; Native American tribes; and other public entities in congressional designation or non-designation of the river, and the extent to which river administration, including costs thereof, may be shared by state and local agencies or other potential partners

Some private citizens and regional and national conservation groups have promoted designation. No state, tribal, or local government has expressed support for inclusion of this river segment in the NWSRS. Local and state agencies, water users, and municipalities oppose designation due to perceptions that existing water rights could be affected and opportunities for water development could be foreclosed, not only within the eligible river segment, but also upstream and downstream. In actuality, there is no likely development identified within the eligible segment, and any upstream or downstream development would only be affected if federal money was involved and if the development would invade or unreasonably diminish fish, wildlife, recreation, or scenic values identified within the designated segment at the time of designation. Although the WSR Act infers a federal reserved water right upon designation, rather than establishing an amount it actually imposes a limit, expressing that any such right is to be the minimum necessary for the purposes of the Act. Such right would have to be adjudicated through the state and would be junior to any existing rights.

There is no opportunity to share costs of administration with the above entities. Also, there is no contiguous federal agency with which to share cost of administration. If the entire watershed of the Dirty Devil River including all of its side canyons is designated, then there is an opportunity for shared administration of the river area with NPS if Congress were to also designate the portion of the river within its boundaries.

The estimated cost to the government of acquiring lands and interests in lands and administering the area if the river is designated into the NWSRS by Congress

No funding for acquisition would be needed because there is no private land within the river corridor. The Utah state-owned lands could be acquired through exchange of lands with other public lands. The initial costs of administration for the first 3 years would involve management plan preparation and implementation. Yearly administration costs thereafter would involve monitoring.

The BLM's ability to manage and protect the values of the river segment as part of the NWSRS if designated by Congress, and other mechanisms to protect identified values or alternative ways to protect rivers other than through Congressional designation under the WSR Act

BLM is capable of managing this segment as wild and scenic. Designation of this segment would not significantly elevate management costs above current levels nor require substantial increases in appropriations or diversion of resources from critical ongoing programs.

Failure to include Beaver Wash Canyon in the NWSRS would not necessarily diminish the values for which the river was determined eligible. The outstandingly remarkable values within this segment could be effectively managed through land use prescriptions contained in the Richfield PRMP/FEIS should congressional designation not occur. The canyon's relevant and important values are currently protected by ACEC designation. Further, the segment is located entirely within the Dirty Devil WSA. WSA management through the IMP would provide protection to the segment's outstandingly remarkable values.

Existing rights that may be adversely affected because of designation into the NWSRS or other issues or concerns

The lands within the river corridor are public lands administered by BLM. There are no valid mining claims, mineral leases, private lands, or other existing rights within the eligible segment that would be affected by congressional designation.

The WSR Act infers a federal reserved water right upon designation. However, it does not quantify the right other than to place limitations on it. The Act states that it shall not be construed as a reservation for purposes other than those specified in the Act, or in quantities greater than necessary to accomplish these purposes. The amount of the federal right will therefore depend upon the river's flow, the values for which the river is being protected, and the unappropriated quantities in the river. It would be adjudicated through the state and would be junior to any rights existing prior to the date of designation.

Larry Canyon

This section is recommended non-suitable because the values identified would be protected by alternative protection methods. The segment is located within the Dirty Devil WSA. WSA management through the IMP would provide protection to the segment's outstandingly remarkable values. BLM believed that the quality of river characteristics in this segment would not significantly enhance nor contribute to the NWSRS.

Characteristics that do or do not make the area a worthy addition to the NWSRS

Larry Canyon is a tributary side canyon to the Dirty Devil River. The canyon is rated Class A scenery. Long technical slots in the upper canyon and natural pour-offs in the lower end hinder access and have kept the middle portion in pristine condition. Cottonwood trees complement the form, line, color, and texture of the canyon walls and shade much of the canyon floor.

Larry Canyon provides one of the main hiking entries into the Dirty Devil River canyon system from the west. These public lands provide a significant part of the regional recreation opportunity, serving as a gateway to the Dirty Devil River. People are willing to travel long distances to use the recreational opportunities within Larry Canyon and other canyons of the Dirty Devil River drainage, as indicated by increasing visitation levels despite lengthy and difficult access. Several guidebooks describe outstanding opportunities for hiking, backpacking, and canyoneering, and there are opportunities for commercial use. There are challenging canyoneering opportunities in the upper stretch of Larry Canyon.

Long stretches of perennial springs within this canyon provide diverse habitats for native plants and support a great variety of bird and animal species. These include the MSO (federally listed) and the goshawk and Peregrine falcon, both sensitive species. This canyon is designated critical MSO habitat. The riparian corridor provides crucial habitat for big game, neo-tropical migratory birds, non-game mammals, bats, and small rodents. It is identified by the Utah Division of Wildlife Resources (UDWR) as critical year-long habitat for the Desert bighorn sheep.

This segment provides an exemplary illustration of the hydrologic transition from headwaters to a deeply incised canyon, all within the course of a few miles. The dramatic changes associated with the transition are visible from several vantage points along the canyon rim as well as while hiking through the canyon.

The drainage is intermittent.

Current status of land ownership and human use of the area

The river segment is 4 miles in length and is administered in its entirety by BLM. The lower end of the canyon could still be grazed. It has not been closed or relinquished for grazing. The primary activity occurring on public lands in the canyon is dispersed primitive recreation including hiking, hunting, and sightseeing. There are no private lands. This canyon is undeveloped and primitive and is within the Dirty Devil WSA.

Uses, including the reasonably foreseeable potential uses of land and water, that would be enhanced, foreclosed, or curtailed if the river were designated into the NWSRS by Congress, and the values that could be lost or diminished if the area is not protected as part of the national system

Designation as a WSR would be compatible with BLM proposals to maintain riparian values, protect the watershed and high quality of water, protect potential habitat for the MSO, protect Desert bighorn sheep habitat, and manage the lands for their primitive recreation opportunities.

There are no proposals or potential for dam-building on this segment. No other developments including roads, pipelines, or other structures are proposed or likely.

The entire canyon is within the Dirty Devil WSA. Designation of Larry Canyon into the NWSRS would be compatible with and enhance wilderness use and management of the area. Designation would also be compatible with management of the area as part of a Dirty Devil SRMA or ACEC, both contained in the Richfield PRMP/FEIS.

Failure to include Larry Canyon in the NWSRS would not necessarily diminish the values for which the river was determined eligible inasmuch as the area's WSA status would continue, and many of the other land use prescriptions contained within the Richfield PRMP/FEIS would, if implemented, also preserve and enhance such values.

Interest by local, state, or federal agencies; Native American tribes; and other public entities in congressional designation or non-designation of the river, and the extent to which river administration, including costs thereof, may be shared by state and local agencies or other potential partners

Some private citizens and regional and national conservation groups have promoted WSR designation. No state, tribal, or local governments have expressed support for inclusion of this river segment in the NWSRS.

None of the above entities would share costs or administration of the area should Congress designate it. There is also no contiguous federal agency to share the costs or administration. If the river was designated as a portion of the larger Dirty Devil watershed, then there would be opportunity for joint management with the adjacent NPS river segment.

The estimated cost to the government of acquiring lands and interests in lands and administering the area if the river is designated into the NWSRS by Congress

No funding for acquisition would be needed because there is no private land within the river corridor. Initial costs of administration would include preparing and implementing a corridor management plan and administering recreation permits. Yearly administration costs thereafter could involve additional studies, monitoring, and administering recreation permits.

The BLM's ability to manage and protect the values of the river segment as part of the NWSRS if designated by Congress, and other mechanisms to protect identified values or alternative ways to protect rivers other than through Congressional designation under the WSR Act

The BLM is capable of managing this segment as wild and scenic. Designation of this segment would not significantly elevate management costs above current levels nor require substantial increases in appropriations or diversion of resources from critical ongoing programs.

Larry Canyon is within the Dirty Devil WSA, which has been recommended for wilderness designation. Other alternatives to congressional WSR designation include land use prescriptions contained in the Richfield PRMP/FEIS to designate the river and surrounding lands as an SRMA and implement land use prescriptions to protect riparian systems, including limiting off-road motorized travel, mining and mineral leasing, and ROWs. New costs could be incurred to implement any of these management schemes.

Existing rights that may be adversely affected because of designation into the NWSRS or other issues or concerns

The lands within the river corridor are public lands administered by the BLM. There are no valid mining claims, mineral leases, private lands, or other existing rights within the eligible segment that would be affected by congressional designation.

Development within the river corridor is unlikely due to its WSA status. There are no issues regarding upstream or downstream effects.

The WSR Act infers a federal reserved water right upon designation. However, it does not quantify the right other than to place limitations on it. The Act states that it shall not be construed as a reservation for purposes other than those specified in the Act, or in quantities greater than necessary to accomplish these purposes. The amount of the federal right will therefore depend upon the river's flow, the values for which the river is being protected, and the unappropriated quantities in the river. It would be adjudicated through the state and would be junior to any rights existing prior to the date of designation.

No Mans Canyon

This section is recommended non-suitable because the values identified would be protected by alternative protection methods. The entire 7.1 miles of this segment are located within the Dirty Devil WSA. WSA management through the IMP would provide protection to the segment's outstandingly remarkable values. The segment would be located within the Dirty Devil SRMA. The proposed management prescriptions for this SRMA in relation to VRM, oil and gas leasing, and off-highway vehicle (OHV) use would provide additional protection to outstandingly remarkable values. The BLM believed that the quality of river characteristics in this segment would not significantly enhance nor contribute to the NWSRS.

Characteristics that do or do not make the area a worthy addition to the NWSRS

No Mans Canyon is a tributary to the Dirty Devil River. The river corridor and surrounding canyon system were inventoried as Class A scenery.

This canyon is one of the few that visitors can generally depend on for a reliable source of fresh water. Almost all visitors are from outside the general area. Almost all use occurs near the confluence with the Dirty Devil River and is associated with more extensive trips along the main drainage.

The river segment is free-flowing but intermittent. Water flows in No Mans Canyon can vary considerably from year to year based on upstream precipitation and water depletions. Large portions of the canyon in the upper reaches dry up during periods of the year.

Current status of land ownership and human use of the area

The eligible segment of No Mans Canyon is 7.1 miles in length. The entire river corridor is public land administered by BLM.

The area is remote and access is limited and difficult, recreational use is relatively light except during the canyoneering season. Mineral exploration has occurred in the past but no unpatented mining claims remain active in the area. The river corridor is within the Dirty Devil WSA. None of the Dirty Devil or its side canyons have been closed or relinquished to grazing.

Uses, including the reasonably foreseeable potential uses of land and water, that would be enhanced, foreclosed, or curtailed if the river were designated into the NWSRS by Congress, and the values that could be lost or diminished if the area is not protected as part of the national system

Designation would be compatible with BLM proposals to maintain riparian values, protect the watershed and high quality of water, protect potential habitat for the MSO, and manage the lands for their primitive recreation opportunities.

There are no proposals or potential for dam-building on this segment. No other development including roads, pipelines, or other structures are proposed or likely.

This entire canyon is within the Dirty Devil WSA. The BLM has recommended these lands to Congress for wilderness designation. Designation of No Mans Canyon into the NWSRS would be compatible with and enhance wilderness use and management of the area. Designation would also be compatible with management of the area as part of a Dirty Devil SRMA or ACEC, which are contained in the Richfield PRMP/FEIS.

Failure to include No Mans Canyon in the NWSRS would not necessarily diminish the values for which the river was determined eligible inasmuch as the area's WSA status would continue, and many of the

other land use prescriptions contained within the Richfield PRMP/FEIS would also preserve and enhance such values if implemented.

Interest by local, state, or federal agencies; Native American tribes; and other public entities in congressional designation or non-designation of the river, and the extent to which river administration, including costs thereof, may be shared by state and local agencies or other potential partners

Some private citizens and regional and national conservation groups have promoted designation. No state, tribal, or local government has expressed support for inclusion of this river segment in the NWSRS.

None of the above entities would share costs or administration of the area should Congress designate it. There is also no contiguous federal agency to share the costs or administration. However, if the river is designated as a portion of the larger Dirty Devil watershed, then there is opportunity for joint management with the adjacent NPS river segment.

The estimated cost to the government of acquiring lands and interests in lands and administering the area if the river is designated into the NWSRS by Congress

No funding for acquisition would be needed because there is no private land within the river corridor. The initial costs of administration for the first 3 years would involve management plan preparation and implementation and ongoing recreation permitting. Yearly administration costs thereafter may involve additional studies, monitoring, and ongoing recreation permitting.

The BLM's ability to manage and protect the values of the river segment as part of the NWSRS if designated by Congress, and other mechanisms to protect identified values or alternative ways to protect rivers other than through Congressional designation under the WSR Act

The BLM is capable of managing this segment as wild and scenic. Designation of this segment would not significantly elevate management costs above current levels nor require substantial increases in appropriations or diversion of resources from critical ongoing programs.

The entire 7.1 miles of this segment are located within the Dirty Devil WSA. WSA management through the IMP would provide protection to the segment's outstandingly remarkable values. The segment would be located within the Dirty Devil SRMA. The proposed management prescriptions for this SRMA in relation to VRM, oil and gas leasing, and OHV use would provide additional protection to the outstandingly remarkable values. New costs could be incurred to implement any of these management schemes.

Existing rights that may be adversely affected because of designation into the NWSRS or other issues or concerns

The lands within the river corridor are public lands administered by the BLM. There are no valid mining claims, mineral leases, private lands, or other existing rights within the eligible segment that would be affected by congressional designation.

Development within the river corridor is unlikely due to its WSA status. There are no issues regarding upstream or downstream effects.

The WSR Act infers a federal reserved water right upon designation. However, it does not quantify the right other than to place limitations on it. The Act states that it shall not be construed as a reservation for purposes other than those specified in the Act, or in quantities greater than necessary to accomplish these purposes. The amount of the federal right will therefore depend upon the river's flow, the values for which the river is being protected, and the unappropriated quantities in the river. It would be adjudicated through the state and would be junior to any rights existing prior to the date of designation.

Robbers Roost Canyon

This section is recommended non-suitable because the values identified would be protected by alternative protection methods. The BLM believed that the quality of river characteristics in this segment would not significantly enhance nor contribute to the NWSRS.

White Roost—4.6 miles of this fork are within the Dirty Devil WSA, and the additional 0.6 mile is proposed for management of wilderness characteristics. WSA management through the IMP and proposed management prescriptions for the wilderness characteristic lands would provide protection to this fork's outstandingly remarkable values.

Robbers Roost Middle Fork—This fork is located within the Dirty Devil WSA. WSA management through the IMP would provide protection to the segment's outstandingly remarkable values.

Robbers Roost North Fork—This fork is located within the Dirty Devil WSA. WSA management through the IMP would provide protection to the segment's outstandingly remarkable values.

Robbers Roost South Fork—This fork includes 10 miles within the Dirty Devil WSA. WSA management through the IMP would provide protection to the segment's outstandingly remarkable values. Management of the 1.6 miles outside the WSA would conflict with water rights and spring developments that occur within that area. This fork would be located within the Dirty Devil SRMA. The proposed management prescriptions for this SRMA in relation to VRM, oil and gas leasing, and OHV use would provide additional protection to the outstandingly remarkable values outside of the WSA.

Characteristics that do or do not make the area a worthy addition to the NWSRS

Robbers Roost Canyon is a side canyon and tributary to the Dirty Devil River. The river corridor and the entire canyon are rated as Class A, with superlative examples of red rock scenery. The name, outlaw lore, and scenery draw recreationists from outside the region. Robbers Roost is the most accessible of all the Dirty Devil side canyons, and is publicized as a destination hike in a number of guidebooks. Canyoneers have come to recognize that the upper ends of each of the Robbers Roost tributaries contain superb opportunities for technical slot canyoneering. The canyon contains prehistoric values associated with Fremont Native American and archaic inhabitants. The river segment is free-flowing in character and free of impoundments and other intrusions. Water flows vary considerably from year to year based on precipitation, and the upper reaches of the canyons dry seasonally.

Current status of land ownership and human use of the area

The river segment is 33 miles in length—31 miles cross public lands administered by BLM and 2 miles cross lands owned by the State of Utah. Although there is livestock grazing on the benchlands above the canyons, most use in the canyons is recreational including hiking, canyoneering, hunting, sightseeing, photography, and primitive recreation. The entire river corridor is within the Dirty Devil WSA.

Uses, including the reasonably foreseeable potential uses of land and water, that would be enhanced, foreclosed, or curtailed if the river was designated into the NWSRS by Congress, and the values that could be lost or diminished if the area is not protected as part of the national system

Designation would be compatible with BLM proposals to maintain riparian values, protect the watershed and high quality of water, protect potential habitat for the MSO, and manage the lands for their primitive recreation opportunities.

There is no proposal or potential for dam-building on this segment. No other development including roads, pipelines, or other structures could be developed within this stretch of river if classified as "wild," but no such development is proposed or likely considering the area's WSA status.

This entire canyon is within the Dirty Devil WSA. The BLM has recommended these lands to Congress for wilderness designation. Designation of Robbers Roost Canyon into the NWSRS would be compatible with and enhance wilderness use and management of the area. Designation would also be compatible with management of the area as part of a Dirty Devil SRMA or ACEC, which are contained in the Richfield PRMP/FEIS.

Failure to include Robbers Roost Canyon in the NWSRS would not necessarily diminish the values for which the river was determined eligible inasmuch as the area's WSA status would continue, and many of the other land use prescriptions contained within the Richfield PRMP/FEIS would also preserve and enhance such values if implemented.

Interest by local, state, or federal agencies; Native American tribes; and other public entities in congressional designation or non-designation of the river, and the extent to which river administration, including costs thereof, may be shared by state and local agencies or other potential partners

Some private citizens and regional and national conservation groups have promoted designation. No state, tribal, or local governments have expressed support for inclusion of this river segment in the NWSRS.

None of the above entities would share costs or administration of the area should Congress designate it. There is also no contiguous federal agency to share the costs or administration. However, if the river was designated as a portion of the larger Dirty Devil Watershed, there would be opportunity for joint management with the adjacent NPS river segment of the Dirty Devil River.

The estimated cost to the government of acquiring lands and interests in lands and administering the area if the river is designated into the NWSRS by Congress

No funding for acquisition would be needed because there is no private land within the river corridor. The lands owned by the State of Utah could be acquired by exchange with public lands elsewhere The initial costs of administration for the first 3 years would involve management plan preparation and implementation and ongoing recreation permitting. Yearly administration costs thereafter may involve additional studies, monitoring, and ongoing recreation permitting.

The BLM's ability to manage and protect the values of the river segment as part of the NWSRS if designated by Congress, and other mechanisms to protect identified values or alternative ways to protect rivers other than through Congressional designation under the WSR Act

BLM is capable of managing this segment as wild and scenic. Designation of this segment would not significantly elevate management costs above current levels nor require substantial increases in appropriations or diversion of resources from critical ongoing programs.

White Roost—4.6 miles of this fork are within the Dirty Devil WSA, and the additional 0.6 mile is proposed for management of wilderness characteristics. WSA management through the IMP and proposed management prescriptions for the wilderness characteristic lands would provide protection to this fork's outstandingly remarkable values.

Robbers Roost Middle Fork—This fork is located within the Dirty Devil WSA. WSA management through the IMP would provide protection to the segment's outstandingly remarkable values.

Robbers Roost North Fork—This fork is located within the Dirty Devil WSA. WSA management through the IMP would provide protection to the segment's outstandingly remarkable values.

Robbers Roost South Fork—This fork includes 10 miles within the Dirty Devil WSA. WSA management through the IMP would provide protection to the segment's outstandingly remarkable values. Management of the 1.6 miles outside the WSA would conflict with water rights and spring developments that occur within that area. This fork would be located within the Dirty Devil SRMA. The proposed management prescriptions for this SRMA in relation to VRM, oil and gas leasing, and OHV use would provide additional protection to the outstandingly remarkable values outside of the WSA.

Existing rights that may be adversely affected because of designation into the NWSRS, or other issues or concerns

The lands within the river corridor are public lands administered by BLM. There are no valid mining claims, mineral leases, private lands, or other existing rights within the eligible segment that would be affected by congressional designation.

Development within the river corridor is unlikely due to its WSA status. There are no issues regarding upstream or downstream effects.

The WSR Act infers a federal reserved water right upon designation. However, it does not quantify the right other than to place limitations on it. The Act states that it shall not be construed as a reservation for purposes other than those specified in the Act, or in quantities greater than necessary to accomplish these purposes. The amount of the federal right will therefore depend upon the river's flow, the values for which the river is being protected, and the unappropriated quantities in the river. It would be adjudicated through the state and would be junior to any rights existing prior to the date of designation.

Sams Mesa Box Canyon

This section is recommended non-suitable because the values identified would be protected by alternative protection methods. The entire 9.5 miles of this segment are located within the Dirty Devil WSA. WSA management through the IMP would provide protection to the segment's outstandingly remarkable values. The segment would be located within the Dirty Devil SRMA. The proposed management prescriptions for this SRMA in relation to VRM, oil and gas leasing, and OHV use would provide additional protection to the outstandingly remarkable values. BLM believed that the quality of river characteristics in this segment would not significantly enhance nor contribute to the NWSRS.

Characteristics that do or do not make the area a worthy addition to the NWSRS

Sams Mesa Box Canyon was inventoried as Class A scenery. It is a very deep, rugged canyon that descends through a series of steep falls that are visually attractive. At 400 to 600 feet deep, it is the deepest of all the Dirty Devil River tributary canyons.

There is no dependable hiking route into this canyon. Most visitors into the canyon use a semi-technical trail that starts on the west side of the Dirty Devil on Burr Point and drops in near Twin Corral Box Canyon. Access to the upper end of Sams Mesa Box Canyon is limited to technical canyoneering. People are willing to travel long distances to use the recreational opportunities along this river segment as indicated by visitation levels despite lengthy and difficult access.

This canyon provides habitat for the MSO and includes two known owl protected activity centers (PACs). The canyon has been designated by the UDWR as year-long critical habitat for Desert bighorn sheep.

The river segment is free of impoundments and other intrusions.

Current status of land ownership and human use of the area

The river segment is 9.5 miles in length, entirely within public lands administered by BLM. Human use includes dispersed recreational activity including hiking, canyoneering, sightseeing, photography, and primitive recreation. The river corridor is almost completely within the Dirty Devil WSA, with the exception of a small portion of the south bank near its junction with the Dirty Devil River.

Although not used in recent years, this area is part of the Robbers Roost grazing allotment.

Uses, including the reasonably foreseeable potential uses of land and water, that would be enhanced, foreclosed, or curtailed if the river was designated into the NWSRS by Congress, and the values that could be lost or diminished if the area is not protected as part of the national system

Designation would be compatible with BLM proposals to maintain riparian values, protect the watershed and high quality of water, protect potential habitat for the MSO and Desert bighorn sheep, and manage the lands for their primitive recreation opportunities

There are no proposals or potential for dam-building on this segment. No other development including roads, pipelines, or other structures are proposed or likely.

Most of this canyon is within the Dirty Devil WSA. The BLM has recommended these lands to Congress for wilderness designation. Designation of Sams Mesa Box Canyon into the NWSRS would be compatible with and enhance wilderness use and management of the area. Designation would also be compatible with management of the area as part of a Dirty Devil SRMA or ACEC, which are contained in the Richfield PRMP/FEIS.

Failure to include Sams Mesa Box Canyon in the NWSRS would not necessarily diminish the values for which the river was determined eligible inasmuch as the area's WSA status would continue, and many of the other land use prescriptions contained within the Richfield PRMP/FEIS would also preserve and enhance such values if implemented.

Interest by local, state, or federal agencies; Native American tribes; and other public entities in congressional designation or non-designation of the river, and the extent to which river administration, including costs thereof, may be shared by state and local agencies or other potential partners

Some private citizens and regional and national conservation groups have promoted designation. No state, tribal, or local government has expressed support for inclusion of this river segment in the NWSRS.

None of the above entities would share costs or administration of the area should Congress designate it. There is also no contiguous federal agency to share the costs or administration. However, if the river was designated as a portion of the larger Dirty Devil watershed there would be opportunity for joint management with the adjacent NPS river segment for the Dirty Devil River.

The estimated cost to the government of acquiring lands and interests in lands and administering the area if the river is designated into the NWSRS by Congress

No funding for acquisition would be needed because there is no private land within the river corridor. The initial costs of administration for the first 3 years would involve management plan preparation and implementation and ongoing recreation permitting. Yearly administration costs thereafter may involve additional studies, monitoring, and ongoing recreation permitting.

The BLM's ability to manage and protect the values of the river segment as part of the NWSRS if designated by Congress, and other mechanisms to protect identified values or alternative ways to protect rivers other than through Congressional designation under the WSR Act

The BLM is capable of managing this segment as wild and scenic. Designation of this segment would not significantly elevate management costs above current levels nor require substantial increases in appropriations or diversion of resources from critical ongoing programs.

The entire 9.5 miles of this segment are located within the Dirty Devil WSA. WSA management through the IMP would provide protection to the segment's outstandingly remarkable values. The segment would be located within the Dirty Devil SRMA. The proposed management prescriptions for this SRMA in relation to VRM, oil and gas leasing, and OHV use would provide additional protection to the outstandingly remarkable values. New costs could be incurred to implement any of these management schemes.

Existing rights that may be adversely affected because of designation into the NWSRS, or other issues or concerns

The lands within the river corridor are public lands administered by the BLM. There are no valid mining claims, mineral leases, private lands, or other existing rights within the eligible segment that would be affected by congressional designation.

Development within the river corridor is unlikely due to its WSA status. There are no issues regarding upstream or downstream effects.

The WSR Act infers a federal reserved water right upon designation. However, it does not quantify the right other than to place limitations on it. The Act states that it shall not be construed as a reservation for purposes other than those specified in the Act, or in quantities greater than necessary to accomplish these purposes. The amount of the federal right will therefore depend upon the river's flow, the values for which the river is being protected, and the unappropriated quantities in the river. It would be adjudicated through the state and would be junior to any rights existing prior to the date of designation.

Twin Corral Box Canyon

This section is recommended non-suitable because the values identified would be protected by alternative protection methods. Of the 9 miles of this segment 8 miles are located within the Dirty Devil WSA. WSA management through the IMP would provide protection to the segment's outstandingly remarkable values located within the WSA. The remainder of the segment is isolated by two state sections, which would result in management conflicts. The segment would be located within the Dirty Devil SRMA. The proposed management prescriptions for this SRMA in relation to VRM, oil and gas leasing, and OHV use would provide additional protection to the outstandingly remarkable value outside of the WSA. BLM believed that the quality of river characteristics in this segment would not significantly enhance nor contribute to the NWSRS.

Characteristics that do or do not make the area a worthy addition to the NWSRS

Twin Corral Box Canyon possesses Class A scenery, enhanced by the transition from the Wingate to the Chinle formation. The canyon provides designated MSO habitat. In addition, the canyon has been designated by the UDWR as year-long critical habitat for Desert bighorn sheep.

The river segment is free-flowing and free of impoundments and other intrusions. Water flows in Twin Corral Box Canyon can vary considerably year to year, and the upper reaches of the canyon dry up seasonally.

Current status of land ownership and human use of the area

The river segment is 10.1 miles in length. Of that, 9 miles cross public lands administered by BLM, with 1.1 river miles crossing lands owned by the State of Utah. There are no private lands. Public lands support dispersed activity including hiking, canyoneering, sightseeing, photography, and primitive recreation.

All but the upper 2 miles of the canyon are within the Dirty Devil WSA. Twin Corral Box Canyon is within the Robbers Roost grazing allotment. Although no grazing has occurred in recent years, it is not closed or relinquished.

Uses, including the reasonably foreseeable potential uses of land and water, that would be enhanced, foreclosed, or curtailed if the river was designated into the NWSRS by Congress, and the values that could be lost or diminished if the area is not protected as part of the national system

Designation as a WSR would be compatible with BLM proposals to maintain riparian values, protect the watershed and water quality, protect designated critical habitat for the MSO, and manage the lands for primitive recreation opportunities.

There are no proposals or potential for dam-building on this segment. No other development including roads, pipelines, or other structures are proposed or likely.

Most of the canyon is within the Dirty Devil WSA. The BLM has recommended these lands to Congress for wilderness designation. Designation of Twin Corral Box Canyon into the NWSRS would be compatible with and enhance wilderness use and management of the area. Designation would also be compatible with management of the area as part of a Dirty Devil SRMA or ACEC, which are contained in the Richfield PRMP/FEIS.

Failure to include Twin Corral Box Canyon in the NWSRS would not necessarily diminish the values for which the river was determined eligible inasmuch as the area's WSA status would continue, and many of the other land use prescriptions contained within the Richfield PRMP/FEIS would also preserve and enhance such values if implemented.

Interest by local, state, or federal agencies; Native American tribes; and other public entities in congressional designation or non-designation of the river, and the extent to which river administration, including costs thereof, may be shared by state and local agencies or other potential partners

Some private citizens and regional and national conservation groups have promoted designation. No state, tribal, or local government has expressed support for inclusion of this river segment in the NWSRS.

None of the above entities would share costs or administration of the area should Congress designate it. There is also no contiguous federal agency to share the costs or administration. However, if the river is designated as a portion of the larger Dirty Devil watershed, then there could be opportunities for joint management with the NPS river segment for the Dirty Devil River.

The estimated cost to the government of acquiring lands and interests in lands and administering the area if the river is designated into the NWSRS by Congress

No funding for acquisition would be needed because there is no private land within the river corridor. The initial costs of administration for the first 3 years would involve management plan preparation and implementation and ongoing recreation permitting. Yearly administration costs thereafter could involve additional studies, monitoring, and ongoing recreation permitting. State lands could be acquired through exchange.

The BLM's ability to manage and protect the values of the river segment as part of the NWSRS if designated by Congress, and other mechanisms to protect identified values or alternative ways to protect rivers other than through Congressional designation under the WSR Act

The BLM is capable of managing this segment as wild and scenic. Designation of this segment would not significantly elevate management costs above current levels nor require substantial increases in appropriations or diversion of resources from critical ongoing programs.

Of the 9 miles of this segment 8 miles are located within the Dirty Devil WSA. WSA management through the IMP would provide protection to the segment's outstandingly remarkable values located within the WSA. The remainder of the segment is isolated by two state sections, which would result in management conflicts. The segment would be located within the Dirty Devil SRMA. The proposed management prescriptions for this SRMA in relation to VRM, oil and gas leasing, and OHV use would provide additional protection to the outstandingly remarkable values outside of the WSA. New costs could be incurred to implement any of these management schemes.

Existing rights that may be adversely affected because of designation into the NWSRS, or other issues or concerns

There are no valid mining claims, mineral leases, or private lands within the public land portion of the eligible segment. The State of Utah manages 1 mile of the eligible segment. Development within the river corridor is unlikely due to its WSA status. There are no issues regarding upstream or downstream effects.

The WSR Act infers a federal reserved water right upon designation. However, it does not quantify the right other than to place limitations on it. The Act states that it shall not be construed as a reservation for purposes other than those specified in the Act, or in quantities greater than necessary to accomplish these purposes. The amount of the federal right will therefore depend upon the river's flow, the values for which the river is being protected, and the unappropriated quantities in the river. It would be adjudicated through the state and would be junior to any rights existing prior to the date of designation.

Other Rivers

Fish Creek

This section is recommended non-suitable because the cultural values identified would be protected by laws and regulations related to cultural resources and lack of management feasibility due to its small size. This segment consists of 0.25 miles of Fish Creek between U.S. Forest Service (USFS) and private lands. Further, USFS has not found its portion of this creek to be neither eligible nor suitable as a WSR. On the national forest sections a potential outstandingly remarkable value of Recreational Fishing was identified. However, the segment was found to be not eligible because the values were rated as only moderately responsive to the definition and attributes. The scale of importance for recreation was less than regional. The BLM believed that the quality of river characteristics in this segment would not significantly enhance nor contribute to the NWSRS.

Characteristics that do or do not make the area a worthy addition to the NWSRS

This stream segment includes a significant Fremont Native American site containing rock art (Fish Creek Cove pictographs) and other evidence of habitation. The rock art is nationally significant and has been nominated to the National Register of Historic Places (NRHP). It is an important site to several Native American tribes.

The river segment is free-flowing in character and free of impoundments and other intrusions. Water flows in Fish Creek can vary considerably from year to year. The segment involving public lands is very short, totaling just 0.25 miles in length.

Current status of land ownership and human use of the area

The river segment is approximately 0.25 miles in length, entirely on public lands administered by the BLM. Public lands within the river corridor support livestock grazing and dispersed activity including sightseeing and photography. Recreation use levels are very low.

Uses, including the reasonably foreseeable potential uses of land and water, that would be enhanced, foreclosed, or curtailed if the river was designated into the NWSRS by Congress, and the values that could be lost or diminished if the area is not protected as part of the national system

Designation would be compatible with BLM proposals to maintain riparian values, protect the watershed and high quality of water, and protect cultural features.

Non-designation would leave open the possibility of future water developments that could alter the free-flowing nature of the stream. No such developments or uses are currently proposed, however.

Interest by local, state, or federal agencies; Native American tribes; and other public entities in congressional designation or non-designation of the river, and the extent to which river administration, including costs thereof, may be shared by state and local agencies or other potential partners

USFS found its upstream section to be neither eligible nor suitable for inclusion into the NWSRS. On the national forest sections a potential outstandingly remarkable value of Recreational Fishing was identified. However, the segment was found not eligible because the values were rated as only moderately responsive to the definition and attributes. The scale of importance for recreation was less than regional.

Some private citizens and regional and national conservation groups have promoted designation as a means of preserving the free-flowing character of the segment. No state, tribal, or local government has expressed support for inclusion of this river segment in the NWSRS. There is no opportunity to share costs with the above entities.

The estimated cost to the government of acquiring lands and interests in lands and administering the area if the river is designated into the NWSRS by Congress

No private lands are proposed for acquisition. The initial costs of administration for the first 3 years would involve management plan preparation and implementation. Yearly administration costs thereafter would involve monitoring.

The BLM's ability to manage and protect the values of the river segment as part of the NWSRS if designated by Congress, and other mechanisms to protect identified values or alternative ways to protect rivers other than through Congressional designation under the WSR Act

The public lands portion of Fish Creek is relatively short and would be difficult to manage separately from adjoining state, private, and national forest lands. USFS did not find its segment of Fish Creek as an eligible WSR. The outstandingly remarkable cultural value within this segment is protected by laws and regulations related to cultural resources.

Existing rights that may be adversely affected because of designation into the NWSRS, or other issues or concerns

No valid existing rights were identified in the eligible segment. The WSR Act infers a federal reserved water right upon designation. However, it does not quantify the right other than to place limitations on it. The Act states that it shall not be construed as a reservation for purposes other than those specified in the

Act, or in quantities greater than necessary to accomplish these purposes. The amount of the federal right will therefore depend upon the river's flow, the values for which the river is being protected, and the unappropriated quantities in the river. It would be adjudicated through the state and would be junior to any rights existing prior to the date of designation.

This segment consists of 0.25 miles of Fish Creek between USFS and private lands. USFS has not found its portion of this creek to be eligible as a WSR. This segment would not be feasible for management as a WSR due to its size. The cultural outstandingly remarkable value of this segment would be protected through laws and regulations related to Cultural Resources.

Fremont River (Below Capitol Reef NP to Caineville Ditch Diversion)

This section was found non-suitable due to ROWs and ownership conflicts. This segment is adjacent to Utah State Highway 24 (south side of the river), and the ROW for this highway is within the 0.25-mile corridor of the segment. The powerline ROW for the communities of Caineville and Hanksville is located on the north side of the river and is within the 0.25-mile corridor of the segment. There are also state and private lands within the segment. This segment of the Fremont River is not recommended for suitability as a WSR due to conflicts with the ROWs and ownership. The BLM believed that the quality of river characteristics in this segment would not significantly enhance nor contribute to the NWSRS.

Characteristics that do or do not make the area a worthy addition to the NWSRS

The canyon of the Fremont River between Capitol Reef National Park and Caineville is geologically interesting in that it illustrates the relatively recent age of the local landscape and the huge volumes of material that were removed in a very short time.

A significant length of this river segment parallels Utah State Highway 24, the main east-west route through the county and the access route to Capitol Reef National Park. Much of the canyon is cut into the highly photogenic Brushy Basin member of the Morrison formation, and examples of large balanced rocks are perched along the canyon walls. That the river cuts through the geological formations and is free-flowing and perennial in character makes it rare in the high desert of Southern Utah. Approximately 700,000 visitors travel to Capitol Reef National Park each year, many of whom enter or leave the park along this stretch of the river.

Current status of land ownership and human use of the area

There are 6 river miles between the Capitol Reef National Park boundary and the Caineville ditch diversion. Of this, 4 miles are public lands administered by the BLM and 2 miles are owned by the State of Utah or privately owned. Other than Utah State Highway 24 that parallels the river, there is no development. Lands within the river corridor are open for grazing, although topography restricts actual use. Several small vehicle pull-offs also exist for day use and overnight camping. Highway 24 is a state-designated scenic highway. The ROW for this highway is within the 0.25-mile corridor of the segment. The powerline ROW for the communities of Caineville and Hanksville is located on the north side of the river and is within the 0.25-mile corridor of the segment. This segment of the Fremont River is not recommended for suitability as a WSR due to conflicts with the ROWs and ownership.

Uses, including the reasonably foreseeable potential uses of land and water, that would be enhanced, foreclosed, or curtailed if the river was designated into the NWSRS by Congress, and the values that could be lost or diminished if the area is not protected as part of the national system

WSR designation would be compatible with BLM proposals to maintain riparian values and protect the watershed and high quality of water. It would help to maintain the important scenic values of the area.

Inclusion into the NWSRS would preclude dams or other water developments within the designated stretch, but no such developments are currently planned. Wayne County interests have proposed water diversion and storage projects for the Fremont River in a variety of locations, including sites upstream and downstream from this location. To date, none of the proposals have moved beyond the idea stage.

Designation would complement management of the eligible river segment within Capitol Reef National Park.

Failure to include this segment of the Fremont River in the NWSRS would not necessarily diminish the values for which the river was determined eligible inasmuch as other land use prescriptions contained within the Richfield PRMP/FEIS could also preserve and enhance such values.

Interest by local, state, or federal agencies; Native American tribes; and other public entities in congressional designation or non-designation of the river, and the extent to which river administration, including costs thereof, may be shared by state and local agencies or other potential partners

Some private citizens and regional and national conservation groups have promoted designation as a means of preserving the free-flowing character and other values of this nationally significant river. No state, tribal, or local government has expressed support for inclusion of the river in the NWSRS. Local and state agencies, water users, and municipalities oppose designation due to perceptions that existing water rights could be affected and opportunities for water development could be foreclosed, not only within the eligible river segment, but also upstream and downstream. In actuality, there is no likely development identified within the eligible segment, and any upstream or downstream development would only be affected if federal money was involved, and even then only if the development would invade or unreasonably diminish fish, wildlife, recreation, or scenic values identified within the designated segment at the time of designation. Wayne County has proposed a water diversion and storage project for the Fremont River in a variety of locations far upstream of the eligible segment in the past and for a number of different purposes, but has no actual proposal under consideration.

Congressional designation of this eligible segment would not preclude consideration of this water diversion and storage project in the future, as long as it would not exceed the "invade or unreasonably diminish" standard discussed above. Although the WSR Act infers a federal reserved water right upon designation, rather than establishing an amount it actually imposes a limit, expressing that any such right is to be the minimum necessary for the purposes of the Act. Such right would have to be adjudicated through the state and would be junior to any existing rights.

Although none of the above entities would share costs, because NPS has determined the contiguous portion of the river that it manages to be eligible, costs and administration of the river area could be shared with it if Congress were to also designate the portion of the river within its boundaries.

The estimated cost to the government of acquiring lands and interests in lands and administering the area if the river is designated into the NWSRS by Congress

Funding for acquisition would be needed if it was determined that the private land within the river corridor were desirable for acquisition. The cost of acquiring the lands is not known at this time. State lands could be acquired through exchange. The initial costs of administration for the first 3 years would involve management plan preparation and implementation. Yearly administration costs thereafter could involve additional studies and monitoring.

The BLM's ability to manage and protect the values of the river segment as part of the NWSRS if designated by Congress, and other mechanisms to protect identified values or alternative ways to protect rivers other than through Congressional designation under the WSR Act

The BLM is capable of managing this segment as wild and scenic. Designation of this segment would not significantly elevate management costs above current levels nor require substantial increases in appropriations or diversion of resources from critical ongoing programs. Also, BLM could partner with NPS in administering the river.

Alternatives to congressional WSR designation are proposed in the Richfield PRMP/FEIS and include prescriptions to manage riparian systems, watershed, water quality, and habitats for sensitive and listed fish and wildlife species, including placing limits on off-road motorized travel, mining and mineral leasing, and ROWs. New costs could be incurred to implement any of these management schemes.

Existing rights that may be adversely affected because of designation into the NWSRS, or other issues or concerns

The lands within the river corridor are public lands administered by the BLM. There are no valid mining claims, mineral leases, private lands, or other existing rights within the eligible segment that would be affected by congressional designation.

Local and state agencies, water users, and municipalities have expressed concern that opportunities for water development could be foreclosed, not only within the eligible river segment, but also upstream and downstream.

The WSR Act infers a federal reserved water right upon designation. However, it does not quantify the right other than to place limitations on it. The Act states that it shall not be construed as a reservation for purposes other than those specified in the Act, or in quantities greater than necessary to accomplish these purposes. The amount of the federal right will therefore depend upon the river's flow, the values for which the river is being protected, and the unappropriated quantities in the river. It would be adjudicated through the state and would be junior to any rights existing prior to the date of designation.

Maidenwater Creek

Maidenwater Creek was not found to be suitable due to the highway corridor ROW and conflicts with ownership. Utah Highway 276 bisects this 4.3-mile segment. The highway ROW consists of 100 feet on each side of centerline, and a box culvert has been constructed in the creek at this location. There are also state lands located within the segment. Further, other management prescriptions would provide protection to the outstandingly remarkable values. The portion of the segment below Highway 276 has been identified for management of the wilderness characteristics of that area. The portion of the segment above Highway 276 is proposed as VRM Class II, which would provide protection for the scenic values. Proposed decisions pertaining to riparian protection zones and fish and wildlife would provide protection for those values. The BLM determined that the quality of river characteristics in this segment would not significantly enhance nor contribute to the NWSRS.

Characteristics that do or do not make the area a worthy addition to the NWSRS

The entire canyon is rated Class A scenery due to the closeness of canyon walls, topographical screening, and the diversity of vegetation, including on the canyon walls. Visitors to the canyon are attracted by the scenic contrast displayed in the formations. This area is unique in that hanging gardens are prevalent and have not been heavily impacted by domestic ungulates.

This narrow slot canyon provides canyoneering opportunities with a variety of visual and other natural attractions. Guidebooks and websites publicize this area and attract visitors from outside the region. Almost all users to the area come from outside the region.

There is a diversity of animal life. Speckled dace, several species of aquatic invertebrates, observed ring-tail cat, deer and bighorn sheep tracks, and scat and old beaver cuttings and blown-out dams were noted in a field visit.

This is an intermittent, free-flowing segment. The amount of water present can vary considerably seasonably and from year to year.

Current status of land ownership and human use of the area

The river segment is 4 miles in length, including 3 miles of public lands administered by BLM and 1 mile of state land. Public lands within the river corridor support livestock grazing and dispersed recreational activity including sightseeing, canyoneering, hiking, and photography. Actual cattle use in the river corridor is restricted by topography to the benchlands above the canyon, because there are limited access points. Utah Highway 276 bisects this 4-mile segment. The highway ROW consists of 100 feet on each side of centerline, and a box culvert has been constructed in the creek at this location. Due to the highway corridor ROW and conflicts with ownership, Maidenwater Creek is not recommended for suitability as a WSR.

Uses, including the reasonably foreseeable potential uses of land and water, that would be enhanced, foreclosed, or curtailed if the river were designated into the NWSRS by Congress, and the values that could be lost or diminished if the area is not protected as part of the national system

Designation would be compatible with BLM proposals to maintain riparian values and protect the watershed and high quality of water.

Non-designation would leave open the possibility of future water developments that could alter the free-flowing nature of the stream, thus diminishing natural values within public lands and limiting options for habitat enhancements. No such developments or uses are currently proposed, however.

Interest by local, state, or federal agencies; Native American tribes; and other public entities in congressional designation or non-designation of the river, and the extent to which river administration, including costs thereof, may be shared by state and local agencies or other potential partners

Some private citizens and regional and national conservation groups have promoted designation. No state, tribal, or local government has expressed support for inclusion of this river segment in the NWSRS. Local and state agencies, water users, and municipalities oppose designation due to perceptions that existing water rights could be affected and opportunities for water development could be foreclosed, not only within the eligible river segment, but also upstream and downstream. In actuality, there is no likely development identified within the eligible segment, and any upstream or downstream development would only be affected if federal money was involved and if the development would invade or unreasonably diminish fish, wildlife, recreation, or scenic values identified within the designated segment at the time of designation. Although the WSR Act infers a federal reserved water right upon designation, rather than establishing an amount it actually imposes a limit, expressing that any such right is to be the minimum necessary for the purposes of the Act. Such right would have to be adjudicated through the state and would be junior to any existing rights.

There is no opportunity to share costs of administration with the above entities. Also, there is no contiguous federal agency with which to share cost of administration.

The estimated cost to the government of acquiring lands and interests in lands and administering the area if the river is designated into the NWSRS by Congress

No funding for acquisition would be needed because there is no private land within the river corridor. Utah state lands could be acquired through exchange with other public lands elsewhere. The initial costs of administration for the first 3 years would involve management plan preparation and implementation. Yearly administration costs thereafter would involve monitoring.

The BLM's ability to manage and protect the values of the river segment as part of the NWSRS if designated by Congress, and other mechanisms to protect identified values or alternative ways to protect rivers other than through Congressional designation under the WSR Act

The BLM is capable of managing this segment as wild and scenic. Designation of this segment would not significantly elevate management costs above current levels nor require substantial increases in appropriations or diversion of resources from critical ongoing programs.

Other management prescriptions would provide protection to the outstandingly remarkable values. The portion of the segment below Highway 276 has been identified for management of the wilderness characteristics of that area. The portion of the segment above Highway 276 is proposed as VRM Class II, which would provide protection for the scenic values. Proposed decisions pertaining to riparian protection zones and fish and wildlife would provide protection for those values.

Existing rights that may be adversely affected because of designation into the NWSRS, or other issues or concerns

The lands within the river corridor are public lands administered by the BLM. There are no valid mining claims, mineral leases, private lands, or other existing rights within the eligible segment that would be affected by congressional designation.

The WSR Act infers a federal reserved water right upon designation. However, it does not quantify the right other than to place limitations on it. The Act states that it shall not be construed as a reservation for purposes other than those specified in the Act, or in quantities greater than necessary to accomplish these purposes. The amount of the federal right will therefore depend upon the river's flow, the values for which the river is being protected, and the unappropriated quantities in the river. It would be adjudicated through the state and would be junior to any rights existing prior to the date of designation.

Quitchupah Creek

Quitchupah Creek was not found to be suitable. The small portion of public land along the river would make management difficult. River corridor uses include livestock grazing and dispersed recreational activities such as hunting. Recreation use levels are very low. The canyon has been proposed and is currently under review for possible development of a coal haul road. The BLM believed that the quality of river characteristics in this segment would not significantly enhance nor contribute to the NWSRS.

Characteristics that do or do not make the area a worthy addition to the NWSRS

There are many documented Fremont and archaic habitation sites and use areas as well as the remnants of more recent historic activity within the river corridor and canyon. Many of these sites have been determined by the Utah State Historic Preservation Officer to be eligible for listing in the NRHP. Also, the Paiute Tribe of Utah and the Hopi Tribe have both stated that the canyon is sacred to them. Tribes contend that the traditional use of the canyon plays an important role in the spiritual welfare and existence of both tribes. An ethnographic study conducted to document the importance and use of the canyon to and by the interested tribes supports this view.

Current status of land ownership and human use of the area

The river segment is 1.4 miles in length, entirely public lands administered by BLM. River corridor uses include livestock grazing and dispersed recreational activities such as hunting. Recreation use levels are very low. The canyon has been proposed and is currently under review for possible development of a coal haul road.

Uses, including the reasonably foreseeable potential uses of land and water, that would be enhanced, foreclosed, or curtailed if the river were designated into the NWSRS by Congress, and the values that could be lost or diminished if the area is not protected as part of the national system

There are no proposals or potential for dam-building on this segment. However, the canyon has been proposed and is currently under review for possible development of a coal haul road. Failure to include Quitchupah Creek in the NWSRS would not necessarily diminish the values for which the river was determined.

Interest by local, state, or federal agencies; Native American tribes; and other public entities in congressional designation or non-designation of the river, and the extent to which river administration, including costs thereof, may be shared by state and local agencies or other potential partners

Tribal governments support WSR designation to protect cultural resource values found along the river corridor. Local and state agencies have expressed opposition due to the effect such designation could have on the proposed coal haul road.

None of the above entities would share costs or administration of the area should Congress designate it. USFS did not find its portion of Quitchupah Creek eligible for inclusion in the NWSRS.

The estimated cost to the government of acquiring lands and interests in lands and administering the area if the river is designated into the NWSRS by Congress

No acquisition of private or state land is proposed. The initial costs of administration for the first 3 years would involve management plan preparation and implementation. Yearly administration costs thereafter could involve additional studies and monitoring.

The BLM's ability to manage and protect the values of the river segment as part of the NWSRS if designated by Congress, and other mechanisms to protect identified values or alternative ways to protect rivers other than through Congressional designation under the WSR Act

The small portion of public land along the river would make management difficult.

Existing rights that may be adversely affected because of designation into the NWSRS, or other issues or concerns

No existing rights were identified that would be affected by adding the river segment to the NWSRS.

The WSR Act infers a federal reserved water right upon designation. However, it does not quantify the right other than to place limitations on it. The Act states that it shall not be construed as a reservation for purposes other than those specified in the Act, or in quantities greater than necessary to accomplish these purposes. The amount of the federal right will therefore depend upon the river's flow, the values for which the river is being protected, and the unappropriated quantities in the river. It would be adjudicated through the state and would be junior to any rights existing prior to the date of designation.

APPENDIX 4—303(D) LIST OF IMPAIRED WATERS

Pursuant to Section 303(d) of the Clean Water Act (as amended), each state is required to identify those water bodies for which existing pollution controls are not stringent enough to maintain state water quality standards. Water or water bodies (e.g., lakes, reservoirs, rivers, and streams) that are not currently achieving or are not expected to achieve those standards are identified as water quality limited. The quality of a water body can be limited because of point sources of pollution, non-point sources of pollution, or both. In addition, pollutants can result from habitat alterations (e.g., riparian habitat loss) or hydrological modifications. Surface water quality problems are detailed in Utah's 303(d) list of impaired waters, as required by the Clean Water Act.

A full list of the streams and water bodies located within the Richfield Field Office (RFO) and listed on Utah's 2006 303(d) list of impaired waters is included in Table A4-1 and Table A4-2. Water bodies that received permit renewals between April 1, 2004, and March 31, 2006, are listed for pollutants that are not controlled through technology-based requirements or end-of-pipe requirements. With few exceptions, stream water bodies assessed as "partially supporting" or "not supporting" their beneficial uses are listed.

Total Maximum Daily Load (TMDL) reports and Water Quality Management Plans are discussed in the table footnotes. Of the six stream assessment units in Category 5A on the 2006 Utah 303(d) List of Impaired Waters, only Sevier River-6 is not included in a current TMDL plan. Lower Ivie, Peterson, and Lost Creeks were assessed for total dissolved solids (TDS) in TMDL plans that the Environmental Protection Agency (EPA) approved 1 to 2 years ago. TDS standards have been determined stream by stream for each of the three streams. They remain in Category 5A while water quality monitoring recalibrated in August 2004 is continued and analyzed to determine whether the new TDS standards are being met for each stream. East Fork Sevier-4 continues to be listed in Category 5A for total phosphorus, even though total phosphorus was included in a TMDL plan that the EPA approved more than a year ago. A Water Quality Management Plan has been approved for the San Pitch River. Of the four lakes and reservoirs in Category 5A on the 2006 Utah 303(d) list, only Piute Reservoir is not included in a current TMDL plan.

Table A4-1. Utah's 2006 303(d) List of Category 5A: Impaired River and Stream Assessment Units Requiring TMDL Analysis

Water Body Name	Water Body Description	Causes
East Fork Sevier River-4	East Fork Sevier River and tributaries from confluence with Sevier River upstream to Antimony Creek confluence, excluding Otter Creek and its tributaries	Temperature Total phosphorus
Lost Creek	Lost Creek and tributaries from confluence with Sevier River upstream about 6 miles	Total Dissolved Solids (TDS)
Sevier River-6	Sevier River from Clear Creek confluence to Hydrologic Unit Code (HUC) boundary	Temperature
Peterson Creek	Peterson Creek and tributaries from confluence with Sevier River to the United States Forest Service (USFS) boundary	TDS
Lower Ivie Creek	Ivie Creek and tributaries from confluence with Muddy Creek to U-10 highway	TDS

Water Body Name	Water Body Description	Causes
San Pitch River-5	San Pitch River and tributaries from beneficial U132 to Pleasant Creek confluence, excluding Cedar Creek, Oak Creek, Pleasant Creek, and Cottonwood Creek	Temperature
Lower Muddy Creek	Muddy Creek from confluence with Fremont River to Ivie Creek confluence	Selenium

Notes: All but one river and stream assessment unit listed in Table A4-1 are discussed in Water Quality Management Plans and/or TMDL reports that have been prepared for the Utah Division of Water Quality, the Utah Department of Environmental Quality, and the U.S. Environmental Protection Agency (EPA). Coverage is as follows:

1. Ivie Creek is discussed in the Price River, San Rafael River, and Muddy Creek TMDLs for Total Dissolved Solids, West Colorado Watershed Management Unit, Utah, January 2004, prepared by MFG, Inc., Fort Collins, Colorado.
2. Lost Creek and Peterson Creek are discussed in the Draft TMDL Water Quality Study of the Middle and Lower Sevier River Watershed, February 9, 2004, submitted by Tetra Tech, Inc., Water Resources and TMDL Center.
3. East Fork Sevier River 4 and its tributaries are rated a high priority for coverage in a TMDL report or Water Quality Management Plan prepared between 2004 and 2006. This is the only river or stream assessment unit listed in Table A4-1 that is not already covered in a draft or final TMDL report or Water Quality Management Plan.
4. San Pitch River is discussed in the San Pitch River Watershed Water Quality Management Plan, prepared by Millennium Science and Engineering and approved by the EPA November 18, 2004.

Table A4-2. Utah's Draft 2004 List of Category 5A—Lakes and Reservoirs Identified as Needing TMDL Analysis

Water Body Name	Water Body ID	Pollutant
Piute Reservoir	UT-L-16030001-011	Total phosphorus
Nine Mile Reservoir	UT-L-16030004-001	Total phosphorus Dissolved oxygen
Otter Creek Reservoir	UT-L-16030002-004	Total phosphorus
Koosharem Reservoir	UT-L-16030002-011	Total phosphorus

APPENDIX 5—LANDS AND REALTY

LAND TENURE ADJUSTMENT CRITERIA

Public lands must meet one or more of the criteria listed below before they can be considered for any form of land tenure adjustment (LTA), including Exchanges, State Indemnity Selection (in lieu of selections), State Grants, Desert Land Entry (DLE), Recreation and Public Purposes Act (R&PP) patents (except Section 203, 206, and 209 of the Federal Land Policy and Management Act [FLPMA] sales), within the Richfield Field Office (RFO) planning area:

1. The LTA is in the public interest and accommodates the needs of state, local, or private entities, including needs for the economy, community growth, and expansion, and are in accordance with other land use goals and objectives and Resource Management Plan (RMP) planning decisions.
2. The LTA results in a net gain of important and manageable resource values on public lands such as crucial wildlife habitat, significant cultural sites, high-value recreation areas, high-quality riparian areas, live water, threatened and endangered species habitat, or areas key to the maintenance of productive ecosystems.
3. The LTA ensures the accessibility of public lands in areas where access is needed and cannot otherwise be obtained.
4. The LTA is essential to allow effective management of public lands in areas where consolidation of ownership is necessary to meet resource management objectives.
5. The LTA results in the acquisition of lands that serve a national priority as identified in national policy directives.
6. In addition to the above criteria, all future land disposal actions will require a site-specific environmental analysis in accordance with the National Environmental Policy Act (NEPA) when an actual LTA action is proposed. A subsequent analysis may reveal resource conditions that could not be mitigated to the satisfaction of the authorized officer and may therefore preclude disposal.
7. All future LTAs must be in conformance with other goals and objectives in the field office RMP, which could preclude LTA. All LTAs will be subject to valid existing rights as determined by the authorized officer.

Public Water Reserve Total Acres: 12,230.77		

* Approximate acres based on 1981–82 Mountain Valley Planning Area Unit Resource Analysis (URA)
** Approximate acres based on Geographic Information Systems (GIS) extraction of Legacy Rehost 2000 data.

Segregative Effects:

Hanksville Administrative Site: Subject to valid existing rights; temporarily withdrew lands from settlement, sale, location, or entry under the general land laws, including the mining laws, but not leasing under the mineral leasing law.

Oil Shale E.O. 5327, 04/15/1930: Subject to valid existing rights; temporarily withdrew lands containing deposits of oil shale "from lease or other disposal." On 02/06/1933, Executive Order (EO) 6016 modified EO 5327 of 04/15/1930 "to the extent of authorizing issuance of oil and gas permits and leases under the general leasing act of 02/25/1920 (41 Stat. 437-451), for any of the lands withdrawn by said order."

Oil Shale E.O. 4522, 09/13/1968: Subject to valid existing rights; temporarily withdrew in part certain lands containing deposits of oil shale "from appropriation under the U.S. mining laws, relating to metalliferous minerals." Supplements but does not otherwise affect the withdrawal for oil shale made by E.O. 5327 of 04/15/1930.

Temporary Power Site Withdrawal No. 42 - 08/26/1909: Temporarily withdrawn from all forms of entry, selection, disposal, settlement, or location.

Federal Energy Regulatory Commission (FERC)–UTU-73084: Fremont Irrigation Company Application filed 03/04/1994. Order Issuing Preliminary Permit Issued 05/20/1994: Mill Meadow Hydropower Project No. P 11461; Federal Power Act, 16 U.S.C. 791(a)-825 (r). The filing of an application for a power

project with the FERC withdraws the lands covered by the application from the operation of the public land laws; however, the lands remain open to the location, lease, or disposal of the mineral estate. The issuance of a permit or license for a project by the FERC withdraws the lands from the operation of the mining laws (See part 3730).

FERC–UTU-73401: Magma Power Company Application filed 06/17/1994; amended on 07/05/1994; Amended Application accepted by FERC on 07/20/1994. Order Issuing Preliminary Permit Issued 10/20/1994: Big Mountain Modular Pumped Storage Project No. P 11489; Federal Power Act, 16 U.S.C. 791(a)-825 (r). The filing of an application for a power project with the FERC withdraws the lands covered by the application from the operation of the public land laws; however, the lands remain open to the location, lease, or disposal of the mineral estate. The issuance of a permit or license for a project by the FERC withdraws the lands from the operation of the mining laws (See part 3730).

E.O. of 03/29/1912, Public Water Reserve (PWR) No. 1: Public lands are withdrawn from settlement, location, selection, sale, or entry and reserved for public use, and all land within one quarter of a mile of every spring or water hole located on un-surveyed public land, and the same was withdrawn from settlement, location, sale, or entry and reserved for public use.

E.O. of 04/17/1926, PWR No. 107: In accordance with the provisions of Sec. 10 of the Act of 12/29/1916 (39 Stat. 862), and in aid of pending legislation, it was ordered that every smallest legal subdivision of the public land surveys that is vacant, unappropriated, unreserved public land and contains a spring or water hole, and all land within one quarter of a mile of every spring or water hole located on unsurveyed public land, and the same was thereby, withdrawn from settlement, location, sale, or entry and reserved for public use.

Table 5-8. Proposed Mineral Withdrawals and Areas Closed to Disposal, by Alternative

Alternative	Proposed Withdrawals		Closed to Disposal	
Alternative N (No Action)	N. Caineville Mesa Area of Critical Environmental Concern (ACEC)	2,200 ac	Wilderness Study Areas (WSAs)	446,900 ac

	Dirty Devil/North Wash ACEC*	47,400 ac	Badlands ACEC (outside WSA)	48,500 ac

Alternative	Proposed Withdrawals		Closed to Disposal	
	Fremont Gorge/Cockscomb ACEC*	4,500 ac	Bull Creek ACEC	4,800 ac
	Henry Mountains ACEC*	53,400 ac	Dirty Devil/ N. Wash ACEC (outside WSA)	74,600 ac
	Little Rockies ACEC*	11,200 ac	Fremont Gorge/Cockscomb ACEC (outside WSA)	31,500 ac
	Old Woman Front ACEC	300 ac	Henry Mountains ACEC (outside WSA)	158,200 ac
	Rainbow Hills ACEC	3,900 ac	Horseshoe Canyon ACEC (outside WSA)	3,100 ac
	Wild and Scenic River Corridors (outside ACEC withdrawals)	28,000 ac	Kingston Canyon ACEC	22,100 ac
			Little Rockies ACEC (outside WSA)	11,800 ac
			Lower Muddy Creek ACEC	16,200 ac
			Old Woman Front ACEC	300 ac
			Parker Mountain ACEC	107,900 ac
			Quitchupah ACEC	180 ac
			Rainbow Hills ACEC	4,000 ac
			Sevier Canyon ACEC	8,900 ac
			Thousand Lake Bench	500 ac
			W&S River corridors (outside WSAs and ACECs)	360 ac
	Alternative C Total	**176,500 ac**	**Alternative C Total**	**939,840 ac**

*Only portions of these ACECs are proposed for withdrawal from mineral entry.

Table 5-9. Designated Right-of-Way Corridors and Management Specifications – Proposed RMP and Alternatives A, C and D

Serial Number	Name and Type	Corridor Width (ft)
UTU-35442	PacifiCorp (Camp Williams-Sigurd #1) 345-kV Transmission Line	¼ mile each side of centerline
UTU-36797	PacifiCorp (Camp Williams-Sigurd #2) 345-kV Transmission Line	¼ mile each side of centerline
UTU-47994	Garkane Power (Sigurd-Koosharem/ Parker Mountain Substation) 138-kV Transmission Line	¼ mile each side of centerline
UTU-57063	PacifiCorp (Sigurd-Antimony/Arizona) 230-kV Transmission Line	¼ mile each side of centerline
UTU-36469	PacifiCorp (Emery County-Sigurd) 345-kV Transmission Line	¼ mile each side of centerline

Serial Number	Name and Type	Corridor Width (ft)
UTU-22141	PacifiCorp (Huntington-Sigurd) 345-kV Transmission Line	¼ mile each side of centerline
UTU-25670	PacifiCorp (Sigurd to Cedar City/Poverty Flat Area) 230-kV Transmission Line	¼ mile each side of centerline
UTU-081591	PacifiCorp (Sigurd-Sevier) 138-kV Transmission Line	¼ mile each side of centerline
UTU-54534	PacifiCorp (Utah to Nevada) 345-kV Transmission Line	¼ mile each side of centerline
UTU-42692	PacifiCorp (Nebo-Moroni) 138-kV Transmission Line	¼ mile each side of centerline
UTU-14023	PacifiCorp (Sigurd-Nevada State Line) 230-kV Transmission Line	¼ mile each side of centerline
UTU-10657	PacifiCorp (Salt Lake-San Juan County) 345-kV Transmission Line	¼ mile each side of centerline
UTU-60034	Questar (Indianola-Cedar City, Utah) 4",6",8",10" Diameter Buried Natural Gas Line	¼ mile each side of centerline
UTU-0110883 UTU-8966 UTU-059061	Interstate 70	400' each side of centerline
UTU-65090 SL-071443	U.S. Highway 50	400' each side of centerline
UTU-0133352 UTU-0053116 UTU-12035	U.S. Highway 89	400' each side of centerline
SL-0062873 SL-0062677	State Highway 10	400' each side of centerline
UTU-013504 SL-063829 SL-062996 SL-052444 SL-052391 SL-052445 SL-0062023	State Highway 24 (Proposed RMP, Alternatives A and C only)	400' each side of centerline
SL-052391	State Highway 25	400' each side of centerline
SL-051932	State Highway 28	400' each side of centerline
UTU-059936 UTU-036663 SL-067357	State Highway 62 (Proposed RMP Alternatives A and C only)	400' each side of centerline
SL-0062804 UTU-004057	State Highway 119	400' each side of centerline
SL-0062891 UTU-019925 SL-067882	State Highway 132	400' each side of centerline

Serial Number	Name and Type	Corridor Width (ft)
UTU-44286	State Highway 153	400' each side of centerline
UTU-0147162	State Highway 95 (To Hite Crossing) (Proposed RMP, Alternatives A and C only)	400' each side of centerline
UTU-1088	State Highway 276 (To Bullfrog) (Proposed RMP, Alternatives A and C only)	400' each side of centerline

All right-of-way (ROW) corridors listed above (Table 5-9) would be managed with the following conditions of use:

1. The road or highway within the ROW corridor would be used to the maximum extent possible for construction and maintenance of new ROWs.
2. Whenever feasible, compatible facilities (e.g., roads, pipeline, and telephone lines) would be located within or adjacent to existing ROW areas.
3. To the maximum extent possible, roads needed for construction of a new ROW would be temporary and fully rehabilitated once construction is completed. When possible, existing transmission line access roads would be used. If a road is needed for long-term operation and maintenance, it must be specifically authorized by a ROW.
4. All land disturbed by new ROWs, except authorized new access roads, would be rehabilitated to as close to natural conditions as possible.
5. Transmission line ROWs would be located adjacent to each other or as close as possible as allowed under utility standards for safety and reliability.
6. Where feasible, buried telephone and fiber optic cable lines would be close to existing roads and highways and generally within the road ROW area.
7. All ROWs must comply with the applicable visual resource management (VRM) classification objectives.
8. Existing major ROWs noted in Table 5-9, shall be recognized as designated corridors. New ROWs would be restricted to within or adjacent to these corridors whenever feasible. New ROWs proposed within or adjacent to segments of corridors that are located within special designations (e.g., ACECs, WSAs, and wild and scenic rivers [WSRs]), would comply with requirements of the relevant designation.

NOTE: Section 368 of the Energy Policy Act of 2005 (designation of West-wide energy corridors) is being implemented through the current development of an interagency programmatic environmental impact statement (PEIS). The PEIS will address numerous energy corridor related issues, including the utilization of existing corridors (enhancements and upgrades), identification of new corridors, supply and demand considerations, and compatibility with other corridor and project planning efforts. It is likely that the identification of corridors in the PEIS will affect the RFO, and the decisions in the approved PEIS will be carried forward into the Richfield Approved RMP. Thus, additional corridors not identified in Table 5-9 could be designated.

APPENDIX 6—WILDLAND FIRE MANAGEMENT

GENERAL RISK CATEGORIES

General Risk Category A

Category A includes areas where fire is not desired at any time and where mitigation and suppression are required to prevent direct threats to life or property. In addition, Category A includes areas where fire has never played a major role historically in the development and maintenance of the ecosystem (e.g., vegetative communities such as blackbrush ecosystems and shadscale ecosystems), and some areas where fire return intervals were very long (such as spruce communities). Other examples are very mesic sites and very xeric sites.

Emphasis will be placed on those actions that will reduce unwanted ignitions and reduce losses from unwanted wildland fires.

Emphasis will be placed on prevention, detection, and rapid suppression response and techniques. Non-fire fuel treatments will be used.

General Risk Category B

Category B includes areas where wildland fire is not desired because of current conditions. It includes areas where fire may naturally have performed an important role in the ecosystem function, but because of current resource concerns and potentially high economic impacts from unplanned ignitions (including in some wildland/urban interface areas), considerable constraints and mitigation measures are required. Sagebrush ecosystems, for example, can fall into this category because of encroachment of cheatgrass or a prolonged lack of fire that leads to large monotypic stands of sagebrush that will not burn as they would have historically.

The appropriate management response is usually aggressive suppression response and techniques.

Response will emphasize prevention and mitigation programs that reduce unwanted fire ignitions and resource threats.

Fuels reduction is a major means of mitigating the potential risks and losses. Fire and non-fire fuels treatments are used to reduce the hazardous effects of wildfire. Prescribed fire projects are often complex and costly because of stringent contingency planning. Hazardous fuel treatments may consist of multiple non-fire treatments before fire will be used.

General Risk Category C

Category C includes areas where wildland fire use is desired, but significant constraints must be considered for its use. Ecological, social, or political constraints must be considered prior to wildland fire use. These constraints could include air quality, threatened and endangered species considerations (e.g., effect of fire on survival of species), or wildlife habitat considerations. Resource considerations will be described for each Fire Management Unit in the annual update of the Fire Management Plan.

In multiple wildland fire situations, Category C areas would generally receive lower suppression priority than category A or B areas.

Fire and non-fire fuels treatments will be used to reduce the hazardous effects of wildland fire. Prescribed fire treatments for hazard reduction are a lower priority than in the category A or B areas.

General Risk Category D

Category D includes areas where wildland fire use is desired, and there are few or no constraints. In these areas, fire is an integral component in maintaining or achieving the desired vegetative condition for affected lands, and there are fewer mitigation requirements or resource constraints. Wildland fires may be managed to meet resource management objectives under an approved Fire Management Plan.

Areas in this category would have the lowest suppression priority in a multiple fire situation.

There is generally less need for hazardous fuel treatments in Category D areas. If treatment is necessary, however, all fire management activities may be used.

FIRE ECOLOGY OF MAJOR COVER TYPES

The way in which fire affects vegetation is an important component of this appendix; it is that direct relationship that influences many of the effects on other resources. The existing vegetation communities reflect evolutionary processes, natural disturbance, recent climatic trends and patterns, historic fire management, (e.g., suppression), and other land use practices (e.g., livestock grazing) that directly affect fuel loading, community composition (e.g., invasive concerns such as cheatgrass, knapweeds, tall peppergrass), and fire return intervals.

Historically, fire played an essential role in the landscape that helped define species composition, structure, and productivity (Bradley et al. 1992, Paysen et al. 2000). Therefore, many plants that make up these communities are adapted to withstand wildfire through a variety of anatomical or physiological mechanisms. However, over the past century, aggressive fire suppression efforts, introduction of exotics (e.g., cheatgrass), juniper encroachment, and some land management practices have altered the fire ecology and dynamics of successional processes across the Richfield Field Office (RFO). Therefore, current-day fire return intervals for many vegetation communities have changed in comparison with historic patterns because of a drastic decrease in fire occurrence and size (Brown 2000). Understanding the fire ecology of the major vegetation cover types is important to reintroducing wildland fire into the environment and restoring natural fire regimes, as well as to understanding the impacts from the proposed decisions. The remainder of this appendix addresses the fire ecology of the dominant vegetation cover types in the RFO.

Desert Shrub

Desert shrub composes nearly half of the vegetation acreage of the RFO, including most of the lower elevation public lands east of Capitol Reef National Park. Located primarily on the valley floors, this vegetation community is most common on well-drained, sandy to rocky soils; however, it can tolerate saline and alkaline soils. Desert shrub is characterized by salt-tolerant succulent shrubs including greasewood, seepweed, ephedra, shadscale, four-wing saltbush blackbrush, and threadleaf rubber rabbitbrush. A single or a few species dominate large areas, creating homogeneous landscapes. There is very sparse vegetation in the interspaces in intact native communities. Biological crusts are usually present and cover most of the interspaces between shrubs in intact, native species-dominated salt desert shrub communities. Cheatgrass expansion into this vegetation type poses a serious threat because it provides a continuous understory of fine fuel and reduces fire return intervals in otherwise non-fire-adapted communities.

Fire Ecology

The desert shrub community is not a fire-adapted community because most shrub species are fire sensitive. Even low-intensity fires can kill most species because most do not resprout or resprout weakly. A lack of continuous cover (e.g., fuels) has made historic fire rare to non-existent. Historically, these communities did not burn often enough or in large enough patches to support dominance of fire-adapted plants. Saltbush communities, however, are considered fire tolerant primarily because saltbush and many of its grass associates resprout vigorously and recover quickly (Evers 1998). In areas with a high percentage of cover of desert grasses, low-intensity fires may have been more common than in more shrub-dominated areas.

Fires in blackbrush were historically infrequent, and this vegetation community is characterized by Fire Regime V and Condition Class 2. This ecosystem is at moderate risk of losing key ecosystem components because of fire.

Recent experience on Utah Bureau of Land Management (BLM) land has shown that blackbrush does not respond favorably to fire. In addition, most of the blackbrush in Utah has suffered substantial dieback because of recent ongoing drought conditions. Burning has promoted succession to grassland by destroying the biological crust that stabilizes the soil. The biological crust provides important soil microflora apparently required for blackbrush survival or reestablishment (Paysen et al. 2000). Frequent large fires can be problematic from a management standpoint because recovery can take more than four decades or, in some cases, not occur at all (Wright and Bailey 1982, Paysen et al. 2000). Fire frequently destroys blackbrush seed banks and mature shrubs.

Fire frequency in the desert shrub communities has been estimated at 35 to more than 300 years for the desert shrub vegetation type (USDA Forest Service 2004). Because of the risk of losing key ecosystem components and greatly increased fire regimes as invasive annual grasses (e.g., cheatgrass) dominate, desert shrub is typically classified as Fire Regime Condition Class 3.

Pinyon-Juniper

Pinyon-juniper woodlands make up more than 25 percent of the vegetation cover in the RFO. It is estimated that pinyon and juniper woodlands have increased 10-fold over the past 130 years throughout the Intermountain West (Miller and Tausch 2001). Forest Inventory and Analysis data collected in the RFO revealed that more than 67 percent of identified plots had a stand age of less than 150 years. Throughout the RFO, this age discrepancy is indicative of juniper woodland expansion to more than 60 percent of its historic range. This expansion is largely a result of historic fire suppression in range communities, primarily grasslands and sagebrush, as well as a reduction of fine fuels that allowed fire to regularly remove young trees from grass/sagebrush ecosystems.

Juniper is considered a climax species for a number of pinyon-juniper, sagebrush steppe, and shrub steppe habitats. Old-growth pinyon-juniper is often restricted to fire-safe habitats, e.g., steep, dissected, and rocky terrain. Old-growth pinyon-juniper can be characterized by large trees, the presence of extensive dead woody material, increased number of canopy layers, rounded canopies, large lower limbs, and large, irregularly shaped and deeply furrowed trunks (Miller et. al. 1999, Miller & Rose 1999).

Pinyon-juniper stands that are most likely to burn are characterized by small, scattered trees with abundant herbaceous fuel between the trees, or dense, mature trees capable of carrying crown fire during dry, windy conditions. Stands of moderate tree density, where overstory competition reduces the herbaceous fuel, and the trees are more widely spaced, are unlikely to burn. Closed pinyon-juniper stands do not have understory shrubs to carry a surface fire, and do not burn until conditions are met to carry a

crown fire. Trees taller than four feet in open pinyon-juniper stands are difficult to kill unless there are heavy accumulations of fine fuel beneath the trees. Because of the lack of undergrowth to act as fuel on dry sites, fire may never have been as important an influence as climatic fluctuations in governing the rate of tree replacement of shrubland or grassland. Moister, more productive sites probably have had more extensive and frequent fires when drought periods occurred. The steady increase in crown fuels has allowed burning through areas with deep soils (formerly sagebrush communities) at higher than normal intensities. These sites have never experienced such intensities and therefore are not adapted to this new fire regime.

Fire Ecology

Most of the area where pinyon-juniper currently dominates was historically characterized by fires burning every 15 to 50 years (Miller and Tausch 2001). Pinyon-juniper in Utah is typically described by Condition Class 2 (elevations greater than 7,000 feet) or 3 (elevations less than 7,000 feet). Areas of Condition Class 3 are characterized by dense stands of pinyon-juniper, scarce understory, and high potential for cheatgrass invasion following fire. Condition Class 2 areas have encroaching pinyon-juniper but are less dense than Condition Class 3 and are at less risk of cheatgrass invasion following fire. Areas of old-growth pinyon-juniper have experienced fire frequencies of 200 to more than 300 years (Goodrich and Barber 1999) and would be classified as Fire Regime V. However, this old-growth component is estimated to be less than 10 percent of the current area classified as pinyon-juniper (Miller and Tausch 2001).

Surface fires readily kill thin-barked young pinyon and juniper trees and have been relatively frequent historically in areas on which juniper has now encroached. It is generally agreed that fire was the most important natural disturbance that impacted the distribution of juniper and/or pinyon-juniper woodlands before the introduction of livestock in the 19th century (Miller and Rose 1999). Burkhardt and Tisdale (1976) concluded that fire frequencies of 30 to 40 years would control juniper expansion into mountain big sagebrush communities.

Sagebrush

Sagebrush cover types compose about 16 percent of the RFO. Historically (e.g., presettlement) sagebrush steppe is estimated to have dominated as much as 30 percent of the RFO. Sagebrush has been lost because of juniper encroachment, historical seedings for forage production (e.g., crested wheatgrass), and cheatgrass conversion.

Because seral diversity applies to sagebrush, a considerable portion of the acreage listed under perennial grasslands (native) and areas with recent sagebrush seedings may be considered as representing the early seral component of sagebrush communities. Healthy sagebrush is a patchwork mosaic of seral communities that range from recovering perennial grass-shrublands following natural fire, to old growth, decadent sagebrush steppe with high canopy cover and reduced herbaceous understory. In the past 100 years, the extent of sagebrush has been greatly reduced because of conversion to irrigated agriculture, livestock grazing, juniper encroachment, cheatgrass conversion, and the deliberate eradication of sagebrush for range improvement.

Low-elevation sagebrush, generally found below 6,500 feet, is dominated by basin big sagebrush and Wyoming big sagebrush. Mid-elevation sagebrush occurs at mid to high elevations (greater than 7,000 feet), is characterized by dominance of mountain big sagebrush, and appears less vulnerable to conversion to annual grasslands than low-elevation shrub steppe. On the other hand, mid-elevation sagebrush steppe is more vulnerable to encroachment of juniper as a result of fire suppression compared with lower-elevation sagebrush. Grass and forb species associated with these low- and mid-elevation sagebrush

communities assist with the spread of fire. When domestic livestock are heavily grazed in sagebrush communities, the understory becomes sparse and can prevent the spread of fire. Ignition probabilities have also declined substantially because of the lack of fine grass fuels.

Fire Ecology

Fire frequency in sagebrush varies for the different sagebrush species but is considered to be between 10 and 110 years depending on precipitation, elevation, and sagebrush species. Presettlement stand-replacing fire frequencies for low-elevation sagebrush are estimated to vary from 60 to 110 years (Whisenant 1990, Peters and Bunting 1994). For mountain big sagebrush, presettlement stand-replacing fire frequencies have been estimated to vary between 10 and 25 years (Houston 1973, Harniss and Murray 1973). Wyoming sagebrush communities burned about every 40 years. Sagebrush is considered to be in Condition Class 2 if it is above 6,500 feet and Condition Class 3 if it is below 6,500 feet because of the high risk of losing key ecosystem components resulting from cheatgrass invasion following fire.

The cold-desert climate, with cold, wet-to-dry winters and springs, and dry, hot summers predispose sagebrush communities to an evolutionary history with recurring fire. Wright et al. (1979) surmised that the interval between fires must have been sufficiently long for big sagebrush, which does not resprout and recolonizes from seeds, to regain dominance.

Most sagebrush species do not sprout after fire, and most plants are killed by low- to high-intensity fires. This is true of all three subspecies of big sagebrush common throughout the RFO. Generally, the herbaceous understory composition does not determine the intensity and severity of wildland fires; sagebrush itself is the primary fire carrier. The high canopy cover associated with late mature sagebrush stands likely facilitated stand-replacing fires historically. However, the prefire understory is an important determinant of post-fire response. Because sagebrush seeds generally are not transported far from the parent, unburned areas within large burn areas are often the most important source of seed material for natural recruitment and reestablishment of sagebrush.

Grassland

Grasslands in the RFO include native perennial grasslands and seedings of native species and exotic perennial grasses, primarily crested wheatgrass; and some cheatgrass is classified as grassland. Cheatgrass is discussed more extensively below.

Crested wheatgrass-dominated grasslands are the deliberate result of historic range improvement projects and post-fire seedings. Other perennial grasslands have expanded in portions of the RFO as a result of the eradication of shrubs, especially sagebrush species or by wildland fires on relatively good condition rangelands where cheatgrass did not invade or does not dominate. Native perennial grasslands are an intermediate successional stage that would eventually return to a diverse sagebrush steppe habitat if allowed to recover for extended periods (e.g., 20 to 70 years) without impacts from wildland fires. Native perennial grass species include Idaho fescue, bluebunch wheatgrass, needlegrass, grama grass, and Indian ricegrass.

Perennial grasslands dominated by crested wheatgrass and/or other non-native species are stable communities that do not trend toward recovery to sagebrush steppe habitat as quickly as native perennial grasslands. Historically, native perennial grasslands would have formed part of the seral mosaic of the sagebrush steppe habitat, although it is unclear how widespread they once may have been across the landscape.

Fire Ecology

Because native grasslands are often seral to sagebrush, fire regimes are similar. Perennial grasses respond vigorously to fires of various intensities by resprouting from basal growing points. The primary determinant of fire response in native perennial grasslands is fire residence time. Fast, high-intensity fires have a short residence time and seldom cause substantial mortality to native perennial bunchgrasses. Slow backing fires have a longer residence time and greater severity; mortality to native perennial bunchgrasses may be high under these conditions. With most natural ignitions, the predominant fire spread would be as a fast moving head fire.

Mountain Shrub

Mountain shrub occupies about 2 percent of the RFO and occurs as a transition vegetation type between mid-elevation sagebrush and conifer vegetation types. This cover type is found at moderately high elevations (7,000–8,500 ft.). Mountain shrub is usually found on north and east slopes that tend to be cooler and moister than south and west aspects. Mountain shrub is a highly diverse community: Gambel oak, chokecherry, serviceberry, currant, mountain snowberry, elderberry, and mountain sagebrush. With its characteristically high productivity and diverse herbaceous understory, it provides important biodiversity, wildlife habitat, and protective ground cover to the ecosystem.

The range of most mountain shrub species has been shrinking as a result of fire exclusion and overgrazing by ungulates. Pinyon-juniper and sagebrush have encroached into sites where fires would have historically prevented their spread into the mountain shrub community. The range of Gambel oak, however, is estimated to be greater today than it was historically (Brown 1958, Christensen 1949, Christensen 1957).

Fire Ecology

Stand-replacing fire frequency ranges from 25 to 100 years in mountain shrub (Loope and Gruell 1973), although return intervals may vary widely with changes in elevation, aspect, site moisture, and the associated forest or woodland type. Fire regimes in mountain shrub cover types vary depending on the dominant species. Condition classes also vary depending on the dominant species, although most mountain shrub communities are in Condition Class 2 because of some missed fire return intervals, moderate risk of losing key ecosystem components, and moderately altered vegetation attributes. However, some mountain shrub communities at lower elevations (below 6,500 feet) are classified as Condition Class 3 because of their high risk of cheatgrass invasion following fire.

All species of mountain shrubs resprout after fire except mountain sagebrush. Mountain shrub communities generally recover rapidly following wildland fire and are considered to be fire tolerant.

Ponderosa Pine

Ponderosa pine occupies less than 2 percent of the RFO, mainly located in the Henry Mountains. Ponderosa pine communities are naturally characterized by an open, savannah-like appearance in which widely spaced large trees are present with open understories that are periodically cleared by low-intensity ground-fires.

Historically, frequent low-severity fire probably restricted the accumulation of large downed woody fuels. Fine fuels (e.g., grasses and needles) were the medium through which historical fires spread because most large fuels (e.g., limbs and trunks) would have been consumed by the frequent fires. Historic land management practices, along with fire exclusion, have created stand conditions that were rare or non-existent prior to European settlement. The absence of disturbance has encouraged a conversion to a higher

proportion of shade-tolerant species such as Douglas fir and white fir. These stands are in the mid- to mature-age classes, overly dense, and more susceptible to insect and disease epidemics (Fule et al. 1997). The steady accumulation of tree biomass has contributed to progressively declining herbaceous productivity. Ladder fuels are well developed and contribute to unwanted wildland fires outside the historical range of intensity and severity.

Fire Ecology

Mature ponderosa pines have thick bark, which protects them from serious damage from surface fires. It is considered to be the most fire-adapted conifer in the west (Bradley et al. 1992). Fire frequency for ponderosa pine communities ranges from 10 to 40 years, with low- to mixed-severity (USDA Forest Service 2004) fires. Ponderosa pine forests in the RFO are classified as Fire Regime I and Condition Class 3. These forests have typically missed up 5 to 10 fire cycles in the years of fire suppression and are at risk of stand-replacing canopy fires.

Mixed Conifer

Major forest community types of mixed conifer include Douglas fir, Engelmann spruce, and sub-alpine fir. These communities occupy more than 1 percent of the RFO and generally occur at elevations above 7,000 feet. These forest types do, however, have a high value for recreation, aesthetics, and special and status species habitat. Forest composition varies with elevation, exposure, and latitude. Fire frequency varies with summer dryness and lightning occurrence and also depends on slope, aspect, elevation, and natural fire barriers.

Because of selective logging practices over the last 100 years, favoring the removal of ponderosa pine and Douglas fir, and fire exclusion, these stands are now dense and even-aged. Once adapted to a more frequent fire regime, they are now predisposed to endure high-intensity fires from the development of ground and ladder fuels. Stand-replacing fires outside the historical range of intensity and severity are likely. Closed stands with dense Douglas fir understories present the highest fire hazard. Stands may have large amounts of downed twigs and small branchwood. Dense overstory trees and the presence of dead branches near the ground create a crown fire potential under severe burning conditions.

Fire Ecology

Fire frequencies range from 100 to 300 years, and these forests are often characterized by a combination of understory and complete stand-replacement fire regimes (Arno 2000). Because of the longer historic fire return intervals and well-functioning vegetation attributes, mixed conifer is classified as Condition Class 1 when associated with Fire Regime IV and Condition Class 2 when associated with Fire Regime III.

This mixed severity fire regime often results in a mosaic pattern of stand structure and fuels. Past stand burn mosaics tend to increase the probability that subsequent fires will also burn in a mixed pattern (Arno 2000). Dead woody fuels accumulate on the ground, often in a haphazard manner, and the greatest fuel loadings tend to occur on the most productive sites, which are predominantly stand-replacement fire regimes.

Aspen

Aspen-dominated communities occupy less than 1 percent of the RFO. Aspen communities can be climax or seral to conifer communities (e.g., Douglas fir) and are found between elevations of 6,500 feet and 10,500 feet. Aspen occurs as pure stands or in association with various conifers. Although conifer invasion is a natural pattern in many aspen stands, because of long-term fire suppression throughout the

RFO, it has resulted in increased representation and dominance by conifer in aspen stands, thus reducing the extent of aspen-dominated stands (Mueggler 1989). The absence of fire, coupled with excessive browsing of young aspen trees by livestock and wildlife, has led to rapid replacement of aspen communities by conifer forests (Bartos 1998). However, the presence of conifers does increase aspen stand flammability and therefore may be essential to carrying the fire to regenerate aspen on the site. Brown and Simmerman (1986) found that livestock grazing reduces fine fuels so that fire intensity and rates of spread may be as low as one-tenth that of ungrazed stands.

Areas with small amounts of aspen in a stand may indicate that the area was once dominated by aspen (Bartos and Campbell 1998). Throughout national forests in Utah, including the adjacent Fishlake National Forest, aspen-dominated landscapes have declined by about 60 percent (Bartos and Campbell 1998). Aspen in the RFO, either adjacent to Forest Service land or in the Henry Mountains, is intermingled with and adjacent to stands of mixed conifer stands. Conditions noted throughout Utah are not expected to be different than those in the RFO.

Fire Ecology

Fire frequencies range between 25 and 100 years with mixed severity (Loope and Gruell 1973). Aspen is characterized by Fire Regime IV and Condition Class 2. Fire regimes have been moderately altered, and vegetation structure has been moderately altered from the historical.

Pure stands of aspen are particularly susceptible to mortality of above-ground stems from fire of low intensity, even though aspen is well adapted to regeneration by sprouting after fire (Jones and DeByle 1985). Aspen stands do not easily burn and often act as natural fuel breaks during wildland fires. Fires in young aspen stands tend to be low-intensity surface fires unless there is a great deal of understory fuel. In older stands, during the warmest and/or driest months of the year, abundant fuel can lead to higher intensity fires.

Riparian/Wetland

Riparian areas occupy only a small portion of the overall landscape (less than 1 percent of the RFO), typically in narrow stringer communities along both sides of the rivers and streams and adjacent to springs. Native tree communities may be dominated by Fremont or narrowleaf cottonwoods with understories of shrubs (such as sandbar, whiplash, and Booth's willows) and herbaceous species.

Invasive species, such as tamarisk, tall whitetop, and Russian olive, along with greasewood, have become well established in the riparian communities and are slowly replacing the native vegetation across much of Utah.

Fire Ecology

Fremont cottonwood communities are characterized by a late seral stage (e.g., all mature to late-mature trees) with little or no representation of younger age-classes and are not typically fire adapted. Narrowleaf cottonwood is a somewhat fire-adapted species that may resprout from roots, provided the stands are not decadent and occur in areas where the water table remains reasonably high throughout the growing season. Willow species typically sprout vigorously following a fast-moving fire. Slow-moving fires are generally more damaging, presumably because of greater heat transfer to root crowns.

Although many riparian species may resprout following a fire, this community is not considered a fire-dependent ecosystem. Historically, fire in these riparian communities would have been infrequent, and vary from small size, with highly mosaic burn patterns as a result of the higher moisture content generally present in riparian areas/species, to stand-replacing burns likely to have occurred only in extreme drought

periods. These riparian communities are classified as Fire Regime IV, with most areas presently in Condition Classes 2 and 3. Lower elevation riparian areas would be in Condition Class 3 because of the higher incidence and potential of invasive species.

Cheatgrass

The effects of cheatgrass on fire ecology raise the importance of addressing it in this appendix. Introduced from Eurasia in the late 1800s (USDA Forest Service 2004), cheatgrass is an opportunistic winter annual that germinates anytime between autumn and spring when temperatures and soil moisture are suitable. It outcompetes native grasses that grow dormant through winter and are slower to develop in the spring. This exotic species may be present in relatively undisturbed plant communities but easily becomes dominant if a site is disturbed. Cheatgrass has been less successful in dominating sites that are above elevations of 7,000 feet, but there are known populations of cheatgrass at higher elevations.

Fire Ecology

The establishment of cheatgrass fosters much more frequent fire return intervals. Shortened natural/historical fire rotations impact perennial vegetation by killing the tops of the plants and allowing little time (e.g., few growing seasons) between recurrent fires. However, the fire regime of cheatgrass-dominated sites is the historical fire regime of that site before it was invaded by cheatgrass. For example, where cheatgrass has invaded a salt desert scrub community, the fire regime would be Fire Regime V. Wherever cheatgrass threatens to dominate the landscape, the vegetation type is managed as Condition Class 3 because of the potential for loss of key ecosystem components (e.g., native species).

The presence of cheatgrass in a wildland community extends the time during which the community is susceptible to wildland fire ignitions. In the summer, cheatgrass dries out 4 to 6 weeks earlier than perennial grasses and forms a fine-textured, highly flammable fuel. Cheatgrass may also be susceptible to fire one to two months longer in the fall because perennial grasses may green up following periods of moisture in the autumn (Paysen et. al. 2000).

Note:
1) Changes in the Wild Horse and Burro management alternatives cause this figure to vary by alternative. The numbers shown represent the Proposed RMP. For the Robbers Roost Allotment in Alternative C and D, 1,200 AUMs would be allocated to wild burros, 1,826 AUMs would be allocated to wildlife, and 100 AUMs would be allocated to management. That would change the total Active AUM allocations in Alternative C as follows: Wildlife: 32,445; Burros: 1,200; Management: 475. There would be no change in livestock or bison allocations from these changes.

APPENDIX 8—COAL RESOURCES WITHIN THE RICHFIELD PLANNING AREA

This appendix includes four documents that address coal resources within the Richfield planning area:

1. Coal Resource Evaluation of the Henry Mountains Coal Field, July 2004
2. Coal Resources of the BLM Richfield Planning Area, July 2003
3. Coal Unsuitability Report, Henry Mountains Coal Field (draft), March 2005
4. Coal Unsuitability Report, Wasatch Plateau and Emery Coal Fields (draft), March 2005

Federal regulations provide detailed guidance for addressing coal resources in Bureau of Land Management (BLM) land use planning under 43 Code of Federal Regulation (CFR) 3400, 30 CFR 700, and elsewhere. These regulations are addressed in the Richfield Proposed Resource Management Plan (RMP)/Final Environmental Impact Statement (FEIS), summarized in Table A8-1, and detailed in the attached reports.

Table A8-1. Federal Regulations Related to Coal

Topic	Federal Regulations (30 and 43 CFR)	Richfield PRMP/FEIS
General Direction for Coal in Land Use Planning	43 CFR 3420.1-4 (a) The Secretary may not hold a lease sale under this part unless the lands containing the coal deposits are included in a comprehensive land use plan. 43 CFR 3420.1-4 (d) A comprehensive land use plan…shall contain an estimate of the amount of coal recoverable by either surface or underground means or both.	The two coal resource evaluations included in this appendix identify lands containing coal deposits, including estimates of the amount of coal recoverable by surface and underground means.
Call for Coal Resource Information	43 CFR 3420.1-2 (a) Prior to or as part of the initiation of a land use plan…a Call for Coal Resource Information shall be made to formally solicit indications of interest and information on coal resource development potential and on other resources which may be affected by coal development…	A "*Call for Coal Resource and Other Resource Information for Public Lands in Garfield, Piute, Sanpete, Sevier, and Wayne Counties, Utah*" was published in the Federal Register on May 2, 2003. During the 30-day comment period, two responses were received, one from the State of Utah School and Institutional Lands Administration and the other from the State of Utah Division of Oil, Gas and Mining.
Coal Screening Process	43 CFR 3420.1-4 (e) The major land use planning decision concerning the coal resource shall be the identification of areas acceptable for further leasing which shall be identified by the [four step] screening process below:	

Topic	Federal Regulations (30 and 43 CFR)	Richfield PRMP/FEIS
Coal Screening Process Step 1: Coal Report	43 CFR 3420.1-4 (e) (1) Only those areas that have development potential may be identified as acceptable for further consideration. The [BLM] shall estimate coal development potential… Where such information is determined to indicate development potential for an area, the area may be included in the land use planning evaluation for coal leasing.	A coal resource evaluation for the Richfield Field Office (RFO) was completed in June 2003. A coal resource evaluation for the Henry Mountain coal field was completed and signed in September 2004. Estimates of amounts of coal recoverable by surface and underground mining are included in the evaluations.
Coal Screening Process Step 2: Coal Unsuitability	43 CFR 3420.1-4 (e) (2) The [BLM] or the surface managing agency conducting the land use planning shall, using the unsuitability criteria and procedures set out in subpart 3461 of this title, review Federal lands to assess where there are areas unsuitable for all or stipulated methods of mining… (The unsuitability criteria are listed under 43 CFR 3461.5.)	Draft unsuitability reports for the Wasatch Plateau and Emery and Henry Mountains coal fields, developed in consultation with the U.S. Fish and Wildlife Service (USFWS), the U.S. Forest Service (USFS), and the State of Utah, are included in this appendix. The public is invited to comment on these reports at this time. Following an analysis of comments, final unsuitability reports will be included in the final Environmental Impact Statement (EIS).
Disclosure of Application of Unsuitability Criteria in the RMP.	43 CFR 3461.2-1 (b) (1) The authorized officer shall describe in the comprehensive land use plan…the results of the application of each unsuitability criteria, exception and exemption [and]…shall state…those areas which could be leased only subject to conditions or stipulations to conform to the application of the criteria or exceptions. Such areas may be ultimately leased provided that these conditions or stipulations are contained in the lease.	The application of the unsuitability criteria is described in the unsuitability reports.
Public Comment on Unsuitability	43 CFR 3461.2-1 (a) (2) Public comments on the application of the unsuitability criteria shall be solicited by a notice published in the Federal Register. This call for comments may be part of the call for public comments on the draft land-use or land-use analysis.	The Notice of Availability for the Draft Resource Management Plan and Draft Environmental Impact Statement includes this statement on the unsuitability analysis: "The application of the Federal coal unsuitability criteria to the Henry Mountain and Emery coal fields is included in Appendix D of the draft environmental impact statement. As required by 43 CFR 3461.2-1(a) (2), the public is invited to comment on the results of the application of the criteria and the application process used. The criteria are listed under 43 CFR 3461.5."
Adequacy of Data Used in Unsuitability Determinations	43 CFR 3461.2-2 (b) (2) …The comprehensive land use plan…shall include an indication of the adequacy and reliability of the data involved…	Draft unsuitability determinations were made in consultation with the USFWS, USFS, and the State of Utah. They are now open for public comment.

Topic	Federal Regulations (30 and 43 CFR)	Richfield PRMP/FEIS
Revising the Unsuitability Determinations After the RMP Is Approved	43 CFR 3461.2-2 (c) Any unsuitability assessments which result from either a designation or a termination of a designation of Federal lands as unsuitable by the Office of Surface Mining Reclamation and Enforcement, or from changes warranted by additional data acquired in the activity planning process, may be made without formally revising the comprehensive land use plan…	This topic is outside the scope of the RMP.
Petition Process for Unsuitability	30 CFR 769.11 Any person having an interest which is or may be adversely affected by surface coal mining operations to be conducted on Federal lands may petition the Secretary to have an area designated as unsuitable for all or certain types of surface coal mining operations, or to have an existing designation terminated… For the purpose of this section, a person having an interest which is or may be adversely affected must demonstrate how he or she meets an "injury in fact" test by describing the injury to his or her specific interests and demonstrate how he or she is among the injured.	This topic is outside the scope of the RMP.
Coal Screening Process Step 3: Multiple Use Analysis	43 CFR 3420.1 (3) Multiple land use decisions shall be made which may eliminate additional coal deposits from further consideration for leasing to protect other resource values and land uses that are locally, regionally, or nationally important or unique and that are not included in the unsuitability criteria… Such values and uses include, but are not limited to, those identified in section 522(a)(3) of the Surface Mining Reclamation and Control Act of 1977 and as defined in 30 CFR 762.51. In making these multiple use decisions, the [BLM] or the surface managing agency conducting the land use planning shall place particular emphasis on protecting the following: Air and water quality; wetlands, riparian areas and sole-source aquifers; the Federal lands which, if leased, would adversely affect units of the National Park System, the National Wildlife Refuge System, the National System of Trails, and the National Wild and Scenic Rivers System.	This step will be completed if and when there is interest in coal leasing. The USFS will complete this analysis for the national forest lands in its land use planning process.

Topic	Federal Regulations (30 and 43 CFR)	Richfield PRMP/FEIS
Coal Screening Process Step 4: Consultation With Other Surface Owners	43 CFR 3420.1-5 (4) (i) While preparing a comprehensive land use plan or land use analysis, the [BLM] shall consult with all surface owners who meet the criteria in paragraphs (gg) (1) and (2) of 3400.0-5 of this title, and whose lands overlie coal deposits, to determine preference for or against mining by other than underground methods.	This step will be completed if and when there is interest in coal leasing.
Hearing Requirements	3420.1-5 After public notice, the [BLM] or other surface management agency shall conduct a public hearing on the proposed comprehensive land use management plan analysis if it involves the potential for coal leasing before it is adopted if such a hearing is requested by any person who is or may be adversely affected by the adoption of the plan. A hearing conducted under part 1600 of this title of this chapter shall fulfill this requirement.	The Notice of Availability for the Draft Resource Management Plan and Draft Environmental Impact Statements includes this statement: "…Additionally, the BLM shall conduct a public hearing on the proposed comprehensive land use plan if it involves the potential for coal leasing before it is adopted if such a hearing is requested by any person who is or may be adversely affected by adoption of this plan."

30 CFR 762.5 Definitions. For the purposes of this part:

Fragile lands means areas containing natural, ecologic, scientific, or esthetic resources that could be significantly damaged by surface coal mining operations. Examples of fragile lands include valuable habitats for fish or wildlife, critical habitats for endangered or threatened species of animals or plants, uncommon geologic formations, paleontological sites, National Natural Landmarks, areas where mining may result in flooding, environmental corridors containing a concentration of ecologic and esthetic features, and areas of high recreational value due to high environmental quality.

Historic lands mean areas containing historic, cultural, or scientific resources. Examples of historic lands include archaeological sites, properties listed or eligible for listing on a state or national register of historic places, national historic landmarks, properties having religious or cultural significance to Native Americans or religious groups, and properties for which historic designation is pending.

Natural hazard lands means geographic areas in which natural conditions exist which pose, or as a result of surface coal mining operations, may pose a threat to the health, safety or welfare of people, property or the environment, including areas subject to landslides, cave-ins, large or encroaching sand dunes, severe wind or soil erosion, frequent flooding, avalanches and areas of unstable geology.

Renewable resource lands mean geographic areas which contribute significantly to the long-range productivity of water supply or food or fiber products, such lands to include aquifers and aquifer recharge areas.

COAL RESOURCE EVALUATION OF THE HENRY MOUNTAINS COAL FIELD

INTRODUCTION

The Bureau of Land Management (BLM) is preparing a land use plan, referred to as a Resource Management Plan (RMP), which will address the management of public land that is administered by the Richfield Field Office. Coal is one of the resources that will be addressed in this plan. To plan for coal exploration and development, the areas with a coal resource, the quantity of recoverable coal, and the development potential must be identified to the extent feasible.

In this report, the coal resources in the Henry Mountains coal field are evaluated to determine the public land that should be considered for the Federal leasing of coal resources. The conclusions in this report are limited to the action prompting this review and are not intended for any other purpose.

SUMMARY, CONCLUSIONS, AND RECOMMENDATIONS

Coal resources have been identified in the Ferron Sandstone and Muley Canyon Sandstone Members of the Mancos Shale in the Henry Mountains coal field. The Dakota Sandstone also contains coal beds, but the coal is not considered a resource. Total, in-place, coal resources considered to have development potential by surface and underground methods are 278.6 million tons in the Ferron Sandstone and 1,472.1 million tons in the Muley Canyon.

Coal resources in central Utah, namely the Wasatch Plateau and Book Cliff coal fields, are expected to meet the demand for Utah coal in the next 15 years or longer, assuming market conditions do not change significantly. The above described Henry Mountains coal field is an additional coal resource that has development potential.

It is recommended that those areas in the Henry Mountains coal field with a coal resource that have development potential be considered for coal leasing in the planning for the RFO. Those areas are identified on maps contained in this report.

ACKNOWLEDGEMENT

This resource evaluation is based primarily on recent published reports by Tabet (1999, 2000) and an unpublished report by Tabet (2002). Tabet's reports provide an adequate evaluation of the coal resources that allows for an assessment of the coal potential as part of land use planning and the preparation of a RMP. I would like to gratefully acknowledge David E. Tabet, Utah Geological Survey, for granting permission to use his reports as the basis for this evaluation.

LANDS INVOLVED

The lands involved are public lands managed by the RFO within the Henry Mountains coal field (Figure 1). The coal field is defined by the outcrop boundary of the Ferron Sandstone Member of the Mancos Shale.

The coal field is approximately 48 miles long in a north–south direction and up to 18 miles wide in an east–west direction. Generally, the land is located within Tps. 27-34 S., Rs. 8-11 E., SLM, Garfield and Wayne counties, Utah.

State Highway 24, which is a main highway to Hanksville and the Henry Mountains area, crosses the northern part of the coal field. The Notom Road, from Highway 24 southward, provides general access to the west side of the field. The Notom Road is paved at its north end.

No rail lines are developed in the area. The nearest railroad is at Green River, which is 60 miles away.

Surface and mineral ownership is shown in Figure 2. No Federal coal leases are currently held on the subject public lands. Federal leases for other mineral resources and mining claims were not checked for this report because the resulting information would not have a bearing on determining coal resources. Portions of the coal field are included within designated wilderness study areas (WSAs). As WSAs are not relevant to determining where coal resources may be situated on the ground, WSAs are not addressed in this report. However, WSAs will need to be addressed in the land use planning process through the application of unsuitability criteria.

A portion of the subject lands has been classified as a Known Recoverable Coal Resource Area (KRCRA) (Figure 3). At one time, KRCRA was a classification used to identify lands that met the minimum standards for recoverable coal in accordance with standard mining methods and to designate lands that would be leased through a competitive process. Under current Federal regulations, coal is leased by a competitive process.

PHYSIOGRAPHIC SETTING

The Henry Mountains coal field is in the Colorado Plateau physiographic province (Stokes 1986) as displayed in Figure 4. The Colorado Plateau is characterized by relatively undeformed Paleozoic and Mesozoic sedimentary strata, but in places, the strata are folded into monoclines and anticlines and are displaced by faults. The coal field is mostly in the Henry Mountains subdivision, with the northern part extending into the Green River Desert.

The Henry Mountains coal field lies between the Henry Mountains on the east and the Waterpocket Fold on the west. The Henry Mountains contain several prominent peaks that are greater than 11,000 feet in elevation which were formed by igneous intrusions, referred to as laccoliths, which have domed the surrounding sedimentary strata. The Waterpocket Fold is a monocline on the east flank of the Circle Cliffs and is a prominent, regional ridge (reef) that is the main physiographic feature of Capitol Reef National Park. Other landforms include buttes and mesas, such as Factory Butte and Swap, Tarantula, Cave Flat, and Wildcat Mesas. Factory Butte is the prominent landform at the northern end of the field; Swap Mesa is near the southern end. The low point in elevation is 4,600 feet at the northern end of the coal field.

The terrain in the coal field is generally rugged and dissected by stream channels. Most channels are ephemeral, with the exception of the Fremont River, which cuts the North and South Caineville mesas, which are on the north end of coal field.

GEOLOGIC SETTING

Stratigraphy

The exposed bedrock near the Henry Mountains coal field is predominantly sedimentary strata of Jurassic and Cretaceous age (see Figures 5 and 6). The Jurassic strata crop out around the perimeter of the coal field while the Cretaceous strata are exposed in the center. These formations contain conglomerate, sandstone, and shale or mudstone of variable thickness and distribution, and were deposited in various marine, marine shoreline, deltaic, fluvial, and continental environments. The peaks of the Henry Mountains are dioritic igneous intrusive rocks. The regional stratigraphy is well described in other reports, namely Hunt et al.(1953) and Doelling (1972), and is not the focus of this report.

The coal-bearing units in the coal field are part of the Dakota Sandstone and Mancos Shale, which are Upper Cretaceous in age. Nomenclature of the Upper Cretaceous stratigraphy, in particular the Mancos Shale, has been developed through numerous investigations and has been revised through the years. Gilbert (1877) and Spieker and Reeside (1926) completed early studies in the basin, and in recent years, Peterson et al. (1975, 1980), Smith (1983), and Eaton (1990) proposed changes to the nomenclature. Peterson et al. determined that the sandstone unit between the Blue Gate and Masuk Members of the Mancos Shale in the Henry Mountains basin did not correlate with the type section of the Emery Sandstone at the Wasatch Plateau. Smith recommended that the Emery Sandstone Member in the Henry Mountains basin be named the Muley Canyon Sandstone, replacing the name Emery Sandstone. Eaton proposed formation status for the Masuk and Muley Canyon Sandstone Members, and that the coal-bearing strata of the Muley Canyon should be included in the Masuk Formation. In addition, the Mesaverde Formation is now named the Tarantula Sandstone.

Tabet (1999, 2000) adopted the stratigraphy proposed by Smith (1983), although the changes proposed by Eaton (1990) may better reflect stratigraphic relationships (Figure 7). As Tabet was compiling geologic information from existing maps, using Eaton's proposal would have made correlation more difficult and Smith's nomenclature could be easily adopted. Because this report is based primarily on Tabet (2000), the Upper Cretaceous stratigraphic nomenclature that will be utilized for this report, in ascending order, is the Dakota Sandstone; the Tununk, Ferron Sandstone, Blue Gate, Muley Canyon Sandstone, and Masuk Members of the Mancos Shale; and the Tarantula Sandstone.

Structure

The coal field lies in a structural basin, the Henry Mountains syncline, which is asymmetric and has a north-trending axis. The syncline lies between the Waterpocket Fold on the west and the Monument Uplift to the east. Strata exposed on the west limb of the syncline, the Waterpocket Fold, dip easterly at 20 to 30 degrees, whereas in the central part of the basin, strata are nearly horizontal in aspect. The east side of the coal field is defined by the Henry Mountains, where strata have a generally westerly dip of 10 degrees.

HISTORY OF COAL EXPLORATION AND DEVELOPMENT

Coal has historically been mined from the Henry Mountain coal field for primarily local use. Coal in the Ferron Sandstone was mined from the Stanton mine at the south end of the field from 1888 to 1900 to supply power for gold dredges on the Colorado River. A mine near Factory Butte, also in the Ferron Sandstone, operated from 1908 to the 1950s and was re-opened in 1978 for a short period of time, when coal was hauled to Green River. There was active mining in Muley Canyon at Sweetwater Creek and

Dugout Creek from about 1914 until the 1940s. Coal from these two mines was used to supply power for drill rigs in the Green River Desert.

In the 1970s Amax leased Federal land in the Henry Mountain coal field and exploration for surface minable coal was conducted by several companies. Since the mid-1980s, exploration and development for Federal coal on Federal land has not been authorized in this area.

Total production for the coal field is reported at about 59,000 tons of coal (Doelling and Smith 1982). Most of this production was from the Factory Butte area at the north end of the field.

METHODOLOGY

Tabet (2000) evaluated coal data that had been collected by subsurface investigations completed by coal companies and the U.S. Geological Survey (USGS) during the 1970s and early 1980s and through outcrop studies by the Utah Geological Survey during the late 1980s. Outcrop data were used only if representative of the full thickness of the coal section. The data for the Ferron Sandstone and the Muley Canyon Sandstone Members of the Mancos Shale were used to determine the thickness of the coal zone (isopach) and the depth to the coal zone (overburden). Then, coal resources were identified in accordance with USGS guidelines. A mineral resource is a concentration of naturally occurring material in such form and amount that economic extraction of a commodity from the concentration is currently or potentially feasible (USGS Circular 831). Tabet (2000, p. R7) defined demonstrated, inferred, and hypothetical resources as—

"Demonstrated resources lie within 0.75 mi from a thickness-measurement point, inferred resources are between 0.75 and 3 mi from a thickness-measurement point, and hypothetical resources lie more than 3 mi from a thickness-measurement point."

Tabet further classified resources using the following depth categories: less than 100 feet, 100 to 1,000 feet, and 1,000 to 2,000 feet. Coal resources in the Ferron Sandstone and Muley Canyon Sandstone generally lie at depths of less than 2,000 feet.

Drill hole and outcrop samples and data were not examined for this assessment. Isopach and overburden maps from Tabet (2000) were used to delineate public lands with a coal resource. Individual coal beds were not identified by Tabet, rather the aggregate thickness of coal beds that are greater than 1 foot were used to determine a resource.

The mining method selected for extracting coal depends on the thickness of the coal bed(s) and the depth to the coal. Assessments of the coal potential in the Henry Mountains coal field and at other coal fields have used variable parameters. The parameters selected depend on the coal resource, the reliability of the data, and the current mining practices. In the Henry Mountains coal field, Doelling (1972) used a 4-foot mining thickness, whereas, a coal development potential report completed by Dames and Moore for the USGS in 1980 used a 5-foot mining thickness and a depth of 100 feet as break between surface and underground mining methods. Tabet (2002) used an approximate 7-foot thickness and 200-foot depth to assess coal resources in the Wasatch Plateau and Book Cliffs coal field in Carbon and Emery counties. Tabet (2003, in preparation and personal communication) is using a 4-foot thickness and a depth of less than 200 feet for surface mining and a 6-foot thickness and a depth of greater than 200 feet for underground mining in the Emery coal field in Sevier County.

For this report, coal resources that are greater than 2 feet in thickness and that have less than 100 feet of overburden are considered to have potential for development by surface mining methods. Underground,

conventional mining methods were considered applicable to coal resources that are 6 feet or greater in thickness and that have a depth of 100 feet or more. These parameters are adaptable to the data at hand from Tabet (1999, 2000) without a need to re-grid and re-tabulate the coal data points. By using a 6-foot thickness for underground mining, the deeper resource may be somewhat under-reported in terms of quantity and acreage. For purposes of delineating public land that should be furthered considered for coal leasing, this methodology is considered adequate for land use planning. For purposes of leasing, minable coal beds would need to be determined.

In this report, although all tonnage quantities are short tons, they are referred to simply as tons. Resource estimates are made without regard to surface or mineral estate; however, most of the land is public land managed by the BLM (Figure 2).

MINERAL DEPOSITS

Coal-bearing strata in the Henry Mountains basin are contained in three Upper Cretaceous stratigraphic units: the Dakota Sandstone and the Ferron Sandstone and Muley Canyon Sandstone Members of the Mancos Shale.

Dakota Sandstone

The Dakota Sandstone has a maximum thickness of 92 feet and has an average thickness of 35 feet; the Dakota Sandstone thickens from the north end of the coal field to the southwest (Hunt, et al. 1953; Peterson, et al. 1983, Tabet 2000). Coal beds within the Dakota Sandstone are thin, usually 2 feet or less in thickness, and their lateral extent is limited and discontinuous (Tabet 2000). Therefore the Dakota Sandstone does not have a coal resource that warrants consideration for development potential.

Ferron Sandstone Member

The Ferron Sandstone contains a lower marine unit and an upper non-marine unit. The upper unit averages 110 feet in thickness and contains a coal resource in a 50-foot interval that overlies the lower marine unit. The coal interval in the Ferron Sandstone consists of one to five beds that have a cumulative thickness of 16.5 feet; the average thickness of the individual coal beds is 1 to 3 feet and is rarely more than 4-feet (Tabet 2000).

The Ferron coal is not uniformly distributed across the coal field and is found in discontinuous pods that are 1 to 5 miles wide and 3 to 10 miles long (see Figure 8). The coal pods are primarily oriented lengthwise in an east-west direction, which may reflect deposition in swamps and fluvial channels or may reflect erosion prior to the deposition of the Blue Gate Member. Three areas, one each in the northern, central, and southern parts of the coal field, contain the thickest coal deposits. The assessment of the coal deposits of the Ferron Sandstone in the central area of the coal field has primarily been extrapolated from data collected from one oil and gas well.

The Ferron Sandstone is exposed in outcrop around the margins of the Henry Mountains coal field (see Figure 8). Coal in the Ferron Sandstone is not present in much of the coal field because of the discontinuity of the coal beds. Thus, the depth to the top of the Ferron Sandstone is mapped, rather than the depth to the Ferron coal. The top of the Ferron Sandstone is a close approximation to the top of the coal because the coal is in the upper part of the sandstone. The Ferron Sandstone is deeper toward the axis of the basin because of the synclinal nature of the Henry Mountains basin. The deepest part is east of Tarantula Mesa, where the depth slightly exceeds 2,000 feet. Most of the Ferron Sandstone is less than 1,000 feet in depth.

Coal Quality

Limited sampling and analysis have been completed on the Ferron coal. Four coal samples have been analyzed, including three from the northern and one from the southern parts of the coal field. Based on these four samples, Tabet (2000, p. R10) states that the apparent rank of the coal is high-volatile C bituminous and that the average for proximate analysis is 14.5% ash, 2.5% sulfur, 11,038 British thermal units (Btu) per pound, 5.8% moisture, 34.8% volatile matter, and 44.9% fixed carbon.

Muley Canyon Sandstone Member

Tabet (2000, p. R14) describes the Muley Canyon coal as follows:

"The upper part of the Muley Canyon Member is a nonmarine coal-bearing interval with thicknesses ranging from 92 to 209 ft thick and averaging 150 ft. This stratigraphic interval, referred to as the Muley Canyon coal zone * * * commonly contains three to four coal beds, but locally has as many as 10 beds. Individual beds range from 0 to 13.4 ft thick and are commonly 2-5 ft thick; aggregate thickness of coal is as much as 27.5 ft. * * * Most of the area underlain by this zone has at least 5 ft of total coal, and about half of the area has 10 ft or more of total coal."

The Muley Canyon coal is distributed more widely in the coal field than the Ferron Sandstone coal (see Figure 9). Similar to the Ferron Sandstone coal, the Muley Canyon coal is thickest near the central part of the Henry Mountains basin in pods that are oriented lengthwise in an east–west direction. The pods tend to be thicker on the west side of field.

The shallower coal beds (depths less than 100 feet) are generally exposed around the perimeter of the coal field. Most of the shallow coal is at the north and south ends of the extent of the Muley Canyon in the general area of Wildcat Mesa, Cave Flat, and Swap Mesa. The deepest coal, at slightly more than 1,000 feet, is under Tarantula Mesa where the coal zone is thicker than 24 feet.

Coal Quality

The Muley Canyon coal has been sampled in more detail than the Ferron Sandstone coal, although the samples are again mostly from the shallower coal beds at the northern and southern ends of the coal field. Based on 7 outcrop samples and 30 drill hole samples, the Muley Canyon coal's rank is sub-bituminous A to high-volatile bituminous C (Tabet 2000, p. R14). The average for proximate analyses of the Muley Canyon coal samples are 11.74% ash, 0.9% sulfur, 10,086 Btu per pound, 12.1% moisture, 35.34% volatile matter, and 40.82% fixed carbon, and the range in heat content is 7,710 to 12,491 Btu. Compared with the Ferron Sandstone coal, the Muley Canyon coal is a lower rank, has lower contents of heat, ash, and sulfur and has higher moisture content. In comparison with coal from the Wasatch Plateau and Book Cliff fields that averages 10% ash, 0.5-0.7% sulfur, and 11,500-12,900 Btu, the Muley Canyon coal has higher ash and sulfur contents and lower heat (Tabet 2000, 2002).

Thirteen samples from ash of the Muley Canyon coal were analyzed for major oxides. Major oxides are used to evaluate the potential for boiler slagging and fouling. Slagging and fouling refer to the accumulation of molten ash and sintered material in different parts of the boiler, and these build-ups could decrease boiler efficiency and life and increase operating costs. The ratio of the sum of the CaO and MgO to Fe2O3 determines whether the ash is lignitic or bituminous. In addition, NaO is indicative of fouling properties of the ash. Most of the Muley Canyon coal ash samples were lignitic and fell in the low fouling range.

Although more sampling has been completed in the Muley Canyon coal than the Ferron Sandstone coal, the sample population of the Muley Canyon is very small in comparison with typical sampling for resource evaluation in a field under exploration and development or for quality control in producing fields, such as those in central Utah. Tabet (2000) infers that quality control, blending of coals, selective mining, and selective washing of Muley Canyon coal could produce a low ash, low sulfur coal with low slagging and fouling characteristics that would be similar to other coal currently mined and produced in central Utah.

ECONOMIC EVALUATION

Worldwide and National Markets

The markets for coal have not been steady in recent years; however, consumption has remained constant on a worldwide scale (Guzzino 2003). The market for exported coal is now a prominent feature of global trade, and coal companies increasingly compete in a global market.

The prediction for markets varies from country to country. In the United States, coal consumption has been about 1.05 billion tons of coal for approximately the last 5 years (Guzzino 2003). This demand is predicted to remain fairly level for the next several years; however, improvement in the U.S. economy and technological changes could increase the demand.

In 2002, 1.1 billion tons were produced in the United States (Guzzino 2003). Warehouse stocks in the United States have remained at about 150 to 190 million tons. Electric power production is the largest market for coal in the United States, which commands about 88% of the total production. That demand has been fairly constant for several years. Because of the stability in demand, coal prices have also remained constant, at about $17 per ton.

Although other energy sources, such as natural gas or renewable resources, seem to have fewer environmental impact issues associated with them, the coal industry appears to be dedicated to finding ways to make coal a clean energy source in order to remain competitive with other fossil fuels and non-fossil fuels as part of the Climate Change initiative and the Clear Skies initiative (Guzzino 2003). Guzzino forecasts that "(t)he U.S. expects to gain greater utilization of its coal-fired power-generating capacity from the addition of new coal-burning units. While details surrounding new coal-fired generators still remain cloudy and idealistic, the subject of new nuclear capacity remains taboo, and renewable resources are still in their infancy…while demand for coal isn't expected to skyrocket, it doesn't seem to be diminishing either."

Utah Coal Markets, Production, and Coal Resources

Tabet (2002) reported that 27 million tons were produced in 2001 from mines in Utah, and the price for coal increased slightly. The active mines are large, efficient producers that use longwall mining technology. Five companies operate 11 mines in the state, and production from individual mines ranged from fewer than 1 million tons per year to 7 million tons per year in 2001. Since 1993, production from Utah has increased about 22%, an increase attributed to Utah's low-sulfur, high-quality, bituminous coal, which is favorable for compliance with Federal emission standards. The markets for Utah coal are electrical power, industrial, export to Pacific Rim nations, and residential and commercial customers, in descending order of significance.

In Utah, production has historically been mostly from underground mines in central Utah, namely in three coal fields—the Wasatch Plateau, Book Cliffs, and Emery fields (Tabet 2002). Production from the

Wasatch Plateau and Book Cliffs has exceeded that of Emery. Historically, other smaller fields in Utah have also produced but have not been as important as these three fields.

The Wasatch Plateau field in Carbon, Emery and Sevier counties has been the largest producer, with a total production of 523.7 million tons through 2001 from more than 80 mines (Tabet 2002). In 1986, production was about 14 million tons, and in 2001, production increased to 22 million tons. Approximately 81% of the total production in Utah in 2001 came from eight mines in the Wasatch Plateau field.

In the portion of the Wasatch Plateau field in Carbon and Emery counties, the remaining in-place resources that are available for mining are estimated at 1,054.8 million tons (Tabet 2002). That resource estimate is based on coal beds that are mostly greater than 7 feet in thickness and that are greater than 200 feet and less than 2,500 feet in depth. Using a 14-foot maximum, mining thickness, which is based on the cutting height of longwall equipment, and applying recoverability factors for individual tracts, the resources are reduced to 686.0 million tons. At a yearly production rate of 14 million tons, this recoverable resource would last for 49 years; at 22 million tons, the life would be 31 years. The minable coal resource estimate for that portion of the Wasatch Plateau field in Sevier County is in progress (Tabet 2003, personal communication).

The Book Cliffs field in Carbon and Emery counties is the second largest producer, with a total production of 293.3 million tons through 2001 (Tabet 2002). From 1986 through 1995, production was in the range of 2 to 3 million tons per year, and since 1996, has been 3 to 5 million tons annually. Coal mined from the Book Cliffs accounted for approximately 19% of the Utah production in 2001.

In the Book Cliffs field, the remaining, in-place coal resources that are available for mining are estimated at 409.1 million tons (Tabet 2002). Using the similar parameters as those used for the Wasatch Plateau field, the recoverable resource estimate is 275.2 million tons. If the production rate held steady at 5 million tons per year, these resources would last for 55 years, and if production were to increase to 7 million tons annually, then the life would be 39 years.

The Emery field in Emery and Sevier counties is currently inactive, having ceased production when the last mine was closed in 1990. In 2002, plans were being developed for reopening that mine. For the field, total production through 1990 was 9.5 million tons, and peak production was fewer than 0.6 million tons in 1989.

In the Emery field, the original in-place resources are estimated at 675.8 million tons (Tabet 2002). Tabet, using a 66% recovery factor, estimated the recoverable reserves at 446.0 million tons. If past mining rates in this field were applied, the expected life would be very long.

MINERAL POTENTIAL OF THE HENRY MOUNTAINS COAL FIELD

Within the Henry Mountains coal field, coal resources are assigned a high potential, based on abundant direct and indirect evidence (H/D). Drill hole and outcrop data support that assignment and support that coal resources in the Ferron Sandstone and Muley Canyon Sandstone Members of the Mancos Shale are favorable for development. Coal is also found in the Dakota Sandstone, but based on available data, is not considered a resource.

Coal Resources—Ferron Sandstone Member

Tabet (2000) estimates 683.5 million tons of in-place, coal resources in Ferron Sandstone Member of the Mancos Shale. The reliability of the resource estimate is categorized as 27% as demonstrated, 67% as inferred, and 6% as hypothetical. Greater than two-thirds of the total resources are in the lower confidence categories, inferred and hypothetical, which reflects that the coal has not been drilled adequately to reduce the distance between data points. Approximately 75% of the Ferron Sandstone coal resource is in Garfield County.

In Table A8-2, the coal resource is tabulated by thickness intervals (isopachs) of 2 to 6 feet, 6 to 10 feet, and greater than 10 feet, and by depth (overburden) intervals of zero to 100 feet, 100 to 1,000 feet, and 1,000 to 2,000 feet. The estimates include all coal beds that are thicker than 1 foot. The coal resource is generally thin, which is indicated by the fact that 68% of the total resource is in the thickness interval of 2 to 6 feet.

Table A8-2. Total Ferron Coal Zone Resources by Thickness and Depth of Cover

Depth (ft)	Thickness (ft)								
	2–6			6–10			10+		
	DEM	INF	HYP	DEM	INF	HYP	DEM	INF	HYP
0–100	54.2	5.1	0.0	6.7	2.2	0.0	6.9	0.0	0.0
100–1,000	81.3	187.4	12.8	20.0	84.4	0.0	5.5	0.0	0.0
1,000–2,000	4.3	103.3	16.0	4.5	75.3	9.8	4.0	0.0	0.0
TOTAL	**139.9**	**295.8**	**28.8**	**31.1**	**161.8**	**9.8**	**16.3**	**0.0**	**0.0**

All coal beds are greater than or equal to 1 foot thick; figures in millions of tons. DEM, demonstrated; INF, inferred; HYP, hypothetical. From Tabet (2000). Individual categories may not sum due to rounding in the original spreadsheet.

Based on a 2-foot minimum thickness and a 100-foot depth as the cut-off requirements for surface mining, 75.1 million tons are considered favorable for mining by surface methods. Deeper resources, which are 100 to 2,000 feet deep and which are 6 feet or greater in thickness, total 203.5 million tons and are considered favorable for underground mining methods. The total resource, considered to have development potential by surface or underground methods, is 278.6 million tons, which is 43% of the in-place resource.

Coal Resources—Muley Canyon Sandstone Member

Tabet (2000) estimates 1,526.1 million tons of in-place coal resources in the Muley Canyon Sandstone Member of the Mancos Shale. All of this resource is categorized as either demonstrated or inferred. The demonstrated resource is 62% of the total in-place resource, and the inferred accounts for 38%. The resource, which is almost exclusively in Garfield County, is only 7.5 million tons, which is approximately 0.5% of the total in-place resource in Wayne County.

In Table A8-3, the coal resource is tabulated by thickness intervals (isopachs) of 2 to 6 feet, 6 to 10 feet, and greater than 10 feet and by depth (overburden) intervals of zero to 100 feet, 100 to 1,000 feet, and 1,000 to 2,000 feet. In the Muley Canyon Sandstone, 91% of the coal resource is 6 feet or thicker and 70% is thicker than 10 feet, which is generally thicker than the Ferron coal. At Tarantula Mesa, one bed is

6 to 12 feet thick. In addition, approximately 26% of the resource has less than 100 feet of cover and 71% is at depth of 1,000 feet or less. The estimates include all coal beds that are 1 feet thick or greater.

Table A8-3. Total Muley Canyon Coal Zone Resources by Thickness and Depth of Cover

Depth (ft)	Thickness (ft)						TOTAL
	2–6		6–10		10+		
	DEM	INF	DEM	INF	DEM	INF	
0–100	78.3	4.4	107.4	7.6	172.4	20.9	391.0
100–1,000	42.1	11.3	118.5	75.7	383.7	449.4	1,087.7
1,000–2,000	1.6	0.0	4.9	1.2	36.8	9.9	54.4
TOTAL	**121.9**	**15.8**	**230.9**	**84.5**	**592.8**	**480.2**	**1,526.1**

All coal beds are greater than or equal to 1 foot thick; figures in millions of tons. DEM, demonstrated; INF, inferred; HYP, hypothetical. From Tabet (2000). Individual categories may not sum due to rounding in the original spreadsheet.

Based on a 2-foot minimum thickness and a 100-foot depth as the cut-off requirements for surface mining, 391.0 million tons are considered favorable for mining by surface methods. Deeper resources, which are 100 to 1,000 feet deep and 1,000 to 2,000 feet deep and which are 6 feet or greater in thickness, total 1,080.1 million tons and are considered favorable for mining by underground methods. The total resource, considered to have development potential by surface or underground methods, is 1,472.1 million tons, which is 96% of the estimated, in-place, coal resource.

Development Potential

Past and current mining in Utah has been mainly from two coal fields in central Utah —the Wasatch Plateau and the Book Cliffs. The Emery field, also in central Utah has been the third largest producer. Based on a study by Tabet (2002), these three fields could meet the demand for Utah coal at current production rates for the next 15 years. These fields, especially the Wasatch Plateau and the Book Cliffs fields, have an infrastructure for transportation and accessibility in place. As marketing conditions change nationally and worldwide, the demand for Utah coal could also change, with an increase in demand, or with a decrease driven by the availability of coal from other nations in the global market. In the next 15 years, at current mining rates, the more easily mined central Utah coal may be depleted, and industry may be interested in evaluating other fields, such as the Henry Mountains field. However, at present, development of coal resources in the Henry Mountains field does not seem likely within the time frame of 15 to 20 years, which is the planning horizon of a BLM land use plan.

COAL RESOURCES OF THE BLM RICHFIELD

PLANNING AREA

EXECUTIVE SUMMARY

All or parts of three coal fields occur within the Richfield planning area: the Wasatch Plateau, Emery, and Henry Mountains coal fields. More than 290 million tons of unleased, recoverable coal remains in the southern Wasatch Plateau coal field, and these resources have the highest development potential. From 2003 through 2017, the coal immediately around the Southern Utah Fuel Company (SUFCO) mine will likely be developed to extend the life of that operation. In the 15 years beyond 2017, other minable resources near the SUFCO mine will also likely be mined to further sustain that operation. Additional coal resources in the southern Wasatch Plateau coal field that could support new mines in the next 30 years occur in the area west of the SUFCO mine once called the Skumpah Canyon tract, the area to the west of the Joes Valley graben around Ferron Canyon, and the area a few miles north of Interstate 70 under the Old Woman Plateau.

The area with the second highest development potential is the Sevier County portion of the Emery coal field, where 190 million tons of recoverable coal resources have been identified. These resources will probably be developed after the Emery County portion of the Emery coal field resources are exhausted around 2030.

Attractive, but more remote coal resources occur in the Henry Mountains coal field, where 130 million tons of recoverable coal resources have been identified. These resources will probably become more important as the resources in the Book Cliffs, Wasatch Plateau, and Emery coal fields are approaching exhaustion— possibly starting by 2030.

INTRODUCTION

Background

To assist the U.S. Bureau of Land Management (BLM) in updating its management plan for the Richfield area, which covers all or parts of Garfield, Piute, Sanpete, Sevier, and Wayne counties in Utah, the Utah Geological Survey (UGS) was asked to generate information on the unleased, recoverable coal resources in the area and provide a reasonably foreseeable development scenario for those resources. The UGS used location and thickness data from its geographic informational system (GIS), information on previously mined areas, fault locations, and natural and cultural features that might inhibit future mining that had been compiled for coal availability studies of the Emery and Wasatch Plateau coal fields with funding from the U.S Geological Survey (USGS), to examine those fields. The analysis of the coal resources for the Henry Mountains coal field was modified from an earlier resource study by the UGS (Tabet 1999); rather than generating coal thickness maps by gridding and contouring via computer, hand-drawn coal isopach maps were digitized to provide thickness data for the new estimate of available coal in the Henry Mountains coal field. BLM mining engineers provided the engineering guidance used by the UGS for its evaluation to derive the coal resources that would be economical to mine under current and reasonably foreseeable market conditions.

Study Methods

This study was undertaken using ArcView™ software (version 3.2, Environmental Systems Research Institute [ESRI]) with ESRI's Spatial Analyst™ software extension running on a personal computer with

a Windows 98™, or higher, operating system. This GIS software allows for the simultaneous analysis of various combinations of resource parameters and the ability to easily repeat an analysis using different assumptions and parameters. Specific details related to the current GIS methodology employed follow.

Calculation of coal resources requires the determination of three parameters: the extent of minable coal in each bed (area), the distribution of the bed thickness in that area, and an estimate of the density of the coal. Maps showing the extent and thickness of identified coal beds were constructed from scattered points of observation (drill hole records and outcrop measurements), or digitized from existing hand drawn coal isopach maps. ESRI's Spatial Analyst software extension allows the choice of different mathematical methods to interpolate between, and extrapolate beyond, point data to construct coal thickness maps of various individual coal beds. An inverse distance weighting method (set to examine the six nearest neighbors and using a fourth-order, distance-weighting function) was selected to assign thickness values to individual 30-meter by 30-meter cells in a grid covering the areal extent of the coal formations in the study area. To define the remaining coal resources, the coal thickness information was combined with information on past mining, current leases, faulting, depth of cover, and other technical and cultural features that would potentially limit future mining.

Using these various individual coal bed thickness maps, polygonal areas were outlined to define the coal that would likely be economical to mine in the future. These polygonal areas generally had to contain coal thicker than 6 feet, cover greater than 100 feet and less than 2,500 feet, and contain resources that could be classified in the USGS's "demonstrated" resource reliability category (Wood et al., 1983) for at least 80% of the resource area. The resulting grids of the areas likely to be mined were converted from a floating-point (decimal) format to integer values. For example, all cells with coal bed thickness values greater than 6 but less than 8 feet were reclassified to the integer 7; for resource calculations, these cells were assigned a thickness of 7 feet of coal. This approximation significantly reduces the size of the resulting data sets and allows subsequent analyses to be undertaken in a reasonable amount of computation time (minutes rather than hours). Classification of coal bed thickness as integer data also allows convenient tabulation in ArcView™ of the areal extent of these thickness intervals; tables containing these data were exported to a spreadsheet for final calculation of the total tons of coal in each thickness interval. The coal resource calculations were accomplished by applying the USGS standard coal density factor for bituminous coal of 1,800 tons of coal per acre-foot (Wood, et al. 1983).

For the resource areas identified for future mining in the Wasatch Plateau coal fields, BLM mining engineers provided the recovery factor to apply to the identified resources to determine the recoverable resources; slightly lower recovery factors were applied to the Emery and Henry Mountains fields because less is known about mining conditions there. In general, coal in tracts suitable for surface mining were assigned an 80% recovery factor, those suitable for longwall mining were assigned a 60 to 70% recovery factor, and tracts suitable for extraction with continuous miners were assigned a 50% recovery factor. Only general information is available at this time regarding the quality of the coal and the roof and floor conditions in the various delineated minable tracts. Specific information about the quality of the coal and roof and floor conditions in the various tracts would help identify areas with quality problems or difficult mining conditions that might further restrict the recoverable coal in the tracts delineated. Some attempt to account for these factors was made in applying slightly different recovery factors to some tracts. Detailed mine planning and study of the economic aspects of extracting and marketing the resources identified is warranted to actually classify them as reserves; however, this study identifies the maximum area likely to be of interest for coal development in the next 30 years and gives an idea of the magnitude of recoverable resources remaining.

Point Data Preparation

Point data used in this study originate from a database compiled by the UGS over the past 20 years for the National Coal Resources Data System (NCRDS), which is a state cooperative program funded in part by the USGS. This database includes information from both unpublished and published sources. The BLM provided additional records as part of a cooperative data sharing agreement.

Keypunched NCRDS files in ASCII format, as well as BLM files in dBase format, were imported into a spreadsheet for simplification as a table of X, Y, Z data (easting, northing, and thickness or elevation) for each coal bed and exported as dBase (*.dbf) files for use in the ArcView™ GIS program. All data records were reexamined to verify correlations and spatial accuracy. Where necessary, spatial coordinates were converted to the Universal Transverse Mercator zone 12 coordinate system, and bed identifications were revised or assigned. Bed thickness is recorded to the nearest tenth of a foot. Elevation (mean sea level) and spatial coordinates are uniformly recorded to the nearest tenth of a meter. However, the overall precision of the elevation and spatial data is probably closer to tens (rather than tenths) of meters; varied sources and vintages of the data hinder more exacting precision estimates.

Data from thousands of point locations were examined for possible use, and only the most reliable data records were selected. Drill hole data were preferentially selected because they provide the most reliable coal bed thickness, depth, and location values. Measured section data were selected in areas where drill hole data were lacking; such data indicate minimum coal thickness because coal beds in Utah commonly thin at the outcrop as a result of weathering, slumping, or burning (Doelling 1968). Furthermore, the precise elevation of coal beds in the measured sections was often difficult to determine. Accordingly, where it was judged an elevation record for a measured section record was unreliable, the record was not used to construct a coal bed elevation map. The selected point data were used to prepare coal bed elevation, interburden, and thickness maps.

Setting

Garfield, Piute, Sanpete, Sevier, and Wayne counties include all or part of 3 of the state's 22 coal fields: the Emery, Henry Mountains, and the southern part of the Wasatch Plateau coal fields. These three coal fields together originally contained a resource estimated at more than 12.8 billion tons of minable coal (see Table A8-4), and were estimated by Doelling (1972a, b) to make up about one-third of the state's coal resources. As of 2003, mining occurs only in the Book Cliffs, Emery, and Wasatch Plateau coal fields.

Table A8-4 shows selected Utah coal fields with original minable resources in billions of tons. (coal beds < 3,000 feet deep and > 4 feet thick; from Doelling 1972a, Anderson 1983, Tabet 1999)

Table A8-4. Selected Utah Coal Fields With Original Minable Resources in Billions of Tons.

Coal Field	Identified Resources	Hypothetical Resources	Grand Total
Alton	1.870	0.279	2.149
Book Cliffs	3.527	0.157	3.684
*Emery	1.430	0.635	2.065
*Henry Mountains	0.543	0.000	0.543
Kaiparowits Plateau	7.878	7.320	15.198

Coal Field	Identified Resources	Hypothetical Resources	Grand Total
Kolob	2.014	0.000	2.014
*Wasatch Plateau	6.379	3.888	10.267
TOTAL	**23.641**	**12.279**	**35.920**

* Field has resources in the Richfield Resource Area

The Emery, Henry Mountains, and Wasatch Plateau coal fields have numerous thick coal zones, some in excess of 15 feet thick. However, most of the coal zones are lenticular and commonly split into several thinner beds and then disappear over a distance of a few miles. The lenticular nature of the coal, the non-uniformity of floor and roof strata over even small areas, the intertonguing stratigraphic relations of the coal-bearing rocks, and faulting make correlation of individual coal beds difficult. The average thickness of the coal beds included in the resource estimates given above is slightly more than 6 feet. At present, nearly all Utah coal operations are mining beds thicker than 6 feet. The coal beds of the Richfield District planning area occur in Upper Cretaceous strata; those of the Henry Mountains coal field occur in both the Ferron Sandstone Member of the Mancos Shale and the Muley Canyon Sandstone; the Wasatch Plateau coals occur in the Blackhawk Formation; and the coals of the Emery coal field are found in the Ferron Sandstone Member of the Mancos Shale.

The heat content of the Richfield planning area's bituminous coal is high compared with that of the sub-bituminous coals typically produced in Montana, New Mexico, and Wyoming. Typical as-received heat contents range from 10,000 to 12,700 British thermal units (Btu) per pound of coal. Sulfur content is usually low (< 1 weight percent) in the coal fields of the planning area, but there are some areas with medium to high (1 to 3 weight percent) sulfur, particularly in the Emery and Henry Mountains coal fields. Near-surface coal quality is commonly degraded by oxidation and it may be burned for a considerable distance from the outcrop.

KNOWN OCCURRENCES AND CHARACTERISTICS

Henry Mountains Coal Field

Setting

The remote Henry Mountains coal field occurs in an area of scenic beauty. The striking Waterpocket Fold to the west has been set aside, in part, as Capitol Reef National Park, while to the south and southeast are parts of Glen Canyon National Recreation Area (NRA). BLM administers the majority of the coal-bearing lands in the coal field. The Henry Mountains coal field area has few paved roads and no railroads. State Highway 24 crosses the northern part of the coal field and is the only paved road in the area. State Routes 95 and 276 run parallel to and 10 miles east of the eastern margin of the coal field. Access to most parts of the coal field is limited to dirt roads. The nearest rail line is the Union Pacific line at Green River about 60 miles to the north. The remote, relatively roadless nature of the Henry Mountains coal field area led the BLM in 1990 to delineate three proposed wilderness areas covering parts of the coal field. The wilderness alternatives proposed by the Utah State Office of the BLM in 1990 for portions of the three Wilderness Study Areas (WSAs) in the Henry Mountains coal field constrain potential development of the coal resources of only a few sections of land, leaving the majority of the area open for future development. Although the BLM (1999) conducted a re-inventory of Utah lands for wilderness that substantially increased the areas in the Henry Mountains coal field considered to have wilderness

potential, those lands have been withdrawn from wilderness protection as the result of settlement of a lawsuit brought by the State of Utah against the U.S. Department of the Interior (DOI).

Elevations in the area of the Henry Mountains coal field range from about 4,600 feet at the far northern end of the field to more than 11,000 feet in the central Henry Mountains. The topography varies from steep, rugged terrain in the Henry Mountains on the east, to a series of dissected mesas and buttes in the central part of the coal field, to cuestas and hogback ridges along the western margin of the coal field.

The principal Cretaceous coal-bearing strata of the Henry Mountains coal field cover parts of central Wayne and Garfield counties. Cretaceous strata are preserved in a structural basin, the Henry Mountains syncline, which is bounded on the west by the monocline of the Waterpocket Fold, and on the east by the Monument upwarp. This north–south elongated basin extends about 50 miles along its axis and is 2 to 18 miles wide.

Along the Waterpocket Fold on the west, the Cretaceous strata have an average inclination of 25 to 30 degrees to the east (Doelling 1972b). Within the center of the basin the strata are nearly horizontal, while the strata on the eastern flank of the basin generally dip gently to the west at less than 10 degrees, except near the Henry Mountains intrusive bodies, where they may be steeply folded and faulted. The only significant faulting unrelated to the intrusive bodies of the Henry Mountains is at the far northern end of the basin near Factory Butte, where a series of east–west trending normal faults with displacements of less than 30 feet have been mapped (Doelling 1972b).

Coal Geology

A small amount of unminable coal occurs in the Dakota Sandstone, and minable quantities occur in the Ferron Sandstone Member of the Mancos Shale and Muley Canyon Formation. The unminable coal in the Dakota Sandstone extends into a very small portion of south central Emery County. The Dakota coals are very thin and discontinuous and are an insignificant resource. The coals of the Ferron are locally thick, but not very continuous, and have limited potentially minable resources. Muley Canyon coals are the thickest, most continuous, and have the largest potentially minable resource (Doelling 1972b).

Ferron Coals—the coals in the Ferron Sandstone Member of the Mancos Shale occur in the upper nonmarine strata, in a 50-foot-thick zone immediately above the lower marine part of the Ferron. The coal interval contains one to five beds that have an aggregate thickness ranging from zero to 16.5 feet. Coal beds seldom exceed 4 feet in thickness and commonly average 1 to 3 feet thick.

The areal distribution of coal is patchy, with isolated, east-west elongated pods found in three separate locations across the Henry Mountains basin. The pods are approximately 1 to 5 miles wide and from 3 to 10 miles long. Although the coal thickness data are primarily from the margins of the coal field, it appears that the coal is best developed in three widely separated areas in the northern, central, and southern parts of the field. The coal estimates in the central area are more speculative than the other two because they rely heavily on data from a single, deep petroleum well. The Ferron coal in the northern area near Factory Butte is the thickest and occurs under cover of less than 200 feet of overburden over an area of a few square miles.

Because the depositional environment for the Ferron in the Henry Mountains basin has been interpreted as a fluvial-deltaic complex (Uresk 1979, Hill 1982), the east–west elongate coal pods might reflect interfluvial swamps formed on eastward prograding fluvial-deltaic lobes that formed in the northern, central, and southern parts of the basin. However, the original distribution of coal near the top of the Ferron might have been altered by erosion prior to the deposition of the overlying Blue Gate Member, leaving a coal bearing unit of variable thickness.

The coal in the Ferron Sandstone generally occurs in its upper portion, but in many places throughout the field no is coal present. Therefore, the top of the Ferron was mapped because it approximated the depth to the coal zone throughout the whole coal field. The top of the Ferron is exposed around the margins of the Henry Mountains basin, and it reaches a maximum depth of slightly more than 2,000 feet under a several-square-mile area beneath the highest portions of Tarantula Mesa in the central part of the basin. Thus, all the Ferron coal deposits of the Henry Mountains coal field, where thick enough to mine, occur at potentially minable depths.

Muley Canyon Coals—The upper part of the Muley Canyon Sandstone is a nonmarine coal-bearing interval, which ranges from 92 to 209 feet thick and averages about 150 feet thick. This stratigraphic interval is considered the Muley Canyon coal zone in this report. Coal in this zone commonly occurs in 3 to 4 beds, but as many as 10 coal beds can be found locally. Individual coal beds range from zero to 13.4 feet thick but are commonly 2 to 5 feet thick. The aggregate thickness of all the coal beds in the Muley Canyon zone ranges from zero to 27.5 feet. Most of area underlain by this zone has at least 5 feet of total coal, and about half of the area has 10 feet or more of total coal.

Unlike the Ferron, coal occurs throughout the area underlain by the Muley Canyon Sandstone. The Muley Canyon coals are thickest in elongate pods oriented in an east–west direction that tend to be thicker on the west side of the basin and that thin gradually to the east (Tabet 1999). The largest thick pod of coal lies in the center of the basin, as was the case with the Ferron coals.

Potentially surface-minable coal is found under broad areas at the northern and southern ends of the Muley Canyon coal zone's extent, where less than 100 feet of cover is common (Tabet 1999). The extensive, thick Muley Canyon coal under Tarantula Mesa reaches a maximum depth of slightly more than 1,000 feet, and therefore is extractable via underground mining methods at shallow to moderate depths.

Coal Quality

Chemistry of the Ferron Coals—The analytical data provided here comes from a UGS coal quality database, now in digital form, much of which was originally complied by Doelling (1972a). Only four coal sample analyses from the Ferron have been published for the Henry Mountains coal field (see Table A8-5). These coals have an apparent rank of high-volatile C bituminous. The four samples are from the northern (three samples) and southern (one sample) edges of the field. The mean values for the sample analyses indicate the coals are high in ash (14.5%) and sulfur (2.5%) contents.

Table A8-5. Proximate Analyses of Ferron Coal Samples from the Henry Mountains Basin

Cadastral Location	Moisture (%)	Volatile Matter (%)	Fixed Carbon (%)	Ash (%)	Sulfur (%)	Btu per Pound (%)

STD.DEV.	**1.7**	**2.2**	**2.8**	**1.4**	**0.7**	**483**

Chemistry of the Muley Canyon Coals—The coal beds in the Muley Canyon have been more extensively sampled than those in the Ferron, but the samples are not uniformly distributed over the whole area underlain by these coals. The samples come primarily from the northern and southern ends of the field (from areas with shallow cover) and not as many are from the deeper central portion of the field. The Muley Canyon analyses come from 3 shallow prospects and 29 drill cores (see Table A8-6).

The Muley Canyon coal has an apparent rank of sub-bituminous A to high-volatile bituminous C (Hatch, et al. 1979, Law 1980). This slightly lower rank than the Ferron coals translates to a lower heat content and higher moisture content for the Muley Canyon coals.

The mean ash content of the Muley Canyon coals, at 12.1%, is less than that of the Ferron coals, but is higher than the coals produced from the Wasatch Plateau and Book Cliffs coal fields, which typically have an average ash content of about 10%. The ash content of the Muley Canyon coals varies across the coal field, and is highest in two east–west trending lobate-shaped areas—one each in the northern and southern parts of the field.

The sulfur content of the Muley Canyon coals can range as high as 3.2% (see Table A8-6), which is as high as the Ferron coals, but the mean sulfur content of the Muley Canyon samples is considerably less at 0.94%. In comparison, the sulfur content of coal presently produced from the Wasatch Plateau and Book Cliffs coal fields ranges from 0.5 to 1.0%. The sulfur content of the Muley Canyon coals across the coal field is highest in one east–west trending area that occurs in the same area as the northern high-ash area (Tabet 1999).

The heat content of Muley Canyon coals ranges from 7,710 to 12,491 Btu per pound and averages 10,067 Btu per pound (see Table A8-6). The average heat content of these coals is considerably below the 11,400 to 12,000 Btu/lb range currently produced at mines in Carbon and Emery counties. The heat content distribution across the coal field consists of east–west trends with low heat areas corresponding directly with areas having high-ash contents (Tabet 1999). In addition to the primary east–west trend of the heat content values, the heat content of the Muley Canyon coals appears to be slightly higher on the eastern side of the field than on the west, suggesting that the coals on the eastern side of the field were possibly thermally upgraded by the intrusion of the Henry Mountains laccoliths.

The ash chemistry of some of the Muley Canyon coals has also been analyzed (Hatch, et al. 1979). This allows for an evaluation of the boiler slagging and fouling characteristics of these coals. Table A8-7 gives the analyzed values of the major oxides in the coal ash that can be used to predict coal utilization characteristics.

The physical and chemical transformations that the minerals in the coal ash undergo during combustion are complex processes. Vaninetti and Busch (1981) define slagging as the buildup of molten ash materials within the lower furnace section of a boiler, and fouling as the accumulation of sintered ash in the convective passes section of a boiler. Both of these problems reduce boiler efficiency, increase operating costs, and shorten boiler life. Various indices can predict the combustion characteristics of coal ash, and two of them are presented in

Table A8-8. The first step in analyzing ash combustion properties is to determine the type of coal ash present. Coal ash is characterized as either lignitic or bituminous, depending on the value determined by summing CaO and MgO values, and dividing the result by the Fe2O3 value. Coal ash is termed lignitic when the resulting value of this calculation is greater than 1.0, and bituminous when the value is less than 1.0. Most of the Muley Canyon ash analyses fall in the lignitic ash category, although two ash samples fall in the bituminous ash category. Both of these bituminous ash analyses come from coal samples with high iron and sulfur contents, indicating high pyrite content.

Table A8-7. Major Oxide Composition of the Ash (in Percent) From 13 Muley Canyon Coal Samples From the Henry Mountains Coal Field

* Base/Acid Ratio = CaO+MgO+Na2O+K2O+Fe2O3/SiO2+Al2O3+TiO2

Sodium content in the ash is critical to various indices of ash-fouling potential; the simplest indicator of fouling is the total sodium oxide content of the ash alone. Bituminous and lignitic ash coals respond differently to increased sodium oxide content. Coals in the bituminous category are much more sensitive to small increases in sodium oxide. The change in ash-fouling tendency with increasing sodium oxide content, according to Vaninetti and Busch (1981), is illustrated in Table A8-9.

Table A8-9. Fouling Tendency

Factor	Ash Type	Low	Medium	High	Severe
Na2O% in ash	bituminous	<0.5	0.5–1.0	1.0-2.5	>2.5
Na2O% in ash	lignitic	<3.0	3.0–5.0	>5.0	

When examining just the sodium content of the ash, all but one of the Muley Canyon coal ash samples fall in the low-fouling potential range.

If coal from the Muley Canyon were mined, various quality control strategies including blending, selective mining, or selective washing could probably produce a low-ash, low-sulfur coal product similar to that presently produced in central Utah. The foregoing analysis of the ash chemistry predicts that most of the Muley Canyon coal produced would have low- to moderate-slagging and low-fouling boiler combustion properties, but detailed, site-specific sampling is needed for each area to be mined.

Coal Resources

Ferron Sandstone Member Resources—The Ferron Sandstone contains an estimated 683.5 million short tons of in-place coal resources. About three-quarters of the coal resources lie in Garfield County. Because of limited exploration data, only 27%, or 187.3 million tons, of the total resources fall into the demonstrated resource category (occurring within 0.75 miles of a thickness measurement point). The bulk of the coal resource, 67%, falls into the inferred resource category (occurring between 0.75 and 3 miles from a thickness measurement point). Only a few percent of the resources lie more than 3 miles from a thickness measurement point, or within the hypothetical category.

Eleven percent of Ferron Sandstone coal resources, or 75.1 million short tons, lie under 100 feet or less of cover. Most of the coal resources, 89%, have cover exceeding 100 feet. Although most of the coal is deeper than 100 feet, all the coal is less than 2,000 feet deep.

As mentioned above, the coal beds in the Ferron Sandstone are generally thin, and this is reflected by the fact that 68% of the resources fall into the 2- to- 6-foot thick resource category. Less than one-third of the coal resources have an aggregate thickness greater than 6 ft. The thickest coal occurs at the far northern extent of the Ferron Sandstone near Factory Butte.

In summary, the majority of the Ferron coal resources are poorly defined by USGS reliability standards, and are primarily less than 6 feet thick, deeper that 100 feet, and lie within Garfield County. The in-place coal resources for the Ferron zone are summarized by thickness, depth, and reliability categories, as well as by county, in Table A8-10,

Table A8-11, and

Table A8-12. Readers are cautioned that the individual resource categories in the tables may not sum to totals at the bottoms of the tables due to independent rounding.

1 DEM = Demonstrated, 2 INF = Inferred, 3 HYP = Hypothetical
(coal beds > one foot thick; figures in millions of short tons).

Muley Canyon Resources—The Muley Canyon Sandstone contains 1,526.1 million short tons of in-place coal resources. Because of fairly uniformly spaced exploration data, 62%, or 945.6 million tons, of the total coal resources fall into the demonstrated, or the most reliable, resource category. The remaining 38% of the coal resources, 580.5 million tons, fall into the inferred resource category, or those resources occurring at between 0.75 and 3 miles from a thickness measurement point. None of the coal resources fall into the hypothetical category (more than 3 miles from a thickness measurement point). There are ample minable coal resources in the Muley Canyon Sandstone, but only half of one percent occur within the Wayne County portion of the field.

Looking at the coal resources by depth of cover shows that 25.6%, or 391 million short tons, lie under 100 feet or less of cover. Most of the coal resources, 74.4%, are under more than 100 feet of overburden. Although most of the coal is deeper than 100 feet, all of the coal in the Muley Canyon zone is less than 1,500 feet deep, and most of the deep coal lies under less than 1,000 feet of overburden.

Ninety-one percent of the Muley Canyon resources have a total coal thickness of 6 feet or greater. In fact, about 70% of the coal resources have a total coal thickness of more than 10 feet. Under much of the area below Tarantula Mesa, the Muley Canyon coal zone consists primary of one 6 to 12 feet thick bed (Tabet 1999). Only 9% of the coal resources have a thickness of less than 6 feet.

In summary, the Muley Canyon coal resources are mostly well defined according to the USGS reliability standards, greater than 6 feet thick, deeper that 100 feet, and lie within Garfield County. The in-place coal resources for the total Muley Canyon coal zone are summarized by thickness, depth, reliability, and county categories in Table A8-13,

Table A8-14, and Table A8-15. Note that the individual resource categories in the tables below may not sum to totals at the bottoms of the tables due to independent rounding.

Wasatch Plateau Coal Field

Setting

The Wasatch Plateau coal field extends southwest about 90 miles from western Carbon County, through western Emery County, and into eastern Sanpete and Sevier counties (Doelling and Smith 1982). The field, as defined by Doelling and Smith (1982), is 13 to 22 miles wide. The outcrop of the coal-bearing Blackhawk Formation forms the eastern edge of the field, and the western edge is bounded by a series of faults forming the Musinia graben near the western edge of the plateau in Sanpete and Sevier counties. Sanpete and Sevier counties contain roughly the southwestern half of the "larger" Wasatch Plateau coal field.

Only the northern third of the field is directly served by rail transportation. One spur leaves the main line of the Union Pacific Railroad at the town of Colton and heads 15 miles southwest to serve the mines near Scofield. Three other spurs branch off at the town of Helper, two running 5 miles west, and one running 20 miles south. The longest one, which runs south to the town of Hiawatha, formerly served the Plateau mine of RAG Coal Company. Rail shipment of coal production from the southern end of the field first requires a truck haul 55 miles westward to a loadout on a branch of the Union Pacific Railroad west of the town of Levan.

Coal Geology

Most of the coal in the Wasatch Plateau field is found in the lower third of the Blackhawk Formation. Eight individual beds have been identified that contain coal more than 6 feet thick. A greater number of thick beds occur in the northern portion of the field than in the southern portion. Major coal bed groups of the Wasatch Plateau include, in ascending order, the Hiawatha zone (consisting of the Knight, Acord Lakes, Axel Anderson, and Cottonwood beds), the Blind Canyon zone, the Wattis zone, the Gordon zone, the Castlegate A zone, and the Castlegate D zone. The thickness range of minable coal for the major zones of the southern part of the Wasatch Plateau field in Sanpete and Sevier counties can be found in Table A8-16.

Table A8-16. Thickness Range of Minable Coal for the Major Zones of the Southern Part of the Wasatch Plateau Field in Sanpete and Sevier Counties

Southern Wasatch Plateau beds	Thickness Range (ft)
Axel Anderson	6 to 15
Acord Lakes (Upper Hiawatha)	6 to 20
Knight (Hiawatha)	6 to 17

The coal beds generally have shallow dips to the west but are cut by several major north–south trending fault zones, or grabens, with displacements ranging from a few feet to a several hundred feet. These

normal faults offset the coal beds and interfere with mining; however, there is usually sufficient room between the faults to conduct mining (Doelling 1972a).

Coal Quality

Coal beds of the Wasatch Plateau field generally have good quality, with low ash and sulfur contents, and high heat contents. Most of the coals are high-volatile C bituminous in rank, although locally, some coals in the northern part of the field are high-volatile B bituminous.

The Wasatch Plateau coal beds are often resin-rich with resin contents of 2 to 15%. Although not presently used, the resin has been historically recovered as a by-product for use in adhesives, paints and coatings, and as a binder in printing ink (Tabet, et al. 1995a). Coal quality statistics are summarized in Table A8-17 and Table A8-18 for two southern Wasatch Plateau field coal beds that have a sample population of more than 30 proximate analyses, and usually more than 20 ultimate analyses (UGS coal quality database, in preparation). The names reported for the Wasatch Plateau coal beds in the coal quality database do not reflect the new names assigned to the beds based on newer understanding of the stratigraphic relations of the beds. Time constraints did not allow the analytical data to be updated with new bed names, and thus the analyses reported here use the older bed names originally assigned. Those two Wasatch Plateau coal beds (using original names) are the Hiawatha, and the Upper Hiawatha.

Table A8-17. Coal Quality Statistics for the Hiawatha Bed From the Upper Cretaceous Blackhawk Formation in the Wasatch Plateau Coal Field (As-received Basis)

Characteristic	Mean	Maximum	Minimum	Standard Deviation	Sample Population
Carbon (%)	64.90	69.75	53.09	4.80	22
Hydrogen (%)	4.59	5.20	3.99	0.32	22
Nitrogen (%)	1.13	1.44	0.96	0.12	22
Oxygen (%)	11.07	18.0	9.22	1.67	22
Chlorine (%)	0.01	0.11	0.00	0.02	21

The Wasatch Plateau coal beds have similar mean proximate and ultimate analytical values, but the Upper Hiawatha bed, which mainly occurs in the southern part of the field, shows the greatest quality differences. This bed is slightly higher in ash and moisture, and slightly lower in heat content and volatile matter content than the other bed reported here. In general, the coals of the Wasatch Plateau decrease slightly in rank and heat content from north to south.

Coal Resources

The Wasatch Plateau coal field is a major Utah coal field with original, in-place coal resources in excess of 10.2 billion tons (Doelling 1972a). Based on UGS work carried out using BLM criteria, at the end of 2002, the Wasatch Plateau contained 1,122.5 billion tons of remaining, unleased, in-place coal resources that were in coal beds at least 6 feet thick and that occurred between depths of 200 to 2,500 feet. The amount of coal likely to be mined and recovered in the near future is discussed in the reasonably foreseeable development scenario at the end of this report. Some of the coal resources in the Sevier County portion of the Wasatch Plateau field are likely to be mined in the next 30 years to provide extended life for the SUFCO mine there. There are also additional resources that could support at least two new mines in the Sanpete and Sevier counties portion of the Wasatch Plateau, but their development would likely occur in the more distant part of the 30-year planning horizon.

Emery Coal Field

Setting

The Emery coal field was originally defined from the surface exposures of the Ferron Sandstone Member of the Mancos Shale (Lupton 1916). The surface exposures cover an area 25 miles long and 2 to 10 miles wide near the Sevier-Emery County border. This area lies about 45 miles southwest of Price and the site of the nearest rail loadout. The field, as originally defined, is bounded on the east by an erosional escarpment, and on the west by a fault zone (Doelling 1972a). Surface exposures show the coal thinning and pinching out to the north; however, published drilling data show that similar thick coal beds also occur in the Upper Cretaceous Ferron Sandstone in the subsurface extending northward all the way to Price (Bunnell and Holberg 1991, Tabet, et al, 1995b). Based on published coal thickness data, the northern boundary of the field should be defined near Price and could potentially extend farther north into the Uinta Basin.

Coal Geology

The coal of the Emery field occurs in the upper part of the 300- to 900-foot-thick Ferron Sandstone Member of the Mancos Shale. Where exposed, this unit contains 13 coal beds, 4 of which exceed 7 feet in thickness. Lupton (1916) gave the beds letter designations from A to M in ascending order of occurrence. Beds I and J are the most important, and the separation between them is minimal in many areas, resulting

in a single bed up to 25 feet thick (Doelling 1972a). The dip of the coal beds varies from 2 to 12 degrees to the west, with most between 4 and 7 degrees. Faulting is minor and presents little difficulty to mining. In the southern end of the field, 76% of the resources are under less than 1,000 feet of cover, and very thin overburden in some areas makes surface mining possible. The reported thickness ranges of the major coal beds in the Emery coal field are given in Table A8-19.

Table A8-19. Thickness Ranges of the Major Coal Beds in the Emery Coal Field

Emery Field Beds	Thickness Range (ft)
Upper Group	
J bed	6 to 13
I bed	6 to 30
Lower Group	
C bed	6 to 20
A bed	6 to 16

Coal Quality

The quality of coal from the Emery field, particularly the sulfur and ash contents, is quite variable throughout the field. Generally the sulfur and ash contents of the beds from this field are somewhat higher than those for coals from the Book Cliffs and Wasatch Plateau coal fields. The rank of the coal is considered to be high-volatile C bituminous where fresh and unweathered. Shallow coal beds are commonly oxidized or burned for a considerable distance away from the outcrop. Summary coal quality data for several beds from the southern Emery coalfield are shown in Table A8-20, Table A8-21, Table A8-22, and Table A8-23.

Table A8-20. Coal Quality Statistics for the A Bed From the Upper Cretaceous Ferron Sandstone Member of the Mancos Shale in the Southern Emery Coal Field (As-received Basis)

Coal Resources

The Emery coal field is also a major Utah coalfield; Quick, et al. (in preparation) estimate remaining, in-place, minable coal resources for the southern portion of the field to be 948 million tons. Emery County contains 68% of the in-place, minable coal resources of the Emery coal field, or 644 million tons. The Sevier County portion of the Emery coal field contains the remaining 32% of the resource, or 304 million tons, and this portion of the field is likely to be mined later than the Emery County portion of the field.

PAST PRODUCTION AND TRENDS

Introduction

Historically, most Utah coal production has come from underground mines in central Utah, and future production will probably continue to be predominantly from the Book Cliffs, Wasatch Plateau, and the Emery fields in this region. However, most of the easy-to-mine coal in this region will likely be depleted in the next 20 to 25 years, and coal from elsewhere in Utah will likely need to be mined to provide fuel for the state's power plants. One nearby field with coal resources favorable for mining is the Henry Mountains coal field.

Henry Mountains Coal Field

Coal in the Henry Mountains coal field has been mined in the past on a very limited scale from both the Ferron Sandstone Member of the Mancos Shale and Muley Canyon Sandstone. This coal was used locally to supply ranchers and residents of nearby towns (Doelling 1972b). Doelling (1972b) estimated the total tonnage removed from the field at about 9,000 tons, with most of it coming from the Ferron.

Ferron coal was first developed at the south end of the coal field at the Stanton mine. A couple thousand tons of coal was mined intermittently between 1888 and 1900 to supply gold dredges on the Colorado River to the south (Doelling 1972b). Small-scale mining of Ferron coal took place over a longer period at the far northern end of the field near Factory Butte. Mining in this area began in 1908 and continued sporadically up through the 1970s. From 1908 through the 1950s, underground coal mining removed about 5,900 tons for local use. Later, the Atlas-Dirty Devil Mining Company briefly attempted strip mining the coal near Factory Butte in the late 1970s. This company opened a surface mine in June 1978, trucked the coal to Green River, and sent a test shipment by rail to the power plant at Moapa, Nevada (Uresk 1979). Problems with coal quality prevented this operation from reaching full production.

The Muley Canyon coals were first developed around 1914 by tunneling into outcrops at the northern extent of this unit. Several small mines were opened along Sweetwater and Dugout creeks to supply coal for local use (Hunt, et al. 1953). Hunt et al. (1953) claim this coal was also later used to fuel a rig drilling a couple of test wells in the Green River Desert. The last known activity at these mines was in the 1940s (Doelling 1972b), and the total coal removed from these mines is estimated to be about 1,000 tons.

During the mid 1970s, AMAX Coal Company, Cayman Corporation, Consolidation Coal Company, Gulf Mineral Resources Company, and the Federal Government carried out widespread exploration on lands covering most of the Muley Canyon coal area. The primary interest at the time was evaluating surface-minable coal deposits, but environmental concerns and limitations, particularly bison herd habitat, eventually caused all prospecting areas to be dropped by 1983. The availability of the exploration data from the combined efforts of all the parties active in the 1970s has allowed the delineation of more than 120 million tons of deep Muley Canyon coal resources that could be mined with less surface disturbance than the originally anticipated surface mines.

Wasatch Plateau Coal Field

The Wasatch Plateau coal field covers parts of Carbon, Emery, Sanpete, and Sevier counties. Overall, this field has both the greatest annual and greatest cumulative coal production of any coal field in the State of Utah (Utah Department of Natural Resources 2003). Coal in this field was first developed in Carbon County during the late 19th century. Over the years, production has expanded from the northern, Carbon County portion of the field to the central and southern parts of the field in Emery and Sevier counties. The Sanpete County portion of the field is generally deep and has not been mined. Cumulative production from more than 80 mines through 2001 has totaled 523.7 million tons.

In 2001, eight active mines in this field produced 21.92 million tons of coal, or about 81% of the state's total. Production from this field has increased rapidly since the mid-1980s, doubling since 1986.

Emery Coalfield

Consolidation Coal Company idled the Emery coal mine in 1990, and through 1994 the activity at the mine was limited to shipping a very small quantity of coal from its stockpile. In 1995, Consolidation Coal decided to seal the portals of the mine and limit maintenance to pumping water to keep the mine from flooding. In early 2002, the company announced plans to re-open the Emery mine and did so by the end of that year.

Production from the Emery coal field has been erratic. Falling coal prices and the lack of nearby rail transportation have undoubtedly hindered large-scale development of the abundant coal resources from this field. Total production from the field through 2001 was about 9.5 million tons (Utah Department of Natural Resources 2003).

CURRENT PRODUCTION ACTIVITIES

Introduction

According to U.S. Mine Safety and Health Administration records, Utah's 2002 coal production was 24.7 million tons, a significant drop from the 2001 level of 27.0 million tons. A weak U.S. economy in 2002 led the average mine-mouth coal price to drop a few percent from 2001, but coal prices should rebound if the U.S. economy starts to grow in late 2003. Most of Utah's coal production comes from large, highly productive mines equipped with longwall mining machines. Four of Utah's mines produced more than 3 million tons in 2002 and rank among the nation's largest underground coal mines.

Coal Industry Structure

The Utah coal industry is highly competitive and production over time has steadily become concentrated among fewer companies with fewer, but larger mines. For example, Utah had 29 mines operated by 16 companies in 1982; however, by 2001 only 11 coal mines were operated by 5 parent coal companies. In addition to raw coal producers, one company, DTE Utah Synfuel (a subsidiary of Detroit Edison), processes and pelletizes coal for sale as a synthetic fuel. As of 2003, the five parent coal companies operating Utah coal mines are Andalex Resources Incorporated (three mines), Canyon Fuel Company (three mines), CONSOL Energy Incorporated (1 mine), CO-OP Mining Company (one mine), and Interwest Mining Company (one mine). Cyprus Plateau Mining Company exited the Utah coal mining business as recently as 2000, and Lodestar Mining Incorporated shut its last Utah coal mine in early 2003 as a result of bankruptcy.

Andalex Resources Incorporated

Andalex Resources has operated coal mines in Utah since 1980, when it opened the Tower Division to operate the Aberdeen, Apex, Centennial, and Pinnacle mines in the Book Cliffs field northeast of Price. In 2003, mining at the Tower Division is currently limited to continuous miner operations, but the mine has requested some new Federal leases to the north of the existing leases in the hope of restarting longwall mining there. Andalex, through its subsidiary Genwal Resources, operates a second coal mine, the Crandall Canyon mine, which is located in the Wasatch Plateau coal field. Andalex purchased its 50% interest in this company in 1994 from Nevada Power; the Intermountain Power Agency (IPA) owns the remaining 50% of Genwal Resources. Longwall reserves at this mine were exhausted in early 2003, and the mine will decrease production as it reverts to a continuous miner operation. Andalex's third mine, West Ridge, was opened in the Book Cliffs coal field in 2000 on leases it purchased from British Petroleum in 1997. Like the Crandall Canyon mine, West Ridge mine is operated by Andalex, but jointly owned by Andalex and the IPA through a company named West Ridge Resources. The West Ridge mine had a longwall mining machine installed in 2001. Production in 2002 from the Tower Division, Crandall Canyon, and West Ridge mines was 0.7, 3.3, and 2.3 million tons, respectively. These three mine sites accounted for 25% of Utah's 2002 coal production.

Canyon Fuel Company, LLC

Canyon Fuel Company operated three coal mines with longwall machines in Utah in 2002. Canyon Fuel Company is owned by the parent company Arch Coal Company (>99%). The company originally included a 9% interest in the Los Angeles Export Terminal Company, but during 2001, Canyon Fuel wrote off the value of its investment in that bankrupt terminal, and the terminal was dismantled in 2003. The three Utah mines operated by Canyon Fuel are the Dugout Canyon, Skyline, and SUFCO mines.

The Dugout Canyon mine, opened in 1998, is in the Book Cliffs coal field, while the Skyline and SUFCO mines are in the Wasatch Plateau coal field. During 2002, these three mines produced a combined total of 13.15 million tons, with 2.08 at Dugout Canyon, 3.48 at Skyline, and 7.60 at SUFCO. Canyon Fuel's mines accounted for 53% of the annual tonnage of coal produced in Utah in 2002. However, in 2003, low coal prices, a depressed market, and difficult mining conditions caused Canyon Fuel to announce that the Skyline mine would be idled in the second quarter of 2004. Although that mine has undeveloped resources on leases to the north, they will not be developed until the coal market improves according to the company statement.

CO-OP Mining Company

The CO-OP Mining Company, a family-owned company, operates the Bear Canyon #1 and #3 mines; the Bear Canyon #2 was idled in 2001. These mines use continuous mining machinery to recover the coal. During 2002, these two mines in the Wasatch Plateau coal field produced a combined total of 0.96 million tons, or about 4% of the state's total for that year. In 1997, the company purchased the Mohrland property from the IPA to provide at least 30 million tons of coal resources for future mining development. This 3,000-acre tract lies due east of the Bear Canyon #1 mine, but is separated from it by a major fault.

Interwest Mining Company

In 2002, PacifiCorp subsidiary Interwest Mining Company operated just one longwall mine in Utah, the Deer Creek mine. This mine produced 3.98 million tons of coal in 2002, or 16% of the state's total coal production for that year. This mine is located in the Wasatch Plateau coal field. The life of the Deer Creek mine was extended in 1999 with the acquisition of the Mill Fork Federal lease tract, which added another 46 million tons of coal to the company holdings.

CONSOL Energy Incorporated

CONSOL Energy reopened the Emery mine in late 2002 after being idle since 1990. Production from this mine in 2002 totaled 0.03 million tons, or one-tenth of one percent of the state's total for that year. This is the only mine operating in the Emery coal field. From 1998 through 2002, Utah has seen the closure of the Star Point, Trail Mountain, and White Oak mines in the Wasatch Plateau coal field, and the Soldier Canyon and Willow Creek mines in the Book Cliffs coal field; the loss of all this productive capacity probably has created a market opportunity that the Emery mine can exploit to remain competitive. This market opportunity will also be enhanced as the Crandall Canyon mine stops longwall production in 2003 and reverts to a smaller, continuous miner operation. CONSOL hopes that the loss of productive capacity at other Utah mines in recent years will allow the Emery mine to ramp up production and eventually install a longwall machine.

Coal Markets

Since the beginning of the new millennia, Utah has experienced a contraction in the number of market segments consuming its coal (Utah Department of Natural Resources 2003). During the late 1990s, coal exports to Pacific Rim nations accounted for 10% of Utah coal production, but by 2003 a strong U.S. dollar, strong competition from Australian and Indonesian producers, and weak Asian economies combined to eliminate an overseas market for Utah coal. Also, the late-2002 final closure of the Geneva Steel coke ovens permanently ended the small coking market for Utah coal.

Utah's main coal market is at electric utility and cogeneration plants primarily in Utah, Nevada, and California. This market segment has traditionally consumed about 75% of the coal produced in Utah, and with the loss of the export market, this market segment's share will increase. The second largest market

for Utah coal is the industrial sector, which has historically consumed about 13% of Utah coal production. The final segment supplied by Utah coal producers is the residential and commercial market; this segment has traditionally consumed 1 or 2% of annual production. Even with the loss of the export and coking coal markets, demand for Utah coal is likely to require annual coal production near 25 million tons for the foreseeable future. Should the plans to expand Utah's electric generation capacity at the Hunter or IPA power stations materialize in the next 10 years, the annual demand for Utah coal could rise to the 30 million ton level. In spite of increasing environmental regulation of emissions from coal-fired power plants, coal still remains a low-cost fuel for electricity generation.

Extraction of Utah coal has been accelerating at a rapid pace in the last 20 years. A time span of 111 years was needed to produce the first 415 million tons of coal from Utah, but only 20 more years were required to produce the second 415 million tons (e.g., by 2001). The next 415 million tons will probably be extracted in 15 years, or by about 2016. Previous UGS work for the BLM identified about 960 million tons of potentially recoverable coal in the Carbon and Emery counties portion of the Book Cliffs and Wasatch Plateau. This estimate was optimistic because it did not take into account site-specific problems in certain areas such as inferior coal quality, losses owing to problems like unmanageable roof and floor, lands that may be unacceptable for leasing, or difficulties such as unexpectedly high levels of water or gas infusions that may hinder actual coal recovery in some areas. At best, these reserves could provide all the coal needed to supply traditional markets for the next 30 years. However, in spite of the potential of the Book Cliffs and Wasatch Plateau fields in Carbon and Emery counties to hypothetically provide all the coal needed by current markets, one mine has reopened in 2002 in the Emery coal field, showing that other market forces such as ease of permitting, proximity to specific customers, or restrictive coal ownership patterns may push coal production into fields outside the Book Cliffs and Wasatch Plateau fields in the next 30 years before the reserves in the latter fields are fully depleted. Therefore, alternative supply regions, such as the Emery and Henry Mountains coal fields, need to be kept open for potential future development in the event there is unanticipated early reserve depletion or abandonment in currently operating areas.

REASONABLY FORESEEABLE DEVELOPMENT

Introduction

While it is impossible to know precisely when and where minable coal resources will be developed in the next 15 or 30 years, the coal resources that are of minable thickness and at favorable depths can be identified as potentially recoverable in the fields outside the traditional mining areas of the Book Cliffs and Wasatch Plateau coal fields in Carbon and Emery counties. Within the Richfield planning area, there are three coal areas that are attractive for future coal mining development. They are, in decreasing order of development potential, the Wasatch Plateau coal field of Sanpete and Sevier counties, the Emery coal field of Sevier County, and the Henry Mountains coal field of Garfield and Wayne counties.

Wasatch Plateau Coal Field (Sanpete and Sevier Counties)

Based on work by the UGS for the BLM, an estimated recoverable resource base of 773.8 million tons of unleased coal is available for mining in the Wasatch Plateau coal field. About 162.8 million tons are likely to be mined in the period from 2003 through 2017, along with the already leased coal resources. Of the coal to be mined in the first 15-year period, about 101 million tons will come from the Carbon-Emery portion to the Wasatch Plateau, while 51.5 million tons is estimated to be recovered from the Sevier County portion near the SUFCO mine (see Table A8-24).

Another 621.0 million tons of recoverable coal is available for mining from 2018 through 2032 and beyond. About 61% of the coal to be recovered in the second 15-year period is expected to come from Carbon and Emery counties, and 39% is expected to come from Sanpete and Sevier counties (see Table A8-24). More than 95% of the coal identified as available for mining in the next 30 years lies within 0.75 miles of a thickness measurement point or in the demonstrated resource reliability category (Wood, et al. 1983). In total, the Sanpete and Sevier counties portion of the Wasatch Plateau contains about 291.1 million tons of recoverable coal.

Table A8-24. Remaining, In-place, Demonstrated (95%) Unleased Resources by Mining Period for the Wasatch Plateau Coal Field

Mining Period	Counties	In-place	Recoverable
2003-2017	Carbon-Emery	148.7	101.3
2018-2032+	Carbon-Emery	558.0	381.3
2003-2017	Sanpete-Sevier	73.5	51.5
2018-2032+	Sanpete-Sevier	342.3	239.7
Total	**All Counties**	**1,122.5**	**773.8**

Given in millions of short tons (for coal beds mostly > 6 feet thick, and with > 200 feet, but < 2,500 feet of overburden).

Emery Coal Field

The UGS has recently reappraised the available coal in the Emery coal field with funding provided by the USGS. Within the Emery coal field, the UGS identified 948 million tons of demonstrated in-place coal resources, the majority of which occur in Emery County (644 million tons), but there are also 304 million tons identified in Sevier County (see Table A8-25). The coal was broken out as either surface or deep minable, with 96% being deep or underground minable. The deep minable coal occurs in eight beds that are 6 feet thick or greater, and the surface minable coal occurs in one bed that is 4 feet thick or greater. The majority of the coal in Sevier County occurs in the A bed (58%), the lowest one stratigraphically. Another 31% of the in-place coal resource occurs in the I bed, with small amounts in the other six coal beds. Recoverable coal was estimated at 65% of the in-place deep coal and 80% of the in-place surface minable coal. Using these recovery factors, there are about 190 million tons of deep recoverable coal, and 9 million tons of surface minable coal in the Sevier County portion of the Emery coal field. The Sevier County minable resources would probably be mined after the Emery County portion of the field, which contains an estimated 304 million tons of recoverable deep minable coal and 141 million tons of recoverable surface minable coal. The Emery County portion of the Emery coal field reserves is sufficient to last at least 30 years, so the Sevier County reserves are likely to be mined only near the end of the 30-year planning horizon.

Table A8-25. Original, In-place, Demonstrated, Minable Coal Resources (Millions of Tons) Given by County for the Southern Emery Coal Field

Mining Period	County	In-place		Recoverable		Total Recoverable
		Surface	Deep	Surface (80%)	Deep (65%)	
2003-17	Emery	0	49	0	32	32
2018-32	Emery	176	419	141	272	413

Mining Period	County	In-place		Recoverable		Total Recoverable
		Surface	Deep	Surface (80%)	Deep (65%)	
2030-50	Sevier	11	292	9	190	199
TOTAL		**188**	**760**	**150**	**494**	**644**

From Quick, et al. in preparation; for coal beds averaging > 6 feet thick and with < 2,500 feet of cover.

Henry Mountains Coal Field

The Henry Mountains coal field contains two areas in the Richfield planning area that have a slim chance of being mined in the next 30 years, but that may draw some serious attention in the next 50 years. One area, located to the north of Factory Butte in Wayne County, contains surface minable Ferron Sandstone coal. The second area, primarily in Garfield County, contains deep minable Muley Canyon Sandstone coal.

While the Henry Mountains coal field contains hundreds of millions of tons of in-place coal in the Ferron zone, only a small portion of these resources have any chance of being mined in the next 30 years. The Ferron Sandstone Member resources with the best development potential are the surface-minable resources near Factory Butte. These resources are the closest to rail transport and the central Utah power plants, they are thickest and shallowest, and they have been extensively drilled, which would allow for adequate and prompt mine planning. The major drawbacks of these resources are their moderately high sulfur content (2 to 3%) and the small size of the resource. However, as the resources in Carbon and Emery counties dwindle, this area could produce one million tons annually over a 14-year period, and the higher sulfur coal could be blended at a power plant with lower sulfur coal from elsewhere. The in-place and strip-mine recoverable coal resources from the Factory Butte area of the Ferron Sandstone Member are summarized in Table A8-26.

Table A8-26. In-place and Recoverable Coal Resources by Mining Period for the Ferron Sandstone Member in the Henry Mountains Coal Field

Mining Period	In-place	Recoverable (80%)
2030 or beyond	17.60	14.08

Given in millions of short tons (for coal in beds mostly > 6 feet thick and with <100 feet of overburden).

The coal resources of the Muley Canyon Sandstone in Garfield County originally attracted industry attention for the significant surface-minable tonnages that occur around the periphery of Tarantula Mesa; however, it is unlikely that future surface mining will be permitted within sight of nearby Capitol Reef National Park. Therefore, the deeper Muley Canyon coal resources found under Tarantula Mesa have the best chance of being mined in the foreseeable future because they could be mined with little or no visual impact on Capitol Reef National Park if developed from the east side of Tarantula Mesa. These deep minable resources generally occur as one bed that is 8 to 14 feet thick and has overburden of less than 1,500 feet, which would be ideal for high-efficiency longwall mining methods. While the whole area under Tarantula Mesa contains more than 500 million tons of in-place, deep minable resources in the Muley Canyon, only 179.5 million tons meet the BLM criterion requiring that at least 80% of the resources fall in the demonstrated reliability category. Because little is known of the ease or difficulty of underground mining of coal from the Muley Canyon, a conservative mining recovery factor of 65% was

applied to the demonstrated resources to arrive at an estimated recoverable coal resource of 116.7 million tons (see Table A8-27). This is enough coal to support a longwall mine producing 4 million tons per year for nearly 30 years. The earliest date any potential development of the Muley Canyon coal could occur is estimated to be about 2030.

Table A8-27. In-place and Recoverable Coal Resources by Mining Period for the Muley Canyon Sandstone in the Henry Mountains Coal Field

Mining Period	In-place	Recoverable (65%)
2030 or beyond	179.5	116.7

Given in millions of short tons (for coal in beds mostly > 6 feet thick and between 100 feet and 1,500 feet of overburden).

COAL UNSUITABILITY REPORT HENRY MOUNTAINS COAL FIELD

INTRODUCTION

The Bureau of Land Management has the responsibility for implementing Federal regulations 43 CFR 3461, Federal Lands Review: Unsuitability for Mining. The general unsuitability criteria, the Federal land review, and the prohibitions against mining are derived from the applicable sections of the Surface Mining Control and Reclamation Act of 1977 [30 U.S.C. 1272(a), (b), (e)]. This review of coal unsuitability is in conjunction with the revision of the existing land use plan and the development of a Resource Management Plan for the Richfield Field Office.

As addressed at 43 CFR 3420.1-4, the Secretary of the Interior may not hold a lease sale of public land containing coal deposits, unless the land is subject to a comprehensive land use plan. Only those lands that have coal resources with development potential may be considered as acceptable for further consideration for leasing. The coal resources, which are evaluated for unsuitability, have been delineated in a report, Coal Resource Evaluation of the Henry Mountains Coal Field, Garfield and Wayne Counties, Utah (2004). The coal report identifies public land that has a coal resource that is to be considered for coal leasing through the land use planning.

This report addresses the unsuitability of the coal resources that have potential for development in the Henry Mountains coal field. Following the identification of the coal resources with development potential, the Bureau of Land Management shall determine whether areas are unsuitable for all or certain stipulated methods of mining. The Department of the Interior has developed 20 criteria that are used for this determination, which are presented at 43 CFR 3461.5.

GEOLOGIC SETTING

The Henry Mountains coal field contains predominately sedimentary strata, which are Jurassic and Cretaceous in age. The coal field is ovate in general outline with dimensions that are approximately 48 miles long in a north-south direction and as much as 18 miles wide in an east-west direction. The Jurassic strata crop out around the perimeter of the field, and the Cretaceous strata are exposed in the central part. The coal-bearing strata are mapped as part of the Ferron Sandstone and the Muley Canyon Sandstone Members of the Mancos Shale.

The Henry Mountains coal field is in a structural basin, centered on the Henry Mountains syncline. The west limb is defined by the Waterpocket Fold; the east limb coincides with the intrusive rocks of the Henry Mountains. The coal-bearing strata between the limbs of the basin are nearly horizontal.

LANDS CONSIDERED

Generally, the Henry Mountains coal field is at T. 27-34 S., R. 8-11 E., SLM, Garfield and Wayne Counties, Utah (Map 1), and the coal field contains 302,876 acres. Most of the land in the coal field is owned by the U.S., but State and privately owned lands are also interspersed with the Federal lands. The Federal lands are administered by the Richfield Field Office of the Bureau of Land Management. Currently, no Federal coal leases are authorized on public lands located within the Henry Mountains coal field.

COAL RESOURCES

A total of 2,209.6 million tons of in-place coal has been identified in the Henry Mountains coal field. This estimate is from the coal report, which is based mostly on resource information from Tabet (1999, 2000).

In the coal report, coal resources that are greater than 2 feet in thickness and that have less than 100 feet of overburden are considered to have potential for development by surface mining methods. Underground, conventional, mining methods are considered applicable to coal resources that are 6 feet or greater in thickness and that have a depth of 100 feet or more.

An exception to the surface and underground parameters was made at Factory Butte at T. 27 S., R. 9 E, where a 270 acre area has slightly greater than 100 feet of overburden. Since the majority of the coal resource at Factory Butte meets the parameters for surface mining, this coal resource that exceeded the 100-foot depth parameter was designated as a surface minable resource.

Surface minable coal resources total approximately 466.1 million tons and by underground minable coal resources total approximately 1,283.6 million tons. Thus, the total coal resource that is considered favorable for mining by surface or underground methods is 1,749.7 million tons. The coal resources that are considered to have development potential are displayed on Map 2. Ownership of the land with coal resources that has development potential is shown in Table A8-28.

Table A8-28. Henry Mountains Coal Resources

Land Status	Surface Minable Acres	Underground Minable Acres
BLM	36,028	50,512
NPS	1,170	756
State	5,556	3,869
Private	414	1,253
Total	**43,168**	**56,390**

Split ownership of private surface and Federal minerals is not presented in the above totals, due to limitations of the current GIS data base. The unsuitability criteria are applied to the Federal lands containing coal resources, as defined at 43 CFR 3400.0-5(o) and required by the regulations at 43 CFR 3461.2-1.

EVALUATION OF THE UNSUITABILITY CRITERIA

The coal resources with development potential are assessed for the unsuitability criteria as outlined at 43 CFR 3461.5. Underground mining of coal deposits is exempt from the criteria, where there would be no surface coal mining operations as stated at 3461.1.1(a). Surface mining operations include surface operations and surface impacts incident to an underground mine as stated at 43 CFR 3400.0-5(mm). In addition, at 43 CFR 3461.1(b), where underground mining will include surface operations and surface impacts on Federal lands to which a criterion applies, the lands shall be assessed as unsuitable unless an exception or exemption applies. Each criterion is subject to exceptions and/or exemptions as prescribed in the regulations.

As stated above, the criteria are applied to the Federal lands with coal resources that are identified as having development potential.

Criterion 1

Summary of the Criterion: All Federal lands included in the following land systems or categories shall be considered unsuitable: National Park System, National Wildlife Refuge System, National System of Trails, National Wilderness Preservation System, National Wild and Scenic Rivers System, National Recreation Areas, lands acquired with money derived from the Land and Water Conservation Fund, National Forests, and Federal lands in incorporated cities, towns, and villages.

1,926 acres of land with the identified coal resources are included within Capitol Reef National Park (Map 1). This land is deemed to be unsuitable for coal leasing. None of the remaining coal resources with development potential are contained within any of the other listed land systems or categories.

The exemptions for valid existing rights do not apply.

Criterion 2

Summary of the Criterion: Federal lands that are within rights-of-way, easements or surface leases for residential, commercial, industrial, or other public purposes on Federally owned surface shall be considered unsuitable.

Several authorized rights-of-way encompass Federal lands with coal resources having development potential (Map 3). These are listed in Table A8-29 below.

Table A8-29. Authorized Rights-of-Way

Serial Number	Holder	Legal Description	Type	Width (ft)
UTU-047320	Garfield County	T. 31 S., R. 9 E., Sec. 30, 31 T. 32 S., R. 9 E., Sec. 5, 6	Road	50
UTU-051955	Tercero Corp	T. 31 S., R. 9 E., Sec. 33	Water Facility	10
UTU-051980	Garfield County	T. 31 S., R. 8 E., Sec. 23-26	Road	50
UTU-0 094714	Federal Highway Administration	T. 28 S., R. 9 E., Sec. 22	Federal Aid Highway	200
UTU-0 057537	Garkane Power Association	T. 28 S., R. 9 E., Sec. 22	Power Transmission Line	50

The coal resources subject to a right-of-way are considered unsuitable; however, exceptions may be applicable where:

- All or certain types of coal development (e.g., underground mining) will not interfere with the purpose of the right-of-way or easement, or
- The right-of-way or easement was issued for a purpose for which it is not being used,
- The parties involved in the right-of-way or easement agree, in writing, to leasing,
- It is impractical to exclude such areas due to the location of coal and method of mining and such areas or uses can be protected through appropriate stipulations.

The above-listed rights-of-way are subject to surface and/or underground mining methods. Mining by underground methods is exempt and should not interfere with the intended use of a right-of-way facility. Where there could be surface operations and surface impacts associated with underground mining, the impacts would be mitigated, subject to an agreement with the right-of-way holder at the time of a specific leasing proposal. Where the coal resources would be mined by surface methods, the facility could be moved during the mining operations and re-located when the land is reclaimed, again, subject to an agreement with the right-of-way holder. Any agreements with the affected holder of the right-of-way would be negotiated at the time of the specific leasing proposal. The Federal lands subject to the above rights-of-way are considered suitable.

The exemption for substantial legal and financial commitments and on-going mining operations does not apply, since coal exploration and development are not currently present or authorized.

Criterion 3

Summary of the Criterion: The terms used in this criterion have their meaning set out in the Office of Surface Mining Reclamation and Enforcement regulations at Chapter VII of Title 30 of the Code of Federal Regulations. Federal lands affected by Section 522(e) (4) and (5) of the Surface Mining Control and Reclamation Act of 1977 shall be considered unsuitable. This includes lands within 100 feet of the outside boundary of a public road right-of-way, lands within 100 feet of a cemetery, or lands within 300 feet of any public building, school, church, community or institutional building, public park, or occupied dwelling.

Exceptions are allowed, if a lease may be issued for lands:

- Used as mine access roads or haulage roads that join the right-of-way for a public road;
- For which the Office of Surface Mining and Reclamation and Enforcement has issued a permit to have public roads relocated;
- If, after public notice and opportunity for public hearing in the locality, a written finding is made by the authorized officer that the interests of the public and the landowners affected by mining within 100 feet of a public road will be protected;
- For which owners of occupied dwellings have given written permission to mine within 300 feet of their buildings.

The coal lands of the Henry Mountain Coal Field do not fall within the stated distances of a cemetery, public building, school, church, community or institutional building, or public park.

Federal lands with development potential for coal resources are located within the100-foot extension of the rights-of-way for a road or highway, which are listed under Criterion 2. Those road and highway rights-of-way are subject to surface and/or underground mining methods. Mining by underground methods is exempt from this review and should not interfere with the intended use of a right-of-way facility. Where the coal resources would be mined by surface methods or a surface operation or impact would be associated with underground mining, the coal would only be leased in compliance with the Office of Surface Mining Reclamation and Enforcement following a public notice and hearing. The Federal lands within the 100-foot extension of road or highway rights-of-way, as listed under Criterion 2, are considered suitable for leasing under this Criterion.

Occupied dwellings are located at T. 31 S., R. 9 E., Sec. 21 at the Starlight Ranch, and T. 31 S., R. 9 E., sec. 32 at the King Ranch. These are furnished dwellings that are not occupied on a long-term basis. Specific distances to the dwellings from the coal resource on Federal land are unknown at this time; however, the distance to the dwellings is believed to be more than 300 feet.

At this time, the Federal lands are considered suitable for mining. If a proposal for leasing is submitted, then appropriate review would be completed with the involvement of the Office of Surface Mining and Reclamation and Enforcement and the public.

Criterion 4

Summary of the Criterion: Federal lands designated as wilderness study areas shall be considered unsuitable while under review by the Administration and the Congress for possible wilderness designation.

Three WSAs encompass lands with coal resources that have development potential by surface or underground mining methods (Map 4). As stated in the Federal regulations at 43 CRF 3461.1, underground mining is exempt from the unsuitability criteria; however, surface operations and surface impacts, which could be associated with underground mining, are unsuitable.

Coal leasing is subject to the Interim Management Policy for Land under Wilderness Review (IMP) in Section B.2.c. of Chapter 3 (Rel. 8-67, 7/5/95), as stated:

> *"The coal unsuitability criteria will be applied to all coal lands being considered in the BLM's planning system. The only BLM-administered lands that will be offered for competitive lease sale are those on which a final wilderness inventory decision has determined that the lands lack wilderness characteristics. Once the Congress has determined that a WSA will not be designated as wilderness, the area may be considered for competitive lease." (Italics added.)*

All lands that are presently included within the boundaries of a WSA have been determined to have wilderness characteristics.

Under Federal regulation the general exemption for underground mining applies to Federal land in a WSA if there are no surface operations or surface impacts. However, based on IMP, coal lands within a WSA cannot be offered for leasing at the present time.

The total acreage of land within WSAs that is unsuitable by either surface or underground methods is 28,683 acres. Approximately 1,400 acres of State land are included in that figure. However, State land is not part of a WSA and unsuitability under the Federal regulations does not apply to the State minerals.

A WSA is a temporary designation, pending Congress either legislatively designating the land as part of the National Wilderness System or releasing the land from consideration under the Wilderness Act. Federal land that is released by act of Congress would then be considered suitable for coal leasing under this Criterion, because such land would no longer be within a WSA or subject to IMP.

As authorized leases are not present on Federal lands, valid existing rights are non-existent. An exemption for existing leases is not applicable.

Criterion 5

Summary of the Criterion: Scenic Federal lands designated by visual resource management (VRM) analysis as Class I (an area of outstanding scenic quality or high visual sensitivity) but not currently on the National Register of Natural Landmarks shall be considered unsuitable.

Federal lands are being considered for designation as VRM Class I under all the alternatives in the Environmental Impact Statement for the Richfield Field Office Resource Management Plan (RMP) (Map 4). The lands, which are proposed for VRM Class I, are coincident with the designated WSAs.

An exception is allowed for the issuance of a lease if the surface management agency determines that surface coal mining operations will not significantly diminish or adversely affect the scenic quality of the designated area. The Federal lands that would be mined by underground methods are exempt; however, the location of the surface facilities would need to be considered in applying the visual resource objectives of Class I. The lands that would be mined by surface methods are considered unsuitable with the VRM Class I objectives. However, all lands that would be designated as VRM Class I in the RMP are unsuitable for surface and underground mining methods under Criterion 4 due to the coincidental boundaries of WSAs and VRM Class I and due to the non-impairment standard of IMP that would disallow the issuance of a lease within WSAs at the present time.

The exemption for substantial legal and financial commitments and on-going mining operations does not apply, since coal exploration and development are not currently present or authorized.

Criterion 6

Summary of the Criterion: Federal lands under permit and being used for scientific studies involving food or fiber production, natural resources, or technology demonstrations and experiments shall be considered unsuitable for the duration of the study.

None of the subject lands are under permit for the described scientific studies. This criterion is not applicable to the subject lands.

Criterion 7

Summary of the Criterion: All publicly or privately owned places which are included in the National Register of Historic Places shall be considered unsuitable.

There are no listed sites within the subject lands that are included on the National Register of Historic Places. This criterion is not applicable.

Criterion 8

Summary of the Criterion: Federal lands designated as natural areas or as National Natural Landmarks shall be considered unsuitable.

None of the subject lands are designated as part of a National Natural Landmark. This criterion is not applicable.

Criterion 9

Summary of the Criterion: Federally designated critical habitat for listed threatened or endangered (T&E) plant and animal species, and habitat proposed to be designated as critical for listed threatened or endangered plant and animal species or species proposed for listing, and habitat for Federal threatened or endangered species which is determined by the Fish and Wildlife Service and the surface management agency to be of essential value and where the presence of threatened or endangered species has been scientifically documented, shall be considered unsuitable.

An exception allows that a lease may be issued and mining operations approved if, after consultation with the Fish and Wildlife Service, it is determined that the proposed activity is not likely to jeopardize the continued existence of the listed species and/or its critical habitat.

Designated critical habitat for the Mexican spotted owl (Strix occidentalis) has been delineated by the U.S. Fish and Wildlife Service (Map 5). This critical habitat overlaps 13,753 acres of surface minable coal resources and 22,317 acres of underground minable coal resources.

BLM has completed inventories of Federal land and has identified areas within designated critical habitat which contains the constituent elements for Mexican spotted owl (Attachment 1). The critical habitat, based on the constituent elements and survey work, is also shown on Map 5. The critical habitat with the constituent elements as inventoried by BLM encompasses 576 acres of surface minable coal and 52 acres of underground minable coal.

The lands with coal resources that would be developed by underground mining are exempt from review. Surface operations and impacts are considered unsuitable, unless at the time of leasing, the Fish and Wildlife Service determines that the proposed activity is not likely to jeopardize the continued existence of the listed species.

If surface mining were to occur, the mining would be completed in stages, or mining units, with mining in one area while an adjacent, previously mined-out area would be reclaimed to restore the critical habitat. Thus, with concurrent mining and reclamation, surface mining would not impact all the acreage within a given lease at one time. Also, all of the above listed land with an identified potential for surface mining may not be developed, because the coal reserves that would support a mine could be less than the currently identified coal resource. However, the coal lands contained within the designated critical habitat with the constituent elements for Mexican spotted owl are considered unsuitable for surface coal mining and surface operations and impacts associated with underground mining. The inventoried habitat is also contained within a WSA and is unsuitable for leasing under Criterion 4.

Occurrences of Wright's fishhook cactus (Sclerocactus wrightiae) are known and documented in the vicinity of Factory Butte (Attachment 2). Habitat that is considered to be of essential value for this species encompasses the surface minable resource at T. 27-28 S., R. 8-9 E. These documented occurrences and habitat of essential value are not shown on Map 5 because the species could be further threatened by collection if the specific locations or habitat of essential value is included in a public document. The coal resources in vicinity of Factory Butte encompass 2,895 acres of Federal coal resources that are considered unsuitable for leasing.

The exemption for substantial legal and financial commitments and on-going mining operations does not apply, since coal exploration and development are not currently present or authorized.

Criterion 10

Summary of the Criterion: Federal lands containing habitat determined to be critical or essential for plant or animal species listed by a state pursuant to state law as endangered or threatened shall be considered unsuitable.

Habitat for the Mexican spotted owl is determined to be critical or essential by the State of Utah. This land is the same as identified for Criterion 9 (Map 5). The coal lands contained within the identified Mexican spotted owl habitat are considered unsuitable for surface coal mining and surface operations and impacts associated with underground mining. This habitat is also contained within a WSA and is unsuitable for leasing under Criterion 4.

The exemption for substantial legal and financial commitments and on-going mining operations does not apply, since coal exploration and development are not currently present or authorized.

Criterion 11

Summary of the Criterion: A bald or golden eagle nest or site on Federal lands that is determined to be active, and an appropriate buffer zone of land around the nest site, shall be considered unsuitable. Consideration of availability of habitat of prey species and of terrain shall be included in the determination. Buffer zones shall be determined in consultation with the Fish and Wildlife Service.

Active eagle nests are not known to be present on the Federal lands under consideration for leasing, based on surveys and knowledge of BLM biologists (Attachment 3). Therefore, this criterion does not apply to the subject lands. If active nests or sites are found at the time of leasing, then consultation will occur with the U.S. Fish and Wildlife Service and appropriate mitigations as outlined in the RMP will be applied.

Criterion 12

Summary of the Criterion: Bald or golden eagle roost and concentration areas on Federal lands, used during migration and wintering, shall be considered unsuitable.

Eagle roosts are not known to be present on the subject lands, therefore, this criterion does not apply. If roosts or concentration areas are found at the time of leasing, then consultation will occur with the U.S. Fish and Wildlife Service and appropriate mitigations as outlined in the RMP will be applied.

Criterion 13

Summary of the Criterion: Federal lands containing a falcon (excluding kestrel) cliff nesting site with an active nest shall be considered unsuitable. A buffer zone will be included around the nest site which considers the availability of habitat for prey species and terrain. Buffer zones shall be determined in consultation with the Fish and Wildlife Service.

Falcon cliff nesting sites with an active nest are not known to be present on the Federal lands (Attachment 3). This criterion does not apply to the subject lands. If an active cliff nesting site is found at the time of leasing, then consultation will occur with the U.S. Fish and Wildlife Service and appropriate mitigations as outlined in the RMP will be applied.

Criterion 14

Summary of the Criterion: Federal lands which are high priority habitat for a migratory bird species of high Federal interest on a regional or national basis, as determined by the surface management agency and the Fish and Wildlife Service, shall be considered unsuitable.

There is no high priority habitat for migratory bird species on the subject lands. This criterion is not applicable.

Criterion 15

Summary of the Criterion: Federal lands which the surface management agency and state jointly agree are habitat for resident species of fish, wildlife, and plants of high interest to the state and which are

essential for maintaining these priority wildlife and plant species shall be considered unsuitable. Examples of such lands include:

- Active dancing and strutting grounds for sage grouse,
- Winter ranges crucial for deer, antelope, and elk,
- Migration corridor for elk, and
- Extremes of range for plant species.

A lease may be issued if, after consultation with the state, the surface management agency determines that all or certain stipulated methods of coal mining will not have a significant long-term impact on the species being protected.

In accordance with the Utah Division of Wildlife Resources, crucial habitat is necessary to sustain the existence and/or perpetuation or introduction of one or more species of historic or existing high interest wildlife during crucial periods of their life cycle. This classification includes all habitats that are highly sensitive to surface disturbance and areas where fish or wildlife management considerations dictate that surface disturbance could not be tolerated by the species.

Coal resources with development potential by surface and underground mining methods are overlain by habitat that is crucial for bison and deer on the Henry Mountains (Maps 6 & 7). The acreage of crucial habitat is identified in Table A8-30.

Table A8-30. Acreage of Minable Coal Resources

Crucial Habitat	Surface Methods	Underground Methods
Bison	33,588	56,877
Deer	14,085	30,408

The coal resources within the crucial deer habitat are also included within the boundaries of the crucial bison habitat; thus, the acreage above for the deer is included in the acreage for the bison.

If surface mining were to occur, the mining would be completed in stages, or mining units, with mining in one area while an adjacent, previously mined-out area would be reclaimed to restore the crucial habitat. Thus, with concurrent mining and reclamation, surface mining would not impact all the acreage within a given lease at one time. Also, all the above land with an identified potential for surface mining may not be developed, because the coal reserves that would support a mine could be less than the currently identified coal resource.

This criterion provides that a lease may be issued, if after consultation with the state, a determination is made that all or certain stipulated methods of coal mining will not have a significant long-term impact on the species being protected. Given that exception, depending on the location, acreage, and specifics of an application to lease coal, impacts to the crucial habitat may be mitigated such that surface coal mining would not have a long-term impact to the species.

Underground mining is exempt. However, surface facilities associated with the coal mining could be located within the crucial habitat and could include a mine portal, buildings, and construction of roads. Haulage of mined coal would also be necessary. The location of these facilities and associated haulage roads could be located as to minimize or reduce the impact to the habitat. Surface operations and impacts would not have an adverse, long-term impact on the bison and deer habitat.

The exemption for substantial legal and financial commitments and on-going mining operations does not apply, since coal exploration and development are not authorized.

Criterion 16

Summary of the Criterion: Federal land in riverine, coastal and special floodplains (100-year recurrence interval) on which the surface management agency determines that mining could not be undertaken without substantial threat of loss of life or property shall be considered unsuitable for all or certain stipulated methods of coal mining.

Federal lands with a coal resource having development potential may be present along some streams, most notably the Fremont River in T. 28 S., R. 9 E., Section 22. Surface mining could be undertaken without substantial threat of loss to life or property. Any mining which is authorized would need to contain lease stipulations to control flooding and potential hazards associated with such events. Underground mining is exempt from review, and surface operations would not result in a substantial threat of loss of life or property. The coal resources having development potential are considered suitable for leasing.

The exemption for substantial legal and financial commitments and on-going mining operations does not apply, since coal exploration and development are not currently present or authorized.

Criterion 17

Summary of the Criterion: Federal lands which have been committed by surface management agency to use as municipal watersheds shall be considered unsuitable.

None of the subject lands with coal resources that have potential for development are within a municipal watershed. This criterion is not applicable.

Criterion 18

Summary of the Criterion: Federal lands with National Resource Waters, including areas identified by states in their water quality management plans and a buffer zone of Federal lands ¼ mile from the outer edge of the far banks of the water, shall be considered unsuitable.

None of the subject lands with coal resources that have potential for development include National Resource Waters which the State of Utah considers as High Quality Waters. This criterion is not applicable.

Criterion 19

Summary of the Criterion: Federal lands identified by the surface management agency, in consultation with the state in which they are located, as alluvial valley floors according to the definition in §3400.0-5(a) of this title, the standards in 30 CFR 822, the final alluvial valley floor guidelines of the Office of Surface Mining Reclamation and Enforcement when published, and approved state programs under the Surface Mining Control and Reclamation Act of 1977, where mining would interrupt, discontinue, or preclude farming, shall be considered unsuitable. Additionally, when mining Federal land outside an alluvial valley floor would materially damage the quantity or quality of water in the surface or underground water systems that would supply alluvial valley floors, the land shall be considered unsuitable.

There are no known conflicts with farming. The Fremont River has a relatively small alluvial valley floor. If surface mining were to occur within the alluvial valley floor, then mining and reclamation would be completed in a manner to minimize disturbances to the hydrologic balance within the permit area by reestablishing the essential hydrologic functions of the alluvial valley floors. Similarly, if mining were to occur outside of the alluvial valley floor, then mining and reclamation would be completed in a manner to minimize disturbances to the hydrologic balance by preserving the essential hydrologic functions. This criterion is not applicable.

Criterion 20

Summary of the Criterion: Federal lands in a state to which is applicable a criterion (i) proposed by the state or Indian tribe located in the planning area, and (ii) adopted by rulemaking by the Secretary, shall be considered unsuitable.

The State of Utah has adopted unsuitability criteria under rule R645-103-300, Utah Criteria for Designating Areas as Unsuitable for Coal Mining and Reclamation Operations. The criteria are similar to the Federal criteria at 43 CFR 3461, which are addressed in this report.

The coal resources that are assessed in this report are not located on tribal lands. An Indian tribe has not proposed or adopted any criteria for coal mining unsuitability that would be applicable to the subject Federal lands.

SUMMARY OF THE UNSUITABILITY EVALUATION

The coal resources with development potential in the Henry Mountains coal field have been evaluated in consideration of the 20 unsuitability criteria. Based on the criteria, the coal resources which are considered suitable for leasing are shown on Map 8. Coal resources have been determined to be unsuitable for leasing, based on Criteria 4 (WSAs) and 9 (T&E plants). The coal resources criteria were applied to Federal land only. The summary of acreage by land ownership is identified in Table A8-31.

Table A8-31. Acreage of Minable Coal Resources

Land Status	Surface Methods	Underground Methods
BLM	4,683	41,842
NPS	0	0

Only Federal surface estate is included in the above totals, since the criteria only apply to Federal lands. Some split estate (private surface and Federal minerals) may not be reflected in the above total, since the GIS data base does not include such information. There is not a significant acreage of split estate in the Henry Mountains coal field.

COAL UNSUITABILITY REPORT WASATCH PLATEAU AND EMERY COAL FIELDS

INTRODUCTION

The Bureau of Land Management (BLM) has the responsibility for implementing Federal regulations 43 CFR 3461, Federal Lands Review: Unsuitability for Mining. The general unsuitability criteria, the Federal land review, and the prohibitions against mining are derived from the applicable sections of the Surface Mining Control and Reclamation Act of 1977 [30 U.S.C. 1272(a), (b), (e)]. This review of coal unsuitability is in conjunction with the revision of the existing land use plan and the development of a Resource Management Plan for the Richfield Field Office.

As addressed at 43 CFR 3420.1-4, the Secretary of the Interior may not hold a lease sale of public land containing coal deposits, unless the land is subject to a comprehensive land use plan. Only those lands that have coal resources with development potential may be considered as acceptable for further consideration for leasing. The coal resources, which are evaluated for unsuitability, have been delineated in a report, Coal Resources of the BLM Richfield Planning Area (2003). The coal report identifies public land that has a coal resource that is to be considered for coal leasing through the land use planning.

This report addresses the unsuitability of the coal resources that have potential for development in the Wasatch Plateau and Emery coal fields. Following the identification of the coal resources with development potential, the Bureau of Land Management shall determine whether areas are unsuitable for all or certain stipulated methods of mining. The Department of the Interior has developed 20 criteria that are used for this determination, which are presented at 43 CFR 3461.5.

GEOLOGIC SETTING

The Wasatch Plateau coal field is on the eastern side of the Wasatch Plateau, whereas the Emery coal field overlaps the Wasatch Plateau and a portion of the Mancos Shale Lowland. The coal fields are elongated in a northeast direction.

The coal deposits in the Emery and Wasatch Plateau coal fields are Cretaceous in age. The Emery coal beds are in the Ferron Sandstone Member of the Mancos Shale and stratigraphically below the Wasatch Plateau coal beds which are in the Blackhawk Formation.

The Wasatch Plateau is an escarpment on the east side of the plateau, and the coal beds have gentle westward dips with local displacement by faulting. The Emery field is located to the east of and topographically lower than the Wasatch Plateau field.

LANDS CONSIDERED

The Emery and Wasatch Plateau coal fields are located in central Utah (Map 1). The Emery coal field is in Sevier, Emery, and Carbon Counties, whereas the Wasatch Plateau coal field is also in Sanpete County (Map 1). This unsuitability report addresses only the coal resources which have development potential in Sevier and Sanpete County (Map 2). The coal resources in these two counties are within the planning area for the Richfield Field Office, Bureau of Land Management.

Within the planning area, the Emery coal field includes Federal land that is managed by the Bureau of Land Management Richfield Field Office and the US Forest Service Fishlake National Forest. The Wasatch Plateau coal field includes Federal land that is managed by BLM Richfield Field Office, and the Fishlake and Manti-La Sal National Forests. Within the planning area, the Emery coal field contains 41,849 acres, and the Wasatch Plateau coal field contains 103,808 acres. The acreage of land with development potential for coal resources is given for each coal field in the subsequent Coal Resources Section.

Within the planning area, Federal coal leases are not currently authorized within the Emery coal field; There are currently seven Federal coal leases authorized within the Wasatch Plateau and none in the Emery coal field. Most of the approximately 23,937 acres under Federal coal leases, are within the boundaries of the Fishlake and Manti-LaSal National Forests (Map 2). The existing Federal coal leases (UTSL-0062583, UTU-028297, UTU- 047080, UTU-062453, UTU-0149084, UTU-063214, and UTU-076195) are not subject to this unsuitability review (43 CFR 3461.3-2).

Further reference in this report to coal fields and coal resources is only to the portions within the subject planning area.

COAL RESOURCES

The Emery coal field contains an estimated 303 million tons of in-place, unleased, minable coal resources; the Wasatch Plateau contains 415.8 million tons of in-place, unleased, minable coal resources (Tabet 2003, p. 41). These estimates include only coal beds of an average thickness of 6 feet or greater with less than 2,500 feet of overburden for underground mining and coal beds of a minimum thickness of a 4 feet and a maximum overburden of 100 feet for surface mining.

In the Emery field, approximately 11 million tons could be mined by surface methods and 292 million tons by underground methods. The coal resources in the Wasatch Plateau field could be mined by underground methods only.

Ownership of lands with coal resources that have development potential is summarized in Table A8-32 and Table A8-33 below.

Table A8-32. Emery Coal Field Coal Resources

Land Status	Surface Minable Acres	Underground Minable Acres
BLM	149	9,624
USFS	534	3,542
State	0	1,673
Private	28	1,164
Total	**711**	**16,003**

Table A8-33. Wasatch Plateau Coal Field Coal Resources

Land Status	Surface Minable Acres	Underground Minable Acres
BLM	0	0

Land Status	Surface Minable Acres	Underground Minable Acres
USFS	0	18,672
State	0	0
Private	0	3,956
Total	**0**	**22,628**

Split ownership of private surface and Federal minerals is not included in the above totals, due to limitations of the current GIS data base. The largest tract of split estate with Federal coal resources is in the vicinity of Acord Lakes. The unsuitability criteria are applied to Federal lands, as defined at 43 CFR 3400.0-5(o) and required by the regulations at 43 CFR 3461.2-1.

EVALUATION OF THE UNSUITABILITY CRITERIA

The coal resources with development potential are assessed for the unsuitability criteria as outlined at 43 CFR 3461.5. Underground mining of coal deposits is exempt from the criteria, where there would be no surface coal mining operations as stated at 3461.1(a). Surface mining operations include surface operations and surface impacts incident to an underground mine as defined at 43 CFR 3400.0-5(mm). In addition, at 43 CFR 3461.1(b), where underground mining will include surface operations and surface impacts on Federal lands to which a criterion applies, the lands shall be assessed as unsuitable unless an exception or exemption applies. Each criterion is subject to exceptions and/or exemptions as prescribed in the regulations.

As stated above, the criteria are applied to the Federal lands with coal resources that are identified as having development potential, not to all the coal deposits within the coal fields.

Criterion 1

Summary of the Criterion: All Federal lands included in the following land systems or categories shall be considered unsuitable: National Park System, National Wildlife Refuge System, National System of Trails, National Wilderness Preservation System, National Wild and Scenic Rivers System, National Recreation Areas, lands acquired with money derived from the Land and Water Conservation Fund, National Forests, and Federal lands in incorporated cities, towns, and villages.

Federal lands with coal resources with development potential are located within the Fishlake and Manti La-Sal National Forests (Map 2 and Table A8-32 and Table A8-33 above). An exception for leasing on National Forest is allowed, if:

> "* * * the Secretary finds no significant recreational, timber, economic or other values which may be incompatible with the lease; and (A) surface operations and impacts are incident to an underground coal mine, or (B) where the Secretary of Agriculture determines, with respect to lands which do not have significant forest cover within those National Forests west of the 100th Meridian, that surface mining may be in compliance with Multiple-Use Sustained Yield Act of 1960, the Federal Coal Leasing Amendments of 1976 and the Surface Mining Control and Reclamation Act of 1977."

The USFS has determined that no significant recreational, timber, economic or other values which may be incompatible with the lease are present within both National Forests. The coal resources that have

development potential by underground methods meet the underground exemption, and any associated surface operations and impacts meet the above exception. Coal resources within the Fishlake National Forest at T. 25 S., R. 4 E. that have development potential by surface mining methods would meet the exception, since significant forest cover is not present and coal mining would be in compliance with the stated laws.

Criterion 2

Summary of the Criterion: Federal lands that are within rights-of-way or easements or within surface leases for residential, commercial, industrial, or other public purposes, on Federally-owned surface shall be considered unsuitable.

Within the Emery coal field, several authorized rights-of-way encompass BLM-administered, Federal lands with coal resources which have development potential (Map 3). These are listed in Table A8-34 below.

Table A8-34. BLM-Administered, Authorized Rights-of-Way within Emery Coal Field

Serial Number	Holder	Legal Description	Type	Acres (ac) or Width (ft)
UTSL-0062677	Federal Highway Administration	T. 23 S., R. 5 E., Sec. 1, 11, 12, 14, 22, 27	Highway	400 ft
UTSL-0062873	Federal Highway Administration	T. 23 S., R. 5 E., Sec. 27, 34	Highway	400 ft
UTU-008966	Federal Highway Administration	T. 23 S., R. 5 E., Sec. 33, 34, 35 T. 24 S., R. 5 E., Sec. 3	Highway	400 ft
UTU-043522	Sevier County	T. 23 S., R. 5 E., Sec. 11, 12, 13	Road	100 ft
UTU- 0107441	Federal Highway Administration	T. 23 S., R. 5 E., Sec. 25	Material Site	166 ac
UTU- 0110883	Federal Highway Administration	T. 23 S., R. 5 E., Sec. 25, 26, 35	Highway	500 ft
UTU- 0136803	Federal Highway Administration	T. 23 S., R. 5 E., Sec. 25	Material Site	203 ac
UTU- 072941	Sevier County	T. 24 S., R. 5 E., Sec. 13	Road	45 ft
UTU- 057036	Federal Highway Administration	T. 25 S., R. 5 E., Sec. 6	Highway	200 ft

This criterion is subject to exceptions. A lease may be issued and mining operations approved, in such areas, if the surface management agency determines that:

- All or certain types of coal development (e.g., underground mining) will not interfere with the purpose of the rights-of-way or easement, or
- The right-of-way or easement was granted for mining purposes,
- The right-of-way or easement was issued for a purpose for which it is not being used,
- The parties involved in the right-of-way or easement agree, in writing, to leasing,

- It is impractical to exclude such areas due to the location of coal and method of mining and such areas or used can be protected through appropriate stipulations.

All the above-listed rights-of-way on BLM-administered lands are subject to development by underground mining, and right-of-way UTU-72941 is also subject to surface mining. Mining by underground methods is exempt and should not interfere with the intended use of a right-of-way facility. Where there could be surface operations and surface impacts associated with underground mining, the impacts would be mitigated, subject to an agreement with the right-of-way holder at the time of a specific leasing proposal. Where the coal resources would be mined by surface methods, the right-of-way facility could be moved during the mining operations and re-located when the land is reclaimed, again, subject to an agreement with the right-of-way holder. The Federal lands subject to the above rights-of-way are considered suitable.

There are no current rights-of-way or easements on NFS lands considered in this report.

The existing coal leases on the Fishlake National Forest are exempt from this criterion.

Criterion 3

Summary of the Criterion: The terms used in this criterion have their meaning set out in the Office of Surface Mining Reclamation and Enforcement regulations at Chapter VII of Title 30 of the Code of Federal Regulations. Federal lands affected by Section 522(e) (4) and (5) of the Surface Mining Control and Reclamation Act of 1977 shall be considered unsuitable. This includes lands within 100 feet of the outside line of a right-of-way of a public road, within 100 feet of a cemetery, or within 300 feet of any public building, school, church, community or institutional building, public park or occupied dwelling.

Exceptions are allowed, if a lease may be issued for lands:

- Used as mine access roads or haulage roads that join the right-of-way for a public road;
- For which the Office of Surface Mining Reclamation and Enforcement has issued a permit to have public roads relocated;
- If, after public notice and opportunity for public hearing in the locality, a written finding is made by the authorized officer that the interests of the public and the landowners affected by mining within 100 feet of a public road will be protected;
- For which owners of occupied dwellings have given written permission to mine within 300 feet of their buildings.

The subject coal lands do not fall within the stated distances of a cemetery, public building, school, church, community or institutional building, or public park.

BLM-administered, Federal lands with development potential for coal resources are located within 100 feet of the rights-of-way for a road or highway, which are listed under Criterion 2. The listed road and highway rights-of-way are subject to underground mining methods, and the right-of-way UTU- 072941 is also subject to surface mining. Mining by underground methods is exempt from this review. Where the coal resources would be mined by surface methods or a surface operation or impact would be associated with underground mining, the coal would only be leased in compliance with the Office of Surface Mining Reclamation and Enforcement and following a public notice and hearing. The Federal lands within 100 feet of road or highway rights-of-way, as listed under Criterion 2, are considered suitable for leasing under this Criterion.

Occupied dwellings are located at T. 22 S., R. 4 E., at Acord Lakes on private surface estate and Federal coal estate. This land would be developed by underground mining methods, and as stated previously, underground mining is exempt from this review, except for surface operations and impacts. Under the exception for this criterion, written permission is required from the owner of an occupied dwelling if surface operations of coal mining are within 300 feet of the occupied dwelling. If surface operations associated with the underground mining are necessary within the 300-foot distance, then that will be addressed as an impact at the time of leasing, and permission from the affected landowner(s) will be sought. However, it is likely that the design of a mine would involve locating surface facilities and impacts on unoccupied lands.

A dwelling is also located at T. 25 S., R. 4 E., Section 22 NE¼SE¼ at Paradise Valley on private land. This structure is more than 300 feet from the identified lands with a potentially developable coal resource as determined from the USGS Geyser Peak 7.5 minute topographic quadrangle (scale 1:24,000).

Criterion 4

Summary of the Criterion: Federal lands designated as wilderness study areas shall be considered unsuitable while under review by the Administration and the Congress for possible wilderness designation.

None of the subject Federal lands are presently within designated wilderness study areas. Some lands administered by the U.S. Forest Service are however being evaluated (inventoried) to determine if those lands have the characteristics of a wilderness study area. In accordance with the criterion, for any Federal land which is to be leased or mined prior to completion of the wilderness inventory by the surface management agency, the environmental assessment or impact statement on the lease sale or mine plan shall consider whether the lands have the characteristics of a wilderness study area. If the finding is affirmative, the land shall be considered unsuitable, unless issuance of noncompetitive coal leases and mining on leases is authorized under the Wilderness Act and the Federal Land Policy and Management Act of 1976 (FLPMA).

None of the subject Federal lands are within a designated wilderness study area.

Criterion 5

Summary of the Criterion: Scenic Federal lands designated by visual resource management analysis as Class I (an area of outstanding scenic quality or high vessel sensitivity) but not currently on the National Register of Natural Landmarks shall be considered unsuitable.

None of the BLM-administered Federal lands are presently located within areas designated as visual resource management Class I, and none of the National Forest lands are presently located within areas designated as visual resource management Class A, which is equivalent to Class I in the BLM classification. Therefore, this criterion is not applicable to the subject lands.

Criterion 6

Summary of the Criterion: Federal lands under permit and being used for scientific studies involving food or fiber production, natural resources, or technology demonstrations and experiments shall be considered unsuitable for the duration of the study.

None of the subject lands are under permit for the described scientific studies. This criterion is not applicable to the subject lands.

Criterion 7

Summary of the Criterion: All publicly or privately owned places which are included in the National Register of Historic Places shall be considered unsuitable.

Presently, there are no listed sites on the subject lands that are included on the National Register of Historic Places. This criterion is not applicable. Any subsequently listed sites and eligible sites will be further evaluated at the time of leasing.

Criterion 8

Summary of the Criterion: Federal lands designated as natural areas or as National Natural Landmarks shall be considered unsuitable.

None of the subject lands are designated as a National Natural Landmark.

Criterion 9

Summary of the Criterion: Federally designated critical habitat for listed threatened or endangered plant and animal species, habitat proposed to be designated as critical for listed threatened or endangered plant and animal species or species proposed for listing, and habitat for Federal threatened or endangered species which is determined by the Fish and Wildlife Service and the surface management agency to be of essential value and where the presence of threatened or endangered species has been scientifically documented, shall be considered unsuitable.

Based upon data currently available, the Federal lands do not meet the guidelines for this criterion. Surveys have been completed in these areas for several other projects. No listed threatened or endangered plant or animal species have been definitely found. No critical habitat is presently designated on the subject lands. Therefore, this criterion does not apply to the subject lands. Subsequently designated critical habitat, proposed critical habitat, and essential-value habitat will be further evaluated at the time of leasing.

Criterion 10

Summary of the Criterion: Federal lands containing habitat determined to be critical or essential for plant or animal species listed by a state, pursuant to state law, as endangered or threatened shall be considered unsuitable.

The State of Utah has not listed any plant species as endangered or threatened, pursuant to State law. Therefore, the criterion does not apply to plant species. The State has listed endangered or threatened animal species, but these are the same as the Federally listed animal species. The State of Utah recognizes the Federal listings and habitat designations. As stated in Criterion 9, no listed endangered or threatened animal species have been found. No critical habitat has presently been designated which on subject lands with coal resources. Therefore, the criterion does not apply to the subject lands. Subsequently designated critical habitat and essential-value habitat will be further evaluated at the time of leasing.

Criterion 11

Summary of the Criterion: A bald or golden eagle nest or site on Federal lands that is determined to be active, including an appropriate buffer zone of land around the nest site, shall be considered unsuitable. Consideration of availability of habitat of prey species and of terrain shall be included in the determination. Buffer zones shall be determined in consultation with the Fish and Wildlife Service.

Eagle nests are not known to be present on the subject lands, therefore this criterion does not apply. If nests or sites are found at the time of leasing, then consultation will occur with the U.S. Fish and Wildlife Service and appropriate mitigations as outlined in the RMP will be applied. The subject Federal lands will be subject to inventory and site-specific analysis at the time of leasing.

Criterion 12

Summary of the Criterion: Bald or golden eagle roost and concentration areas on Federal lands used during migration and wintering shall be considered unsuitable.

Eagle roosts are not known to be present on the subject Federal lands, therefore this criterion does not apply. If roosts or concentration areas are found at the time of leasing, then consultation will occur with the U.S. Fish and Wildlife Service and appropriate mitigations as outlined in the RMP will be applied.

Criterion 13

Summary of the Criterion: Federal lands containing a falcon (excluding kestrel) cliff nesting site with an active nest and including a buffer zone of Federal land around the nest site shall be considered unsuitable. Consideration of availability of habitat for prey species and of terrain shall be included in the determination of buffer zones. Buffer zones shall be determined in consultation with the Fish and Wildlife Service.

Active falcon nesting sites are not known to be present on the subject Federal lands, therefore this criterion does not apply to the subject lands. If active nesting sites are found at the time of leasing, then consultation will occur with the U.S. Fish and Wildlife Service and appropriate mitigations as outlined in the land use plan will be applied.

Criterion 14

Summary of the Criterion: Federal lands which are high priority habitat for a migratory bird species of high Federal interest on a regional or national basis, as determined by the surface management agency and the Fish and Wildlife Service, shall be considered unsuitable.

High priority habitat for migratory birds overlaps a portion of the underground minable coal resource in the vicinity of Old Woman Plateau. The acreage involved is 2,048. The exemption for underground mining applies to this habitat; however surface operations and surface impacts may be unsuitable or be mitigated at the time of leasing. The Federal lands will be subject to inventory and site-specific analysis at the time of leasing.

Criterion 15

Summary of the Criterion: Federal lands which the surface management agency and state jointly agree are habitat for resident species of fish, wildlife, and plants of high interest to the state and which are

essential for maintaining these priority wildlife and plant species shall be considered unsuitable. Examples of such lands include:

- Active dancing and strutting grounds for sage grouse,
- Winter ranges crucial for deer, antelope, and elk,
- Migration corridor for elk, and
- Extremes of range for plant species.

A lease may be issued if, after consultation with the state, the surface management agency determines that all or certain stipulated methods of coal mining will not have a significant long-term impact on the species being protected.

Underground mining is exempt. Surface facilities associated with the coal mining could be located within the crucial habitat and could include a mine portal, buildings, and construction of roads. Haulage of mined coal would also be necessary. The location of these facilities and associated haulage could be located as to minimize or reduce the impact to the habitat. Surface operations and impacts would not have an adverse, long-term impact on the crucial habitats.

Crucial habitat for deer, elk, and black bear overlaps Federal lands with coal resources that would be mined by underground methods (Maps 5, 6, and 7). The coal resources that would be developed by underground mining on BLM and National Forest lands are exempt from this criterion. Surface operations and surface impacts that would be associated with this type of mining would not have a long-term effect on the species, as determined in consultation with the USFS and the Division of Wildlife Resources, State of Utah. Underground mining meets the exception of this criterion, and surface operations and surface impacts would be subject to a site-specific review as part of the consideration of an application to lease coal.

Crucial habitat for deer, elk, and black bear is present on the Fishlake National Forest at T. 25 S., R. 4 E., in an area that could be mined by surface methods (Maps 5, 6, and 7). The maximum area that would be surface mined would involve approximately 534 acres of National Forest lands. If surface mining were to occur, the mining would probably be completed in stages, or mining units, with mining in one area while an adjacent, previously mined-out area would be reclaimed to restore the crucial habitat. Thus, with concurrent mining and reclamation, surface mining would not impact all the acreage within a given lease at one time. Also, all the above land with an identified potential for surface mining may not be developed, because the coal reserves that would support a mine could be less than the currently identified coal resource. However, this land that could have surface mining is unsuitable, as determined in consultation with the USFS and the Division of Wildlife Resources, State of Utah.

Crucial habitat for deer and elk is present on BLM-administered lands at T. 24 S., R. 5 E. that could be mined by surface methods (Maps 5 and 6). The surface minable coal resource is approximately 149 acres. Whereas, the elk habitat only partially overlaps the surface minable coal, the deer habitat encompasses all of the land with the surface minable coal resource. The surface minable coal resource at this location is considered unsuitable, as determined in consultation with the USFS and the Division of Wildlife Resources, State of Utah.

The existing Federal leases are exempt from this criterion.

Criterion 16

Summary of the Criterion: Federal land in riverine, coastal and special floodplains (100-year recurrence interval) on which the surface management agency determines that mining could not be undertaken

without substantial threat of loss of life or property shall be considered unsuitable for all or certain stipulated methods of coal mining.

None of the subject lands are on lands where mining would result in substantial loss of life or property. Therefore, this criterion is not applicable.

Criterion 17

Summary of the Criterion: Federal lands which have been committed by surface management agency to use as municipal watersheds shall be considered unsuitable.

None of the subject lands with coal resource that has potential for development are within a municipal watershed. Therefore this criterion is not applicable.

Criterion 18

Summary of the Criterion: Federal lands with National Resource Waters, as identified by states in their water quality management plans including a buffer zone of Federal lands ¼ mile from the outer edge of the water bodies shall be considered unsuitable.

The State of Utah considers National Resource Waters as High Quality Waters (State Code R317-2-12). High Quality Waters are considered to be all surface waters geographically located within the boundaries of National Forests and certain designated stream channels or basins. Underground minable coal resources are exempt from this criterion. An exception to this criterion may be granted when the surface management agency determines that a buffer zone is unnecessary.

Surface streams cross many of the coal resource tracts in the Wasatch Plateau within the National Forests (Map 8). These National Forest System lands have development potential by underground mining. A coal resource at T. 25 S., R. 4 E. has potential by surface mining. Surface mining and surface operations and surface impacts that could be associated with underground mining would be subject to site-specific analysis and the consideration of buffers as mitigation at the time of leasing; therefore, impacts to High Quality Waters could be mitigated at the time of leasing.

None of the coal resources with development potential on BLM land are classified as High Quality Waters by the State. Therefore, the coal resources with development potential on BLM land are considered available for leasing under this criterion.

Criterion 19

Summary of the Criterion: Federal lands identified by the surface management agency, in consultation with the state in which they are located, as alluvial valley floors according to the definition in §3400.0-5(a) of this title, the standards in 30 CFR 822, the final alluvial valley floor guidelines of the Office of Surface Mining Reclamation and Enforcement when published, and approved state programs under the Surface Mining Control and Reclamation Act of 1977, where mining would interrupt, discontinue, or preclude farming, shall be considered unsuitable. Additionally, when mining Federal land outside an alluvial valley floor would materially damage the quantity or quality of water in the surface or underground water systems that would supply alluvial valley floors, the land shall be considered unsuitable.

No alluvial valley floors occur on lands, considered in this report and there are no known conflicts between minable land and farming land. Impacts to water quality can be addressed at the time of

evaluating specific mining proposals and can be mitigated at that time. Therefore, this criterion is not applicable.

Criterion 20

Summary of the Criterion: Federal lands in a state to which is applicable a criterion (i) proposed by the state or Indian tribe located in the planning area, and (ii) adopted by rulemaking by the Secretary, shall be considered unsuitable.

The State of Utah under State rule, R645-103-300, Utah Criteria for Designating Areas as Unsuitable for Coal Mining and Reclamation Operations, has developed unsuitability criteria, which are similar to the Federal criteria at 43 CFR 3461 as addressed in this report. No Indian tribe has proposed a criterion for coal mining unsuitability. Therefore, this criterion is not applicable at this time.

SUMMARY OF THE UNSUITABILITY EVALUATION

The coal resources with development potential in the Emery and Wasatch Plateau coal fields have been evaluated in consideration of the 20 unsuitability criteria. Based on the criteria, the coal resources which could be developed by surface mining methods in the Emery coal field at T. 25 S., R. 4 E., on the Fishlake National Forest and at T. 24 S., R. 5 E. on the BLM are considered to be unsuitable for leasing. Thus, 534 acres on the National Forest and the 149 acres on BLM would not be available for coal leasing. The other coal resources within Sanpete and Sevier Counties with development potential by underground methods are considered suitable for leasing (Map 9). The acreage considered suitable for the consideration of leasing of Federal coal resources is listed below in Table A8-35 and Table A8-36.

Table A8-35. Emery Coal Field Federal Coal Resources

Land Status	Surface Minable Acres	Underground Minable Acres
BLM	149	9,624
USFS	534	3,542
Total	**683**	**13,166**

Table A8-36. Wasatch Plateau Coal Field Federal Coal Resources

Land Status	Surface Minable Acres	Underground Minable Acres
USFS	0	18,672
Total	**0**	**18,672**

Private and state lands are not subject to the unsuitability criteria for Federal lands and are not included in the above totals.

APPENDIX 9—TRAVEL MANAGEMENT/ROUTE DESIGNATION PROCESS

The Richfield Field Office (RFO) used the following process for route designation alternatives during the development of the Richfield Resource Management Plan (RMP) and Environmental Impact Statement (EIS). This process included route inventory, interdisciplinary team assessment, and cooperating agency coordination.

ROUTE INVENTORY

The RFO conducted a route inventory beginning in 2002, to develop a route baseline for use in the planning process. The Bureau of Land Management (BLM) used a variety of methods to inventory existing routes/ways within the RFO for consideration in the planning process, including Global Positioning System (GPS) (when available), data provided by the counties, map and orthophoto data, and staff/cooperator knowledge. BLM employees with GPS equipment digitized the routes while traveling on off-highway vehicles (OHV) and by foot. While inventorying the routes, staff collected surface type and primary and secondary usage associated with each route. The digitized route data was verified and prepared for interdisciplinary review. The counties provided route data in a Geographic Information System (GIS) data layer. Data from the BLM inventory was overlaid with the county route data, and discrepancies were identified, reviewed, and resolved through interdisciplinary team review. In the more remote areas of the RFO for which GPS/GIS data was not available, map and orthophoto data was used.

INTERDISCIPLINARY TEAM ASSESSMENT

Team members, who included BLM staff specialists and county cooperators, reviewed the route inventory during a series of interdisciplinary team meetings. These meetings were held in each county to address the specific routes within that county. The following assumptions were applied:

- Prohibit motorized vehicle cross-country travel, except in designated open areas
- Designate existing routes for motorized use unless closed or restricted (permanently, seasonally, or by size) as appropriate to address specific resource concerns
- Evaluate parallel, duplicative, or redundant routes for potential closure
- Allow closed or non-designated routes to rehabilitate naturally unless a specific resource impact is occurring that warrants expedited rehabilitation of the route (e.g., soil erosion, water quality concerns, and/or continued illegal use)
- Prohibit motorized use of designated closed routes, except for BLM administrative and emergency use
- Sign and map designated routes as motorized or nonmotorized; travel maps should be user friendly and easily accessible
- May be changes in existing route designations pursuant to land management objectives.

The interdisciplinary team applied the following factors to the route inventory and used other BLM inventories and natural and cultural resource information to identify routes for designation. The team considered the following:

- Environmental sensitivity of the areas surrounding the route, including soil type/condition, riparian areas and their condition, wilderness study areas (WSA), and sensitive plant species

- Wildlife habitat sensitivity of the areas surrounding the route, including designated critical habitat, sensitive status species habitat, crucial habitat, and sensitive season
- Current and anticipated use levels, as well as travel and transportation needs and desires
- Management objectives for the area, as well as the potential for user and resource conflicts
- Access needs for BLM-permitted or -authorized activities (e.g., range permittees, recreation permittees, mineral developments)
- Access needs for non-BLM administered lands
- Cultural resources and specific sites that require protection.

PLAN MAINTENANCE AND CHANGES TO ROUTE DESIGNATIONS

The Proposed RMP includes criteria to be considered when conducting plan maintenance, amendments, or revisions related to OHV area designations or the approved road and trail system within "Limited" areas. Future conditions may require the designation or construction of new routes or closure of existing routes to better address resources and resource use conflicts. Actual route designations within the Limited category can be modified without completing a plan amendment, although compliance with the National Environmental Policy Act (of 1969) (NEPA) is still required.

The RFO is aware that the current inventory of roads and trails being used for the route designation process is not 100 percent correct or complete. The RFO anticipates that in spite of intensive quality control and review, there will be errors. Some undesirable unintended consequences may result from the final configuration of the Travel Route Designations. Adjustments may be needed to make the travel designation compatible with adjacent landowners. For example, edge matching has occurred with adjacent BLM and United States Forest Service (USFS) jurisdictions, but continued review and coordination will be required as changes resulting from continued motorized travel planning occur in the future. Routes currently not in the inventory may need to be added and designated as part of the implementation process. An adaptive management process that will allow adjustments to the final decision and will maintain the validity and integrity of the analyses and public disclosure presented in the Final EIS is outlined below. This process includes pre-defining actions for the disposition of routes discovered after the decision date, adding new routes, correcting errors, and adjusting the route designations that lead to undesirable, unintended consequences.

As IM 2004-061 notes, plan maintenance can be accomplished through additional analysis and land use planning (e.g., activity-level planning). BLM will collaborate with affected and interested parties in evaluating the designated route network for suitability for active OHV management and envisioning potential changes in the existing system or adding new trails that would help meet current and future demands. In conducting such evaluations, the following factors would be considered:

- The travel management plan should be flexible to allow designating existing routes that were not identified in the baseline data.
- The travel management plan should be flexible about the location of new routes needed to provide access for new activities, to new areas, or to reduce resource and/or user conflicts.
- Route designations would be coordinated and made consistent with criteria and resource decisions identified in the Proposed RMP.
- Measures needed to meet the objectives stated in the Proposed RMP (e.g., cultural resources, soil resources, special status species, and recreation).

- Where and when appropriate, plan, develop, and designate (in cooperation with user groups and cooperating agencies) new routes and trails that enhance and expand recreational opportunities and encourage responsible use.
- Routes suitable for various categories of OHVs (e.g., motorcycles, all-terrain vehicles [ATVs], dune buggies, and 4-wheel drive touring vehicles) and opportunities for joint trail use.
- Needs for parking, trailheads, informational and directional signs, mapping and profiling, and development of brochures or other materials for public dissemination.
- Opportunities to tie into existing or planned route networks.
- Public land roads or trails determined to cause considerable adverse effects or to constitute a nuisance or threat to public safety would be considered for relocation or closure and rehabilitation after appropriate coordination with applicable agencies and partners.
- Those areas managed as closed will not be available for new motorized designation.

Regulations at 43 *Code of Federal Regulations* (CFR) 8342.2 require BLM to monitor the effects of OHV use. Changes should be made to the Travel Plan based on the information obtained through monitoring. Site-specific NEPA documentation is required for changing the route designations in this Travel Plan.

COOPERATING AGENCY COORDINATION

Interdisciplinary route assessment meetings were held by county, with county representatives in attendance. BLM managers and planners also met with cooperating agency representatives to review the proposed RMP and discuss concerns. Specifically, Garfield County representatives raised concerns regarding routes they claimed under Revised Statute 2477 (R.S. 2477). In addition, concerns were raised regarding routes not included in the baseline data, and access to the counties' resources and state lands.

IMPLEMENTATION PROCESS

Implementation decisions are actions that BLM takes to implement land use plans and generally constitute BLM's final approval for allowing on-the-ground actions to proceed. These types of decisions, which are based on site-specific planning and NEPA analyses, are subject to the administrative remedies set forth in the regulations that apply to each BLM resource management program. Implementation decisions are not subject to protest under the planning regulations; rather, they are subject to various administrative remedies. Where implementation decisions are made as part of the land use planning process, they are still subject to the appeals process or other administrative review as prescribed by specific resource program regulations after BLM resolves the protests to land use plan decisions and makes a decision to adopt or amend the Proposed RMP.

Travel planning and the implementation process include the following:

- The monitoring of the transportation system and modifying as appropriate
- A map of roads and trails for all travel modes
- Notations of any limitation for specific roads and trails
- Criteria to select or reject roads and trails in the final travel management network, add new roads or trails, and specify limitations
- Guidelines for management, monitoring, and maintenance of the transportation system
- Needed easements and rights-of-ways (to be issued to BLM or others) to maintain the existing road and trail network providing public land access.

The Proposed RMP completes the initial route designation component of the Travel Management Plan and implementation process. These routes would be the initial basis for signing and enforcement. The RFO will prioritize additional implementation actions, resources, and geographic areas based on RMP goals and objectives and the guidelines noted above.

APPENDIX 10—RAPTOR BEST MANAGEMENT PRACTICES

INTRODUCTION

Raptors, or *Birds of Prey*, are found on public lands throughout Utah. Approximately 31 species of raptors use public lands for at least a portion of their life cycle. These species include 20 diurnal raptors, including the eagles, hawks, falcons, osprey, turkey vulture, and California condor in addition to 11 mostly nocturnal owl species. At least 16 of the diurnal raptors are known to nest, roost, and forage on public lands, while two others are probable nesters within the southern part of the state. The California condor is known to use public lands for roosting and foraging but is not currently known to nest within the state. The rough-legged hawk is a winter resident that uses public lands for foraging. All of the owl species nest, roost, and forage on public lands in Utah.

The Bureau of Land Management (BLM) considers eight of Utah's raptors to be special status species. These raptors currently receive enhanced protection in addition to the regulatory authority the Migratory Bird Treaty Act (MBTA) provides in covering all raptor species. The Mexican spotted owl is listed as a federally threatened species and is afforded the protection, as well as the Section 7 consultation requirements, of the Endangered Species Act (ESA). The bald eagle has been delisted by the U.S. Fish and Wildlife Service (USFWS), but remains on the Sensitive Species list. Both the bald eagle and golden eagle are protected by the provisions of the Eagle Protection Act. The California condor is a federally endangered species; however, the birds found in southern Utah are part of an Experimental Non-essential Population reintroduced to northern Arizona under Section 10(j) of the ESA. BLM is required to treat the condor as a species proposed for listing for Section 7 purposes of the ESA. The northern goshawk is managed by a multi-agency Conservation Agreement. The ferruginous hawk, short-eared owl, and burrowing owl are listed as Wildlife Species of Concern by the Utah Division of Wildlife Resources (UDWR 2006), and are therefore recognized as BLM state-sensitive species under the Bureau's 6840 Manual. The BLM's 6840 Policy states that "*BLM shall…ensure that actions authorized, funded, or carried out…do not contribute to the need for the species to become listed.*"

Future raptor management on BLM lands in Utah will be guided by using Best Management Practices (BMPs), which are BLM-specific recommendations for implementing the USFWS Utah Field Office's, "*Guidelines for Raptor Protection From Human and Land Use Disturbances"* (*"Guidelines"*) (USFWS 1999). USFWS originally developed the "*Guidelines*" in 1999 and updated them in 2002 to reflect changes brought about by court and policy decisions and to incorporate Executive Order 13186, Responsibilities of Federal Agencies to Protect Migratory Birds. The *"Guidelines"* were provided to BLM and other land-managing agencies in an attempt to provide raptor management consistency, while ensuring project compatibility with the biological requirements of raptors and encouraging an ecosystem approach to habitat management.

These BMPs, or specific elements of the BMPs that pertain to a proposal, should be attached as Conditions of Approval to all BLM use authorizations that have the potential to adversely affect nesting raptors, or would cause occupied nest sites to become unsuitable for nesting in subsequent years.

Raptor management is a dynamic and evolving science, and consequently, as the science evolves, these BMPs will undergo subsequent revision. As more information becomes available through implementation of these raptor BMPs, and as our knowledge of raptor life-cycle requirements increases, findings will be incorporated into future revisions of the BMP document. In addition, BLM and the Department of Energy

are initiating a 3-year Raptor Radii study, which will test traditional spatial and seasonal nest buffers during actual oil and gas development activities for a select suite of species. Study results would be incorporated into new BMP revisions as well.

To adequately manage raptors and their habitats and to reduce the likelihood of a raptor species being listed under the ESA, BLM-authorized or proposed management activities and/or land-disturbing actions would be subject to the criteria and processes specified within these BMPs. The implementation of raptor spatial and seasonal buffers under the BMPs would be consistent with Table 2 of the *"Guidelines,"* included here as Attachment 2. As specified in the *"Guidelines,"* modifications of spatial and seasonal buffers for BLM-authorized actions would be permitted if the protection of nesting raptors was ensured. State and/or federally listed, proposed, and candidate raptor species, as well as BLM state-sensitive raptor species, should be afforded the highest level of protection through this BMP process; however, all raptor species would continue to receive protection under the Migratory Bird Treaty Act. Modification of the buffers for threatened or endangered species would be considered, pending the results of Section 7 consultation with USFWS.

As stated in the *"Guidelines,"* spatial and seasonal buffers should be considered as the best available recommendations for protecting nesting raptors under a wide range of activities statewide. However, they are not necessarily site-specific to proposed projects. Land managers should evaluate the type and duration of the proposed activity, the position of topographic and vegetative features, the sensitivity of the affected species, the habituation of breeding pairs to existing activities in the proposed project area, and the local raptor nesting density when determining site-specific buffers. BLM would be encouraged to coordinate informally with UDWR and USFWS any time a site-specific analysis shows that an action may adversely affect nesting raptors. The coordination would determine whether the impact could be avoided or must be mitigated, and if so, to determine appropriate and effective mitigation strategies.

Potential modifications of the spatial and seasonal buffers identified in the *"Guidelines"* may provide a viable management option. Modifications would ensure that nest protection would occur, while allowing various management options that may deviate from the suggested buffers within the *"Guidelines."* These options, if adequately monitored, could provide valuable information for incorporation into future management actions.

Local raptor nesting authorities who know the raptor nesting chronologies within their local area should review the seasonal raptor buffers provided in Attachment 2. For those nesting raptors for which local nesting chronologies remain uncertain, the Attachment 2 seasonal buffers should serve as the default. However, for those raptor species whose known nesting chronologies differ from the seasonal buffers provided in Attachment 2, the local seasonal buffers may be used as a modification of the *"Guidelines."*

Criteria that would need to be met before implementing modifications to the spatial and seasonal buffers in the *"Guidelines"* would include the following:

1. A wildlife biologist or other qualified individual will complete a site-specific assessment. See example in Attachment 1.

2. The BLM Field Office Wildlife biologist will write documentation identifying the proposed modification and affirming that implementing the proposed modification(s) would not affect nest success or the suitability of the site for future nesting. Modification of the *"Guidelines"* would not be recommended if it is determined that adverse impacts to nesting raptors would occur or that the suitability of the site for future nesting would be compromised.

3. A BLM biologist or other raptor biologist will develop a monitoring and mitigation strategy. Impacts of authorized activities would be documented to determine whether the modifications were implemented as described in the environmental documentation or Conditions of Approval and were adequate to protect the nest site. If adverse impacts are identified during monitoring of an activity, BLM would follow an appropriate course of action, which may include cessation or modification of activities that would avoid, minimize, or mitigate the impact. Or, with the approval of UDWR and USFWS, BLM could allow the activity to continue while requiring monitoring to determine the full impact of the activity on the affected raptor nest. A monitoring report would be completed and forwarded to UDWR for incorporation into the Natural Heritage Program (NHP) raptor database.

In a further effort to provide additional support and expertise to local BLM field biologists, a network of biologists from various agencies with specific expertise in raptor management has been identified and included as Attachment 3. The personnel identified have extensive backgrounds in raptor management issues and are available, upon request, to assist BLM field biologists on a case-by-case basis. Field biologists are encouraged to use this network, via informal conference, with one or more of the individuals identified. This coordination should be clearly distinguished from the consultation process required under Section 7 of the ESA. Individuals on the expert panel should not be expected to provide formal advice, but should serve as a sounding board for discussing potential affects of a proposal as well as potential mitigation measures on specific projects which may be useful to BLM biologists.

HABITAT ENHANCEMENT

As recommended in the *"Guidelines,"* raptor habitat management and enhancement, both within and outside of buffers, would be an integral part of these BMPs, with the understanding that for raptors to maintain high densities and maximum diversity, it is necessary that the habitat upon which they and their prey species depend be managed to promote healthy and productive ecosystems. Habitat loss or fragmentation would be minimized and/or mitigated to the extent practical, and may include such measures as drilling multiple wellheads per pad, limiting access roads and avoiding loop roads to well pads, effectively rehabilitating or restoring plugged and abandoned well locations and access roads that are no longer required, and rehabilitating or restoring wildland fires to prevent domination by nonnative invasive annual species, vegetation treatments, and riparian restoration projects to achieve Rangeland Health Standards.

In some cases, artificial nesting structures, located in areas where preferred nesting substrates are limited but where prey base populations are adequate and human disturbances are limited, may enhance some raptor populations, or may serve as mitigation for impacts occurring in other areas.

PROTECTION OF NEST SITES AND BUFFER ZONES

As stated in the *"Guidelines,"* protecting both occupied and unoccupied nests is important because not all raptor pairs breed every year, nor do they always use the same nest within a nesting territory. Individual raptor nests left unused for a number of years are frequently reoccupied, if all of the nesting attributes which originally attracted a nesting pair to a location are still present. Nest sites are selected by breeding pairs for the preferred habitat attributes provided by that location.

Raptor nest buffer zones are established for planning purposes because the nest serves as the focal point for a nesting pair of raptors. The buffer should serve as a threshold of potential adverse affect to nest

initiation and productivity. Actions proposed within these buffer zones are considered potentially impacting and, therefore, trigger the need for consideration of site-specific recommendations.

Seasonal (temporal) buffer zones are conservation measures intended to schedule potentially impacting activities to periods outside of the nesting season for a particular raptor species. These seasonal limitations are particularly applicable to actions proposed within the spatial buffer zone of a nest for short duration activities. These activities include pipeline or power line construction, seismic exploration activity, vegetative treatments, fence or reservoir construction, permitted recreational events, where subsequent human activity would not be expected to occur.

Spatial buffer zones are those physical areas around raptor nest sites where seasonal conservation measures or surface occupancy restrictions may be applied, depending on the type and duration of activity, distance and visibility of the activity from the nest site, adaptability of the raptor species to disturbance, etc. Surface occupancy restrictions should be used for actions that would involve human activities within the buffer zone for a long duration (more than one nesting season) and that would cause an occupied nest site to become unsuitable for nesting in subsequent years.

Unoccupied Nests

All Activities, Including All Mineral Leases

Surface disturbing activities occurring outside the breeding season (seasonal buffer), but within the spatial buffer, would be allowed during a minimum 3-year nest monitoring period if a wildlife biologists determines that the activity would not cause the nest site to become unsuitable for future nesting. Facilities and other permanent structures would be allowed if they meet the above criteria.

Some examples of typical surface disturbing actions occurring outside of the seasonal buffer which may not be expected to affect nest production or future nesting suitability would include pipelines, power lines, seismographic exploration, communication sites, an oil or gas well with offsite facilities which does not require routine visitation, recreation events, fence or reservoir construction, vegetative treatments, and other actions with discreet starting and ending times, and for which subsequent human activity or heavy equipment operation within the spatial buffer would not be expected to occur, or could be scheduled outside of the seasonal buffer in subsequent years.

Surface-disturbing activities that would be expected to potentially affect nest production or nest site suitability include oil and gas facilities requiring regular maintenance, sand and gravel operations, road systems, wind energy projects, mining operations, and other actions requiring continual, random human activity or heavy equipment operation during subsequent nesting seasons.

A nest site that does not exhibit evidence of use—such as greenery in the nest, fresh whitewash, obvious nest maintenance or the observed presence of adults or young at the nest—for three consecutive years (verified through monitoring)would be deemed abandoned, and all seasonal and spatial restrictions would cease to apply to that nest. All subsequent authorizations for permanent activities within the spatial buffer of the nest could be permitted. If the nest becomes reoccupied after authorized activities are completed, conservation measures would be considered to reduce potential adverse effects and to comply with the Migratory Bird Treaty Act and the Eagle Protection Act.

The 3-year non-use standard varies from the *"Guidelines"* suggested 7-year non-use standard before declaring nest abandonment. This variation is based on a similar standard that has been applied for more than 20 years in two administrative areas within Utah. Empirical evidence would suggest the 3-year non-use standard has been effective in conserving raptor species. The 3-year standard has been applied

without legal challenge or violation of "Take" under the Migratory Bird Treaty Act or the Eagle Protection Act.

Because prey base populations are known to be cyclic and because raptor nest initiation or nesting success can be affected by drought and other random natural events, care should be taken when applying the 3-year non-activity standard. The 3-year nest occupancy monitoring requirement should be viewed as a minimum time period during those years of optimal raptor nesting conditions. During suboptimal raptor nesting years, when nesting habitat may be affected by drought, low prey base populations, fire, or other events, the monitoring standard should be increased to allow raptors the opportunity to reoccupy nesting sites when nesting conditions become more favorable.

Occupied Nests

All Activities

Land use activities that would adversely affect an occupied raptor nest would not be allowed within the spatial or seasonal buffer.

CONSIDERATION OF ALTERNATIVES AND MITIGATION MEASURES

Alternatives, including denial of the proposal, should be identified, considered, and analyzed in a National Environmental Policy Act (NEPA) document any time an action is proposed within the spatial buffer zone of a raptor nest. Selecting a viable alternative that avoids an impact to nesting raptors should be chosen over attempting to mitigate those impacts. If unavoidable impacts are identified, mitigation measures should be applied as necessary to lessen adverse impacts of resource uses and development on nesting raptors. Monitoring the effectiveness of the mitigation measures should be mandatory and should be included as a Condition of Approval.

SPECIFIC STRATEGIES TO BE IMPLEMENTED REGARDING OTHER RESOURCE USES

The following management strategies are designed to reduce or eliminate potential conflicts between raptors and other resource uses. This list of examples is not intended to be all-inclusive. In all cases, when an activity on BLM lands is proposed and a NEPA document is developed, the site-specific analysis process identified in Attachment 1 may be implemented to identify and either avoid or mitigate impacts to raptors from the proposal. These strategies apply to both BLM and applicant-generated proposals. The strategies are as follows.

Cultural Resources

Excavation and studies of cultural resources in caves and around cliff areas should be delayed until a qualified biologist surveys the area to be disturbed or impacted by the activity for the presence of raptors or nest sites. If nesting raptors are present, the project should be rescheduled to occur outside of the seasonal buffer recommended by the "*Guidelines.*"

Forestry and Harvest of Woodland Products

Timber harvest would be subject to NEPA analysis and would be conducted in a manner that would avoid impacts to raptor nests. This could also apply to areas identified for wood gathering and firewood sales.

Hazardous Fuel Reduction/Habitat Restoration Projects

Hazardous fuels reduction projects and shrub-steppe restoration projects should be reviewed for possible impacts to nesting raptors. Removal of trees containing either stick nests or nesting cavities, through prescribed fire or mechanical or manual treatments, should be avoided.

It is important to note that certain raptor species are tied to specific habitat types, and that consideration must be made on a site-specific basis when vegetation manipulation projects are proposed to determine which raptor species may benefit and which may be adversely affected by the vegetation composition post-treatment.

Livestock Grazing

Manage rangelands and riparian areas in a manner that promotes healthy, productive rangelands and functional riparian systems. Rangeland Health Assessments should be conducted on each grazing allotment, and rangeland guidelines should be implemented where Rangeland Health Standards are not being met to promote healthy rangelands.

Locations of sheep camps and other temporary intrusions would be located in areas away from raptor nest sites during the nesting season. Placement of salt and mineral blocks would also be located away from nesting areas.

Season of use, kind of livestock, and target utilization levels of key species affect vegetative community attributes (percent cover, composition, etc.) and influence small mammal and avian species diversity and density. While not all raptor species would be affected in the same way, livestock management practices that maintain or enhance vegetative attributes will preserve prey species density and diversity, which will benefit the raptor resource.

Off-Highway Vehicle Use

Special Recreation Management Areas (SRMAs) that are developed for off-highway vehicle (OHV) use would not be located in areas that have important nesting, roosting, or foraging habitat for raptors.

OHVs use would be limited to designated roads, trails, and managed open areas. Lands categorized as “open” for OHV use should not be in areas important to raptors for nesting, roosting, and foraging.

When proposals for OHV events are received, a qualified wildlife biologist would survey the area to be impacted to determine if the area is used by raptors. Potential conflicts would be identified and either avoided or mitigated prior to the issuance of any permit.

Oil and Gas Development

The Code of Federal Regulations (CFR), 43 CFR 3101.1-2, allows for well site location and timing to be modified from that requested by the lessee to mitigate conflicts at the proposed site, and states that the location can be moved up to 200 meters, and the timing of the actual drilling can be delayed for up to 60

days to mitigate environmental concerns. The regulation also allows BLM to move a location more than 200 meters, or delay operations more than 60 days to protect sensitive resources, with supporting rationale and where lesser restrictions are ineffective. The Site-Specific Analysis (Attachment 1) would provide the supporting rationale. Provisions are also present within Sections 3 and 6 of the Standard Lease Form that require compliance with existing laws and would allow BLM to impose additional restrictions at the permitting phase if the restrictions will prevent violation of law, policy, or regulation, or if they avoid undue and unnecessary degradation of lands or resources.

Realty

Lands proposed for disposal, which include raptor nesting, roosting, or important foraging areas, would be analyzed and evaluated for the relative significance of these resources before a decision is made for disposal or retention.

A priority list of important raptor habitat areas, especially for federally listed or state-sensitive raptor species, on state and private lands should be developed and used as lands to be acquired by BLM when opportunities arise to exchange or otherwise acquire lands.

Lands and realty authorizations would include appropriate conservation measures to avoid and/or mitigate impacts to raptors.

Recreation

Development of biking trails near raptor nesting areas would be avoided.

Rock climbing activities would be authorized only in areas where there are no conflicts with cliff-nesting raptors.

In high recreation use areas where raptor nest sites have been made unsuitable by existing disturbance or habitat alteration, mitigation should be considered to replace nest sites with artificial nest structures in nearby suitable habitat, if it exists, and consider seasonal protection of nest sites through fencing or other restrictions.

Dispersed recreation would be monitored to identify where this use may be affecting nesting success of raptors.

Wild Horse Program

In areas where wild horse numbers are determined to be in excess of the carrying capacity of the range, removal of horses, as described in the various herd management area plans, would continue to prevent further damage to rangelands.

INVENTORY AND MONITORING

a) Each Field Office should cooperatively manage a raptor database, with UDWR and USFWS, as part of the BLM Corporate database. Raptor data should be collected and compiled using the Utah Raptor Data Collection Standards developed by the Utah State Office so that personnel from other agencies can access the data. Appropriate survey and monitoring protocols should be followed, when available. This database should be updated as new inventory and monitoring data

becomes available. The data should also be forwarded to UDWR and the NHP, which has been identified as the central repository for raptor data storage for the State of Utah.

b) Use of seasonal employees and volunteers, as well as "Challenge Cost Share" projects, should be used to augment the inventory and monitoring of raptor nests within a planning area, with the data entered into the above-mentioned databases at the close of each nesting season. Project proponents, such as energy development interests, would be encouraged to participate and help support an annual raptor nest monitoring effort within their areas of interest.

c) Active nest sites should be monitored during all authorized activities that may have an impact on the behavior or survival of the raptors at the nest site. A qualified biologist would conduct the monitoring and document the impacts of the activity on the species and to determine if adjustments to a site-specific project may be necessary. A final report of the impacts of the project should be placed in the environmental assessment (EA) file, with a copy submitted to the NHP. The report would be made available for review and should identify what activities may affect raptor nesting success, and should be used to recommend appropriate buffer zones for various raptor species.

d) As data are gathered, and impact analyses are more accurately documented, "adaptive management" principles should be implemented. Authorization of future activities should take new information into account, better protecting raptors while potentially allowing more development and fewer restrictions, if data indicates that current restrictions are beyond those necessary to protect nesting raptors, or conversely indicates that current guidance is inadequate for protection of nesting raptors.

1 Length of post-fledge dependency period to parents is longer than reported in this table. Reported dependency periods reflect the amount of time the young are still dependent on the nest site; e.g., they return to the nest for feeding.
2 Due to apparent high population densities and ability to adapt to human activity, a spatial buffer is not currently considered necessary for maintenance of American kestrel or Common barn-owl populations. Actions resulting in direct mortality of individual birds or take of known nest sites are unlawful.

ATTACHMENT 3 – UTAH RAPTOR MANAGEMENT EXPERTS FROM VARIOUS AGENCIES

The personnel listed are from various agencies in Utah who are recognized experts in the field of raptor ecology or who have extensive field experience in managing raptor resources with competing land uses. BLM field biologists and managers can use this network of specialized expertise to assist, as time permits, with specific raptor management issues. Individuals in this Utah raptor network also have well-established contacts with an informal extended network of highly qualified raptor ecologists outside the state (e.g., USGS, state wildlife agencies, universities) to provide an additional regional perspective.

This list is not intended to replace or interfere with established lines of communication but rather supplement these lines of communication.

APPENDIX 11—OIL AND GAS LEASING STIPULATIONS AND LEASE NOTICES

This appendix lists, by alternative, the stipulations on oil and gas leasing referenced in Chapter 2 of this Proposed Resource Management Plan/Final Environmental Impact Statement. Oil and gas lease notices regarding listed plant and animal species have also been included in this document. These notices will be made a part of any oil and gas leases issued by the Field Office. Applicable stipulations would be appended to permits and leases issued for oil and gas resources on the public lands.

DESCRIPTION OF SURFACE STIPULATIONS

Three types of surface stipulations can be applied to oil and gas leases: (1) no surface occupancy (NSO), (2) timing limitations (TL), and (3) controlled surface use (CSU).

- **No Surface Occupancy:** Areas closed to placement of surface facilities such as roads, oil and gas wells, and other facilities.
- **Timing Limitations:** Areas closed to construction and developmental activities during identified time frames. Timing limitation areas may be open to maintenance activities, including associated vehicle travel, during the closed period unless otherwise specified in the stipulation.
- **Controlled Surface Use:** Areas where surface uses are subject to specified controls or constraints to protect identified resource values.

Table A11-1 shows resources of concern, stipulations for addressing those concerns, and criteria for considering exceptions, modifications, and waivers.

Exceptions, Modifications, and Waivers

An operator submitting a plan of operations to the Bureau of Land Management (BLM) may request an exception, modification, or waiver of a stipulation included in a lease.

- **Exception:** A one-time exemption to a lease stipulation determined on a case-by-case basis.
- **Modification:** A change to the provisions of a lease stipulation, either temporarily or for the term of the lease.
- **Waiver:** A permanent exemption to a lease stipulation.

The resource management plan (RMP) serves as the vehicle for explaining to industry and the public the conditions under which waivers, exceptions, or modifications of lease stipulations may be granted. All circumstances for granting a waiver, exception, or modification must be documented in the RMP.

The person requesting the exception, modification, or waiver is encouraged to submit information that might assist the authorized official in making a decision. The authorized officer reviews information submitted in support of the request and other pertinent information. The authorized officer may modify, waive, or grant an exception to a stipulation if:

- The action is consistent with federal laws.
- The action is consistent with the RMP.
- The management objectives that led the BLM to require the lease stipulation can be met without restricting operations in the manner provided for by the stipulation given changes in the condition

of the surface resources involved, or given the nature, location, timing, or design of the proposed operations.

- The action is acceptable to the authorized officer based on a review of the environmental consequences.

Table A11-1 includes criteria for considering requests for exceptions, modifications or waivers. Where there are overlapping stipulations on the same land, the more stringent stipulation applies.

Table A11-1. Oil and Gas Lease Stipulations—Richfield Field Office

Resource of Concern	Applicable Area	Stipulation	Alternative					Stipulation Description
			N	A	Proposed RMP	C	D	
Light and Sound	Sensitive Areas	CSU				X	X	Minimize noise and light pollution in sensitive areas (e.g., special status species habitat, developed campgrounds, and river corridors) using best available technology such as installing multi-cylinder pumps, installing hospital sound-reducing mufflers, and placing exhaust systems to direct noise away from the protection area/resource. In addition, reduce light pollution by using methods such as limiting height of light poles, timing of lighting operations (limiting lighting to times of darkness associated with drilling and work or maintenance operations), limiting wattage intensity, and constructing light shields. **Exception:** Consider exceptions if natural barriers or viewsheds would mitigate light and noise impacts. Modification: None Waiver: None
Light and Sound	Areas adjacent to Capitol Reef National Park	NSO				X	X	Allow NSO in areas adjacent to Capitol Reef National Park to minimize noise and light pollution. **Exception:** An exception may be granted if it is determined that technology such as installation of multi-cylinder pumps, hospital sound reducing mufflers, and placement of exhaust systems to direct noise away from the national park would meet mitigation objectives. Additionally, there would be a requirement to reduce light pollution by using methods such as limiting height of light poles, timing of lighting operations (limiting lighting to times of darkness associated with drilling and work or maintenance operations), limiting wattage

Resource of Concern	Applicable Area	Stipulation	Alternative					Stipulation Description
			N	A	Proposed RMP	C	D	
								intensity, and constructing light shields. Modification: None Waiver: None
Light and Sound	Areas adjacent to Capitol Reef National Park, Canyonlands National Park, and Glen Canyon National Recreation Area (NRA)	CSU				X	X	Minimize noise and light pollution adjacent to national park units using best available technology such as installation of multi-cylinder pumps, hospital sound reducing mufflers, and placement of exhaust systems to direct noise away from the national park. Additionally, there would be a requirement to reduce light pollution by using methods such as limiting height of light poles, timing of lighting operations (limiting lighting to times of darkness associated with drilling and work or maintenance operations), limiting wattage intensity, and constructing light shields. Movement of operations to mitigate sound and light impacts would be required to be at least 200 meters from the national park boundary for Visual Resource Management (VRM) Classes II, III, and IV. **Exception:** Exceptions may be granted if a determination is made that natural barriers or viewsheds would meet these mitigation objectives. Modification: None Waiver: None
Soil and Water	Slopes 30% or greater	CSU	X	X	X	X	X	Surface disturbing proposed projects involving construction on slopes greater than 30% would be avoided. If the action cannot be avoided, rerouted, or relocated than a proposed project would include an erosion control strategy, reclamation and a site plan with a detailed survey and design completed by a certified engineer. This proposed project must be approved by the BLM prior to construction and maintenance.

Resource of Concern	Applicable Area	Stipulation	Alternative					Stipulation Description
			N	A	Proposed RMP	C	D	
								Exception: None Modification: None Waiver: None
Soil and Water	Slopes greater than 50%	NSO	X					Allow NSO on slopes greater than 50%. **Exception:** Consider exceptions to NSO if the project would not cause undue or unnecessary degradation to surface resources. In addition, require the operator to submit a plan prior to commencing operations that addresses: • Erosion control strategies • GIS modeling • Proper survey and design by a certified engineer. **Modification:** Modifications may be granted if a more detailed analysis finds that surface disturbance activities could be allowed on slopes greater than 50% without accelerating erosion. Waiver: None
Soil and Water	Slopes greater than 40%	NSO		X		X	X	Allow NSO on slopes greater than 40%. **Exception:** Consider exceptions to NSO if the project would not cause undue or unnecessary degradation to surface resources. In addition, require the operator to submit a plan prior to commencing operations that addresses: • Erosion control strategies • GIS modeling • Proper survey and design by a certified engineer. **Modification:** Modifications may be granted if a more detailed analysis finds that surface disturbance activities could be allowed on slopes greater than 40% without

Resource of Concern	Applicable Area	Stipulation	Alternative					Stipulation Description
			N	A	Proposed RMP	C	D	
								accelerating erosion. Waiver: None
Soil and Water	Soils identified by National Resources Conservation Service (NRCS) as having high potential for wind erosion through research studies or monitoring	CSU	X	X	X	X	X	If surface disturbing activities cannot be avoided on areas identified as having high potential for wind erosion, require a plan of operation that addresses erosion control strategies or mitigation measures, such as signing along roadways. Exception: None **Modification:** Consider modification if site-specific environmental analysis shows that alternatives would cause undue or unnecessary degradation to surface resources and impacts from wind erosion would not affect long-term soil productivity, would not impact air quality in nearby Class I airsheds, nor pose safety hazards to recreationists or motorists. Waiver: None
Soil and Water	Riparian and wetland areas	CSU	X					Prohibit oil and gas exploration and development activities within 500 feet of live water. **Exception:** Consider exceptions if (1) there are no practical alternatives, (2) impacts can be fully mitigated, and (3) the action is designed to enhance the riparian resources. Modification: None Waiver: None
Soil and Water	Riparian and wetland areas	NSO		X	X			Maintain buffer zones of no surface disturbance and/or occupancy around natural springs. Base the size of the buffer on hydrological, riparian, and other factors necessary to protect the water quality of the springs. If these factors cannot be determined, maintain a 330-foot buffer zone from outer edge.

Resource of Concern	Applicable Area	Stipulation	Alternative					Stipulation Description
			N	A	Proposed RMP	C	D	
								Exception: Consider exceptions if it can be shown that (1) there are no practical alternatives to the disturbance, (2) all long-term impacts can be fully mitigated, and (3) the activity will benefit and enhance the riparian area. Consider compensatory mitigation where surface disturbance cannot be avoided within riparian wetland habitats on a site-specific basis. Modification: None Waiver: None
Soil and Water	Riparian and wetland areas	NSO				X	X	Maintain buffer zones of no surface disturbance and/or occupancy around natural springs. Base the size of the buffer on hydrological, riparian, and other factors necessary to protect the water quality of the springs. If these factors cannot be determined, maintain a 660-foot buffer zone from outer edge. **Exception:** Consider exceptions if it can be shown that (1) there are no practical alternatives to the disturbance, (2) all long-term impacts can be fully mitigated, and (3) the activity will benefit and enhance the riparian area. Consider compensatory mitigation where surface disturbance cannot be avoided within riparian wetland habitats on a site-specific basis. Modification: None Waiver: None
Soil and Water	Wetland soils or soils identified as having hydric soil properties	NSO	X	X	X	X	X	Allow NSO on wetland soils or soils identified as having hydric soil properties. **Exception:** Consider exceptions to NSO if a site-specific environmental analysis determines that other placement alternatives would cause undue or unnecessary degradation to resources. In addition, require

Special Status Species	Sage Grouse Leks	Timing and CSU	X					Prohibit surface disturbing activities near sage grouse leks from March 1 through July 15, to protect species sensitivity during lekking activities. **Exception:** Consider exceptions if the proposed activity would not impair the function or utility of the site for current or subsequent reproductive display, including daytime loafing/staging activities. **Modification:** Consider modifying the CSU stipulation or substituting with a timing

Resource of Concern	Applicable Area	Stipulation	Alternative					Stipulation Description
			N	A	Proposed RMP	C	D	
								limitation if the CSU area is nonessential to site utility or function, or if the proposed action could be conditioned to not impair the function or utility of the site for current or subsequent reproductive display, including daytime loafing/staging activities. **Waiver:** Consider waiving the stipulation if, in cooperation with the State of Utah Division of Wildlife Resources (UDWR), it is determined that the site has been permanently abandoned or unoccupied for a minimum of 5 years; or site conditions have changed and there is no reasonable likelihood of site occupation for a subsequent minimum period of 10 years.
Special Status Species	Sage Grouse Leks	Timing and CSU		X				Prohibit surface disturbing activities within one-quarter mile of sage grouse leks from March 15 through June 1 to protect species sensitivity during lekking activities. Any surface disturbing activity conducted outside this time frame may not result in an above-ground structure within one-quarter mile of sage grouse leks that are in place from March 15 through June 1. **Exception:** Consider exceptions if the proposed activity would not impair the function or utility of the site for current or subsequent reproductive display, including daytime loafing/staging activities. **Modification:** Consider modifying the CSU use stipulation or substituting with a timing limitation if the CSU area is nonessential to site utility or function, or if the proposed action could be conditioned to not impair the function or utility of the site for current or subsequent reproductive display, including daytime loafing/staging activities. **Waiver:** Consider waiving the stipulation if, in cooperation with UDWR, it is determined

Resource of Concern	Applicable Area	Stipulation	Alternative					Stipulation Description
			N	A	Proposed RMP	C	D	
								that the site has been permanently abandoned or unoccupied for a minimum of 5 years; or site conditions have changed and there is no reasonable likelihood of site occupation for a subsequent minimum period of 10 years.
Special Status Species	Sage Grouse Leks	Timing and CSU				X	X	Prohibit surface disturbing activities within 2 miles of sage grouse leks from March 15 through June 1 to protect species sensitivity during lekking activities. Any surface disturbing activity conducted outside this time frame may not result in an above-ground structure within 2 miles of sage grouse leks that is in place from March 15 through June 1. **Exception:** Consider exceptions if the proposed activity would not impair the function or utility of the site for current or subsequent reproductive display, including daytime loafing/staging activities. **Modification:** Consider modifying the CSU stipulation or substituting with a timing limitation if the CSU area is nonessential to site utility or function, or if the proposed action could be conditioned to not impair the function or utility of the site for current or subsequent reproductive display, including daytime loafing/staging activities. **Waiver:** Consider waiving the stipulation if, in cooperation with UDWR, it is determined that the site has been permanently abandoned or unoccupied for a minimum of 5 years; or site conditions have changed and there is no reasonable likelihood of site occupation for subsequent minimum period of 10 years.
Special Status Species	Sage Grouse Leks	NSO			X			Manage oil and gas leasing as open subject to major constraints (NSO) within ½ mile of

Resource of Concern	Applicable Area	Stipulation	Alternative					Stipulation Description
			N	A	Proposed RMP	C	D	
								greater sage-grouse leks. **Exception:** An exception may be granted by the Field Manager if the operator submits a plan that demonstrates that impacts from the proposed action can be adequately mitigated. **Modification:** The Field Manager may modify the boundaries of the stipulation area if (1) portions of the area do not include lek sites, (2) the lek site(s) have been completely abandoned or destroyed, or (3) occupied lek site(s) occur outside the current defined area, as determined by the BLM. **Waiver:** A waiver may be granted if there are no active lek site(s) in the leasehold and it is determined the site(s) have been completely abandoned or destroyed or occur outside current defined area, as determined by the BLM.
Special Status Species	Sage Grouse Brooding Habitat	TL	X					Prohibit surface disturbing activities within sage grouse brooding habitat from April 1 through June 15 to protect brooding and nesting activities. **Exception:** Consider exceptions if consultation with UDWR indicates that the proposed action can be conditioned to not affect nest attendance, egg, or chick survival, nor affect nesting success. Actions designed to enhance the long-term utility or availability of suitable sage grouse habitat may be exempted from this timing limitation. **Modification:** Consider modifying the size and shape of the timing limitation area if consultation with UDWR indicates that the actual habitat suitability for nesting is greater or less than the identified area. Consider modifying timing limitations based on studies documenting actual use.

Resource of Concern	Applicable Area	Stipulation	Alternative					Stipulation Description
			N	A	Proposed RMP	C	D	
								Waiver: Consider waiving the stipulation if UDWR determines that the described lands are incapable of serving the long-term requirements of sage grouse nesting habitat and that these ranges no longer warrant consideration as components of sage grouse habitat.
Special Status Species	Sage Grouse Brooding Habitat	TL			X			Allow no surface disturbing or otherwise disruptive activities within 2 miles of a greater sage-grouse lek from March 15 to July 15 to protect sage grouse breeding and brood-rearing habitat. **Exception:** An exception could be granted if surveys determine that the Greater sage-grouse lek in nesting and brood-rearing habitat is not occupied. An exception may also be granted by the Field Manager if the operator submits a plan that demonstrates that impacts from the proposed action can be adequately mitigated or it is determined the lek sites are not active. **Modification:** The Field Manager may modify the boundaries of the stipulation area if portions of the area do not include habitat or are outside the current defined area, as determined by the BLM. **Waiver:** A waiver may be granted if it is determined the habitat no longer exists or has been destroyed.
Special Status Species	Sage Grouse Brooding Habitat	TL				X	X	Prohibit long-term surface disturbing activities within sage grouse brooding/nesting habitat from April 1 through July 15 to protect brooding and nesting activities. **Exception:** Consider exceptions if an environmental analysis and consultation with UDWR indicates that the proposed action can be conditioned so as not to affect nest

Resource of Concern	Applicable Area	Stipulation	Alternative					Stipulation Description

								attendance, egg or chick survival, or nesting success. Actions designed to enhance the long-term utility or availability of suitable sage grouse habitat may be exempted from this timing limitation. **Modification:** Consider modifying the size and shape of the timing limitation area if consultation with UDWR indicates that the actual habitat suitability for nesting is greater or less than the identified area. Consider modifying timing limitations based on studies documenting actual use. **Waiver:** Consider waiving the stipulation if UDWR determines that the described lands are incapable of serving the long-term requirements of sage grouse nesting habitat and that these ranges no longer warrant consideration as components of sage grouse habitat.
Special Status Species	Sage Grouse Brooding Habitat	TL			X			Allow no surface disturbing or otherwise disruptive activities in greater sage-grouse winter habitat from December 15 through March 14. **Exception:** An exception could be granted if surveys determine that the Greater sage-grouse lek in winter habitat is not occupied, and that snow depths in the area allow continued sage-grouse use. An exception may also be granted by the Field Manager if the operator submits a plan that demonstrates that impacts from the proposed action can be avoided, sufficiently minimized, or adequately mitigated. **Modification:** The Field Manager may modify the boundaries of the stipulation area if portions of the area do not include habitat or are outside the current defined area, as determined by the BLM.

Resource of Concern	Applicable Area	Stipulation	Alternative					Stipulation Description
			N	A	Proposed RMP	C	D	
								Waiver: A waiver may be granted if it is determined the habitat no longer exists or has been destroyed.
Fish and Wildlife	Crucial Bison Habitat	TL	X					Restrict oil and gas exploration and development activities in crucial bison habit from December 1 through April 15. **Exception:** Consider exception if bison are not present or the lessee/operator can demonstrate that adverse impacts can be mitigated. Modification: None Waiver: None
Fish and Wildlife	Crucial Bison Habitat	TL			X	X	X	Restrict oil and gas exploration and development activities in crucial bison habit from November 1 through May 15. **Exception:** This stipulation does not apply to the maintenance and operation of existing and ongoing facilities. An exception may be granted by the Field Manager if the operator submits a plan that demonstrates that impacts from the proposed action can be adequately mitigated or it is determined the habitat is not being used during the winter period for any given year. **Modification:** The Field Manager may modify the boundaries of the stipulation area if (1) a portion of the area is not being used as crucial range by bison, (2) habitat outside of stipulation boundaries is being used as crucial range and needs to be protected, or (3) the migration patterns have changed causing a difference in the season of use. **Waiver:** A waiver may be granted if the crucial range habitat is unsuitable or unoccupied during winter months by bison and there is no reasonable likelihood of future winter range use.

Resource of Concern	Applicable Area	Stipulation	Alternative					Stipulation Description
			N	A	Proposed RMP	C	D	
Fish and Wildlife	Crucial and High Value Mule Deer and Elk Habitat	TL	X					Restrict oil and gas exploration and development in crucial and high-value mule deer and elk habitats from December 15 through May 15 to protect winter habitats and species sensitivity during fawning season. **Exception:** Consider exception if deer and/or elk are not present or if the lessee/operator can demonstrate that adverse impacts can be mitigated. Modification: None Waiver: None
Fish and Wildlife	Crucial and High Value Mule Deer and Elk Habitat	TL				X	X	Restrict surface disturbing activities in crucial and high-value mule deer and elk habitats from December 15 through April 15 to protect winter habitats. **Exception:** This stipulation does not apply to the maintenance and operation of existing and ongoing facilities. An exception may be granted by the Field Manager if the operator submits a plan that demonstrates that impacts from the proposed action can be adequately mitigated or it is determined the habitat is not being used during the winter period for any given year. **Modification:** The Field Manager may modify the boundaries of the stipulation area if (1) a portion of the area is not being used as crucial winter range by deer/elk, (2) habitat outside of stipulation boundaries is being used as crucial winter range and needs to be protected, or (3) the migration patterns have changed causing a difference in the season of use. **Waiver:** A waiver may be granted if the winter range habitat is unsuitable or unoccupied during winter months by deer/elk and there is no reasonable likelihood of

Attachment A—Lease Notice for Bald Eagle

Utah's Threatened and Endangered Species Notices

Lease Notice – Bald Eagle

The Lessee/Operator is given notice that the lands in this parcel contains nesting/winter roost habitat for the bald eagle, a federally listed species. Avoidance or use restrictions may be placed on portions of the lease. Application of appropriate measures will depend on whether the action is temporary or permanent, and whether it occurs within or outside the bald eagle breeding or roosting season. A temporary action is completed prior to the following breeding or roosting season, leaving no permanent structures and resulting in no permanent habitat loss. A permanent action continues for more than one breeding or roosting season and/or causes a loss of eagle habitat or displaces eagles through disturbances (e.g., creation of a permanent structure). The following avoidance and minimization measures have been designed to ensure activities carried out on the lease are in compliance with the Endangered Species Act (ESA). Integration of, and adherence to, these measures will facilitate review and analysis of any submitted permits under the authority of this lease. Following these measures could reduce the scope of ESA Section 7 consultation at the permit stage.

Current avoidance and minimization measures include the following:

1. Surveys will be required prior to operations, unless species occupancy and distribution information is complete and available. All surveys must be conducted by qualified individual(s), and be conducted according to protocol.
2. Lease activities will require monitoring throughout the duration of the project. To ensure desired results are being achieved, minimization measures will be evaluated and, if necessary, Section 7 consultation reinitiated.
3. Water production will be managed to ensure maintenance or enhancement of riparian habitat.
4. Temporary activities within 1.0 mile of nest sites will not occur during the breeding season of January 1 to August 31, unless the area has been surveyed according to protocol and determined to be unoccupied.
5. Temporary activities within 0.5 miles of winter roost areas, e.g., cottonwood galleries, will not occur during the winter roost season of November 1 to March 31, unless the area has been surveyed according to protocol and determined to be unoccupied.
6. No permanent infrastructure will be placed within 1.0 mile of nest sites.
7. No permanent infrastructure will be placed within 0.5 miles of winter roost areas.
8. Remove big game carrion to 100 feet from on lease roadways occurring within bald eagle foraging range.
9. Avoid loss or disturbance to large cottonwood gallery riparian habitats.
10. Where technically and economically feasible, use directional drilling or multiple wells from the same pad to reduce surface disturbance and eliminate drilling in suitable habitat. Utilize directional drilling to avoid direct impacts to large cottonwood gallery riparian habitats. Ensure that such directional drilling does not intercept or degrade alluvial aquifers.
11. All areas of surface disturbance within riparian areas and/or adjacent uplands should be re-vegetated with native species.

Additional measures may also be employed to avoid or minimize effects to the species between the lease sale stage and lease development stage. These additional measures will be developed and implemented in consultation with the U.S. Fish and Wildlife Service to ensure continued compliance with the ESA.

Attachment B—Lease Notice for Mexican Spotted Owl

Utah's Threatened and Endangered Species Notices

Lease Notice – Mexican Spotted Owl

The Lessee/Operator is given notice that the lands in this lease contain suitable habitat for Mexican spotted owl, a federally listed species. **Insert the following if lease contains Designated Critical Habitat:** *[The Lessee/Operator is given notice that the lands in this lease contain Designated Critical Habitat for the Mexican spotted owl, a Federally listed species. Critical habitat was designated for the Mexican spotted owl on August 31, 2004 (69 FR 53181-53298).]* Avoidance or use restrictions may be placed on portions of the lease. Application of appropriate measures will depend on whether the action is temporary or permanent, and whether it occurs within or outside the owl nesting season. A temporary action is completed prior to the following breeding season, leaving no permanent structures and resulting in no permanent habitat loss. A permanent action continues for more than one breeding season and/or causes a loss of owl habitat or displaces owls through disturbances (e.g., creation of a permanent structure). The following avoidance and minimization measures have been designed to ensure activities carried out on the lease are in compliance with the Endangered Species Act (ESA). Integration of, and adherence to, these measures, will facilitate review and analysis of any submitted permits under the authority of this lease. Following these measures could reduce the scope of ESA Section 7 consultation at the permit stage.

Current avoidance and minimization measures include the following:

1. Surveys will be required prior to operations, unless species occupancy and distribution information is complete and available. All surveys must be conducted by qualified individual(s).
2. Assess habitat suitability for both nesting and foraging using accepted habitat models in conjunction with field reviews. Apply the conservation measures below if project activities occur within 0.5 mile of suitable owl habitat. Determine potential effects of actions to owls and their habitat.
    a. Document type of activity, acreage and location of direct habitat impacts, type and extent of indirect impacts relative to location of suitable owl habitat.
    b. Document if the action is temporary or permanent.
3. Lease activities will require monitoring throughout the duration of the project. To ensure desired results are being achieved, minimization measures will be evaluated and, if necessary, Section 7 consultation reinitiated.
4. Water production will be managed to ensure maintenance or enhancement of riparian habitat.
5. Where technically and economically feasible, use directional drilling or multiple wells from the same pad to reduce surface disturbance and eliminate drilling in canyon habitat suitable for Mexican spotted owl nesting.
6. For all temporary actions that may impact owls or suitable habitat:
    a. If the action occurs entirely outside of the owl breeding season (March 1 to August 31) and leaves no permanent structure or permanent habitat disturbance, action can proceed without an occupancy survey.
    b. If the action will occur during a breeding season, survey for owls prior to commencing activity. If owls are found, activity must be delayed until outside of the breeding season.
    c. Rehabilitate access routes created by the project through such means as raking out scars, revegetation, gating access points, etc.
7. For all permanent actions that may impact owls or suitable habitat:
    a. Survey two consecutive years for owls according to accepted protocol prior to commencing activities.
    b. If owls are found, no actions will occur within 0.5 mile of identified nest site. If nest site is unknown, no activity will occur within the designated Protected Activity Center (PAC).
    c. Avoid drilling and permanent structures within 0.5 mile of suitable habitat unless surveyed and not occupied.
    d. Reduce noise emissions (e.g., use hospital-grade mufflers) to 45 dBA at 0.5 mile from suitable habitat, including canyon rims. Placement of permanent noise-generating facilities should be determined by a noise analysis to ensure noise does not encroach upon a 0.5 mile buffer for suitable habitat, including canyon rims.
    e. Limit disturbances to and within suitable habitat by staying on approved routes.
    f. Limit new access routes created by the project.

Additional measures to avoid or minimize effects to the species may be developed and implemented in consultation with the U.S. Fish and Wildlife Service between the lease sale stage and lease development stage to ensure continued compliance with the ESA.

Attachment C—Lease Notice for Southwestern Willow Flycatcher

Utah's Threatened and Endangered Species Notices

Lease Notice – Southwestern Willow Flycatcher

The Lessee/Operator is given notice that the lands in this parcel contain riparian habitat that falls within the range for southwestern willow flycatcher, a federally listed species. Avoidance or use restrictions may be placed on portions of the lease. Application of appropriate measures will depend on whether the action is temporary or permanent, and whether it occurs within or outside the nesting season. A temporary action is completed prior to the following breeding season leaving no permanent structures and resulting in no permanent habitat loss. A permanent action continues for more than one breeding season and/or causes a loss of habitat or displaces flycatchers through disturbances (e.g., creation of a permanent structure). The following avoidance and minimization measures have been designed to ensure activities carried out on the lease are in compliance with the Endangered Species Act (ESA). Integration of, and adherence to, these measures, will facilitate review and analysis of any submitted permits under the authority of this lease. Following these measures could reduce the scope of ESA Section 7 consultation at the permit stage.

Current avoidance and minimization measures include the following:

1. Surveys will be required prior to operations, unless species occupancy and distribution information is complete and available. All surveys must be conducted by qualified individual(s), and be conducted according to protocol.
2. Lease activities will require monitoring throughout the duration of the project. To ensure desired results are being achieved, minimization measures will be evaluated and, if necessary, Section 7 consultation reinitiated.
3. Water production will be managed to ensure maintenance or enhancement of riparian habitat.
4. Where technically and economically feasible, use directional drilling or multiple wells from the same pad to reduce surface disturbance and eliminate drilling in suitable riparian habitat. Ensure that such directional drilling does not intercept or degrade alluvial aquifers.
5. Drilling activities will maintain a 300 ft. buffer from suitable riparian habitat year long.
6. Drilling activities within 0.25 mile of occupied breeding habitat will not occur during the breeding season of May 1 to August 15.
7. Ensure that water extraction or disposal practices do not result in change of hydrologic regime that would result in loss or degradation of riparian habitat.
8. Revegetate with native species all areas of surface disturbance within riparian areas and/or adjacent uplands.

Additional measures to avoid or minimize effects to the species may be developed and implemented in consultation with the U.S. Fish and Wildlife Service between the lease sale stage and lease development stage to ensure continued compliance with the ESA.

Attachment D—Lease Notice for Colorado River Fish

Utah's Threatened and Endangered Species Notices

Lease Notice – Endangered Fish of the Upper Colorado River Drainage Basin

The Lessee/Operator is given notice that the lands in this parcel contain Critical Habitat for the Colorado River fish (bonytail chub, humpback chub, Colorado pike minnow, and razorback sucker, listed as endangered under the Endangered Species Act (ESA), or these parcels have watersheds that are tributary to designated habitat. Critical habitat was designated for the four endangered Colorado River fishes on March 21, 1994 (59 FR 13374-13400). Designated critical habitat for all the endangered fishes includes those portions of the 100-year floodplain that contain primary constituent elements necessary for survival of the species. Avoidance or use restrictions may be placed on portions of the lease. The following avoidance and minimization measures have been designed to ensure activities carried out on the lease comply with the ESA. Integration of, and adherence to, these measures will facilitate review and analysis of any submitted permits under the authority of this lease. Following these measures could reduce the scope of ESA Section 7 consultation at the permit stage.

Current avoidance and minimization measures include the following:

1. Surveys will be required prior to operations, unless species occupancy and distribution information is complete and available. All surveys must be conducted by qualified individual(s).
2. Lease activities will require monitoring throughout the duration of the project. To ensure desired results are being achieved, minimization measures will be evaluated and, if necessary, Section 7 consultation reinitiated.
3. Water production will be managed to ensure maintenance or enhancement of riparian habitat.
4. Avoid loss or disturbance of riparian habitats.
5. Where technically and economically feasible, use directional drilling or multiple wells from the same pad to reduce surface disturbance and eliminate drilling in suitable riparian habitat. Ensure that such directional drilling does not intercept or degrade alluvial aquifers.
6. Conduct watershed analysis for leases in designated critical habitat and overlapping major tributaries in order to determine toxicity risk from permanent facilities.
7. Implement the Utah Oil and Gas Pipeline Crossing Guidance (from BLM National Science and Technology Center).
8. Drilling will not occur within 100-year floodplains of rivers or tributaries to rivers that contain listed fish species or critical habitat.
9. In areas adjacent to 100-year flood plains, particularly in systems prone to flash floods, analyze the risk for flash floods to impact facilities, and use closed loop drilling, and pipeline burial or suspension according to the Utah Oil and Gas Pipeline Crossing Guidance, to minimize the potential for equipment damage and resulting leaks or spills.

Water depletions from *any* portion of the Upper Colorado River drainage basin above Lake Powell are considered to adversely affect or adversely modify the critical habitat of the four resident endangered fish species, and must be evaluated with regard to the criteria described in the Upper Colorado River Endangered Fish Recovery Program. Formal consultation with U.S. Fish and Wildlife Service (USFWS) is required for all depletions. All depletion amounts must be reported to BLM.

Additional measures to avoid or minimize effects to the species may be developed and implemented in consultation with the USFWS between the lease sale stage and lease development stage to ensure continued compliance with the ESA.

Attachment E—Lease Notice for Utah Prairie Dog

Utah's Threatened and Endangered Species Notices

Lease Notice – Utah Prairie Dog

The Lessee/Operator is given notice that lands in this lease may contain historic and/or occupied Utah prairie dog habitat, a threatened species under the Endangered Species Act (ESA). Avoidance or use restrictions may be placed on portions of the lease. Application of appropriate measures will depend on whether the action is temporary or permanent, and whether it occurs when prairie dogs are active or hibernating. A temporary action is completed prior to the following active season leaving no permanent structures and resulting in no permanent habitat loss. A permanent action continues for more than one activity/hibernation season and/or causes a loss of Utah prairie dog habitat or displaces prairie dogs through disturbances (e.g., creation of a permanent structure). The following avoidance and minimization measures have been designed to ensure activities carried out on the lease are in compliance with the ESA. Integration of, and adherence to, these measures will facilitate review and analysis of any submitted permits under the authority of this lease. Following these measures could reduce the scope of ESA Section 7 consultation at the permit stage.

Current avoidance and minimization measures include the following:

1. Surveys will be required prior to operations unless species occupancy and distribution information is complete and available. All surveys must be conducted by qualified individual(s).
2. Lease activities will require monitoring throughout the duration of the project. To ensure desired results are being achieved, minimization measures will be evaluated and, if necessary, Section 7 consultation reinitiated.
3. Where technically and economically feasible, use directional drilling or multiple wells from the same pad to reduce surface disturbance and eliminate drilling in prairie dog habitat.
4. Surface occupancy or other surface disturbing activity will be avoided within 0.5 mile of active prairie dog colonies.
5. Permanent surface disturbance or facilities will be avoided within 0.5 mile of potentially suitable, unoccupied prairie dog habitat, identified and mapped by Utah Division of Wildlife Resources since 1976.
6. The lessee/operator should consider if fencing infrastructure on well pad, e.g., drill pads, tank batteries, and compressors, would be needed to protect equipment from burrowing activities. In addition, the operator should consider if future surface disturbing activities would be required at the site.
7. Within occupied habitat, set a 25 mph speed limit on operator-created and maintained roads.
8. Limit disturbances to and within suitable habitat by staying on designated routes.
9. Limit new access routes created by the project.

Additional measures to avoid or minimize effects to the species may be developed and implemented in consultation with the U.S. Fish and Wildlife Service between the lease sale stage and lease development stage to ensure continued compliance with the ESA.

Attachment F—Lease Notice for Listed Plant Species

Utah's Threatened and Endangered Species Notices

Lease Notice – Listed Plant Species

The Lessee/Operator is given notice that the lands in this parcel contain suitable habitat for federally listed plant species under the Endangered Species Act (ESA). The following avoidance and minimization measures have been developed to facilitate review and analysis of any submitted permits under the authority of this lease

1. Site inventories:
    a. Must be conducted to determine habitat suitability
    b. Are required in known or potential habitat for all areas proposed for surface disturbance before initiating project activities, at a time when the plant can be detected, and during appropriate flowering periods
    c. Should include documentation on individual plant locations and suitable habitat distributions
    d. Must have qualified individuals conduct all surveys.
2. Lease activities will require monitoring throughout the duration of the project. To ensure desired results are being achieved, minimization measures will be evaluated and, if necessary, Section 7 consultation reinitiated.
3. Project activities must be designed to avoid direct disturbance to populations and to individual plants:
    a. Designs will avoid concentrating water flows or sediments into plant occupied habitat.
    b. Construction will occur downslope of plants and populations where feasible; if well pads and roads must be sited upslope, buffers of 100 feet minimum between surface disturbances and plants and populations will be incorporated.
    c. Where populations occur within 200 feet of well pads, a buffer or fence will be established between the individuals or groups of individuals and the well pads during and post-construction.
    d. Areas for avoidance will be visually identifiable in the field, e.g., flagging, temporary fencing, rebar.
    e. For surface pipelines, a 10-foot buffer will be used from any plant locations:
        i. If on a slope, stabilizing construction techniques will be used to ensure the pipelines do not move toward the population.
4. For riparian/wetland-associated species, e.g. Ute ladies'-tresses, avoid loss or disturbance of riparian habitats:
    a. Water extraction or disposal practices will not result in change of hydrologic regime.
5. Disturbances to and within suitable habitat will be limited by staying on designated routes.
6. New access routes created by the project will be limited.
7. To limit OHV travel in sensitive areas, signing will be placed appropriately.
8. Dust abatement practices will be implemented near occupied plant habitat.
9. All disturbed areas will be revegetated with native species composed of species indigenous to the area.
10. Post-construction monitoring for invasive species will be required.
11. Where technically and economically feasible, directional drilling or multiple wells will be used from the same pad to reduce surface disturbance and eliminate drilling in plant habitat. Ensure that such directional drilling does not intercept or degrade alluvial aquifers.
12. Lease activities will require monitoring throughout the duration of the project. To ensure desired results are being achieved, minimization measures will be evaluated and, if necessary, Section 7 consultation reinitiated.

Additional measures to avoid or minimize effects to the species may be developed and implemented in consultation with the U.S. Fish and Wildlife Service between the lease sale stage and lease development stage to ensure continued compliance with the ESA.

Attachment G—Lease Notice for California Condor

Utah's Threatened and Endangered Species Notices

Lease Notice – California Condor

The Lessee/Operator is given notice that the lands located in this parcel contain potential habitat for the California Condor, a federally listed species. Avoidance or use restrictions may be placed on portions of the lease if the area is known or suspected to be used by condors. Application of appropriate measures will depend on whether the action is temporary or permanent, and whether it occurs within or outside potential habitat. A temporary action is completed prior to the following important season of use, leaving no permanent structures and resulting in no permanent habitat loss. This would include consideration for habitat functionality. A permanent action continues for more than one season of habitat use, and/or causes a loss of condor habitat function or displaces condors through continued disturbance (i.e. creation of a permanent structure requiring repetitious maintenance, or emits disruptive levels of noise).

The following avoidance and minimization measures have been designed to ensure activities carried out on the lease are in compliance with the Endangered Species Act (ESA). Integration of, and adherence to these measures will facilitate review and analysis of any submitted permits under the authority of this lease. Following these measures could reduce the scope of ESA, Section 7 consultation at the permit stage.

Current avoidance and minimization measures include the following:

1. Surveys will be required prior to operations unless species occupancy and distribution information is complete and available. All Surveys must be conducted by qualified individual(s) approved by the BLM, and must be conducted according to approved protocol.
2. If surveys result in positive identification of condor use, all lease activities will require monitoring throughout the duration of the project to ensure desired results of applied mitigation and protection. Minimization measures will be evaluated during development and, if necessary, Section 7 consultation may be reinitiated.
3. Temporary activities within 1.0 mile of nest sites will not occur during the breeding season.
4. Temporary activities within 0.5 miles of established roosting sites or areas will not occur during the season of use, August 1 to November 31, unless the area has been surveyed according to protocol and determined to be unoccupied.
5. No permanent infrastructure will be placed within 1.0 mile of nest sites.
6. No permanent infrastructure will be placed within 0.5 miles of established roosting sites or areas.
7. Remove big game carrion to 100 feet from on lease roadways occurring within foraging range.
8. Where technically and economically feasible, use directional drilling or multiple wells from the same pad to reduce surface disturbance and eliminate drilling in suitable habitat Utilize directional drilling to avoid direct impacts to large cottonwood gallery riparian habitats. Ensure that such directional drilling does not intercept or degrade alluvial aquifers.
9. Reinitiation of section 7 consultation with the Service will be sought immediately if mortality or disturbance to California condors is anticipated as a result of project activities. Additional site-specific measures may also be employed to avoid or minimize effects to the species. These additional measures will be developed and implemented in consultation with the U.S. Fish and Wildlife Service to ensure continued compliance with the ESA.

Additional measures may also be employed to avoid or minimize effects to the species between the lease sale and lease development stages. These additional measures will be developed and implemented in consultation with the U.S. Fish and Wildlife Service to ensure continued compliance with the ESA.

Attachment H—Lease Notice for Barneby Reed Mustard

Utah's Threatened and Endangered Species Notices

Lease Notice – Barneby Reed-Mustard

In order to minimize effects to the federally threatened Barneby reed-mustard, the Bureau of Land Management (BLM), in coordination with the U.S. Fish and Wildlife Service (Service), has developed the following avoidance and minimization measures. Implementation of these measures will help ensure the activities carried out during oil and gas development (including but not limited to drilling, production, and maintenance operations) are in compliance with the Endangered Species Act (ESA). For the purposes of this document, the follow terms are so defined:

- *Potential habitat* is defined as areas which satisfy the broad criteria of the species habitat description; usually determined by preliminary, in-house assessment.
- *Suitable habitat* is defined as areas which contain or exhibit the specific components or constituents necessary for plant persistence; determined by field inspection and/or surveys; may or may not contain clay reed-mustard; habitat descriptions can be found in Federal Register Notice and species recovery plan links at <http://www.fws.gov/endangered/wildlife.html>.
- *Occupied habitat* is defined as areas currently or historically known to support clay reed-mustard; synonymous with "known habitat."

The following avoidance and minimization measures should be included in the Plan of Development:

1. Pre-project habitat assessments will be completed across 100% of the project disturbance area within potential habitat[1] prior to any ground disturbing activities (including ATV use) to determine if suitable Barneby reed-mustard habitat is present.

2. Site inventories will be conducted within suitable habitat to determine occupancy. Where standard surveys are technically infeasible and otherwise hazardous due to topography, slope, etc., suitable habitat will be assessed and mapped for avoidance (hereafter, "avoidance areas"); in such cases, in general, 300' buffers will be maintained between surface disturbance and avoidance areas. However, site specific distances will need to be approved by FWS and BLM when disturbance will occur upslope of habitat. Where conditions allow, inventories:
   a. Must be conducted by qualified individual(s) and according to BLM and Service accepted survey protocols,
   b. Will be conducted in suitable and occupied habitat for all areas proposed for surface disturbance prior to initiation of project activities and within the same growing season, at a time when the plant can be detected (usually April 15th to June 5th, however, surveyors should verify that the plant is flowering by contacting a BLM or FWS botanist or demonstrating that the nearest known population is in flower),
   c. Will occur within 300' from the centerline of the proposed right-of-way for surface pipelines or roads; and within 300' from the perimeter of disturbance for the proposed well pad including the well pad,
   d. Will include, but not be limited to, plant species lists and habitat characteristics, and
   e. Will be valid until April 15th the following year.

3. Design project infrastructure to minimize impacts within suitable habitat:
   a. Where standard surveys are technically infeasible, infrastructure and activities will avoid all suitable habitat (avoidance areas) and incorporate 300' buffers, in general; however, site specific distances will need to be approved by FWS and BLM when disturbance will occur upslope of habitat,
   b. Reduce well pad size to the minimum needed, without compromising safety,
   c. Where technically and economically feasible, use directional drilling or multiple wells from the same pad,
   d. Limit new access routes created by the project,
   e. Roads and utilities should share common right-of-ways where possible,
   f. Reduce the width of right-of-ways and minimize the depth of excavation needed for the road bed; where feasible, use the natural ground surface for the road within habitat,
   g. Place signing to limit off-road travel in sensitive areas, and
   h. Stay on designated routes and other cleared/approved areas.
   i. All disturbed areas will be revegetated with native species comprised of species indigenous to the area and non-native species that are not likely to invade other areas.

Utah's Threatened and Endangered Species Notices

4. Within occupied habitat, project infrastructure will be designed to avoid direct disturbance and minimize indirect impacts to populations and to individual plants:
   a. Follow the above recommendations (#3) for project design within suitable habitats,
   b. To avoid water flow and/or sedimentation into occupied habitat and avoidance areas, silt fences, hay bales, and similar structures or practices will be incorporated into the project design; appropriate placement of fill is encouraged,
   d. Construction of roads will occur such that the edge of the right of way is at least 300' from any plant and 300' from avoidance areas,
   e. Roads will be graveled within occupied habitat; the operator is encouraged to apply water for dust abatement to such areas from April 15th to June 5th (flowering period); dust abatement applications will be comprised of water only,
   f. The edge of the well pad should be located at least 300' away from plants and avoidance areas, in general; however, site specific distances will need to be approved by FWS and BLM when disturbance will occur upslope of habitat,
   g. Surface pipelines will be laid such that a 300' buffer exists between the edge of the right of way and plants and 300' between the edge of right of way and avoidance areas; use stabilizing and anchoring techniques when the pipeline crosses suitable habitat to ensure pipelines don't move towards the population; site specific distances will need to be approved by FWS and BLM when disturbance will occur upslope of habitat,
   h. Construction activities will not occur from April 15th through June 5th within occupied habitat,
   i. Before and during construction, areas for avoidance should be visually identifiable in the field, e.g., flagging, temporary fencing, rebar, etc.,
   j. Place produced oil, water, or condensate tanks in centralized locations, away from occupied habitat, and
   k. Minimize the disturbed area of producing well locations through interim and final reclamation. Reclaim well pads following drilling to the smallest area possible.

5. Occupied Barneby reed-mustard habitats within 300' of the edge of the surface pipelines' right of ways, 300' of the edge of the roads' right of ways, and 300' from the edge of the well pad shall be monitored for a period of three years after ground disturbing activities. Monitoring will include annual plant surveys to determine plant and habitat impacts relative to project facilities. Annual reports shall be provided to the BLM and the Service. To ensure desired results are being achieved, minimization measures will be evaluated and may be changed after a thorough review of the monitoring results and annual reports during annual meetings between the BLM and the Service.

6. Reinitiation of section 7 consultation with the Service will be sought immediately if any loss of plants or occupied habitat for the Barneby reed-mustard is anticipated as a result of project activities. Additional site-specific measures may also be employed to avoid or minimize effects to the species. These additional measures will be developed and implemented in consultation with the U.S. Fish and Wildlife Service to ensure continued compliance with the ESA.

Attachment I—Lease Notice for Last Chance Townsendia

Utah's Threatened and Endangered Species Notices

Lease Notice – Last Chance Townsendia (*Townsendia aprica*)

In order to minimize effects to the federally threatened Last Chance townsendia, the Bureau of Land Management (BLM), in coordination with the U.S. Fish and Wildlife Service (Service), has developed the following avoidance and minimization measures. Implementation of these measures will help ensure the activities carried out during oil and gas development (including but not limited to drilling, production, and maintenance operations) are in compliance with the Endangered Species Act (ESA). For the purposes of this document, the follow terms are so defined:

- *Potential habitat* is defined as areas which satisfy the broad criteria of the species habitat description; usually determined by preliminary, in-house assessment.
- *Suitable habitat* is defined as areas which contain or exhibit the specific components or constituents necessary for plant persistence; determined by field inspection and/or surveys; may or may not contain clay reed-mustard; habitat descriptions can be found in Federal Register Notice and species recovery plan links at <http://www.fws.gov/endangered/wildlife.html>.
- *Occupied habitat* is defined as areas currently or historically known to support clay reed-mustard; synonymous with "known habitat."

The following avoidance and minimization measures should be included in the Plan of Development:

1. Pre-project habitat assessments will be completed across 100% of the project disturbance area within potential habitat prior to any ground disturbing activities to determine if suitable Last Chance townsendia habitat is present.

2. Site inventories will be conducted within suitable habitat to determine occupancy. Where standard surveys are technically infeasible and otherwise hazardous due to topography, slope, etc., suitable habitat will be assessed and mapped for avoidance (hereafter, "avoidance areas"); in such cases, in general, 300' buffers will be maintained between surface disturbance and avoidance areas. However, site specific distances will need to be approved by FWS and BLM when disturbance will occur upslope of habitat. Where conditions allow, inventories:
   a. Must be conducted by qualified individual(s) and according to BLM and Service accepted survey protocols,
   b. Will be conducted in suitable and occupied habitat for all areas proposed for surface disturbance prior to initiation of project activities and within the same growing season, at a time when the plant can be detected (usually April 1st to May 30th, however, surveyors should verify that the plant is flowering by contacting a BLM or FWS botanist or demonstrating that the nearest known population is in flower),
   c. Will occur within 300' from the centerline of the proposed right-of-way for surface pipelines or roads; and within 300' from the perimeter of disturbance for the proposed well pad including the well pad,
   d. Will include, but not be limited to, plant species lists and habitat characteristics, and
   e. Will be valid until April 1st the following year.

3. Design project infrastructure to minimize impacts within suitable habitat:
   a. Where standard surveys are technically infeasible, infrastructure and activities will avoid all suitable habitat (avoidance areas) and incorporate 300' buffers, in general; however, site specific distances will need to be approved by FWS and BLM when disturbance will occur upslope of habitat,
   b. Reduce well pad size to the minimum needed, without compromising safety,
   c. Where technically and economically feasible, use directional drilling or multiple wells from the same pad,
   d. Limit new access routes created by the project,
   e. Roads and utilities should share common right-of-ways where possible,
   f. Reduce the width of right-of-ways and minimize the depth of excavation needed for the road bed; where feasible, use the natural ground surface for the road within habitat,
   g. Place signing to limit off-road travel in sensitive areas, and
   h. Stay on designated routes and other cleared/approved areas.
   i. All disturbed areas will be revegetated with native species comprised of species indigenous to the area and non-native species that are not likely to invade other areas.

Utah's Threatened and Endangered Species Notices

4. Within occupied habitat, project infrastructure will be designed to avoid direct disturbance and minimize indirect impacts to populations and to individual plants:
   a. Follow the above recommendations (#3) for project design within suitable habitats,
   b. To avoid water flow and/or sedimentation into occupied habitat and avoidance areas, silt fences, hay bales, and similar structures or practices will be incorporated into the project design; appropriate placement of fill is encouraged,
   d. Construction of roads will occur such that the edge of the right of way is at least 300' from any plant and 300' from avoidance areas,
   e. Roads will be graveled within occupied habitat; the operator is encouraged to apply water for dust abatement to such areas from April 15st to June 30th (flowering period); dust abatement applications will be comprised of water only,
   f. The edge of the well pad should be located at least 300' away from plants and avoidance areas, in general; however, site specific distances will need to be approved by FWS and BLM when disturbance will occur upslope of habitat,
   g. Surface pipelines will be laid such that a 300' buffer exists between the edge of the right of way and plants and 300' between the edge of right of way and avoidance areas; use stabilizing and anchoring techniques when the pipeline crosses suitable habitat to ensure pipelines don't move towards the population; site specific distances will need to be approved by FWS and BLM when disturbance will occur upslope of habitat,
   h. Construction activities will not occur from April 15th through June 30th within occupied habitat,
   i. Before and during construction, areas for avoidance should be visually identifiable in the field, e.g., flagging, temporary fencing, rebar, etc.,
   j. Place produced oil, water, or condensate tanks in centralized locations, away from occupied habitat, and
   k. Minimize the disturbed area of producing well locations through interim and final reclamation. Reclaim well pads following drilling to the smallest area possible.

5. Occupied Last Chance townsendia habitats within 300' of the edge of the surface pipelines' right of ways, 300' of the edge of the roads' right of ways, and 300' from the edge of the well pad shall be monitored for a period of three years after ground disturbing activities. Monitoring will include annual plant surveys to determine plant and habitat impacts relative to project facilities. Annual reports shall be provided to the BLM and the Service. To ensure desired results are being achieved, minimization measures will be evaluated and may be changed after a thorough review of the monitoring results and annual reports during annual meetings between the BLM and the Service.

6. Reinitiation of section 7 consultation with the Service will be sought immediately if any loss of plants or occupied habitat for the Last Chance Townsendia is anticipated as a result of project activities. Additional site-specific measures may also be employed to avoid or minimize effects to the species. These additional measures will be developed and implemented in consultation with the U.S. Fish and Wildlife Service to ensure continued compliance with the ESA.

Attachment J—Lease Notice for Wright Fishhook Cactus

Utah's Threatened and Endangered Species Notices

Lease Notice – Wright Fishhook Cactus (*Sclerocactus wrightii*)

In order to minimize effects to the federally endangered Wright fishhook cactus, the Bureau of Land Management (BLM), in coordination with the U.S. Fish and Wildlife Service (Service), has developed the following avoidance and minimization measures. Implementation of these measures will help ensure the activities carried out during oil and gas development (including but not limited to drilling, production, and maintenance operations) are in compliance with the Endangered Species Act (ESA). For the purposes of this document, the follow terms are so defined:

- *Potential habitat* is defined as areas which satisfy the broad criteria of the species habitat description; usually determined by preliminary, in-house assessment.
- *Suitable habitat* is defined as areas which contain or exhibit the specific components or constituents necessary for plant persistence; determined by field inspection and/or surveys; may or may not contain clay reed-mustard; habitat descriptions can be found in Federal Register Notice and species recovery plan links at <http://www.fws.gov/endangered/wildlife.html>.
- *Occupied habitat* is defined as areas currently or historically known to support clay reed-mustard; synonymous with "known habitat."

The following avoidance and minimization measures should be included in the Plan of Development:

1. Pre-project habitat assessments will be completed across 100% of the project disturbance area within potential habitat prior to any ground disturbing activities to determine if suitable Wright fishhook cactus habitat is present.

2. Within suitable habitat, site inventories will be conducted to determine occupancy. Where standard surveys are technically infeasible and otherwise hazardous due to topography, slope, etc., suitable habitat will be assessed and mapped for avoidance (hereafter, "avoidance areas"); in such cases, in general, 300' buffers will be maintained between surface disturbance and avoidance areas. However, site specific distances will need to be approved by FWS and BLM when disturbance will occur upslope of habitat. Inventories:
    a. Must be conducted by qualified individual(s) approved by BLM using accepted survey protocols,
        i. Will be conducted in suitable and occupied habitat for all areas proposed for surface disturbance prior to initiation of project activities and within the same growing season, at a time when the plant can be detected and during appropriate flowering periods. Inventories should be conducted between April 1st to June 15th, however, surveyors should verify that the plant is flowering by contacting a BLM or FWS botanist or demonstrating that the nearest known population is in flower,
    b. Will occur within 300' from the centerline of the proposed right-of-way for surface pipelines or roads; and within 300' from the perimeter of disturbance for the proposed well pad including the well pad,
    c. Will include, but not be limited to, plant species lists and habitat characteristics, and
    d. Will be valid until April 1st the following year.

3. Design project infrastructure to minimize impacts within suitable habitat:
    a. Where standard surveys are technically infeasible, infrastructure and activities will avoid all suitable habitat (avoidance areas) and incorporate 300' buffers, in general; however, site specific distances will need to be approved by FWS and BLM when disturbance will occur upslope of habitat,
    b. Reduce well pad size to the minimum needed, without compromising safety,
    c. Where technically and economically feasible, use directional drilling or multiple wells from the same pad,
    d. Limit new access routes created by the project,
    e. Roads and utilities should share common right-of-ways where possible,
    f. Reduce the width of right-of-ways and minimize the depth of excavation needed for the road bed; where feasible, use the natural ground surface for the road within habitat,
    g. Place signing to limit off-road travel in sensitive areas, and
    h. Stay on designated routes and other cleared/approved areas.
    i. All disturbed areas will be revegetated with native species comprised of species indigenous to the area and non-native species that are not likely to invade other areas.

Utah's Threatened and Endangered Species Notices

4. Within occupied habitat, project infrastructure will be designed to avoid direct disturbance and minimize indirect impacts to populations and to individual plants:
   a. Follow the above recommendations (#3) for project design within suitable habitats,
   b. To avoid water flow and/or sedimentation into occupied habitat and avoidance areas, silt fences, hay bales, and similar structures or practices will be incorporated into the project design; appropriate placement of fill is encouraged,
   d. Construction of roads will occur such that the edge of the right of way is at least 300' from any plant and 300' from avoidance areas,
   e. Roads will be graveled within occupied habitat; the operator is encouraged to apply water for dust abatement to such areas from April 1st to June 15th (flowering period); dust abatement applications will be comprised of water only,
   f. The edge of the well pad should be located at least 300' away from plants and avoidance areas, in general; however, site specific distances will need to be approved by FWS and BLM when disturbance will occur upslope of habitat,
   g. Surface pipelines will be laid such that a 300' buffer exists between the edge of the right of way and plants and 300' between the edge of right of way and avoidance areas; use stabilizing and anchoring techniques when the pipeline crosses suitable habitat to ensure pipelines don't move towards the population; site specific distances will need to be approved by FWS and BLM when disturbance will occur upslope of habitat,
   h. Construction activities will not occur from April 1st through June 15th within occupied habitat,
   i. Before and during construction, areas for avoidance should be visually identifiable in the field, e.g., flagging, temporary fencing, rebar, etc.,
   j. Place produced oil, water, or condensate tanks in centralized locations, away from occupied habitat, and
   k. Minimize the disturbed area of producing well locations through interim and final reclamation. Reclaim well pads following drilling to the smallest area possible.

5. Occupied Wright fishhook cactus habitats within 300' of the edge of the surface pipelines' right-of-ways, 300' of the edge of the roads' right-of-ways, and 300' from the edge of the well pad shall be monitored for a period of three years after ground disturbing activities. Monitoring will include annual plant surveys to determine plant and habitat impacts relative to project facilities. Annual reports shall be provided to the BLM and the Service. To ensure desired results are being achieved, minimization measures will be evaluated and may be changed after a thorough review of the monitoring results and annual reports during annual meetings between the BLM and the Service.

6. Reinitiation of section 7 consultation with the Service will be sought immediately if any loss of plants or occupied habitat for the Wright fishhook cactus is anticipated as a result of project activities.

Additional site-specific measures may also be employed to avoid or minimize effects to the species. These additional measures will be developed and implemented in consultation.

Attachment K—Lease Notice for Winkler Pincushion Cactus

Utah's Threatened and Endangered Species Notices

Lease Notice – Winkler Pincushion Cactus (*Pediocactus winkleri*)

In order to minimize effects to the federally threatened Winkler pincushion cactus, the Bureau of Land Management (BLM), in coordination with the U.S. Fish and Wildlife Service (Service), has developed the following avoidance and minimization measures. Implementation of these measures will help ensure the activities carried out during oil and gas development (including but not limited to drilling, production, and maintenance operations) are in compliance with the Endangered Species Act (ESA). For the purposes of this document, the follow terms are so defined:

- *Potential habitat* is defined as areas that satisfy the broad criteria of the species habitat description; usually determined by preliminary, in-house assessment.
- *Suitable habitat* is defined as areas which contain or exhibit the specific components or constituents necessary for plant persistence; determined by field inspection and/or surveys; may or may not contain clay reed-mustard; habitat descriptions can be found in Federal Register Notice and species recovery plan links at <http://www.fws.gov/endangered/wildlife.html>.
- *Occupied habitat* is defined as areas currently or historically known to support clay reed-mustard; synonymous with "known habitat."

The following avoidance and minimization measures should be included in the Plan of Development:

1. Pre-project habitat assessments will be completed across 100% of the project disturbance area within potential habitat prior to any ground disturbing activities to determine if suitable Winkler pincushion cactus habitat is present.

2. Within suitable habitat, site inventories will be conducted to determine occupancy. Where standard surveys are technically infeasible and otherwise hazardous due to topography, slope, etc., suitable habitat will be assessed and mapped for avoidance (hereafter, "avoidance areas"); in such cases, in general, 300' buffers will be maintained between surface disturbance and avoidance areas. However, site specific distances will need to be approved by FWS and BLM when disturbance will occur upslope of habitat. Inventories:
   a. Must be conducted by qualified individual(s) approved by BLM using accepted survey protocols,
   b. Will be conducted in suitable and occupied[1] habitat for all areas proposed for surface disturbance prior to initiation of project activities and within the same growing season, at a time when the plant can be detected, and during appropriate flowering periods. Inventories should be conducted between March 15th to June 1st, however, surveyors should verify that the plant is flowering by contacting a BLM or FWS botanist or demonstrating that the nearest known population is in flower,
   c. Will occur within 300' from the centerline of the proposed right-of-way for surface pipelines or roads; and within 300' from the perimeter of disturbance for the proposed well pad including the well pad,
   d. Will include, but not be limited to, plant species lists and habitat characteristics, and
   e. Will be valid until March 15th the following year.

3. Design project infrastructure to minimize impacts within suitable habitat:
   a. Where standard surveys are technically infeasible, infrastructure and activities will avoid all suitable habitat (avoidance areas) and incorporate 300' buffers, in general; however, site specific distances will need to be approved by FWS and BLM when disturbance will occur upslope of habitat,
   b. Reduce well pad size to the minimum needed, without compromising safety,
   c. Where technically and economically feasible, use directional drilling or multiple wells from the same pad,
   d. Limit new access routes created by the project,
   e. Roads and utilities should share common right-of-ways where possible,
   f. Reduce the width of right-of-ways and minimize the depth of excavation needed for the road bed; where feasible, use the natural ground surface for the road within habitat,
   g. Place signing to limit off-road travel in sensitive areas, and
   h. Stay on designated routes and other cleared/approved areas.
   i. All disturbed areas will be revegetated with native species comprised of species indigenous to the

[1] Occupied habitat *is defined as areas currently or historically known to support Winkler pincushion cactus; synonymous with "known habitat."*

Utah's Threatened and Endangered Species Notices

area and non-native species that are not likely to invade other areas.

4. Within occupied habitat, project infrastructure will be designed to avoid direct disturbance and minimize indirect impacts to populations and to individual plants:
   a. Follow the above recommendations (#3) for project design within suitable habitats,
   b. To avoid water flow and/or sedimentation into occupied habitat and avoidance areas, silt fences, hay bales, and similar structures or practices will be incorporated into the project design; appropriate placement of fill is encouraged,
   d. Construction of roads will occur such that the edge of the right of way is at least 300' from any plant and 300' from avoidance areas,
   e. Roads will be graveled within occupied habitat; the operator is encouraged to apply water for dust abatement to such areas from March 15th to June 1st (flowering period); dust abatement applications will be comprised of water only,
   f. The edge of the well pad should be located at least 300' away from plants and avoidance areas, in general; however, site specific distances will need to be approved by FWS and BLM when disturbance will occur upslope of habitat,
   g. Surface pipelines will be laid such that a 300' buffer exists between the edge of the right of way and plants and 300' between the edge of right of way and avoidance areas; use stabilizing and anchoring techniques when the pipeline crosses suitable habitat to ensure pipelines don't move towards the population; site specific distances will need to be approved by FWS and BLM when disturbance will occur upslope of habitat,
   h. Construction activities will not occur from March 15th through June 1st within occupied habitat,
   i. Before and during construction, areas for avoidance should be visually identifiable in the field, e.g., flagging, temporary fencing, rebar, etc.,
   j. Place produced oil, water, or condensate tanks in centralized locations, away from occupied habitat, and
   k. Minimize the disturbed area of producing well locations through interim and final reclamation. Reclaim well pads following drilling to the smallest area possible.

5. Occupied Winkler pincushion cactus habitats within 300' of the edge of the surface pipelines' right-of-ways, 300' of the edge of the roads' right-of-ways, and 300' from the edge of the well pad shall be monitored for a period of three years after ground disturbing activities. Monitoring will include annual plant surveys to determine plant and habitat impacts relative to project facilities. Annual reports shall be provided to the BLM and the Service. To ensure desired results are being achieved, minimization measures will be evaluated and may be changed after a thorough review of the monitoring results and annual reports during annual meetings between the BLM and the Service.

6. Reinitiation of section 7 consultation with the Service will be sought immediately if any loss of plants or occupied habitat for the Winkler pincushion cactus is anticipated as a result of project activities.

Additional site-specific measures may also be employed to avoid or minimize effects to the species. These additional measures will be developed and implemented in consultation with the U.S. Fish and Wildlife Service to ensure continued compliance with the ESA.

Attachment L—Lease Notice for the San Rafael Cactus

Utah's Threatened and Endangered Species Notices

Lease Notice – San Rafael Cactus (*Pediocactus despainii*)

In order to minimize effects to the federally endangered San Rafael cactus, the Bureau of Land Management (BLM) in coordination with the U.S. Fish and Wildlife Service (Service), have developed the following avoidance and minimization measures. Integration of and adherence to these measures will help ensure the activities carried out during oil and gas development (including but not limited to drilling, production, and maintenance) are in compliance with the Endangered Species Act (ESA). The following avoidance and minimization measures should be included in the Plan of Development:

1. Pre-project habitat assessments will be completed across 100% of the project disturbance area within potential habitat[2] prior to any ground disturbing activities to determine if suitable San Rafael cactus habitat is present.

2. Within suitable habitat[3], site inventories will be conducted to determine occupancy. Inventories:
    a. Must be conducted by qualified individual(s) approved by BLM using accepted survey protocols,
        i. Will be conducted in suitable and occupied[4] habitat for all areas proposed for surface disturbance prior to initiation of project activities and within the same growing season, at a time when the plant can be detected, and during appropriate flowering periods. Inventories should be conducted between March 15th to June 1st, unless extended by the BLM
    b. Will occur within 300' from the centerline of the proposed right-of-way for surface pipelines or roads; and within 100' from the perimeter of disturbance for the proposed well pad including the well pad,
    c. Will include, but not be limited to, plant species lists and habitat characteristics, and
    d. Will be valid until March 15th the following year.

3. Design project infrastructure to minimize impacts within suitable habitat[2]:
    a. Reduce well pad size to the minimum needed, without compromising safety,
    b. Where technically and economically feasible, use directional drilling or multiple wells from the same pad,
    c. Limit new access routes created by the project,
    d. Roads and utilities should share common right-of-ways where possible,
    e. Reduce width of right-of-ways and minimize the depth of excavation needed for the road bed; where feasible, use the natural ground surface for the road within habitat,
    f. Place signing to limit off-road travel in sensitive areas,
    g. Stay on designated routes and other cleared/approved areas, and
    h. All disturbed areas will be re-vegetated with native species comprised of species indigenous to the area and non-native species that are not likely to invade other areas.

4. Within occupied habitat[3], project infrastructure will be designed to avoid direct disturbance and minimize indirect impacts to populations and to individual plants:
    a. Follow the above (#3) recommendations for project design within suitable habitats,
    b. Buffers of 100 feet minimum between the edge of the right of way (roads and surface pipelines) or surface disturbance (well pads) and plants and populations will be incorporated,
    c. Surface pipelines will be laid such that a 100 foot buffer exists between the edge of the right of way and the plants, use stabilizing and anchoring techniques when the pipeline crosses the habitat to ensure the pipelines don't move towards the population,
    d. Before and during construction, areas for avoidance should be visually identifiable in the field,

---

2 Potential habitat *is defined as areas which satisfy the broad criteria of the species habitat description; usually determined by preliminary, in-house assessment.*

3 Suitable habitat *is defined as areas which contain or exhibit the specific components or constituents necessary for plant persistence; determined by field inspection and/or surveys; may or may not contain San Rafael cactus. Habitat descriptions can be found on the U.S. Fish and Wildlife Service's web site (http://www.fws.gov/endangered/wildlife.html) or the Utah Division of Wildlife Resources website (http://wildlife.utah.gov/index.php).*

4 Occupied habitat *is defined as areas currently or historically known to support San Rafael cactus; synonymous with "known habitat."*

Utah's Threatened and Endangered Species Notices

e.g., flagging, temporary fencing, rebar, etc.,

e. Where technically and economically feasible, use directional drilling or multiple wells from the same pad,

f. Designs will avoid concentrating water flows or sediments into occupied habitat,

g. Place produced oil, water, or condensate tanks in centralized locations, away from occupied habitat, and

h. Minimize the disturbed area of producing well locations through interim and final reclamation. Reclaim well pads following drilling to the smallest area possible.

5. Occupied San Rafael cactus habitats within 100' of the edge of the surface pipelines' right-of-ways, 100' of the edge of the roads' right-of-ways, and 100' from the edge of the well pad shall be monitored for a period of three years after ground disturbing activities. Monitoring will include annual plant surveys to determine plant and habitat impacts relative to project facilities. Annual reports shall be provided to the BLM and the Service. To ensure desired results are being achieved, minimization measures will be evaluated and may be changed after a thorough review of the monitoring results and annual reports during annual meetings between the BLM and the Service.

6. Reinitiation of section 7 consultation with the Service will be sought immediately if any loss of plants or occupied habitat for the San Rafael cactus is anticipated as a result of project activities.

Additional site-specific measures may also be employed to avoid or minimize effects to the species. These additional measures will be developed and implemented in consultation with the U.S. Fish and Wildlife Service to ensure continued compliance with the ESA.

Attachment M—Lease Notice for the Ute Ladies' Tresses

Utah's Threatened and Endangered Species Notices

Lease Notice – Ute Ladies' Tresses (*Spiranthes diluvialis*)

In order to minimize effects to the federally threatened Ute ladies'-tresses, the Bureau of Land Management (BLM) in coordination with the U.S. Fish and Wildlife Service (Service), developed the following avoidance and minimization measures. Integration of and adherence to these measures will help ensure the activities carried out during oil and gas development (including but not limited to drilling, production, and maintenance) are in compliance with the Endangered Species Act (ESA). Ute ladies'-tresses habitat is provided some protection under Executive Orders 11990 (wetland protection) and 11988 (floodplain management), as well as section 404 of the Clean Water Act. Although plants, habitat, or populations may be afforded some protection under these regulatory mechanisms, the following conservation measures should be included in the Plan of Development:

1. Pre-project habitat assessments will be completed across 100% of the project disturbance area, including areas where hydrology might be affected by project activities, within potential habitat[5] prior to any ground disturbing activities to determine if suitable Ute ladies'-tresses habitat is present.

2. Within suitable habitat[6], site inventories will be conducted to determine occupancy. Inventories:
    a. Must be conducted by qualified individual(s) and according to BLM and Service accepted survey protocols,
    b. Will be conducted in suitable and occupied[7] habitat for all areas proposed for surface disturbance or areas that could experience direct or indirect changes in hydrology from project activities,
    c. Will be conducted prior to initiation of project activities and within the same growing season, at a time when the plant can be detected, and during appropriate flowering periods (usually August 1st and August 31st in the Uintah Basin; however, surveyors should verify that the plant is flowering by contacting a BLM or FWS botanist or demonstrating that the nearest known population is in flower),
    d. Will occur within 300' from the centerline of the proposed right-of-way for surface pipelines or roads; and within 300' from the perimeter of disturbance for the proposed well pad including the well pad,
    e. Will include, but not be limited to, plant species lists, habitat characteristics, source of hydrology, and estimated hydroperiod, and
    f. Will be valid until August 1st the following year.

3. Design project infrastructure to minimize direct or indirect impacts to suitable habitat[2] both within and downstream of the project area:
    a. Alteration and disturbance of hydrology will not be permitted,
    b. Reduce well pad size to the minimum needed, without compromising safety,
    c. Limit new access routes created by the project,
    d. Roads and utilities should share common right-of-ways where possible,
    e. Reduce width of right-of-ways and minimize the depth of excavation needed for the road bed,
    f. Construction and right-of-way management measures should avoid soil compaction that would impact Ute ladies' tresses habitat,
    g. Off-site impacts or indirect impacts should be avoided or minimized (i.e. install berms or catchment ditches to prevent spilled materials from reaching occupied or suitable habitat through either surface or groundwater),
    h. Place signing to limit off-road travel in sensitive areas,

---

5 Potential habitat *is defined as areas which satisfy the broad criteria of the species habitat description; usually determined by preliminary, in-house assessment.*

6 Suitable habitat *is defined as areas which contain or exhibit the specific components or constituents necessary for plant persistence; determined by field inspection and/or surveys; may or may not contain Ute ladies'-tresses. Habitat descriptions can be found in Recovery Plans and Federal Register Notices for the species at <http://www.fws.gov/endangered/wildlife.html>.*

7 Occupied habitat *is defined as areas currently or historically known to support Ute ladies'-tresses; synonymous with "known habitat."*

Utah's Threatened and Endangered Species Notices

i. Stay on designated routes and other cleared/approved areas, and
j. All disturbed areas will be re-vegetated with species approved by FWS and BLM botanists.

4. Within occupied habitat[3], project infrastructure will be designed to avoid direct disturbance and minimize indirect impacts to populations and to individual plants:
   a. Follow the above (#3) recommendations for project design within suitable habitats,
   b. Buffers of 300 feet minimum between right of way (roads and surface pipelines) or surface disturbance (well pads) and plants and populations will be incorporated,
   c. Surface pipelines will be laid such that a 300-foot buffer exists between the edge of the right of way and the plants, using stabilizing and anchoring techniques when the pipeline crosses habitat to ensure the pipelines don't move towards the population,
   d. Before and during construction, areas for avoidance should be visually identifiable in the field, e.g., flagging, temporary fencing, rebar, etc.,
   e. Where technically and economically feasible, use directional drilling or multiple wells from the same pad,
   f. Designs will avoid altering site hydrology and concentrating water flows or sediments into occupied habitat,
   g. Place produced oil, water, or condensate tanks in centralized locations, away from occupied habitat, with berms and catchment ditches to avoid or minimize the potential for materials to reach occupied or suitable habitat, and
   h. Minimize the disturbed area of producing well locations through interim and final reclamation. Reclaim well pads following drilling to the smallest area possible.

5. Occupied Ute ladies'-tresses habitats within 300' of the edge of the surface pipelines' right-of-ways, 300' of the edge of the roads' right-of-ways, and 300' from the edge of the well pad shall be monitored for a period of three years after ground disturbing activities. Monitoring will include annual plant surveys to determine plant and habitat impacts relative to project facilities. Habitat impacts include monitoring any changes in hydrology due to project related activities. Annual reports shall be provided to the BLM and the Service. To ensure desired results are being achieved, minimization measures will be evaluated and may be changed after a thorough review of the monitoring results and annual reports during annual meetings between the BLM and the Service.

6. Reinitiation of section 7 consultation with the Service will be sought immediately if any loss of plants or occupied habitat for the Ute ladies'-tresses is anticipated as a result of project activities.

Additional site-specific measures may also be employed to avoid or minimize effects to the species. These additional measures will be developed and implemented in consultation with the U.S. Fish and Wildlife Service to ensure continued compliance with the ESA.

Attachment N—Lease Notice for the Maguire Daisy

Utah's Threatened and Endangered Species Notices

Lease Notice – Maguire Daisy (*Erigeron maguirei*)

In order to minimize effects to the federally threatened Maguire Daisy, the Bureau of Land Management (BLM), in coordination with the U.S. Fish and Wildlife Service (Service), has developed the following avoidance and minimization measures. Implementation of these measures will help ensure the activities carried out during oil and gas development (including but not limited to drilling, production, and maintenance operations) are in compliance with the Endangered Species Act (ESA). For the purposes of this document, the follow terms are so defined:

- *Potential habitat* is defined as areas which satisfy the broad criteria of the species habitat description; usually determined by preliminary, in-house assessment.
- *Suitable habitat* is defined as areas which contain or exhibit the specific components or constituents necessary for plant persistence; determined by field inspection and/or surveys; may or may not contain clay reed-mustard; habitat descriptions can be found in Federal Register Notice and species recovery plan links at <http://www.fws.gov/endangered/wildlife.html>.
- *Occupied habitat* is defined as areas currently or historically known to support clay reed-mustard; synonymous with "known habitat."

The following avoidance and minimization measures should be included in the Plan of Development:

1. Pre-project habitat assessments will be completed across 100% of the project disturbance area within potential habitat[1] prior to any ground disturbing activities to determine if suitable Maguire Daisy habitat is present.

2. Site inventories will be conducted within suitable habitat to determine occupancy. Where standard surveys are technically infeasible and otherwise hazardous due to topography, slope, etc., suitable habitat will be assessed and mapped for avoidance (hereafter, "avoidance areas"); in such cases, in general, 300' buffers will be maintained between surface disturbance and avoidance areas. However, site specific distances will need to be approved by FWS and BLM when disturbance will occur upslope of habitat. Where conditions allow, inventories:
    a. Must be conducted by qualified individual(s) and according to BLM and Service accepted survey protocols,
    b. Will be conducted in suitable and occupied[3] habitat for all areas proposed for surface disturbance prior to initiation of project activities and within the same growing season, at a time when the plant can be detected (usually May 1st to June 30th, however, surveyors should verify that the plant is flowering by contacting a BLM or FWS botanist or demonstrating that the nearest known population is in flower),
    c. Will occur within 300' from the centerline of the proposed right-of-way for surface pipelines or roads; and within 300' from the perimeter of disturbance for the proposed well pad including the well pad,
    d. Will include, but not be limited to, plant species lists and habitat characteristics, and
    e. Will be valid until May 1st the following year.

3. Design project infrastructure to minimize impacts within suitable habitat:
    a. Where standard surveys are technically infeasible, infrastructure and activities will avoid all suitable habitat (avoidance areas) and incorporate 300' buffers, in general; however, site specific distances will need to be approved by FWS and BLM when disturbance will occur upslope of habitat,
    b. Reduce well pad size to the minimum needed, without compromising safety,
    c. Where technically and economically feasible, use directional drilling or multiple wells from the same pad,
    d. Limit new access routes created by the project,
    e. Roads and utilities should share common right-of-ways where possible,
    f. Reduce the width of right-of-ways and minimize the depth of excavation needed for the road bed; where feasible, use the natural ground surface for the road within habitat,
    g. Place signing to limit off-road travel in sensitive areas, and
    h. Stay on designated routes and other cleared/approved areas.
    i. All disturbed areas will be revegetated with native species comprised of species indigenous to the area and non-native species that are not likely to invade other areas.

Utah's Threatened and Endangered Species Notices

4. Within occupied habitat, project infrastructure will be designed to avoid direct disturbance and minimize indirect impacts to populations and to individual plants:
    a. Follow the above recommendations (#3) for project design within suitable habitats,
    b. To avoid water flow and/or sedimentation into occupied habitat and avoidance areas, silt fences, hay bales, and similar structures or practices will be incorporated into the project design; appropriate placement of fill is encouraged,
    d. Construction of roads will occur such that the edge of the right of way is at least 300' from any plant and 300' from avoidance areas,
    e. Roads will be graveled within occupied habitat; the operator is encouraged to apply water for dust abatement to such areas from May 1st to June 30th (flowering period); dust abatement applications will be comprised of water only,
    f. The edge of the well pad should be located at least 300' away from plants and avoidance areas, in general; however, site specific distances will need to be approved by FWS and BLM when disturbance will occur upslope of habitat,
    g. Surface pipelines will be laid such that a 300' buffer exists between the edge of the right of way and plants and 300' between the edge of right of way and avoidance areas; use stabilizing and anchoring techniques when the pipeline crosses suitable habitat to ensure pipelines don't move towards the population; site specific distances will need to be approved by FWS and BLM when disturbance will occur upslope of habitat,
    h. Construction activities will not occur from May 1st through June 30th within occupied habitat,
    i. Before and during construction, areas for avoidance should be visually identifiable in the field, e.g., flagging, temporary fencing, rebar, etc.,
    j. Place produced oil, water, or condensate tanks in centralized locations, away from occupied habitat, and
    k. Minimize the disturbed area of producing well locations through interim and final reclamation. Reclaim well pads following drilling to the smallest area possible.

5. Occupied Maguire Daisy habitats within 300' of the edge of the surface pipelines' right of ways, 300' of the edge of the roads' right of ways, and 300' from the edge of the well pad shall be monitored for a period of three years after ground disturbing activities. Monitoring will include annual plant surveys to determine plant and habitat impacts relative to project facilities. Annual reports shall be provided to the BLM and the Service. To ensure desired results are being achieved, minimization measures will be evaluated and may be changed after a thorough review of the monitoring results and annual reports during annual meetings between the BLM and the Service.

6. Reinitiation of section 7 consultation with the Service will be sought immediately if any loss of plants or occupied habitat for the Maguire Daisy is anticipated as a result of project activities. Additional site-specific measures may also be employed to avoid or minimize effects to the species. These additional measures will be developed and implemented in consultation with the U.S. Fish and Wildlife Service to ensure continued compliance with the ESA.

APPENDIX 12—REASONABLY FORESEEABLE DEVELOPMENT SCENARIO FOR OIL AND GAS AND GEOTHERMAL RESOURCES

OIL AND GAS

Summary

Recent exploration and drilling results in the western portion of the Richfield planning area have precipitated much interest in leasing and exploration. During the past 15 years, the area has received little attention as a potential oil and gas area. On the basis of geology, leasing activity, proposed drilling, and a comparison with the history of development in the Northern Utah–Wyoming Overthrust Belt in the 1970s, Bureau of Land Management (BLM) has projected that 360 wells will be drilled in this area during the next 15 years. The ownership pattern in this belt is a mixture of BLM lands, State of Utah lands, and privately owned lands. Each well pad will disturb about 4 acres and will require about 2 miles of new roads. Early development activity indicates that multiple wells will be drilled from many pads, with the overall effect of reducing total impacts.

The southern half of the planning area will likely receive much less attention, and only 45 wells are projected for that area (again, with 4 acre pads and 2 miles of road per well pad). The remainder of the planning area is the Wasatch Plateau, which is largely national forest. Forty-nine wells are expected in this area, many of which will be coalbed natural gas (CBNG) tests. Each pad will disturb about 2 acres and require about 5 miles of road per well.

The other major source of surface disturbance will be geophysical exploration. Most of this exploration is projected to occur in the western part of the planning area and will disturb approximately 4,500 acres, much of which will likely be on privately owned lands. In the Wasatch Plateau area, helicopters will be used in some areas, and disturbance is expected on about 360 acres. Fewer geophysical surveys are anticipated for the remainder of the planning area, and it is estimated that about 240 acres will be disturbed.

It is assumed that any future pipelines, power lines, etc., would follow roads where possible and that continuing reclamation of surface disturbance would reduce net impacts. Future field discoveries, if any, will result in the construction of production facilities and some additional impacts beyond the well pads.

Total surface impacts are estimated to be about 8,180 acres (5,100 acres from geophysical exploration and 3,080 acres from drilling).

Introduction

The following Reasonably Foreseeable Development (RFD) scenario projects the level of oil and gas activity that can reasonably be expected during the next 15 years in the planning area. All lands (federal, State of Utah, and private) are included in the projection, following the guidance in BLM Handbook H-1624-1, *Planning for Fluid Mineral Resources* and Instruction Memorandum No. 2004-089, *Policy for Reasonably Foreseeable Development (RFD) Scenario for Oil and Gas*. It is assumed that all potentially productive areas are open under standard lease terms and conditions, except those areas designated as closed to leasing by law, regulation, or executive order.

Worldwide demand for oil and gas continues to grow and all indications are that growth will continue. Against this background, geology, past and present activity, economics, and other factors will determine the level of activity in the planning area.

Description of Geology

Geology is the ultimate controlling factor determining future hydrocarbon exploration and development. This discussion will consider the geological differences within the planning area as they relate to oil and gas potential. The basic units considered will be the individual oil and gas "play" (Gautier et al. 1996) and "assessment unit" (Schenk et al. 2003) as these terms are used by the United States Geological Survey (USGS) in its national assessments of oil and gas resources. The Mineral Potential Report for the Richfield Resource Management Plan (RMP) (Booz Allen Hamilton 2004) discusses the geology of the planning area and gives descriptions of most of the plays that are shown in Figure A12-1 of this report.

The geologically oldest play in the planning area is the Late Proterozoic and Cambrian Play (USGS-2403), which was described in the Northern Arizona Province but includes a large portion of southern and central Utah, including the southern part of the planning area. The play is based on the recognition of carbonaceous shale in the Upper Proterozoic Chuar Group in the Grand Canyon and the projection of these units in the subsurface of northern Arizona and southern and central Utah (Rauzi 1990). Given this potential source rock, a potential exists for hydrocarbons in uppermost Proterozoic and lower Cambrian reservoirs. The play received a great deal of attention in the 1990s, and several test wells were drilled in southern Utah. Some of the wells encountered carbon dioxide gas, but no hydrocarbons were reported and interest in the play waned.

Four classic Paradox Basin plays underlie the extreme eastern corner of the planning area, the area generally east of Range 12 East in easternmost Wayne and Garfield counties. The plays are identified as Buried Fault Blocks (USGS-2101), Porous Carbonate Buildup (USGS-2102), Fractured Interbed (USGS-2103), and Salt Anticline Flank (USGS-2105) (Huffman 1996). Play 2101 is exemplified by the prolific Lisbon Field in northern San Juan County, where oil and gas are produced from Devonian and Mississippian age carbonate rocks and sandstones in a faulted anticline (Smouse 1993). Play 2102 is primarily an oil play, characterized by hydrocarbon accumulations in porous algal mounds and related rocks in the Paradox Formation of the Hermosa Group (Pennsylvanian age). Traps are largely stratigraphic in nature, involving porosity and permeability differences in carbonate and evaporitic rocks and organic-rich dolomitic shales. Structures of Pennsylvanian age may have influenced the locations of the algal buildups. The Giant Aneth Field in San Juan County is the largest field in this play, but many other smaller isolated buildups have produced (Huffman 1996).

Play 2103 is a continuous oil and gas play with organic rich dolomitic shales serving as both source and reservoir rocks. Fracturing of the otherwise tight rocks is necessary if the play is to be productive. Dolomitic shales are interbedded with salt in a cyclical sequence, where the salt provides a seal for the fractured reservoirs (Huffman 1996). This play is productive in southwestern Grand County, where current development involves horizontal wells designed to intersect vertical fractures in areas where structures have enhanced fracturing. Play 2105 involves Pennsylvanian and Permian age carbonate and sandstone reservoirs along the flanks of northwest-trending salt anticlines. Production to date has been gas—mostly from Andy's Mesa Field in Colorado—but the play is lightly explored (Huffman 1996).

The Permo-Triassic Unconformity Play (USGS-2106) was included in the 1995 USGS Assessment of greater Paradox Basin resources even though it is outside the Paradox Basin proper. The Permo-Triassic Unconformity Play includes a large part of the planning area. Known occurrences and shows are in upper Permian and lower Triassic carbonate and sandstone formations. Upper Valley Oil Field south of the planning area produces from this play, and oil and gas shows have been reported over a large area in

southern and central Utah. The trapping mechanism at Upper Valley is anticlinal, but the oil is offset from the crest by a strong hydrodynamic drive. Huffman (1996) described the play as lightly explored and emphasized unanswered questions about source rock and timing.

Two hypothetical Eastern Great Basin Province plays, the Late Paleozoic Play (USGS-1902) and the Sevier Frontal Zone Play (USGS-1907), include western Sevier and Sanpete counties. Both of these plays were nonproductive and hypothetical when first described (Peterson and Grow 1996), but recent drilling has since confirmed the Sevier Frontal Zone Play. Play 1902 is based on the possibility of early-formed traps in middle and upper Paleozoic carbonates and sandstones. Potential source rocks include organic-rich marine shales in Mississippian, Pennsylvanian, and Permian age formations, which may have favorable maturity levels in some areas of the play. A variety of structural and stratigraphic traps may be present, but the play remains hypothetical at this time.

Play 1907 was also hypothetical and was based in large part on similarities in lithology and structural style between this area and productive segments of the Overthrust Belt in northeastern Utah and southwestern Wyoming. Potential traps exist in structures formed along and near the leading edge of Sevier thrust plates, and favorable reservoir rock is present in several formations. Recent drilling has confirmed the presence of oil at one location along this zone, and additional exploration is in progress.

The Cretaceous Sandstone Play (USGS-2107) was also included in the Paradox Basin Assessment (Huffman 1996) although it is outside the geologic boundaries of the basin. This play specifically relates to gas occurrences in sandstone reservoirs in the Wasatch Plateau. Currently, there is interest, not so much in the sandstone reservoirs, but in coalbeds within the sandstones (e.g., for CBNG). The most productive coals have been in the Ferron Sandstone Member of the Mancos Shale in Carbon and Emery counties. Similar coals in the Emery Sandstone in the Wasatch Plateau are prospective targets. Both of these units extend into the planning area in the Wasatch Plateau area. The CBNG resource was evaluated in more detail in the 2003 USGS Assessment, although the area of interest coincides with that of Play 2107.

The USGS completed a new assessment of oil and gas resources in the Uinta-Piceance Province in 2003 and included the Wasatch Plateau and the Ferron Trend in the analysis. Parts of both of these regions extend into the planning area. The Uinta Basin Blackhawk Formation Coalbed Gas Assessment Unit (USGS-AU 50200281) evaluates CBNG resources in the Blackhawk and Emery Sandstone coals in the Book Cliffs and Wasatch Plateau. CBNG production from Blackhawk coals has been established in the Castlegate Field in northern Carbon County, but production has been hampered by problems with dewatering the coal. Coalbeds are also in the Emery Sandstone in the Wasatch Plateau in Carbon, Sanpete, and Sevier counties, which may have favorable maturity levels in some areas (Johnson and Roberts 2003).

Five assessment units (USGS-AU 50200161, AU 50200183, AU 50200184, AU 50200185, and AU 50200101) of the Ferron/Wasatch Plateau Total Petroleum System are partially or wholly in the northeastern part of the planning area. More than 30 wells have been drilled in these assessment units, with only one listed as productive; however, no volumes are listed (Henry and Finn 2003, p. 26). All of these wells were based on the known occurrence of coalbeds in the Ferron Sandstone Member of the Mancos Shale. All of these gas assessments units are included within the area covered by the Cretaceous Sandstone Play (USGS-2107).

Past and Present Oil and Gas Activity

Geophysical Exploration

Richfield Field Office (RFO) records indicate that approximately 90 authorizations for geophysical surveys were issued from 1972 to the present in the western parts of the planning area (the old Sevier River Resource Area). Sixty-five of these were issued between 1976 and 1982, with only four issued after 1988. The surveys resulting from the permits were spread over most of the western part of the planning area.

Fewer surveys, of unknown dates, have been conducted in the eastern part of the planning area (eastern Wayne and Garfield counties) with a concentration in and around T. 30 S., R. 12 E. on the line separating the two counties. Several nonproductive wells have been drilled in this same area.

Since 2004, interest has increased in acquiring geophysical data in the vicinity of Sevier Valley related to the recent discovery of oil. One large project (115 miles) was completed in 2004, and additional proposals by multiple companies are anticipated.

Federal Oil and Gas Leasing

Significant portions of Sanpete and Sevier counties are currently under federal lease (See Table 2 of the Mineral Potential Report for the Richfield RMP [Booz Allen Hamilton 2004]). Leases are clustered in the western and eastern parts of the two counties, with most of the eastern leases located in the Manti-La Sal National Forest and related to the Sevier Frontal Play and the Cretaceous Sandstone and CBNG plays, respectively. Few leases are in the Fishlake National Forest, including the southern part of the Wasatch Plateau. Another block of leases covers the eastern part of the planning area in eastern Wayne and Garfield counties. This latter group has combined hydrocarbon lease conversions in the Tar Sand Triangle Special Tar Sand Area (STSA).

The largest federal lease sale involving lands in the planning area occurred in June 2004. In this sale (the June 25, 2004, BLM Competitive Oil and Gas Lease Sale) 81 parcels, encompassing 146,365 acres in the planning area, were offered for lease. Several of the tracts in the western part of the area received bonus bids of more than $100 per acre, with a maximum bid of $360 per acre indicating strong industry interest in this area. The lease tracts extend northward from southwestern Sevier County through western Sanpete County. This area of interest coincides with the Sevier Frontal Zone Play (USGS-1907) described above. Another block of pending leases in northeastern Wayne County resulted from the November 2003 and June 2004 lease sale, but these were obtained for the minimum bonus bid ($2.00 per acre) or noncompetitively the day after the sale.

Oil and Gas Units

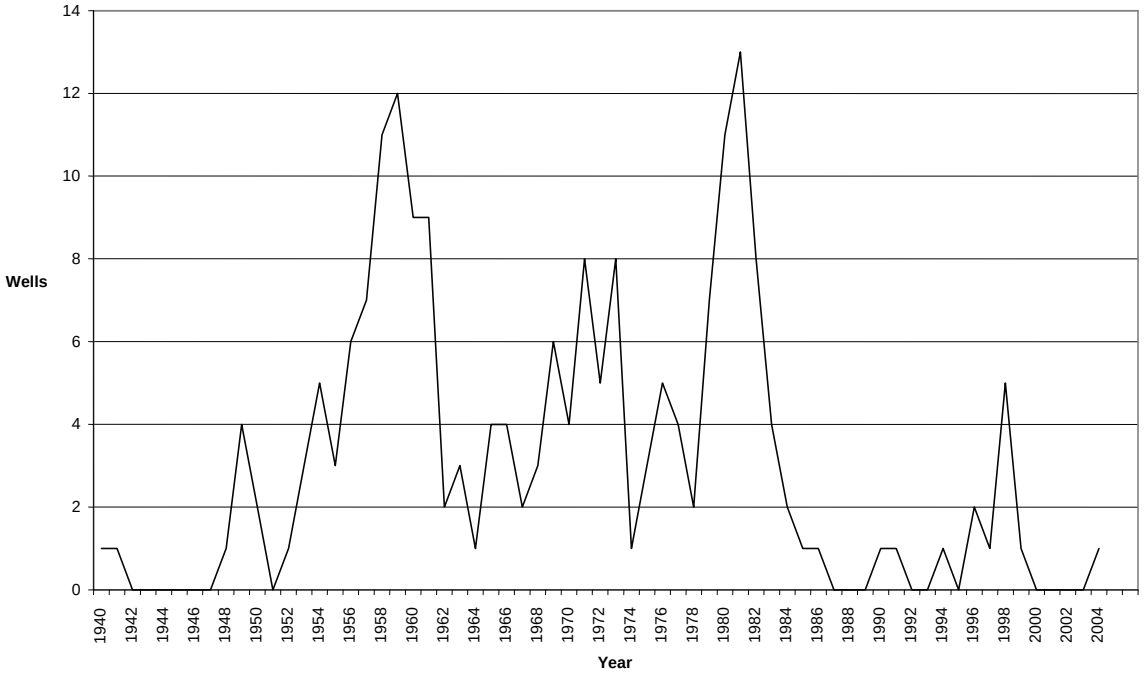
Wolverine Gas and Oil established the Wolverine Unit in June 2003. The Unit Area includes 65,980 acres of federal, state, and private lands in Sevier and Sanpete counties. The first unit obligation well was completed in 2004, and additional wells are currently permitted. No other exploration units were in the planning area as of February 2005.

Historical Drilling and Production

Altogether, approximately 220 exploration wells have been drilled in the planning area (IHS Energy Well Data 2004). Thirteen of these were drilled during 1990 to 2004, yielding an average of 0.9 new wells per year. Drilling activity peaked in the late 1950s (12 wells per year) and again in the early 1980s (13 wells

per year). From 1940 to 2004, the average number of wells drilled each year was slightly over three (see Figure A12-1).

Figure A12-1. Wells Drilled/Year (1940-2004)



Utah Division of Oil, Gas, and Mining production data (February 2004) lists only 405 barrels of oil and 3,027,708 thousand cubic feet (mcf) of gas for Sanpete County, with 3,027,183 mcf being from the abandoned Joe's Valley Field. The source of the remaining 525 mcf of gas and 405 barrels of oil is not given. No other historical production is listed for the planning area, and Joe's Valley is the only identified field.

Oil production in the Covenant Field, associated with the Wolverine Unit, began in 2004. Production quantities are not available at this time.

Infrastructure

The Kern River gas pipeline parallels the western boundary of the planning area at a distance of 2 to 5 miles. This pipeline was built in 1991 and expanded in 2003 to transport natural gas from southwestern Wyoming and Utah to markets in southern Nevada and California. A Questar pipeline follows Highway 89 through the planning area. No oil pipelines are within this part of the State, and if oil is produced, it would probably be trucked to Salt Lake City as has been done for 40 years with oil produced in the Upper Valley Field.

Oil and Gas Occurrence Potential

The Mineral Potential Report for the Richfield RMP (Booz Allen Hamilton 2004) describes oil and gas occurrence potential and includes maps depicting occurrence potential ratings.

Potential for Oil and Gas Activity

In the following discussion, the term "oil and gas activity" will be used instead of "development" to avoid possible confusion between "exploration" and "development" in the strict sense. Only one known field in the planning area exists at this time, and many of the future wells will be exploratory in nature. The purpose of the RFD is to arrive at a reasonable estimate of surface impacts resulting from all future oil and gas activity, whether this results from exploration or from development activity. Future activity levels will be determined largely by the outcome of continuing testing of the Sevier Frontal Zone Play (USGS-1907) and the gas resources in the Wasatch/Ferron and Mesaverde Blackhawk assessment units, essentially the area covered by the Play. Energy demand will likely only increase in the future, and if additional economically recoverable resources can be identified in the Sevier Frontal Zone Play and the area covered by Play 2107, significant activity may occur. Other plays would seem to be less promising but will probably continue to be tested periodically. Activity levels will be projected by play, or overlapping groups of plays, and then related to geographic subdivisions in the planning area.

The northwestern corner of the Paradox Basin underlies the extreme eastern portion of Garfield and Wayne counties and includes four partially overlapping plays: 2101 (Buried Fault Blocks), 2102 (Porous Carbonate Buildup), 2103 (Fractured Interbed), and 2105 (Salt Anticline Flank). These plays have been tested by several wells, and it is unlikely that significant drilling will occur there in the next 15 years (although a few tests can be expected). Huffman (1996) gave the following assessment of Plays 2101, 2102, 2103, and 2105 for the Paradox Basin as a whole: Play 2101—low to moderate future potential for small to medium-sized fields with minimal oil columns; Play 2102—small fields in the 1 to 3 million barrels of oil range; Play 2103—greatest potential in the Cane Creek, Chimney Rock, Gothic, and Hovenweep Shales due to organic content and thickness; and Play 2105—low potential for oil, fair to good for gas. Several horizontal wells have produced from Play 2103 in the Kane Springs Unit Area in Grand County southeast of the planning area, but the wells are expensive and production rates declined fairly rapidly.

Plays 2106 (Permo-Triassic Unconformity) and 2403 (Upper Proterozoic Cambrian) underlie large areas in the southern and central parts of the planning area. The northern and western parts of these plays have encountered carbon dioxide gas, and the Paleozoic age rocks of this entire region appear to have been flushed by carbon dioxide generated by igneous activity to the north (Utah Geological Survey 2004). Hydrocarbons may still be present in these reservoirs in the eastern and southern parts of the planning area. In the Upper Valley Oil Field (USGS-2106), near Escalante, a strong hydrodynamic drive has offset the oil onto the flank of an anticlinal structure, and other anticlinal flanks will probably be tested. Huffman (1996) described Play 2106 as lightly explored and projected a low probability of any significant exploration effort until source rock and timing questions were answered.

Two hypothetical Eastern Great Basin plays (USGS-1902 and USGS-1907) cover western Sevier and Sanpete counties. Play 1907 is characterized by structures along the leading edge of Sevier age faults analogous to those productive in the Wyoming Thrust Belt to the north (Peterson and Grow 1996). Several test wells were drilled in this play in the 1970s, but it had received little attention in recent years until Wolverine Gas and Oil established the Wolverine Unit in 2003. Wolverine Gas and Oil has now completed two wells, with oil production reported from the Navajo Sandstone (The Rocky Mountain Oil Journal, vol. 84, no. 27, July 2004; Moulton and Pinnell 2005), and is drilling additional wells while acquiring additional two-dimensional seismic data. Parcels within and near this play received large bonus bids at the June 2004 BLM lease sale, indicating renewed industry interest. Exploration wells will probably be located at different locations along the north-trending play, and if exploration is successful, this will be followed by development wells. Multiple wells are projected from many drill pads, which will minimize surface disturbance.

Much of the land in this play is privately owned, but a block of BLM land in and around Ts. 17 and 18 S., R. 1E. is unleased and would attract a great deal of industry interest if offered for competitive bidding. Other larger blocks of BLM lands are under lease, and the lands mentioned above appear to be the only BLM lands where a lack of leases would be an impediment to exploration and development.

Continuing evaluation of coals and their including sandstones for gas resources can be expected in eastern Sanpete and Sevier counties. The Uinta Basin Blackhawk Coalbed Gas Assessment Unit (AU 50200281) covers parts of three field offices, with approximately 45 percent of the assessment unit located in the planning area. The USGS's estimated mean value for total technically recoverable CBNG in the unit is 499 billion cubic feet (BCF) in the Blackhawk and Emery coals. If it is assumed that the resource is more or less evenly distributed throughout the assessment unit, however questionable this assumption might be, the planning area could contain 225 BCF of this CBNG. Tabet and Quick (2003, p. 10) estimated that the Emery coals under the Wasatch Plateau might contain an in-place gas resource of 0.8 to 3.2 trillion cubic feet (TCF). It appears that roughly 60 percent of the area included in these authors' estimate (or 0.5 to 1.9 TCF of CBNG) lies in the planning area. How much recoverable gas is present remains to be determined, but certainly interest will continue in the CBNG resource in this part of the planning area. These potential resources are in the Wasatch Plateau portion of the planning area, within the Manti-LaSal and Fishlake National Forests. Existing leases already cover significant portions of the Manti-La Sal National Forest in eastern Sanpete County. However, leasing is not allowed under the current Fishlake National Forest Plan unless an environmental analysis is completed for specific leasing proposals. Until a new forest plan is developed, the absence of leasing is an impediment to exploration and development in this national forest.

Several assessment units of the Ferron/Wasatch Plateau Total Petroleum System are partially or completely in the planning area in eastern Sanpete and Sevier counties. These units include Deep Coal and Sandstone Gas (AU 50200161), Southern Coal Fairway (AU 50200183), Joe's Valley and Musinia Grabens (AU 50200184), and Southern Coal Outcrop (AU 50200185). The "EPCA" Inventory, prepared under a provision of the 2000 Energy Policy and Conservation Act (U.S. Departments of the Interior, Agriculture, and Energy 2003, pp. 2–14), assigns undiscovered technically recoverable resources of 223 BCF of gas to these assessment units.[1] Prorating these numbers according to area shows 173 BCF of gas in the planning area. Again, most of this resource lies under the Manti-LaSal and Fishlake National Forests, but a narrow strip of BLM land in extreme eastern Sevier County could contain some gas.

The gas content of the Ferron coals appears to decrease southward from the Drunkards Wash Field in Carbon County (Lamarre 2001, Utah Geological Survey 2004), and Nuccio and Roberts (2003, p. 32) show vitrinite reflectance values of less than 0.60 at the base of the Mancos Shale in much of the eastern and southern parts of the Wasatch Plateau. Higher values are indicated for parts of the northwestern Plateau in Sanpete County. These data suggest that the potential for CBNG occurrence in the Fishlake National Forest is less than the potential in the Manti-LaSal National Forest.

In addition to the coals, gas in conventional sandstone reservoirs in the same stratigraphic sequence may be tested. This area of moderate activity potential is generally the area of Play 2107.

Coalbeds are known to occur in rocks of Cretaceous age in the Henry Mountains Basin in northern Garfield and southern Wayne counties in the eastern part of the planning area. The presence of these coals raises the possibility of CBNG activity in the basin. Coal occurs in three formations, in ascending order: the Dakota Sandstone, the Ferron Sandstone, and the Muley Canyon Sandstone. The thickest and most continuous coals are in the Muley Canyon Sandstone, with the other two zones containing thinner and less continuous beds (Law 1980, p. 326). No information is available on the gas content of the coal, and the USGS has not produced an assessment of the potential resource. In many areas, the Muley Canyon

1 *AU 50200184 was not assessed by the USGS.*

coal is at or near the surface, often exposed on the tops and flanks of mesas. The coal-bearing rocks are deeper in the southwestern part of the basin, which may provide some potential for CBNG retention. No oil and gas leases currently exist in the Henry Mountains Basin.

The greatest potential for oil and gas activity appears to be in Sevier and Sanpete counties within the Sevier Frontal Zone Play (USGS-1907) and in the Wasatch Plateau area of these same two counties (gas in Cretaceous coals and sandstones). This potential is rated as high in the Sevier Frontal Zone Play and moderate in the northern part of the Wasatch Plateau, decreasing toward the southwest. Less activity is predicted in the remaining parts of the planning area, but exploration wells will probably continue to be drilled at near the historical rate (0.9 to 3.12 per year) if oil and gas prices remain at current levels or increase, as is generally expected.

RFD Baseline Scenario Assumptions and Discussion

In developing the baseline scenario, it was assumed that all potentially productive areas are open under standard lease terms and conditions, except those areas designated as closed to leasing by law, regulations, or executive order. The largest block of excluded lands would be the wilderness study areas (WSA), but most of these are in areas where the potential for activity is low.

Long-term well completion rates for 1940 to 2004 have averaged slightly more than three wells per year. When only the past 15 years (1990 to 2004) are considered, the rate drops to slightly less than one well per year (IHS Well Data 2004). Recent interest in parts of the planning area indicates that activity during the next 15 years will be considerably higher than that for either of these intervals.

For purposes of estimating the number of wells to be drilled during the next 15 years, the planning area has been divided into four geographic areas, defined by USGS plays and assessment units. These are (1) the eastern portion of Wayne and Garfield counties (generally east of R. 12 E.), which is underlain by true Paradox Basin plays (USGS-2101, USGS-2102, USGS-2103, and USGS-2105); (2) the southern part of the planning area, as defined by the Permo-Triassic Unconformity Play (USGS-2106); (3) the Wasatch Plateau, defined by the Cretaceous Sandstone Play (USGS-2107), but also including CBNG in the Ferron, Emery, and Blackhawk coals; and (4) the area from the eastern boundary of the Sevier Frontal Zone Play (USGS-1907) to the western boundary of the planning area.

Potential for activity in Areas (plays included in each area are listed in Table A12-1) 1 and 2 (entire southern part of the planning area) is considered to be low, as noted above. Exploration in these areas is expected to continue at near historic rates (considered to be three wells per year). This would produce 45 wells during the projection period (15 years).

Activity levels in Area 3 are expected to be higher because of the existence of coal in the Ferron, Emery, and Blackhawk formations, as well as conventional sandstone reservoirs. The Utah Geological Survey (2004, p. 38) projects four CBNG wells for the Fishlake National Forest during the next 15 years, and this number will be used here for the southern part of the Wasatch Plateau. Potential for drilling activity on the northern part of the plateau (Manti-La Sal National Forest) is considered to be higher, as discussed above. In the northern part of the plateau, 45 wells (three per year) are projected, resulting in a total of 49 wells in Area 3 during the next 15 years.

The Sevier Frontal Zone Play (USGS-1907) and adjacent areas in western Sevier and Sanpete counties are expected to be the focus of activity during the life of the plan. At the time of this report, two wells have been completed in the Covenant Field of the Wolverine Unit. Seven additional, collocated wells are currently permitted. Moulton and Pinnell (2005, p. 42) anticipate six or more additional wells along the play by mid-2005. This would result in a total of at least 13 wells for the first half of 2005.

Play 1907 is geologically similar to the Utah-Wyoming Overthrust Belt, which was the site of major exploration and development in the 1970s, but includes a larger area than the productive area around the Pineview Field (Moulton and Pinnell 2005). This central Utah thrust belt overlaps the hypothetical Late Paleozoic Play (USGS-1902), and the thrust play (USGS-1907) is extended to the western boundaries of Sevier and Sanpete counties. Moulton and Pinnell (2005) seem to concur, showing a lease area, related to this thrust play, extending west of the Sevier and Sanpete county lines. Leases in this area commanded high bonus bids at the June 2004 BLM lease sale. If the analogy holds true, we can expect exploration activity along the length of the play, followed by field development around discoveries. Moulton and Pinnell (2005, p. 42) reported that, during the 5 years after the 1975 discovery of the Pineview Field in northern Utah, 175 wildcat wells were drilled, leading to the discovery of 11 new fields. This averages 16 wildcat wells drilled for each field discovered. The course of development for the Pineview Field area may provide an indication of what will occur in western Sevier and Sanpete counties.

Additional data on the Utah-Wyoming Overthrust Belt indicates that between 1976 and 1997 a total of 485 wells were drilled (Vrona, personal communication, 2005). One hundred thirty-one (27 percent) of these wells were completed as dry holes. This number equates to a rate of 24 wells drilled per year; and if this drilling rate is projected for Area 4, a total of 360 wells would be drilled during the next 15 years.

Table A12-1 provides a summary of these estimates for each area.

Table A12-1. Number of Wells by Area

Area	Number of Wells
Combined Areas 1 and 2a	45
Area 3b	49
Area 4c	360
Total	**454**

a Plays 2101, 2102, 2103, 2104, 2105, 2106, and 2403.
b Play 2107.
c Plays 1907 and 1902.

Most of the 45 wells in Areas 1 and 2 will probably be on BLM lands. The northern part of Area 3 is in the Manti-La Sal National Forest, and the southern part is in the Fishlake National Forest; therefore, all the 49 projected wells for this area are likely to be on national forest lands. Area 4 (USGS-1907) contains a mixture of BLM, state, and private lands; however, state acreage is much less than BLM and private holdings, which are approximately equal in proportion. The 360 wells in Area 4 are expected to be divided between federal and private lands. Overall, 10 percent of the wells are projected to be on national forest lands, 45 percent on BLM lands, 5 percent on state lands, and 40 percent on private lands.

This projection should not be considered a ceiling for permitting additional wells. Any upper limit on drilling should be based on total surface disturbance and should consider ongoing reclamation, drilling multiple wells from a single pad, and other factors.

SURFACE DISTURBANCE DUE TO OIL AND GAS ACTIVITY ON ALL LANDS

Oil and Gas

Geophysical Surveys

Future surface disturbance will result largely from geophysical surveys and drilling (and associated access). The Utah Geological Survey (2004) projected that approximately 625 line miles of geophysical surveys would be required in the 1,250 square miles of prospective lands in the Fishlake National Forest. Area 3 is approximately this size; thus, using the above ratio of line miles to square miles, approximately 600 line miles can be projected for the planning area portion of the Wasatch Plateau. Also following the Utah Geological Survey's Fishlake estimates, about 50 percent of the surveys would be buggy mounted and 50 percent would be conducted by helicopter, resulting in approximately 300 line miles for each type of disturbance. The Utah Geological Survey (2004) estimates that buggy-mounted surveys disturb 1.2 acres per line mile, whereas helicopter-conducted surveys disturb only 0.007 acre per line mile.

On the basis of these projections, the total disturbance would be (300 x 1.2) + (300 x 0.007) = 360 + 2.1 = 362.1 acres (rounded to 360 acres).

Approximately 1,260 square miles of Play 1907 lies within the planning area, but leasing interest covers a somewhat larger total area. Since the discovery of the Covenant Field, several lessees have expressed interest in obtaining permits for geophysical exploration on BLM lands. Interest in geophysical surveys on private lands in the play area will increase in a similar manner. At this point, it is not clear how much of the work will be conducted by buggy and how much by helicopter, nor is it clear how much will be 2-D and how much will be 3-D. Some surveys will probably be conducted by vibroseis. Early discussions indicate that BLM can expect several hundred miles of seismic surveys during the next few years on BLM and private lands. BLM is estimating an average of 250 miles of survey per year over the 15-year period under consideration. Activity may exceed this average in the near future but is likely to decrease later in the cycle. If most of the surveys are buggy mounted, the total disturbance in Area 4 is likely to be **4,500 acres** (3,750 miles x 1.2 acres/mile).

Few surveys are expected in the remaining parts of the planning area (Areas 1 and 2) based on past activity and current interest. A total of 200 miles of geophysical surveys is proposed for the 15-year time period, resulting in **240 acres** of disturbance in these areas.

On the basis of these projections, the total surface disturbance expected from **geophysical surveys in the planning area would be 360 + 4,500 + 240 = 5,100 acres.**

Wells

Forty-nine wells are projected for Area 3 (Wasatch Plateau). The Utah Geological Survey (2004) assumed a drill pad of size of 2 acres and 5 miles of road (4 acres of disturbance per mile) for each well in the Fishlake National Forest. Using these values, the 49 projected wells would impact approximately **1,100 acres**.

Areas 1, 2, and 4 are projected to contain 405 wells overall. For Area 4, many of these wells would probably be directional wells from a single drill pad. Based on the projection of 360 wells for this area, with an average of three wells per pad, the number of well pads for Area 4 is projected at 120. The 45 wells in Areas 1 and 2 are assumed to be single well pads (one well per pad). Thus, the total number of

pads for the three areas is projected at 165. Assuming a pad size of 4 acres plus 2 miles of road (with 4 acres of disturbance per mile) would result in a projected surface disturbance of **1,980 acres**.

On the basis of these projections, the total surface disturbance in the planning area from **drilling 454 wells would be 1,100 + 1,980 = 3,080 acres**.

Summary

Total surface disturbance for the planning area from all oil and gas activity (geophysical surveys and wells) is projected at 5,100 + 3,080 = 8,180 acres.

The disturbance estimated above will be future disturbance during the 15-year life of the plan. Current disturbance is minimal, and areas of past disturbance have largely been reclaimed. Disturbance associated with future nonproductive wells should be reclaimed within 3 to 4 years after a well has been plugged and abandoned.

TAR SANDS

The unconventional resource contained in the Tar Sand Triangle STSA received considerable industry interest in the late 1970s and early 1980s. Applications were received to convert existing oil and gas leases to combined hydrocarbon leases under the terms of the Combined Hydrocarbon Leasing Act of 1981. BLM and the National Park Service initiated an environmental impact statement (EIS) to consider the applications, but the EIS was never completed and the conversions are still pending. No wells are projected for exploration or development, because of the unfinished EIS, the uncertain future of oil sand as an economic resource, and the belief that any proposed activity would not follow conventional oil and gas techniques and would be better considered in a site-specific National Environmental Policy Act (NEPA) document.

STATEMENT OF QUALIFICATIONS

This RFD was prepared by James Fouts, Geologist in the Utah BLM State Office. Mr. Fouts has B.S., M.S., and Ph.D. degrees in geology and has worked for Shell Oil Co., Essex International Corporation, Auburn University, the U.S. Bureau of Mines Salt Lake City Research Center, the U.S. Geological Survey, the U.S. Minerals Management Service, Westminster College, and Salt Lake City Community College.

APPENDIX 13—COUNTY PLAN PUBLIC LAND COMMENTS SUMMARY

Section 202 (c) (9) of the Federal Land Policy and Management Act of 1976 (FLPMA) states that "Land use plans of the Secretary [of the Interior]…shall be consistent with state and local plans to the maximum extent he finds consistent with federal law and purposes of this Act." In developing the Richfield Resource Management Plan (RMP), the Bureau of Land Management (BLM) is committed to considering state and local plans. In the case of Utah counties, "local plans" are titled "general management plans."

In 1992, the Utah State Legislature adopted the "County Land Use Development and Management Act." This legislation's purpose was to enable counties to develop comprehensive general management plans for their present and future needs and growth and development of lands within their borders. Counties completed general management plans in the mid to late 1990s, with funding provided by the Governor's Office of Planning and Budget. Public lands and resources are only one of many topics addressed in the plans.

This document summarizes statements, comments, and direction provided by the counties on the public land and resource management contained in the general plans of the five counties that the BLM's Richfield Field Office (RFO) encompasses.

This document makes no judgments about the appropriateness or correctness of the counties' statements; it simply records them as written. Resources are listed below in the sequence in which they appear in Appendix C of the BLM's *Land Use Planning Handbook,* H-1601-1. Because county plans are organized differently, this sometimes required summarizing or taking county plan statements out of context. Consequently, a page attribution for each statement cited is included. If readers have questions, they are invited to check the county plans. Not every county commented on every resource, and none of the counties commented on some resources of concern to the BLM.

GENERAL STATEMENTS

Garfield County

- The small private land base cannot be effectively sustained without considering the management of the public lands. Therefore, county leaders will develop a cooperative working relationship with all government agency managers to ensure the inclusion of local perspectives and concerns in public land management directions. (Garfield, p. 3-2)
- Practice has shown that attempts to manage natural resource development with a single resource focus fail to reflect the true scope of impacts to the natural and built environment. At the same time, the "ecosystem management" concept, as described by federal agencies, tends to treat humans as intruders in the natural system. County leaders reject this supposition and will insist that natural RMPs and/or "ecosystem" management plans for all county lands, public or private, consider humans as part of the system. (Garfield, p. 3-2)
- …the county deems it critical that RMPs provide for range improvements, current grazing on public lands be preserved, county water rights be maintained, and public lands timber harvesting be continued and mining leases be considered and encouraged. (Garfield, p. 6-8)
- …it is in the county's best interest that BLM/U.S. Forest Service (USFS) management practices encourage economic ecological sustainability… (Garfield, p. 6-8)

Piute County

- Because about 85 percent of the land area in Piute County is publicly owned, it is extremely important that consideration be given to the coordination and consistency with the federal and state RMPs. It is the intent of the Piute County General Plan to influence the planning processes and management practices occurring on these publicly administered lands… (Piute, p. 2)
- …it is in the county's best interest that BLM and USFS lands be managed for multiple use [and] access is maintained on public lands. (Piute, p. 11)

Sanpete County

- The Sanpete County Commission shall establish a standing Planning Commission Subcommittee on Public Lands. (Sanpete, p. 10-9)
- Given that Sanpete County's economic stability depends on public lands…this General Plan policy: (a) requires federal and state agencies to coordinate present and future land use plans with and through the Sanpete County Public Lands Committee, planning commission, and county commission; (b) requires public lands in Sanpete County to be managed under the principles of multiple-use and sustained yield for which the property is intended. (Sanpete, p. 10-9)
- Federal…agencies shall also endeavor to work closely with Sanpete County officials in resolving conflicts between private and public entities when issues arise. (Sanpete, p. 10-9)

Sevier County

- Multiple-use activities on public lands in Sevier County should continue and should include uses such as agricultural grazing, fishing and hunting, mineral exploration and mining, recreation, wildlife habitat and timber sales…. Federal land agencies should seek input through the Sevier County Public Lands Committee on land use management decisions within the county… (Sevier, p. 3-10)
- Because Sevier County is economically dependent on the use and development of public land resources, a principal concern is that public land use and road management decisions are based on input from county officials and residents. Consistent with federal regulations, federal land managers have a responsibility to inform and involve local county and community leaders and multiple users of public lands in public land access decisions. (Sevier, p. 9-3)

Wayne County

- […the livestock and agriculture industries] currently contribute significantly to the county's lifestyle and economic base and are heavily dependent on the use and availability of public lands and resources. We view the use of these lands as a traditional property right. Therefore, we require that RMPs provide for range improvements, current stocking rates on public lands be preserved, county water rights be maintained, and public land timber harvesting be continued. (Wayne, p. 10)
- Wayne County reminds all public land managers…of their responsibility to the citizens of Wayne County to consider any impact their public land decisions will have on the private property of Wayne County. (Wayne, p. 10)
- …it is the county's desire that each resource be managed for the optimal economic return, but in ways that do not sacrifice the county's natural aesthetic values. (Wayne, p. 12)
- Wayne County supports preserving traditional multiple use of resources. (Wayne, p. 13)

- Wayne County…requires all federal and state public land and resource managers to consider the impact of management decisions on Wayne County custom and culture and economic base. (Wayne, p. 17)
- Wayne County supports the multiple-use concept on Parker Mountain with common sense environmentalism. (Wayne, p. 19)
- When you manage resources, you manage people and their lifestyle. We believe all resources should be managed for the multiple use concept, grazing, mining, and timber. (Wayne, p. 21)
- The BLM should be allowed to manage the National Park Service (NPS) lands as though they were regular BLM land, except for the areas of critical environmental concern (ACEC) near the campground, visitor center, etc. (Wayne, p. 22)

NATURAL, BIOLOGICAL, AND CULTURAL RESOURCES

Air

Garfield County

- The preservation of clean air is one of the goals of Garfield County. Currently, this goal does not present a conflict with economic or resource development, except in a few selected areas… (Garfield, p. 4-2)

Piute County

- Air quality in Piute County is excellent. Many residents value clean air as a cultural benefit associated with the rural county lifestyle. (Piute, p. 78)

Wayne County

- Air quality in Wayne County is excellent. Many residents value clean air as a cultural benefit associated with the rural county lifestyle. (Wayne, p. 99)

Soil and Water

Garfield County

- The county will identify and map all drinking water source protection zones in effect in the county and will recognize their importance in land use permit reviews and approvals. (Garfield, p. 3-4)

Piute County

- Piute County wishes to maintain its existing water rights. (Piute, p. 14)

Sevier County

- Sevier County should support efforts to improve the vegetative management and protect the watershed on public lands. Activities such as chaining, burning, fencing, reseeding, grazing, and others are beneficial to the watershed. (Sevier, p. 3-11)

Wayne County

- Wayne County wishes to preserve and expand existing water rights. (Wayne, p. 13)
- …we feel all dam diversions, ditches, and other waterways and rights must be recognized and honored by any management plan. (Wayne, p. 21)
- Salinity problems should be addressed by federal entities that possess the means to solve the problem. (Wayne, p. 21)
- Water is a critical resource in the Henry Mountain area. It should be used as it has been used with protection for all the rights and privileges of the people with established use[s]… The riparian area should be treated with common sense environmental concern. (Wayne, p. 22)

Cultural Resources

Garfield County

- The subcommittee thought that protecting the county's traditional land uses and rural aesthetics should be one of the ordinance's main objectives. (Garfield, p. 7-1)

Sevier County

- Expanding the county's historical values and cultural assets and preserving its rural lifestyle are land use and planning priorities in Sevier County. (Sevier, p. 4-9)
- It is the intent of these land use policies to foster and preserve the county's culture… (Sevier, p. 4-9)

Wayne County

- Wayne County…requires all federal and state public land and resource managers to consider the impact of management decisions on Wayne County custom and culture and economic base. (Wayne, p. 17)
- Historical and cultural values are of great importance to Wayne County. All historical and cultural values and uses should be identified, recognized, and honored. (Wayne, p. 21)

Visual Resources

Wayne County

- National Park…viewsheds should not be expanded nor should viewsheds be maintained on BLM lands. (Wayne, p. 12)

Fish and Wildlife

Garfield County

- …the county desires that wildlife resources be comprehensively managed without detriment to county economic interests. (Garfield, p. 6-8)
- …wildlife numbers must be established for designated areas within the county. It is county policy that introduction of any exotic plant or animal species into the county should not take place without formal concurrence by the county commission and that public hearings should be held in Garfield County prior to any such introductions. (Garfield, p. 6-10)

- Garfield County believes watchable wildlife areas should be developed. (Garfield, p. 6-10)
- Garfield County has organized a wildlife committee to make recommendations on wildlife numbers. Committee recommendations should be based on balancing economic, recreational, environmental, and other needs and demands. (Garfield, p. 6-10)

Piute County

- …the county desires that wildlife resources be comprehensively managed to preserve and enhance…economic and recreational opportunities. (Piute, p. 10)

Sevier County

- Hunting and fishing are integral parts of the culture and lifestyle in Sevier County. At certain times of the year, virtually all of the economy of Sevier County is focused on hunting, fishing, and related seasonal activities. (Sevier, p. 3-7)
- Grazing is another important consideration in managing wildlife. The agencies must balance grazing versus the special interest of hunters and revenue from the permits for wildlife. (Sevier, p. 3-7)
- Wildlife is a vital part of the lifestyle and culture of Sevier County. (Sevier, p. 3-9)
- Sevier County land use policies should encourage…reasonable wildlife management as long as this management does not create a single-use status adversely impacting or limiting other resources on public lands. (Sevier, p. 3-11)

Wayne County

- We require that wildlife resources be comprehensively managed in ways that optimize wildlife resources opportunities in coordination with agriculture, livestock, timber, recreation, and other important economic interests. (Wayne, p. 11)
- Wayne County supports establishing and maintaining upper limits on big game herd sizes. (Wayne, p. 14)
- Wayne County supports increasing the number of cougar permits. (Wayne, p. 14)
- …we support a controlled number of antelope at no more than 400 head [on Parker Mountain].
- Bison are part of the region and should be managed not to exceed a herd of 200 head. (Wayne, p. 21)
- Management of Big Horn Sheep should continue as they are presently being managed. (Wayne, p. 22)

Fire Management

Sevier County

- Sevier County officials intend to adopt agreements and ordinances consistent with fire, interface, mitigation, and natural hazard codes that assist in protecting private and public property within the county from natural hazards and wildland fires. (Sevier, p. 3-33)

RESOURCE USES

Forestry

Garfield County

- Continue to support the timber industry with the goal of achieving the highest long-term sustained production level. (Garfield, p. 5-4)

Piute County

- …the county supports responsible timber and woodland resource management. (Piute, p. 11)
- Piute County supports responsible timber/wood product management practices on public lands. (Piute, p. 12)
- Piute County believes that federal and state public land/natural resource stewards should manage timber and wood products in ways that allow continued public access and use. (Piute, p. 20)

Sevier County

- …timbering shall be actively extended and promoted in Sevier County. (Sevier, p. 3-33)

Wayne County

- …we require that RMPs provide for public land timber harvesting to be continued. (Wayne, p. 10)
- Wayne County seeks to maintain the current level of timber harvest of 4 million board feet. (Wayne, p. 15)
- Wayne County supports restructuring timber sale contracts to eliminate the discrimination of our local mills caused by the current sale size and administration. (Wayne, p. 15)

Livestock Grazing

Garfield County

- Maintenance and expansion of the livestock trade should be encouraged. (Garfield, p. 5-4)
- …the county deems it critical that RMPs provide for range improvements [and] current grazing on public land be preserved.
- …the number of animal unit months (AUM) allocated within the county should be expanded to the full carrying capacity of the forage resource. (Garfield, p. 6-10)

Piute County

- …the county desires to preserve and enhance the livestock and agricultural industries within the county. (Piute, p. 10)
- Piute County supports maintaining and increasing…(AUMs) through developing county policies supporting affordable grazing fees and range improvement incentives. (Piute, p. 12)
- Piute County wishes to expand the number of AUMs. (Piute, p. 13)
- The county supports maintaining affordable grazing fees and implementing range improvement incentive programs on public lands… (Piute, p. 16)

Sevier County

- Commercial grazing is very important to the economy and heritage of Sevier County. The BLM and USFS should continue to promote, permit, and regulate grazing on public lands. However, removing livestock should not be the only option for managing public lands for utilization. (Sevier, p. 3-10)
- Sevier County should support the current PRIA formula for determining AUMs for grazing public lands. (Sevier, p. 3-10)
- Local agricultural boards, councils, and permittees could be and should be consulted by the federal agencies to help with local input on grazing issues. (Sevier, p. 3-10)

Wayne County

- Wayne County believes BLM and USFS rangelands should be managed and improved using all effective traditional range improvement methods. (Wayne, p. 13)
- Wayne County supports increasing predator control. (Wayne, p. 14)
- Wayne County supports maintaining the number of…AUMs within the county. (Wayne, p. 15)
- We support allotment boundaries as established and livestock numbers and time of use as prior to drought conditions [on Parker Mountain]. (Wayne, p. 20)

Recreation

Garfield County

- The county will support efforts to establish hiking and off-highway vehicle (OHV) trails across public lands, including a bicycle trail along Highway 12, which is a designated Scenic Byway. (Garfield, p. 2-6)
- … to strengthen its economic base, the county wishes to increase its revenue opportunities through enhancing county recreational opportunities and developing destination-related activities. (Garfield, p. 5-3)
- Garfield County supports exploring tourism and recreational opportunities in the county. (Garfield, p. 5-3)
- Garfield County supports creating new attractions and recreational facilities within the county. (Garfield, p. 5-3)

Piute County

- …the county desires to strengthen its economic base by further responsibly developing [recreation] resources. (Piute, p. 10)
- Piute County supports exploring tourism and recreational opportunities within the county. (Piute, p. 12)
- Explore and encourage the development of recreational, fishing, and wildlife opportunities within the county. (Piute, p. 19)

Sevier County

- The Paiute ATV Trail is a series of roads and trails, tied together and mapped for the use of off-road and all terrain vehicles (ATV). This trail system resulted from a cooperative effort among the Utah State Parks Service, County Commissions, the BLM, the USFS, and many community groups. Sevier County wants to ensure this trail system remains intact well into the future. (Sevier, p. 3-6)

- Preserving, protecting, and promoting increased use of recreational resources in Sevier County is a fundamental policy of this general plan….Sevier County shall continue its support for increased commerce, travel, tourism, and land uses in mountain and valley locations that are compatible with present multiple land uses in the county. (Sevier, p. 4-9)
- Sevier County citizens and officials strongly support the Paiute ATV Trail system and the designation of ATV routes within communities in the county that allow ATV riders access to necessary and required services in Sevier County communities and resort areas. (Sevier, p. 9-19)
- The county would like to continue to capitalize on its proximity to limitless recreational sites and activities and to focus on its human resources and natural assets as a means for attracting recreationists, travelers, and visitors as participants in the county's exceptional historic and scenic features. Preserving, protecting, and promoting increased use of recreational resources in Sevier County is a fundamental policy of this General Plan… (Sevier, p. 12-15)

Wayne County

- …it is our intent that recreational growth be carefully planned to balance recreational developments with the county's ability to provide essential services, ensure other important economic resources are not sacrificed for the benefit of recreational development, [and] preserve the county's custom and culture. (Wayne, p. 11)
- The impact of increased recreation should be managed to protect the environment as other uses are. We believe in the "pack-it-in, pack-it-out" concept. (Wayne, p. 21)
- Recreation, hunting, hiking, boating, camping, and four-wheeling should be managed to protect the environment and other uses. (Wayne, p. 22)
- Wayne County supports exploring tourism and recreational opportunities in the county. (Wayne, p. 31)
- Create the financial mechanisms that are necessary for generating the public funds needed to cover the costs associated with providing services to an increased number of tourists. (Wayne, p. 32)

Lands and Realty

Garfield County

- Transfers of private land to federal or state ownership should not result in a net "private land" acreage loss, unless they result in long-term, ongoing, economic benefits to the county. (Garfield, p. 6-8)
- Garfield County supports identifying possible federal and state land exchanges, with the understanding that such exchanges will not increase the net acreage of federal lands in the county. (Garfield, p. 6-9)
- Garfield County will normally, before supporting or approving any federal-state-county exchanges, involve the County Natural Resource/Land Use Committee. (Garfield, p. 6-10)

Sanpete County

- Sanpete County should encourage development around existing municipalities with existing infrastructure for development. (Sanpete, p. 9-11)
- This policy documents the intent of the Sanpete County Commission…to propose land uses or exchanges that assure there will be no net loss of private lands in Sanpete County. (Sanpete, p. 10-9)

Sevier County

- Sevier County leaders may identify any federal lands in the county for exchange with School Trust Lands. Some possible areas that Sevier County leaders may want to be exchanged are Poverty Flat south of Monroe, some BLM land south of Glenwood, and some lands west of Aurora. (Sevier, p. 3-4)

Wayne County

- No net increase in federal ownership as a result of state school land and federal land exchanges within the county. (Wayne, pp. 11-12)
- No involuntary transfer of private lands to public ownership if such transfers result in a tax revenue and value loss. (Wayne, p. 12)
- State school trust lands should not be consolidated. Checkerboard should be maintained on BLM lands. (Wayne, p. 12)
- The county supports privatization of land. (Wayne, p. 12)
- Transfers of private lands to federal or state ownership should not result in a net "private land" acreage loss. (Wayne, p. 12)
- Wayne County supports establishing a policy statement supporting no involuntary transfer of private land to federal or state ownership if such transfers result in a tax or revenue loss. (Wayne, p. 14)
- Where possible and necessary, any public land needed by towns or cities for expansion purposes should be provided if it does not infringe on others with established use. (Wayne, p. 20)
- All transactions should be brought to the attention of county officials before the exchange takes place. (Wayne, p. 21)

Minerals and Mining

Garfield County

- Garfield County supports aggressively pursuing coal and other mineral resource development. (Garfield, p. 5-3)
- Continue to support the highest economically allowable development of the…Henry Mountain coal reserves. (Garfield, p. 5-4)
- Continue to support the redevelopment of Ticaboo and the uranium mines and mill. (Garfield, p. 5-4)

Piute County

- …it is in the county's best interest that federal and state land management plans continue to provide opportunities for the growth and development of the mining industry. (Piute, p. 11)
- Piute County wishes to ensure mineral development within the county continues as an option and to pursue the development of mineral resources. (Piute, p. 12)
- Piute County supports mineral resource development. As a result of recent national mining/mineral law changes, the county believes that it is important to protect and preserve existing mining rights and privileges. The county also believes that future mining/mineral interests should be protected and that development opportunities should not be stifled by prohibitive regulations and restrictions. (Piute, p. 23)

Sevier County

- Minerals, mining, and mineral related production…shall be actively extended and promoted in Sevier County. (Sevier, p. 3-33)

SPECIAL DESIGNATIONS

Wilderness Study Areas

Sevier County

- There are no lands currently being considered by any federal agency for wilderness designation in Sevier County. (Sevier, p. 3-4)

Wayne County

- Wayne County does not favor any land being designated as wilderness in Wayne County. (Wayne, p. 20)
- Wayne County feels all land designated as Wilderness Study Areas (WSA) should be released immediately and opened for mineral exploration. (Wayne, p. 21)

Wild and Scenic River Suitability

Garfield County

- Garfield County will, if it deems appropriate, comment on and may develop and submit proposals for Wild and Scenic River designations to the appropriate federal land management agencies. (Garfield, p. 6-11)

Wayne County

- We feel that Wayne County does not have any rivers or streams that qualify for Wild and Scenic River designation. We feel this designation is too restrictive and would interfere with water rights upstream. (Wayne, p. 21)
- We do not feel the Fremont River meets the criteria as a Wild and Scenic River because the eastern portion of the river, where it joins the Dirty Devil, has been dry in some summer months. (Wayne, p. 22)

Areas of Critical Environmental Concern

Wayne County

- Special designation such as ACECs should not be considered at this time. We feel ACEC designation to be too restrictive for the multiple use concept. (Wayne, pp. 20-21)
- Special designation such as ACEC should be designated only in the National Parks where there is heavy pressure by visitors. (Wayne, p. 22)
- The BLM should be allowed to manage the National Park Service lands as though they were regular BLM land, except for the ACEC near the campground, visitor center, etc. (Wayne, p. 22)

SUPPORT

Transportation and Facilities

Garfield County

- Maintain or improve the existing roadway system within the county, including the preservation of RS-2477 access rights-of-way (ROW) to federal and state lands for mining, timber, grazing, etc. Such activity is authorized by state law (UCA 27-12-25). (Garfield, p. 2-5)
- Existing public access to public land [should] be protected and all RS-2477 ROWs preserved. (Garfield, p. 6-8)
- It is the policy of Garfield County to preserve and enhance access to public lands. (Garfield, p. 6-11)

Piute County

- Piute County wishes to ensure local input regarding access on existing roads (RS2477) be maintained. (Piute, p. 12)
- In Piute County, the preservation of RS 2477 rights is very important because land within the county is predominantly owned by state government and the Federal Government. Loss of access means loss of use and loss of revenue. Because of this, Piute County has filed various RS 2477 claims with the Bureau of Reclamation[?] at the state level as part of the congressional hearing and evaluation process… Maps of RS 2477 roads are available by contacting the Clerk's office… (Piute, p. 22)

Sevier County

- Sevier County shall continue the road use agreements with the BLM, USFS, and other agencies that own public and private lands so that rights-of-ways and access to public land are maintained. All present or expanded RS-2477 roads within Sevier County shall be recognized by applicable federal land management agencies. (Sevier, p. 3-11)
- Access to natural resources in Sevier County shall be preserved and protected. (Sevier, p. 3-33)
- Sevier County leaders also believe that federal and state regulations on access…must recognize the need for roadway maintenance and for new road development… (Sevier, p. 9-3)
- Historical and continued use of man-made trails as thoroughfares for agricultural, ranching, recreation, and related purposes, allows Sevier County to claim historical and prescriptive use on or across public lands as valid RS-2477 ROWs. (Sevier, p. 9-4)
- In cooperation with BLM and USFS land managers, Sevier County is in the process of listing all roads within the county that traverse public lands. This listing is planned for completion by the end of calendar year 1998. It is Sevier County's claim that these roads are valid public thoroughfares and are, by definition and use, granted "public right of way" status. These roads will be added to those presently identified on the county's public land and public roads ROW map on file at the Sevier County Clerk's Office. (Sevier, p. 9-4)
- Sevier County citizens shall continue to use, and to expand through appropriate procedures, RS-2477 designated roadways throughout the county. (Sevier, p. 9-18)
- Sevier County officials shall work to maintain the historical and continuing use of trail ways, byways, highways, roadways, and ROWs established by agriculturists, herders, and livestock owners in the county. (Sevier, p. 9-18)

Wayne County

- All transportation routes on public lands (e.g., primitive ROW, trails, roads, canals, ditches, pipelines, transmission lines, livestock driveways, and any other traditional use) should be protected. (Wayne, p. 12)
- Wayne County has more than 600 miles of county roads. Three hundred of these miles are west of Capitol Reef National Park. We feel all roads and highways, bridges, flumes, and culverts should be recognized and honored and be well maintained and improved as finances will allow, with 60 to 100 feet of ROW allowed wherever possible. No obstructions or gates are to be put in place unless agreed by all concerned. (Wayne, p. 20)
- Wayne County interprets highway to mean trails, stock driveways, pipelines, roads, ditches, canals, and transmission lines [with regard to RS2477 assertions]. (Wayne, p. 114)

OTHER COUNTY ISSUES

Payment in Lieu of Taxes

Garfield County

- Garfield County wishes to increase payments in lieu of taxes (PILT). (Garfield, p. 5-3)
- The county takes the position that it should not be penalized, through loss of federal or state shared revenues, such as PILT, mineral leasing, or other revenues when federal lands become state lands or when state school trust lands are exchanged. (Garfield, p. 6-9)

Sanpete County

- Public land owners shall provide an equitable in-lieu payment and bear a proportionate share of the costs associated with administering public lands in Sanpete County. (Sanpete, p. 10-9)

Wayne County

- Wayne County supports an increase in…PILT by the Federal Government. (Wayne, p. 14)

Search and Rescue

Garfield County

- …Garfield County…supports establishing a state search and rescue fund. Monies from this fund would be used to reimburse counties for county-provided search and rescue services. (Garfield, p. 4-8)
- As a matter of economic reality, Garfield County reserves the right to establish user fees for search and rescue activities, based on a user pay concept. (Garfield, p. 6-9)

Piute County

- Piute County supports a user fee for search and rescue. (Piute, p. 13)

APPENDIX 14—COMMITTED CONSERVATION MEASURES AND BEST MANAGEMENT PRACTICES FOR FEDERALLY LISTED SPECIES

CONSERVATION MEASURES

Utah BLM is committed to the conservation of federally listed species. Pursuant to the Endangered Species Act (ESA), this means that BLM will endeavor to use necessary methods and procedures to improve the status of federally listed species and their habitats to a point where the provisions of the ESA are no longer necessary. This includes ensuring that BLM actions requiring permits or approvals are consistent with the objectives of approved recovery plans for listed species.

Conservation measures are part of the programmatic Section 7 consultation with USFWS. BLM, in coordination with USFWS, developed the following list of species-specific conservation measures for activities that will be implemented under this RMP. All implementation proposals potentially impacting listed species will consider these conservation measures. Incorporating these measures will help the BLM meet the standard of "may affect, but not likely to adversely affect" for species listed under the ESA. Where BLM determines that deviation, modification, or waiver of these conservation measures is prudent and necessary, early coordination and Section 7 consultation with USFWS will be necessary. BLM will reinitiate Section 7 consultation at the project level, as necessary, to ensure proper management of listed species.

Conservation measures were developed for the following listed species inhabiting (or potentially inhabiting) lands managed by the Richfield Field Office (RFO):

- Ute ladies'-tresses (*Spiranthes diluvialis*)
- Wright fishhook cactus (*Sclerocactus wrightiae*)
- San Rafael and Winkler cacti (*Pediocactus spp.)*
- Maguire daisy (*Erigeron maguirei*)
- Last chance townsendia (*Townsendia aprica*)
- Barneby reed-mustard (*Schoenocrambe barnebyi*)
- Bald eagle (*Haliaeetus leucocephalus*)
- Colorado River endangered fish
  - Colorado pikeminnow (*Ptychocheilus lucius*)
  - Humpback chub (*Gila cypha*)
  - Bonytail chub (*Gila elegans*)
  - Razorback sucker (*Xyrauchen texanus*)
- Mexican spotted owl (*Strix occidentalis lucida*)
- Utah prairie dog (*Cynomys parvidens*)
- Southwestern willow flycatcher (*Empidonax trailii extimus*).

Ute ladies'-tresses (*Spiranthes diluvialis*)

Conservation Measures

To minimize effects to the federally threatened Ute ladies'-tresses, the BLM, in coordination with USFWS, developed the following avoidance and minimization measures. Integration of and adherence to these measures will help ensure the activities carried out during oil and gas development (including but

not limited to drilling, production, and maintenance) are in compliance with the ESA. Ute ladies'-tresses habitat is provided some protection under Executive Orders 11990 (wetland protection) and 11988 (floodplain management), as well as Section 404 of the Clean Water Act. Although plants, habitat, or populations may be afforded some protection under these regulatory mechanisms, the following conservation measures should be included in the Plan of Development:

1. Pre-project habitat assessments will be completed across 100 percent of the project disturbance area, including areas where hydrology might be affected by project activities, within potential habitat[1] prior to any ground disturbing activities to determine if suitable Ute ladies'-tresses habitat is present.

2. Within suitable habitat[2], site inventories will be conducted to determine occupancy. Inventories:

    a. Must be conducted by qualified individual(s) and according to BLM and Service accepted survey protocols,

    b. Will be conducted in suitable and occupied[3] habitat for all areas proposed for surface disturbance or areas that could experience direct or indirect changes in hydrology from project activities,

    c. Will be conducted prior to initiation of project activities and within the same growing season, at a time when the plant can be detected, and during appropriate flowering periods (usually August 1st and August 31st in the Uintah Basin; however, surveyors should verify that the plant is flowering by contacting a BLM or FWS botanist or demonstrating that the nearest known population is in flower),

    d. Will occur within 300' from the centerline of the proposed right-of-way for surface pipelines or roads; and within 300' from the perimeter of disturbance for the proposed well pad including the well pad,

    e. Will include, but not be limited to, plant species lists, habitat characteristics, source of hydrology, and estimated hyroperiod, and

    f. Will be valid until August 1st the following year.

3. Design project infrastructure to minimize direct or indirect impacts to suitable habitat both within and downstream of the project area:

    a. Alteration and disturbance of hydrology will not be permitted,

    b. Reduce well pad size to the minimum needed, without compromising safety,

    c. Limit new access routes created by the project,

---

1 Potential habitat is defined as areas that satisfy the broad criteria of the species habitat description; usually determined by preliminary, in-house assessment.

2 Suitable habitat is defined as areas that contain or exhibit the specific components or constituents necessary for plant persistence, determined by field inspection and/or surveys, and may or may not contain Ute ladies'-tresses. Habitat descriptions can be found in Recovery Plans and Federal Register Notices for the species at <http://www.fws.gov/endangered/wildlife.html>.

3 Occupied habitat is defined as areas currently or historically known to support Ute ladies'-tresses; synonymous with "known habitat."

d. Roads and utilities should share common right-of-ways where possible,

e. Reduce width of right-of-ways and minimize the depth of excavation needed for the road bed,

f. Construction and right-of-way management measures should avoid soil compaction that would impact Ute ladies' tresses habitat,

g. Off-site impacts or indirect impacts should be avoided or minimized (i.e. install berms or catchment ditches to prevent spilled materials from reaching occupied or suitable habitat through either surface or groundwater),

h. Place signing to limit off-road travel in sensitive areas,

i. Stay on designated routes and other cleared/approved areas, and

j. All disturbed areas will be re-vegetated with species approved by FWS and BLM botanists.

4. Within occupied habitat, project infrastructure will be designed to avoid direct disturbance and minimize indirect impacts to populations and to individual plants:

   a. Follow the above (#3) recommendations for project design within suitable habitats,

   b. Buffers of 300 feet minimum between right of way (roads and surface pipelines) or surface disturbance (well pads) and plants and populations will be incorporated,

   c. Surface pipelines will be laid such that a 300-foot buffer exists between the edge of the right of way and the plants, using stabilizing and anchoring techniques when the pipeline crosses habitat to ensure the pipelines don't move towards the population,

   d. Before and during construction, areas for avoidance should be visually identifiable in the field, e.g., flagging, temporary fencing, rebar, etc.,

   e. Where technically and economically feasible, use directional drilling or multiple wells from the same pad.

   f. Designs will avoid altering site hydrology and concentrating water flows or sediments into occupied habitat.

   g. Place produced oil, water, or condensate tanks in centralized locations away from occupied habitat, with berms and catchment ditches to avoid or minimize the potential for materials to reach occupied or suitable habitat.

   h. Minimize the disturbed area of producing well locations through interim and final reclamation. Reclaim well pads following drilling to the smallest area possible.

5. Occupied Ute ladies'-tresses habitats within 300 feet of the edge of the surface pipelines' ROWs, 300 feet of the edge of the roads' ROWs, and 300 feet from the edge of the well pad shall be monitored for a period of 3 years after ground disturbing activities. Monitoring will include annual plant surveys to determine plant and habitat impacts relative to project facilities. Habitat impacts include monitoring any changes in hydrology due to project related activities. Annual

reports shall be provided to the BLM and USFWS. To ensure desired results are being achieved, minimization measures will be evaluated and may be changed after a thorough review of the monitoring results and annual reports during annual meetings between the BLM and USFWS.

6. Reinitiation of section 7 consultation with USFWS will be sought immediately if any loss of plants or occupied habitat for the Ute ladies'-tresses is anticipated as a result of project activities.

Additional site-specific measures may also be employed to avoid or minimize effects to the species. These additional measures will be developed and implemented in consultation with USFWS to ensure continued compliance with the ESA.

Wright fishhook cactus (*Sclerocactus wrightiae*)

Conservation Measures

The following list of measures provides species-specific guidance intended to avoid, minimize, or reduce potential adverse impacts from implementation of BLM actions under the authority of current Utah BLM LUPs on the Wright fishhook cactus (*Sclerocactus wrightiae*). This list is not comprehensive. Additional conservation measures, or other modified versions of these measures, may be applied for any given BLM-authorized activity upon further analysis, review, coordination efforts, and/or appropriate levels of section 7 consultation with the USFWS.

1. Prior to surface disturbing activities in habitat for the species, presence/absence surveys of potentially affected areas will be conducted in accordance with established protocols.

2. Appropriate avoidance/protection/mitigation will be used to manage potential impacts of similar subsequent projects. These measures should include, but are not be limited to:

    - the stabilization of soils to minimize or avoid impacts related to soil erosion;
    - marking/flagging of suitable and/or occupied habitat (including predetermined buffers) prior to development to avoid trampling by crew members or equipment during disturbance related activities; and
    - require project proponents to conduct surveys and monitoring actions using BLM-approved specialists to document population effects and individual impacts.

3. BLM shall continue to document new populations of Wright fishhook cactus as they are encountered.

4. To assist and support recovery efforts, BLM will minimize or avoid surface disturbances in habitats that support the species.

5. BLM will encourage and assist project proponents in development and design of their proposed actions in order to avoid direct disturbance to populations or individuals where feasible. Designs should consider water flow, slope, appropriate buffer distances, possible fencing needs, and pre-activity flagging of sensitive areas that are planned for avoidance.

6. BLM will consider emergency OHV closure or additional restrictions to protect, conserve, and recover the species.

7. In areas where dispersed recreational uses are identified as threats to populations of the species, BLM will consider the development of new recreational facilities/opportunities that concentrate dispersed recreational use away from habitat, especially occupied habitat.

8. Cultural and paleontological survey/recovery technicians (i.e., archeologists and/or paleontologists), conducting work in the vicinity of known populations, will be educated in the identification of listed species in order to avoid inadvertent trampling or removal during survey, mapping, or excavation of cultural or paleontological resources.

9. Areas of viable habitat, in the vicinity of populations considered for prescribed burning, will be surveyed according to established protocols for new or undocumented populations of the species.

10. Lands being considered for exchange or disposal that contain suitable habitat for the species will be surveyed for undocumented populations, according to established protocols, prior to approval of such disposal. Lands supporting populations shall not be disposed of unless it is determined that the action will not threaten the survival and recovery of the species in accordance with the ESA and BLM Guidance and Policy Manual *6840 – Special Status Species Management*.

11. BLM will encourage the avoidance of key habitats during livestock herding and trailing activities on BLM administered lands. (Key habitats are those that are deemed necessary for the conservation of the species including, but not necessarily limited to, designated critical habitat and other occupied or unoccupied habitats considered important for the species survival and recovery as determined in coordination with the USFWS).

12. As funding permits, BLM will consider research opportunities to determine whether the mortality to recruitment ratio of 2.5 to 1, observed by Kass (2001) persists within studied populations. These observed ratios have resulted in the decline and ultimate loss of some populations. Therefore, future research might study how widespread the decline may be. To accomplish this, several populations should be selected that represent a range of habitats, locations, proximity to potential threats and relative population sizes. Populations should be monitored for changes in number and overall condition to determine whether these observed mortality rates are characteristic of the species throughout its range.

13. As funding permits, monitoring will be continued on the Hebe Devil Dizzy Gypsum Mine area to assess long-term survival and viability of transplanting populations of Wright fishhook cactus.

San Rafael and Winkler Cacti (*Pediocactus spp.)*

Conservation Measures

The following list of measures provides species-specific guidance intended to avoid, minimize, or reduce potential adverse impacts from implementation of BLM actions under the authority of current Utah BLM LUPs on the San Rafael (*Pediocactus despainii)* and Winkler cactus *(Pediocactus winkleri)*. This list is not comprehensive. Additional conservation measures, or other modified versions of these measures, may be applied for any given BLM-authorized activity upon further analysis, review, coordination efforts, and/or appropriate levels of section 7 consultation with the USFWS.

1. Prior to surface disturbing activities in habitat for the species, presence/absence surveys of potentially affected areas will be conducted in accordance with established protocols.

2. Appropriate avoidance/protection/mitigation will be used to manage potential impacts of similar subsequent projects. These measures should include, but are not be limited to:

    - the stabilization of soils to minimize or avoid impacts related to soil erosion;
    - marking/flagging of suitable and/or occupied habitat (including predetermined buffers) prior to development to avoid trampling by crew members or equipment during disturbance related activities; and
    - require project proponents to conduct surveys and monitoring actions using BLM approved specialists to document population effects and individual impacts.

3. BLM shall continue to document new populations of San Rafael and Winkler cacti as they are encountered.

4. To assist and support recovery efforts, BLM will minimize or avoid surface disturbances in habitats that support the species.

5. BLM will encourage and assist project proponents in development and design of their proposed actions in order to avoid direct disturbance to populations or individuals where feasible. Designs should consider water flow, slope, appropriate buffer distances, possible fencing needs, and pre-activity flagging of sensitive areas that are planned for avoidance.

6. BLM will consider emergency OHV closure or additional restrictions to protect, conserve, and recover the species.

7. In areas where dispersed recreational uses are identified as threats to populations of the species, BLM will consider the development of new recreational facilities/opportunities that concentrate dispersed recreational use away from habitat, especially occupied habitat.

8. Cultural and paleontological survey/recovery technicians (i.e., archeologists and/or paleontologists), conducting work in the vicinity of known populations, will be educated in the identification of listed species in order to avoid inadvertent trampling or removal during survey, mapping, or excavation of cultural or paleontological resources.

9. Areas of viable habitat, in the vicinity of populations considered for prescribed burning, will be surveyed according to established protocols for new or undocumented populations of the species.

10. Lands being considered for exchange or disposal that contain suitable habitat for the species will be surveyed for undocumented populations, according to established protocols, prior to approval of such disposal. Lands supporting populations shall not be disposed of unless it is determined that the action will not threaten the survival and recovery of the species in accordance with the ESA and BLM Guidance and Policy Manual *6840 – Special Status Species Management*.

11. BLM will encourage the avoidance of key habitats during livestock herding and trailing activities on BLM administered lands. (Key habitats are those that are deemed necessary for the conservation of the species including, but not necessarily limited to, designated critical habitat and other occupied or unoccupied habitats considered important for the species survival and recovery as determined in coordination with the USFWS).

12. As additional funding becomes available, BLM should develop a travel management plan specifically for areas of occupied and potential habitat for San Rafael and Winkler cactus.

13. As additional funding becomes available, BLM will conduct or encourage monitoring studies in areas to which topsoil has been placed with the intention of transferring the seed bank from San Rafael and Winkler cactus populations, to mitigate population losses from development activities. The purpose of these studies would be to evaluate mitigation measures for effectiveness in reestablishing populations of the species.

Maguire Daisy (*Erigeron maguirei*)

Conservation Measures

The following conservation measures provide guidance for avoiding, minimizing, or reducing potential adverse impacts to the Maguire daisy from implementing actions authorized in this RMP. This list is not all-inclusive. Additional conservation measures, or other modified versions of these measures, may be applied for any given BLM-authorized activity upon further analysis, review, coordination efforts, and/or appropriate levels of Section 7 consultation with USFWS:

1. Prior to approving surface disturbing activities in species habitat, survey for the presence of the species in potentially affected areas in accordance with established protocols.

2. Use appropriate avoidance, protection, and mitigation measures to manage potential impacts of similar, subsequent projects. Measures include, but are not be limited to:

    a. Stabilizing soils to minimize or avoid impacts related to soil erosion

    b. Marking/flagging of suitable and/or occupied habitat (including predetermined buffers) prior to development to avoid trampling by crew members or equipment during disturbance-related activities

    c. Requiring project proponents to conduct surveys and monitoring actions using BLM-approved specialists to document impacts to populations and individuals.

3. Continue documenting new populations of Maguire daisy as they are encountered.

4. To assist and support recovery efforts, minimize or avoid surface disturbances in habitats that support the species.

5. Encourage and assist project proponents in developing and designing their proposed actions to avoid directly disturbing populations or individuals. Designs should consider water flow, slope, appropriate buffer distances, possible fencing needs, and pre-activity flagging of sensitive areas that are planned for avoidance.

6. Consider emergency OHV area closures or other OHV restrictions needed to protect, conserve, and recover the species.

7. In areas where recreational uses are identified as threats to populations of the species, consider developing new recreational facilities and/or opportunities that would direct dispersed recreational uses away from habitat, especially occupied habitat.

8. Cultural and paleontological survey/recovery technicians (e.g., archaeologists and paleontologists) working in the vicinity of known populations would be educated in the

identification of listed species in order to avoid inadvertent trampling or removal during survey, mapping, or excavation of cultural or paleontological resources.

9. Survey areas of viable habitat in the vicinity of populations within areas being considered for prescribed burning for new or undocumented populations of the species.

10. Lands being considered for land tenure adjustments that contain suitable habitat for the species would be surveyed, according to established protocols prior to approval of the land tenure adjustment action. Lands supporting populations would not be disposed of unless it is determined that the action would not threaten the survival and recovery of the species in accordance with the ESA and BLM Guidance and Policy Manual 6840, Special Status Species Management.

11. Encourage the avoidance of key habitats during livestock herding and trailing activities on public lands. Key habitats are those that are deemed necessary for the conservation of the species, including, but not limited to, designated critical habitat and other occupied or unoccupied habitats considered important for the species survival and recovery as determined in coordination with USFWS.

Last Chance Townsendia (*Townsendia aprica*)

Conservation Measures

The following list of measures provides species-specific guidance intended to avoid, minimize, or reduce potential adverse impacts from implementation of BLM actions under the authority of current Utah BLM LUPs on the Last chance townsendia (*Townsendia aprica*). This list is not comprehensive. Additional conservation measures, or other modified versions of these measures, may be applied for any given BLM-authorized activity upon further analysis, review, coordination efforts, and/or appropriate levels of section 7 consultation with the USFWS.

1. Prior to surface disturbing activities in habitat for the species, presence/absence surveys of potentially affected areas will be conducted in accordance with established protocols.

2. Appropriate avoidance/protection/mitigation will be used to manage potential impacts of similar subsequent projects. These measures should include, but are not be limited to:

    - the stabilization of soils to minimize or avoid impacts related to soil erosion;
    - marking/flagging of suitable and/or occupied habitat (including predetermined buffers) prior to development to avoid trampling by crew members or equipment during disturbance related activities; and
    - require project proponents to conduct surveys and monitoring actions using BLM approved specialists to document population effects and individual impacts.

3. BLM shall continue to document new populations of Last chance townsendia (*Townsendia aprica*) as they are encountered.

4. To assist and support recovery efforts, BLM will minimize or avoid surface disturbances in habitats that support the species.

5. BLM will encourage and assist project proponents in development and design of their proposed actions in order to avoid direct disturbance to populations or individuals where feasible. Designs

should consider water flow, slope, appropriate buffer distances, possible fencing needs, and pre-activity flagging of sensitive areas that are planned for avoidance.

6. BLM will consider emergency OHV closure or additional restrictions to protect, conserve, and recover the species.

7. In areas where dispersed recreational uses are identified as threats to populations of the species, BLM will consider the development of new recreational facilities/opportunities that concentrate dispersed recreational use away from habitat, especially occupied habitat.

8. Cultural and paleontological survey/recovery technicians (i.e., archeologists and/or paleontologists), conducting work in the vicinity of known populations, will be educated in the identification of listed species in order to avoid inadvertent trampling or removal during survey, mapping, or excavation of cultural or paleontological resources.

9. Areas of viable habitat, in the vicinity of populations considered for prescribed burning, will be surveyed according to established protocols for new or undocumented populations of the species.

10. Lands being considered for exchange or disposal that contain suitable habitat for the species will be surveyed for undocumented populations, according to established protocols, prior to approval of such disposal. Lands supporting populations shall not be disposed of unless it is determined that the action will not threaten the survival and recovery of the species in accordance with the ESA and BLM Guidance and Policy Manual *6840 – Special Status Species Management*.

11. BLM will encourage the avoidance of key habitats during livestock herding and trailing activities on BLM administered lands. (Key habitats are those that are deemed necessary for the conservation of the species including, but not necessarily limited to, designated critical habitat and other occupied or unoccupied habitats considered important for the species survival and recovery as determined in coordination with the USFWS).

Barneby Reed-Mustard (*Schoenocrambe barnebyi*)

Conservation Measures

The following list of measures provides species-specific guidance intended to avoid, minimize, or reduce potential adverse impacts from implementation of BLM actions under the authority of current Utah BLM LUPs on the Berneby reed-mustard (*Schoencrambe barnebyi*). This list is not comprehensive. Additional conservation measures, or other modified versions of these measures, may be applied for any given BLM-authorized activity upon further analysis, review, coordination efforts, and/or appropriate levels of section 7 consultation with the USFWS.

1. Prior to surface disturbing activities in habitat for the species, presence/absence surveys of potentially affected areas will be conducted in accordance with established protocols.

2. Appropriate avoidance/protection/mitigation will be used to manage potential impacts of similar subsequent projects. These measures should include, but are not be limited to:

    - the stabilization of soils to minimize or avoid impacts related to soil erosion;

- marking/flagging of suitable and/or occupied habitat (including predetermined buffers) prior to development to avoid trampling by crew members or equipment during disturbance related activities; and
- require project proponents to conduct surveys and monitoring actions using BLM approved specialists to document population effects and individual impacts.

3. BLM shall continue to document new populations of each species as they are encountered.

4. To assist and support recovery efforts, BLM will minimize or avoid surface disturbances in habitats that support the species.

5. BLM will encourage and assist project proponents in development and design of their proposed actions in order to avoid direct disturbance to suitable habitat, populations or individuals where feasible. Designs should consider water flow, slope, appropriate buffer distances, possible fencing needs, and pre-activity flagging of sensitive areas that are planned for avoidance.

6. BLM will consider emergency OHV closure or additional restrictions to protect, conserve, and recover the species.

7. In areas where dispersed recreational uses are identified as threats to populations of the species, BLM will consider the development of new recreational facilities/opportunities that concentrate dispersed recreational use away from habitat, especially occupied habitat.

8. Cultural and paleontological survey/recovery technicians (i.e., archeologists and/or paleontologists), conducting work in the vicinity of known populations, will be educated in the identification of listed species in order to avoid inadvertent trampling or removal during survey, mapping, or excavation of cultural or paleontological resources.

9. Areas of viable habitat, in the vicinity of populations considered for prescribed burning, will be surveyed according to established protocols for new or undocumented populations of the species.

10. Lands being considered for exchange or disposal that contain suitable habitat for the species will be surveyed for undocumented populations, according to established protocols, prior to approval of such disposal. Lands supporting populations shall not be disposed of unless it is determined that the action will not threaten the survival and recovery of the species in accordance with the ESA and BLM Guidance and Policy Manual *6840 – Special Status Species Management*.

11. BLM will encourage the avoidance of key habitats during livestock herding and trailing activities on BLM administered lands. (Key habitats are those that are deemed necessary for the conservation of the species including, but not necessarily limited to, designated critical habitat and other occupied or unoccupied habitats considered important for the species survival and recovery as determined in coordination with the USFWS).

Bald Eagle (*Haliaeetus leucocephalus*)

Conservation Measures

The following conservation measures provide guidance for avoiding, minimizing, or reducing potential adverse impacts to the bald eagle from implementing actions authorized in this RMP. This list is not all-inclusive. Additional conservation measures, or other modified versions of these measures, may be

applied for any given BLM-authorized activity upon further analysis, review, coordination efforts, and/or appropriate levels of Section 7 consultation with USFWS:

1. Implement restrictions on all authorized (permitted) activities that may adversely impact bald eagles, their breeding habitat, roosting sites, or known winter concentration areas to avoid or minimize the impacts. Measures were adapted from guidance published in the Utah Field Office *Guidelines for Raptor Protection from Human and Land Use Disturbances* (USFWS 2002), and from coordination between BLM and USFWS. Measures include, but are not limited to seasonal and/or daily timing limitations and/or spatial buffers as follows:

    a. Temporary activities[4] or habitat alterations that could disturb nesting bald eagles would be restricted from January 1 to August 31 within 1 mile of nest sites. Exceptions would be considered where no nesting behavior is initiated prior to June 1.

    b. Temporary activities or habitat alterations that could disturb bald eagles would be restricted within one-half mile of known eagle winter roost areas from November 1 to March 31. In addition, require daily activities approved through subsequent consultation within these spatial buffers to start after 9 a.m. and terminate at least 1 hour before sunset to ensure that bald eagles using these roosts have the opportunity to vacate their roost in the morning and return undisturbed in the evening.

    c. Allow no permanent[5] structures within 1 mile of bald eagle nest sites or within one-half mile of bald eagle winter concentration areas (roosts).

    d. Where activities are authorized within breeding habitats or known winter concentration areas, monitoring efforts would document what, if any, impacts occur during project implementation and to what extent the species was affected. Utilize the monitoring results in designing and implementing future projects as part of the adaptive management process.

2. For all project-related survey and monitoring actions:

    a. Provide monitoring reports to the RFO within 15 days of completion of surveys or monitoring efforts. Reports must follow BLM-specified formats for written and automated databases.

    b. Any detection of bald eagle presence during survey or monitoring efforts to the authorized officer within 48 hours of detection.

3. Conduct appropriately timed surveys in suitable bald eagle nesting habitat or identified concentration areas in accordance with approved protocols prior to any activities that may disturb bald eagles. Surveys would only be conducted by BLM-approved individuals or personnel.

4. In coordination with cooperating agencies and/or partners (e.g., Utah Division of Wildlife Resources [UDWR] and USFWS), verify annual status (active versus inactive) of all known bald eagle nests and other identified eagle concentration areas on BLM-administered lands.

---

[4] Temporary activities are defined as those that are completed prior to the start of the following raptor breeding season, leaving no permanent structures and resulting in no permanent habitat loss.

[5] Permanent activities continue for more than one breeding season and/or cause a loss of habitat or displace individuals through disturbance (e.g., creation of a permanent structure including but not limited to well pads, roads, pipelines, and electrical powerlines).

5. When project proposals that may affect threatened and endangered species are received, coordinate with USFWS at the earliest possible date so that USFWS can provide conservation measures needed to minimize or avoid impacts.

6. BLM-administered lands within 1 mile of bald eagle nests or identified communal winter roosts should be retained in federal ownership. If it is imperative that these lands be transferred out of public ownership, make every effort to include conservation easements in conveyance documents or seek voluntary conservation restrictions to protect the bald eagles and support their conservation.

7. Notify proponents of BLM-authorized actions that roadside carrion can attract foraging bald eagles and potentially increase the risk of vehicle collisions with eagles feeding on carrion. When carrion is found on roads, notify the appropriate agency for its removal.

8. Require powerlines to be constructed to standards and guidelines identified by the Avian Protection Plan (APP) Guidelines (USFWS and APLIC 2005).

9. Provide educational information to project proponents and the general public pertaining to the following topics:

    a. Appropriate vehicle speeds and the associated benefit of reduced vehicle collisions with wildlife

    b. Use of lead shot (particularly over water bodies)

    c. Use of lead fishing weights

    d. General ecological awareness of habitat disturbance.

10. Since bald eagles often prey upon aquatic species, periodically review water quality records (e.g., Utah Department of Environmental Quality [UDEQ], UDWR, and U.S. Geological Survey [USGS]) from monitoring stations at or near important bald eagle habitats (e.g., nests, roosts, and concentration areas) on BLM-administered lands for conditions that could adversely affect eagles or their prey. If water quality problems are identified, contact the appropriate jurisdictional entity to cooperatively monitor the condition and/or take corrective action.

Colorado Pikeminnow (*Ptychocheilus lucius*), Humpback Chub (*Gila cypha*), Bonytail Chub (*Gila elegans*), and Razorback Sucker (*Xyrauchen texanus*)

Conservation Measures

The following list of measures provides species-specific guidance intended to avoid, minimize, or reduce potential adverse impacts from implementation of BLM actions under the authority of current Utah BLM LUPs on the Colorado pikeminnow, Humpback chub, bonytail, and razorback sucker, herein referred to as the Colorado River fishes. This list is not comprehensive. Additional conservation measures, or other modified versions of these measures, may be applied for any given BLM-authorized activity upon further analysis, review, coordination efforts, and/or appropriate levels of section 7 consultation with the USFWS.

1. Monitoring of impacts of site-specific projects authorized by the BLM will result in the preparation of a report describing the progress of each site-specific project, including implementation of any associated reasonable and prudent measures or reasonable and prudent alternatives. This will be a requirement of project proponents and will be included as a condition of approval (COA) on future proposed actions that have been determined to have the potential for take. Reports will be submitted annually to the USFWS - Utah Field Office, beginning after the first full year of implementation of the project, and shall list and describe:

    - Any unforeseen direct or indirect adverse impacts that result from activities of each site-specific project;
    - Estimated levels of impact or water depletion, in relation to those described in the original project-level Consultation effort, in order to inform the Service of any intentions to reinitiate Section 7 Consultation; and
    - Results of annual, periodic monitoring which evaluates the effectiveness of any site-specific terms and conditions that are part of the formal Consultation process. This will include items such as an assessment of whether implementation of each site-specific project is consistent with that described in the BA, and whether the project has complied with terms and conditions.

2. The BLM shall notify the USFWS immediately of any unforeseen impacts detected during project implementation. Any implementation action that may be contributing to the introduction of toxic materials or other causes of fish mortality must be immediately stopped until the situation is remedied. If investigative monitoring efforts demonstrate that the source of fish mortality is not related to the authorized activity, the action may proceed only after notification of USFWS authorities.

3. Unoccupied, suitable habitat areas should be protected in order to preserve them for future management actions associated with the recovery of the Endangered Colorado River Fish, as well as approved reintroduction, or relocation efforts.

    - BLM will avoid impacts where feasible, to habitats considered most representative of prime suitable habitat for these species.
    - Surface disturbing activities will be restricted within ¼ mile of the channel centerline of the Colorado, Green, Duchesne, Price, White, and San Rafael Rivers
    - Surface disturbing activities proposed to occur within floodplains or riparian areas will be avoided unless there is no practical alternative or the development would enhance riparian/aquatic values. If activities must occur in these areas, construction will be designed to include mitigation efforts to maintain, restore, and/or improve riparian and aquatic conditions. If conditions could not be maintained, offsite mitigation strategies should be considered.

4. BLM will ensure project proponents are aware that designs must avoid as much direct disturbance to current populations and known habitats as is feasible. Designs should include:

    - protections against toxic spills into rivers and floodplains;
    - plans for sedimentation reduction;
    - minimization of riparian vegetation loss or degradation;
    - pre-activity flagging of critical areas for avoidance;
    - design of stream-crossings for adequate passage of fish; and
    - measures to avoid or minimize impacts on water quality at the 25-year frequency runoff

5. Prior to surface disturbing activities, specific principles will be considered to control erosion. These principles include:

    - Conduct long-range transportation planning for large areas to ensure that roads will serve future needs. This will result in less total surface disturbance.
    - Avoid, where possible, surface disturbance in areas with high erosion hazards.
    - Avoid mid-slope location of drill pads, headwalls at the source of tributary drainages, inner valley gorges, excessively wet slopes such as those near springs and avoid areas where large cuts and fills would be required.
    - Design and locate roads to minimize roadway drainage areas and to avoid modifying the natural drainage areas of small streams.

6. Where technically and economically feasible, project proponents will use directional drilling or multiple wells from a single pad to reduce surface disturbance and eliminate drilling in suitable riparian habitat. Ensure that such drilling does not intercept or degrade alluvial aquifers. Drilling will not occur within 100 year floodplains that contain listed fish species or their designated critical habitats.

7. The Utah Oil and Gas Pipeline Crossing Guidance (BLM National Science and Technology Center), or other applicable guidance, will be implemented for oil and gas pipeline river/stream crossings.

8. In areas adjacent to 100-year floodplains, particularly in systems prone to flash floods, BLM will analyze the risk for flash floods to impact facilities. Potential techniques may include the use of closed loop drilling and pipeline burial or suspension as necessary to minimize the potential for equipment damage and resultant leaks or spills.

9. Water depletions from any portion of the Upper Colorado River drainage basin above Lake Powell are considered to adversely affect and adversely modify the critical habitat of these endangered fish species. Section 7 consultation will be completed with the Service prior to any such water depletions.

10. Design stream-crossings for adequate passage of fish (if present), minimum impact on water quality, and at a minimum, a 25-year frequency run-off.

Mexican Spotted Owl (*Strix occidentalis lucida*)

Conservation Measures

The following list of measures provides species-specific guidance intended to avoid, minimize, or reduce potential adverse impacts from implementation of BLM actions under the authority of current Utah BLM LUPs on the Mexican spotted owl (*Strix occidentalis lucida*). This list is not comprehensive. Additional conservation measures, or other modified versions of these measures, may be applied for any given BLM-authorized activity upon further analysis, review, coordination efforts, and/or appropriate levels of section 7 consultation with the USFWS.

1. BLM will place restrictions on all authorized (permitted) activities that may adversely affect the Mexican spotted owl in identified PACs, breeding habitat, or designated critical habitat, to reduce the potential for adverse impacts to the species. Restrictions and procedures have been adapted

from guidance published in the Utah Field Office Guidelines for Raptor Protection from Human and Land Use Disturbances (USFWS 2002b), as well as coordination between BLM and the Service. Measures include:

a. Surveys, according to USFWS protocol, will be required prior to any disturbance related activities that have been identified to have the potential to impact Mexican spotted owl, unless current species occupancy and distribution information is complete and available. All surveys must be conducted by USFWS certified individuals, and approved by the BLM authorized officer.

b. Assess habitat suitability for both nesting and foraging using accepted habitat models in conjunction with field reviews. Apply the appropriate conservation measures below if project activities occur within 0.5 mile of suitable owl habitat, dependent in part on if the action is temporary[6] or permanent[7]:

For all temporary actions that may impact owls or suitable habitat:

- If action occurs entirely outside of the owl breeding season, and leaves no permanent structure or permanent habitat disturbance, action can proceed without an occupancy survey.

- If action will occur during a breeding season, survey for owls prior to commencing activity. If owls are found, activity should be delayed until outside of the breeding season.

- Eliminate access routes created by a project through such means as raking out scars, revegetation, gating access points, etc. For all permanent actions that may impact owls or suitable habitat:

For all permanent actions that may impact owls or suitable habitat:

- Survey two consecutive years for owls according to established protocol prior to commencing of activity.
- If owls are found, no actions will occur within 0.5 mile of identified nest site.
- If nest site is unknown, no activity will occur within the designated Protected Activity Center (PAC).
- Avoid placing permanent structures within 0.5 mi of suitable habitat unless surveyed and not occupied.
- Reduce noise emissions (e.g., use hospital-grade mufflers) to 45 dBA at 0.5 mile from suitable habitat, including canyon rims (Delaney et al. 1997). Placement of permanent noise-generating facilities should be determined by a noise analysis to ensure noise does not encroach upon a 0.5 mile buffer for suitable habitat, including canyon rims.
- Limit disturbances to and within suitable owl habitat by staying on designated routes.
- Limit new access routes created by the project.

[6]Temporary activities are defined as those that are completed prior to the start of the following raptor breeding season, leaving no permanent structures and resulting in no permanent habitat loss.

[7] Permanent activities continue for more than one breeding season and/or cause a loss of owl habitat or displaces owls through disturbances, e.g., creation of a permanent structure including but not limited to well pads, roads, pipelines, electrical power line.

2. BLM will, as a condition of approval (COA) on any project proposed within identified PACs, designated critical habitat, or within spatial buffers for Mexican spotted owl nests (0.5 mile), ensure that project proponents are notified as to their responsibilities for rehabilitation of temporary access routes and other temporary surface disturbances, created by their project, according to individual BLM Field Office standards and procedures, or those determined in the project-specific Section 7 Consultation.

3. BLM will require monitoring of activities in designated critical habitat, identified PACs, or breeding habitats, wherein it has been determined that there is a potential for take. If any adverse impacts are observed to occur in a manner, or to an extent that was not considered in the project-specific Section 7 Consultation, then consultation must be reinitiated.

    - Monitoring results should document what, if any, impacts to individuals or habitat occur during project construction/implementation. In addition, monitoring should document successes or failures of any impact minimization, or mitigation measures. Monitoring results would be considered an opportunity for adaptive management, and as such, would be carried forward in the design and implementation of future projects.

4. For all survey and monitoring actions:
    - Reports must be provided to affected field offices within 15 days of completion of survey or monitoring efforts.
    - Report any detection of Mexican spotted owls during survey or monitoring to the authorized officer within 48 hours.

5. BLM will, in areas of designated critical habitat, ensure that any physical or biological actors (i.e., the primary constituent elements), as identified in determining and designating such habitat, remains intact during implementation of any BLM-authorized activity.

6. For all BLM actions that "*may adversely affect*" the primary constituent elements in any suitable Mexican spotted owl habitat, BLM will implement measures as appropriate to minimize habitat loss or fragmentation, including rehabilitation of access routes created by the project through such means as raking out scars, revegetation, gating access points, etc.

7. Where technically and economically feasible, use directional drilling from single drilling pads to reduce surface disturbance, and minimize or eliminate needing to drilling in canyon habitats suitable for Mexican spotted owl nesting.

8. Prior to surface disturbing activities in Mexican spotted owl PACs, breeding habitats, or designated critical habitat, specific principles should be considered to control erosion.

These principles include:

- Conduct long-range transportation planning for large areas to ensure that roads will serve future needs. This will result in less total surface disturbance.
- Avoid surface disturbance in areas with high erosion hazards to the greatest extent possible. Avoid mid-slope locations, headwalls at the source of tributary drainages, inner valley gorges, and excessively wet slopes such as those near springs. In addition, avoid areas where large cuts and fills would be required.
- Locate roads to minimize roadway drainage areas and to avoid modifying the natural drainage areas of small streams.

9. Project developments should be designed, and located to avoid direct or indirect loss or modification of Mexican spotted owl nesting and/or identified roosting habitats.

10. Water production associated with BLM authorized actions should be managed to ensure maintenance or enhancement of riparian habitats.

Utah Prairie Dog (*Cynomys parvidens*)

Conservation Measures

The following list of measures provides species-specific guidance intended to avoid, minimize, or reduce potential adverse impacts from implementation of BLM actions under the authority of current Utah BLM LUPs on the Utah prairie dog (*Cynomys parvidens*). This list is not comprehensive. Additional conservation measures, or other modified versions of these measures, may be applied for any given BLM-authorized activity upon further analysis, review, coordination efforts, and/or appropriate levels of section 7 consultation with the USFWS.

1. Surveys according to approved protocols and procedures will be required prior to surface disturbance unless species occupancy and distribution information is complete, current, and available. Surveys would be conducted by BLM-approved biologists. In the event species occurrence is verified, the project proponent may be required to modify operational plans, at the discretion of the authorized officer, to include additional, appropriate protection measures or practices for the minimization of impacts to the Utah prairie dog and its habitat.

2. BLM will restrict surface disturbing activities within 0.5 mile of active Utah prairie dog colonies when and where necessary, upon the recommendation of BLM FO staff biologists to BLM management and as necessary in coordination or consultation with USFWS.

3. No permanent surface disturbance or facility will be allowed within 0.5 mile of potentially suitable Utah prairie dog habitat, as identified and mapped by the Utah Division of Wildlife Resources or BLM, since 1976.

4. Unavoidable surface disturbing activities in Utah prairie dog habitat should be conducted between April 1 and September 30 (the period when prairie dogs are most likely to be found above ground). BLM projects will be designed to avoid direct disturbance to Utah prairie dog populations and habitat wherever possible. Designs should consider flow of water, slope, buffers, possible fencing, and pre-activity flagging of critical areas for avoidance.

5. Reclamation and restoration efforts in Utah prairie dog habitat will be conducted using native seed, unless otherwise specified in coordination with USFWS.

6. As funding allows, BLM should complete a comprehensive assessment locating and mapping OHV use areas that interface with Utah prairie dog populations. Comparison of GIS layers for Utah prairie dog populations and OHV use should give BLM personnel another tool to manage and/or minimize impacts from OHV use near known Utah prairie dog populations and habitat. Based on the information that is developed via GIS applications, appropriate actions should be taken to prevent OHV use in occupied territories.

7. BLM will consider emergency OHV closures or additional restrictions to protect, conserve, and recover the species.

8. Where technically and economically feasible, the use of directional drilling or drilling of multiple wells from a single pad will be required to reduce surface disturbance in Utah prairie dog habitat.

9. For existing facilities, BLM and facility operators, will consider if fencing infrastructure on well pads (e.g., drill pads, tank batteries, and compressors) would be needed to protect equipment from burrowing activities. In addition, BLM and project proponents should consider if future surface disturbing activities would be required at the site.

10. BLM will provide educational information for project proponents and the general public pertaining to appropriate vehicle speeds and the associated benefit of reduced vehicle collisions with wildlife, and to improve general ecological awareness of habitat disturbance.

11. Project related vehicle maintenance activities will be conducted in maintenance facilities. Should it become necessary to perform vehicle or equipment maintenance on-site, these activities will avoid identified Utah prairie dog colonies or within a 350-foot distance from colonies. Precautions shall be taken to ensure that contamination of maintenance sites by fuels, motor oils, grease, etc. does not occur and such materials are contained and properly disposed of off-site. Inadvertent spills of petroleum based or other toxic materials shall be cleaned up and removed immediately.

12. BLM will coordinate with interested private and governmental agencies and landowners to identify voluntary opportunities to modify current land stewardship practices that may have detrimental impacts on the Utah prairie dog and its habitat.

11. BLM-authorized equipment and vehicles planned for use within Utah prairie dog habitat will be cleaned to minimize the spread of noxious weeds or other undesirable vegetation types.

Southwestern Willow Flycatcher (*Empidonax trailii extimus*)

Conservation Measures

The following list of measures provides species-specific guidance intended to avoid, minimize, or reduce potential adverse impacts from implementation of BLM actions under the authority of current Utah BLM LUPs on the Southwestern willow flycatcher (*Empidonax traillii extimus*). This list is not comprehensive. Additional conservation measures, or other modified versions of these measures, may be applied for any given BLM-authorized activity upon further analysis, review, coordination efforts, and/or appropriate levels of section 7 consultation with the USFWS.

1. Surveys will be required prior to operations that *"may adversely affect"* the Southwestern willow flycatcher unless species occupancy data and distribution information is complete and available. Surveys will only be conducted by BLM-approved personnel. In the event species occurrence is verified, project proponents may be required to modify operational plans at the discretion of the authorized officer. Modifications may include appropriate measures for minimization of adverse effects to the Southwestern willow flycatcher and its habitat.

2. BLM will monitor and restrict, when and where necessary, authorized or casual use activities that *"may adversely affect"* the Southwestern willow flycatcher, including but not limited to, recreation, mining, and oil and gas activities. Monitoring results should be considered in the design and implementation of future projects.

3. To monitor the impacts of BLM-authorized projects determined *"likely to adversely affect"* the Southwestern willow flycatcher, BLM should prepare a short report describing progress, including success of implementation of all associated mitigation. Reports shall be submitted annually to the USFWS Utah Field Office by March 1st beginning one full year from date of implementation of the proposed action. The report shall list and describe the following items:

    - Any unforeseen adverse effects resulting from activities of each site-specific project (may also require reinitiation of formal Consultation);
    - When, and if, any level of anticipated incidental take is approached (as allowed by separate Incidental Take Statements of site-specific Formal Section 7 Consultation efforts);
    - When, or if, the level of anticipated take (as allowed by separate Incidental Take Statements from site-specific formal consultations) is exceeded; and • Results of annual, periodic monitoring which evaluate the effectiveness of the reasonable and prudent measures or terms and conditions of the site-specific Consultation.

4. BLM should avoid granting activity permits or authorizing development actions in Southwestern willow flycatcher habitat. Unoccupied potential habitat should be protected in order to preserve them for future management actions associated with the recovery of the Southwestern willow flycatcher.

5. BLM will ensure project design incorporates measures to avoid direct disturbance to populations and suitable habitats where possible. At a minimum, project designs should include consideration of water flows, slope, seasonal and spatial buffers, possible fencing, and pre-activity flagging of critical areas for avoidance.

6. The BLM will continue to address illegal and unauthorized OHV use and activity upon BLM administered lands. In order to protect, conserve, and recover the Southwestern willow flycatcher in areas of heavy unauthorized use, temporary closures, or use restrictions beyond those which are already in place, may be imposed. As funding allows, BLM should complete a comprehensive assessment of all OHV use areas that interface with Southwestern willow flycatcher populations. Comparison of Southwestern willow flycatcher populations and OHV use areas using GIS would give BLM personnel another tool to manage and/or minimize impacts.

7. All surface disturbing activities should be restricted within a 0.25 mile buffer from suitable riparian habitats and permanent surface disturbances should be avoided within 0.5 mile of suitable Southwestern willow flycatcher habitat.

    - Unavoidable ground disturbing activities in occupied Southwestern willow flycatcher habitat should only be conducted when preceded by current year survey, should only occur between August 16 and April 30 (the period when Southwestern willow flycatcher are not likely to be breeding), and should be monitored to ensure that adverse impacts to Southwestern willow flycatcher are minimized or avoided, and to document the success of project specific mitigation/protection measures. As monitoring is relatively undefined, project specific requirements must be identified.

8. BLM will properly consider nesting periods for Southwestern willow flycatcher when conducting horse gathering operations in the vicinity of habitat.

9. BLM will ensure that plans for water extraction and disposal are designed to avoid changes in the hydrologic regime that would likely result in loss or undue degradation of riparian habitat.

10. Native species will be preferred over non-native for revegetation of habitat in disturbed areas.

11. BLM will coordinate with other agencies and private landowners to identify voluntary opportunities to modify current land stewardship practices that may impact the Southwestern willow flycatcher and its habitats.

12. Limit disturbances to within suitable habitat by staying on designated routes.

13. Ground-disturbing activities will require monitoring throughout the duration of the project to ensure that adverse impacts to Southwestern willow flycatcher are avoided. Monitoring results should document what, if any, impacts to individuals or habitat occur during project construction/implementation. In addition, monitoring should document successes or failures of any impact minimization or mitigation measures. Monitoring results would be considered an opportunity for adaptive management and, as such, would be carried forward in the design and implementation of future projects.

14. Where technically and economically feasible, use directional drilling or multiple wells from the same pad to reduce surface disturbance and eliminate drilling in Southwestern willow flycatcher habitat.

15. Habitat disturbances (i.e., organized recreational activities requiring special use permits, drilling activities, etc.) will be avoided within 0.25 mile of suitable Southwestern willow flycatcher habitat from May 1 to August 15.

16. Grazing allotments that contain habitat for the species will be managed with consideration for recommendations provided by the Southwestern Willow Flycatcher Recovery Plan, and other applicable research.

POTENTIAL BEST MANAGEMENT PRACTICES

Best management practices (BMP) are those land and resource management techniques determined to be the most effective and practical means of maximizing beneficial results and minimizing conflicts and adverse environmental impacts of management actions. BMPs could include, but are not limited to, structural and nonstructural controls, specific operations, and maintenance procedures. BMPs can be applied before, during, and after activities to reduce or eliminate adverse environmental impacts. BMPs are not one-size-fits-all solutions. BMPs should be matched and adapted through interdisciplinary analysis to determine which management practices would be necessary to meet the goals and objectives in the Resource Management Plan (RMP). The actual practices and mitigation measures that are best for a particular site are evaluated through the site-specific National Environmental Policy Act (NEPA) process and vary to accommodate unique, site-specific and local resource conditions.

BMPs described in this appendix are designed to assist in achieving the RMP objectives. These guidelines could apply, where appropriate, to all use authorizations, including projects initiated by the Bureau of Land Management (BLM). BMPs are dynamic, and should not be interpreted as specific direction at the same level as the RMP decisions. BMPs are selected and implemented as necessary, based on site-specific conditions, to meet resource objectives for specific management actions.

This appendix does not provide an exhaustive list of BMPs. Additional BMPs may be identified during an interdisciplinary process when evaluating site-specific management actions. Implementation and effectiveness of BMPs must be monitored to determine whether the practices are achieving RMP goals and objectives. Adjustments could be made as necessary to ensure RMP goals and objectives are met, as well as to conform with changes in BLM regulations, policy, direction, or new scientific information. BMPs may also be updated as new technology emerges. In addition, applicants can suggest alternate conditions that could accomplish the same result.

Because the management of environmental impacts is an ongoing process, continual refinement of BMP design is necessary. This process can be described in these five steps: (1) selection of design of a specific BMP; (2) application of the BMP; (3) monitoring; (4) evaluation; and (5) feedback. Data gathered through monitoring is evaluated and used to identify changes needed in BMP design or application or in the monitoring program.

BMPs have been developed and used by numerous energy companies and state and federal agencies throughout the nation. BLM and other agencies are continually gathering and developing BMPs and sharing them, allowing for the application of years of experience. Development and sharing of BMPs represents a commitment to the idea that smart planning and responsible follow-through manage and in some cases reduce impacts to resources, both now and in the future. The BMPs developed by other agencies could be considered in addition to those identified in this document. Other BMPs include those contained in the following documents and websites:

- *Utah's Forest Water Quality Guidelines: A Practical User's Guide for Landowners, Loggers, and Resource Managers* (State of Utah, Department of Natural Resources, Division of Forestry, Fire and State Lands). As of September 2007, an electronic version of this document was available at http://extension.usu.edu/forestry/Management/UtFWQGuide/Assets/PDFDocs/UFWQGBOO.PDF.
- *Coalbed Methane Best Management Practices: A Handbook – 2006 Update* (Western Governors' Association). As of September 2007, an electronic version of this document was available at www.westgov.org/wga/initiatives/coalbed/.

- *Low-Volume Roads Engineering Best Management Practices Field Guide* (U.S. Forest Service). As of September 2007, an electronic version of this document was available at www.blm.gov/bmp/field%20guide.htm.
- *Water-Road Interaction Technology Series Documents* (U.S. Forest Service). As of September 2007, electronic versions of these documents were available at www.stream.fs.fed.us/water-road/.
- *National Menu of Stormwater Best Management Practices* (U.S. Environmental Protection Agency). As of September 2007, electronic versions of these documents were available at http://cfpub.epa.gov/npdes/stormwater/menuofbmps/index.cfm.
- *Technical Information Sheets: Specific and Detailed BMP Guidance* (Bureau of Land Management). As of September 2007, an electronic version of this document was available through hyperlinks at www.blm.gov/bmp/Technical_Information.htm.
- *Surface Operating Standards and Guidelines for Oil and Gas Exploration and Development: The Gold Book* (Bureau of Land Management). As of September 2007, an electronic version of this document was available through hyperlinks at www.blm.gov/bmp/Technical_Information.htm.

In addition, this appendix contains conservation measures identified jointly by the BLM and the U.S. Fish and Wildlife Service (USFWS) as needed to protect specific threatened or endangered species. These conservation measures are targeted to specific species and must be considered and applied as appropriate.

Surface Disturbing Activities

- Evaluate areas subject to surface disturbance for the presence of cultural resources or values. This is usually accomplished through the completion of a cultural clearance. An on-the-ground inspection by a qualified archaeologist, historian, or paleontologist is required. In cases where cultural resources are found, the preferred response would be to modify the proposed action to avoid the cultural resource (avoidance). If avoidance is not possible, actions would be taken to preserve the data or value represented by the cultural resource (mitigation).
- Evaluate areas subject to surface disturbance for the presence of threatened, endangered, or candidate animal or plant species. This is usually accomplished through the completion of a biological clearance. An on-the-ground inspection by a qualified biologist is required. In cases where threatened, endangered, or candidate species are affected, the preferred response would be to modify the proposed action to avoid species or their habitat (avoidance). If avoidance of a threatened, endangered, or candidate species or its habitat is not possible, a Section 7 consultation with USFWS would be required, and a biological assessment would be prepared to recommend actions to protect the species or its habitat.
- Consider requiring special design and reclamation measures to protect scenic and natural landscape values. These may include transplanting trees and shrubs, mulching and fertilizing disturbed areas, use of low-profile permanent facilities, and painting to minimize visual contrasts. Surface disturbing activities may be moved to avoid sensitive areas or to reduce the visual effects of the proposal.
- Design above-ground facilities requiring painting to blend in with the surrounding environment.
- Implement reclamation concurrent with construction and site operations to the extent possible. Final reclamation actions shall be initiated within 6 months of the termination of operations unless otherwise approved in writing by the authorized officer.
- Ensure fill material is pushed into cut areas and up over back slopes. Depressions should not be left that would trap water or form ponds.

Mineral Exploration and Development

- Reduce impacts to wildlife and visual resources by applying the following, as appropriate:

  - Directional drilling of oil and gas wells
  - Drilling of multiple wells from a single pad
  - Closed drilling systems
  - Cluster development
  - Below-ground wellheads
  - Remote well monitoring
  - Piping of produced liquids to centralized tank batteries off site to reduce traffic to individual wells
  - Transportation planning (e.g., to reduce road density and traffic volumes)
  - Compensatory mitigation
  - Noise reduction techniques and designs
  - Installation of raptor anti-perch devices in Greater sage-grouse habitat
  - Monitoring of wildlife populations during drilling operations
  - Avoidance of human activity between 8 p.m. and 8 a.m. from March 1 through May 15 within one-quarter mile of the perimeter of occupied Greater sage-grouse leks
  - Onsite bioremediation of oil field wastes and spills
  - Removal of trash, junk, waste, and other materials not in current use.
- Reclaim all disturbed surface areas promptly, performing concurrent reclamation as necessary, and minimize the total amount of all surface disturbance.
- Ensure all surface soil is stripped prior to conducting operations, stockpiled, and reapplied during reclamation, regardless of soil quality. Minimize the length of time soil remains in stockpiles and the depth or thickness of stockpiles.
- Strip and separate soil surface horizons where feasible and reapply in proper sequence during reclamation.
- Establish vegetation cover on soil stockpiles that are to be in place longer than 1 year.
- Construct and rehabilitate temporary roads to minimize total surface disturbance, consistent with intended use.
- Consider temporary measures such as silt fences, straw bales, or mulching to trap sediment in sensitive areas until reclaimed areas are stabilized with vegetation.
- Reshape to the approximate original contour all areas to be permanently reclaimed, providing for proper surface drainage.

Road Design and Maintenance

- Keep access roads to a minimum and use to only when necessary.
- Design roads to minimize total disturbance, conform with topography, and minimize disruption of natural drainage patterns.
- Locate roads on stable terrain, such as ridgetops; natural benches; and flatter transitional slopes near ridges, valley bottoms, and moderate sideslopes, and away from slumps, slide-prone areas, concave slopes, clay beds, and where rock layers dip parallel to the slope. Locate roads on well-drained soil types; avoid wet areas.
- Construct roads for surface drainage by using outslopes, crowns, grade changes, drain dips, waterbars, and/or insloping to ditches as appropriate. Maintain drain dips, waterbars, road crown, insloping, and outsloping, as appropriate, during road maintenance. Grade roads only as necessary.
- Sloping the road base to the outside edge for surface drainage is normally recommended for local spurs or minor collector roads where low traffic volume and lower traffic speeds are anticipated. This is also recommended in situations where long intervals between maintenance will occur and where minimum excavation is wanted. Outsloping is not recommended on steep slopes. Sloping the road base to the inside edge is an acceptable practice on roads with steep sideslopes and

where the underlying soil formation is very rocky and not subject to appreciable erosion or failure.

- Crown and ditching is recommended for arterial and collector roads where traffic volume, speed, intensity, and user comfort are considerations. Recommended gradients range from 0 percent to 15 percent where crown and ditching may be applied, as long as adequate drainage away from the road surface and ditch lines is maintained.
- In soil types with a low sand component, construct roads when soils are dry and not frozen, if possible. When these types of soils or road surfaces become saturated to a depth of three inches, BLM-authorized activities should be limited or cease unless otherwise approved by the authorized officer.
- Retain vegetation between roads and streams to filter runoff caused by roads.
- Use culverts that pass, at a minimum, a 50-year storm event and/or have a minimum diameter of 13 inches for permanent stream crossings and a minimum diameter of 18 inches for road cross-drains.
- Strip and stockpile topsoil ahead of construction of new roads, if feasible. Reapply soil to cut and fill slopes prior to revegetation.
- Use existing roads whenever possible rather than constructing new road systems.

Right-of-Way and Utility Corridors

- Ensure rights-of-way (ROW) and utility corridors use areas adjoining or adjacent to previously disturbed areas whenever possible.
- Stabilize disturbed areas within road ROWs and utility corridors with vegetation practices designed to hold soil in place and minimize erosion. Reestablish vegetation cover to increase infiltration and provide additional protection from erosion.
- Construct sediment barriers when needed to slow runoff, allow deposition of sediment, and prevent transport from the site. Straining or filtration mechanisms may also be employed for the removal of sediment from runoff.

Noxious Weed Management

- To reduce the potential for the introduction of noxious weeds, clean off all equipment with pressure washing prior to operating on BLM lands. Removal of all dirt, grease, and plant parts that may carry noxious weed seeds or vegetative parts is required and may be accomplished with a pressure hose.
- Ensure all seed, hay, straw, mulch, or other vegetation material transported and used on public land weed free zones for site stability, rehabilitation, or project facilitation is free of noxious weeds and noxious weed seed as certified by a qualified federal, state, or county officer.

Reducing Impacts to Visual Resource Management Class II and Class III Areas

- Bury distribution powerlines and flow lines in or adjacent to access roads.
- Use repetition of elements of form, line, color, and texture to blend facilities with the surrounding landscape.
- Paint all above-ground structures not requiring safety coloration an environmental color two shades darker than the surrounding environment.
- Reclaim and recontour all disturbed areas, including access roads, to the original contour or a contour that blends with the surrounding topography.
- Avoid facility placement on steep slopes, ridge tops, and hilltops.

- Reclaim unused well pads within 1 year.

Developed Recreation

- Construct recreation sites and provide appropriate sanitation facilities to minimize impacts to resource values, maximize public health and safety, and minimize user conflicts related to approved activities and access within an area as appropriate.
- Use public education and/or physical barriers (such as rocks, posts, and vegetation) to direct or preclude uses and to minimize impacts to resource values.

Riparian/Wetland Areas

- Avoid locating roads, trails, and landings in wetlands.
- Locate, identify, and mark riparian management areas during design of projects that may cause adverse impacts to riparian management areas.
- Keep open water free from slash.
- Avoid equipment operation in areas of open water, seeps, and springs.
- Use low ground pressure equipment (floatation tires or tracked) as necessary to minimize rutting and compaction.

Water Developments

- Actual work in springs and stream beds will be done by hand where possible. If machinery is needed in these areas, it will be selected to minimize disturbance.
- After construction of spring head boxes, troughs, pipelines, and well sites, the areas will be cleaned up and refuse removed.
- Cuts, fills, and excavations will be dressed and seeded to blend with surroundings. Pipelines will be buried where possible.
- Original water sources will be protected, fenced if required, and an off-stream watering supply will be provided near the site.
- Size of storage tanks and troughs will be designed to accommodate expected needs of livestock and wildlife using each water source.
- Water will be left at the site for wildlife. Wells will be cased to prevent cave-ins and well sites will be fenced.
- Storage structures will be designed to provide water for wildlife. Drinking ramps will be installed and heights will not prohibit young wildlife from obtaining water.

APPENDIX 15—BLM WIND ENERGY DEVELOPMENT PROGRAM POLICIES AND BEST MANAGEMENT PRACTICES
(FROM THE BLM'S WIND ENERGY DEVELOPMENT PROGRAM RECORD OF DECISION, 2005)

The Bureau of Land Management's (BLM) Wind Energy Development Program will establish a number of policies and best management practices (BMP), provided below, on developing wind energy resources on BLM-administered public lands. The policies and BMPs will apply to all wind energy development projects on BLM-administered public lands. The policies will address the administration of wind energy development activities, and the BMPs will identify required mitigation measures to be incorporated into project-specific Plans of Development (POD) and right-of-way (ROW) authorization stipulations. Additional mitigation measures will be applied to individual projects, in the form of stipulations in the ROW authorization as appropriate, to address site-specific and species-specific issues.

These policies and BMPs were formulated when the Final Wind Energy Programmatic Environmental Impact Statement (PEIS) (BLM 2005) was prepared. The PEIS included detailed, comprehensive analysis of the potential impacts of wind energy development and relevant mitigation measures; reviews of existing, relevant mitigation guidance; and reviews of comments received during scoping and public review of the Draft PEIS.

POLICIES

- BLM will not issue ROW authorizations for wind energy development on lands on which wind energy development is incompatible with specific resource values. Lands that will be excluded from wind energy site monitoring and testing and development include designated areas that are part of the National Landscape Conservation System (NLCS) (e.g., wilderness areas, wilderness study areas [WSA], national monuments, national conservation areas [NCA],[1] wild and scenic rivers, and national historic and scenic trails) and areas of critical environmental concern (ACEC).[2] Additional areas of land may be excluded from wind energy development based on findings of resource impacts that cannot be mitigated and/or that conflict with existing and planned multiple-use activities or land use plans.
- To the extent possible, wind energy projects shall be developed in a manner that will not prevent other land uses, including minerals extraction, livestock grazing, recreational use, and other ROW uses.
- Entities seeking to develop a wind energy project on BLM-administered lands shall consult with appropriate federal, state, and local agencies regarding specific projects as early in the planning process as appropriate to ensure that all potential construction, operation, and decommissioning issues and concerns are identified and adequately addressed.
- The BLM will initiate government-to-government consultation with Indian Tribal governments whose interests might be affected directly and substantially by activities on BLM-administered lands. This consultation will take place as early in the planning process as appropriate ensure that

[1] *Wind energy development is permitted in one NCA, the California Desert Conservation Area (CDCA), in accordance with the provisions of the* California Desert Conservation Area Plan 1980, as Amended *(BLM 1999).*

[2] *Although the Maximum Potential Development Scenario (MPDS) developed for this PEIS (Section 2.2.1 and Appendix B) did not exclude all of these lands at the screening level, they will be excluded from wind energy development.*

construction, operation, and decommissioning issues and concerns are identified and adequately addressed.

- Entities seeking to develop a wind energy project on BLM-administered lands, in conjunction with BLM Washington Office (WO) and Richfield Field Office (RFO) staff, will consult, as early in the planning process as appropriate, with the U.S. Department of Defense (DOD) regarding the location of wind power projects and turbine siting. This consultation will occur concurrently at both the Field Office (FO) level and the Pentagon/BLM WO level. An interagency protocol agreement is being developed to establish a consultation process and to identify the scope of issues for consultation. Lands withdrawn for military purposes are under the administrative jurisdiction of the DOD or a military service. The BLM does not issue wind energy authorizations for these lands.
- The BLM will consult with the U.S. Fish and Wildlife Service (USFWS) as required by Section 7 of the Endangered Species Act of 1973 (ESA). The specific consultation requirements will be determined on a project-by-project basis.
- The BLM will consult with the State Historic Preservation Office (SHPO) as required by Section 106 of the National Historic Preservation Act of 1966 (NHPA). The specific consultation requirements will be determined on a project-by-project basis. If programmatic Section 106 consultations have been conducted and are adequate to cover a proposed project, additional consultation may not be needed.
- Existing land use plans will be amended, as appropriate, to (1) adopt provisions of the BLM's Wind Energy Development Program, (2) identify land considered to be available for wind energy development, and (3) identify land that will not be available for wind energy development.
- The level of environmental analysis to be required under the National Environmental Policy Act (NEPA) for individual wind power projects will be determined at the FO level. For many projects, it may be determined that a tiered environmental assessment (EA) is appropriate in lieu of an environmental impact statement (EIS). To the extent that the PEIS addresses anticipated issues and concerns associated with an individual project, including potential cumulative impacts, the BLM will tier off of the decisions embedded in the PEIS and limit the scope of additional project-specific NEPA analyses. The site-specific NEPA analyses will include project site configuration analyses and micro-siting considerations, program requirements monitoring, and appropriate mitigation measures. In particular, the mitigation measures discussed in Chapter 5 of the PEIS may be consulted in determining site-specific requirements. Public involvement will be incorporated into all wind energy development projects to ensure that all concerns and issues are identified and adequately addressed. In general, the scope of the NEPA analyses will be limited to the proposed action on BLM-administered public lands. However, if access to proposed development on adjacent non-BLM-administered lands depends entirely on obtaining ROW access across BLM-administered public lands and no alternatives to that access exist, the NEPA analysis for the proposed ROW may need to assess the environmental effects from that proposed development. The BLM's analyses of ROW access projects may tier off of the PEIS to the extent that the proposed project falls within the scope of the PEIS analyses.
- Site-specific environmental analyses will tier from the PEIS and identify and assess any cumulative impacts that are beyond the scope of the cumulative impacts addressed in the PEIS.
- The Categorical Exclusion (CX) applicable to issuing short-term ROWs or land use authorizations may also apply to some site monitoring and testing activities. The relevant CX, established for the BLM in the Department of the Interior (DOI) Departmental Manual 516, Chapter 11, Sec. 11.5, E(19) (DOI 2004), encompasses "issuance of short-term (3 years or fewer) ROWs or land use authorizations for such uses as storage sites, apiary sites, and construction sites where the proposal includes rehabilitation to restore the land to its natural or original condition."
- The BLM will require financial bonds for all wind energy development projects on BLM-administered public lands to ensure compliance with the terms and conditions of the ROW authorization and the requirements of applicable regulatory requirements, including reclamation

costs. The amount of the required bond will be determined during the ROW authorization process based on site-specific and project-specific factors. The BLM may also require financial bonds for site monitoring and testing authorizations.

- Entities seeking to develop a wind energy project on BLM-administered public lands will develop a project-specific POD that incorporates all BMPs and, as appropriate, the requirements of other existing and relevant BLM mitigation guidance, including the BLM's interim offsite mitigation guidance (BLM 2005a). Additional mitigation measures will be incorporated into the POD and into the ROW authorization as project stipulations, as needed, to address site-specific and species-specific issues. The POD will include a site plan showing the locations of turbines, roads, power lines, other infrastructure, and other areas of short- and long-term disturbance.
- The BLM will incorporate management goals and objectives specific to habitat conservation for species of concern (e.g., sage grouse), as appropriate, into the POD for proposed wind energy projects.
- The BLM will consider the visual resource values of the public lands involved in proposed wind energy development projects, consistent with BLM Visual Resource Management (VRM) policies and guidance. The BLM will work with the ROW applicant to incorporate visual design considerations into the planning and design of the project to minimize potential visual impacts of the proposal and to meet the VRM objectives of the area.
- Operators of wind power facilities on BLM-administered public lands shall consult with the BLM and other appropriate federal, state, and local agencies regarding any planned upgrades or changes to the wind facility design or operation. Proposed changes of this nature may require additional environmental analysis and/or POD revision.
- The BLM's Wind Energy Development Program will incorporate adaptive management strategies to ensure that potential adverse impacts of wind energy development are avoided (if possible), minimized, or mitigated to acceptable levels. The programmatic policies and BMPs will be updated and revised as new data concerning the impacts of wind power projects become available. At the project level, operators will be required to develop monitoring programs to evaluate the environmental conditions at the site through all phases of development, to establish metrics against which monitoring observations can be measured, to identify potential mitigation measures, and to establish protocols for incorporating monitoring observations and additional mitigation measures into standard operating procedures and project-specific stipulations.

BEST MANAGEMENT PRACTICES

The BMPs will be adopted as required elements of project-specific PODs and/or as ROW authorization stipulations. They are categorized by development activity: site monitoring and testing, POD development, construction, operation, and decommissioning. The BMPs for POD development identify required elements of the POD needed to address potential impacts associated with subsequent phases of development.

Site Monitoring and Testing

- The area disturbed by installing meteorological towers (e.g., footprint) shall be kept to a minimum.
- Existing roads shall be used to the maximum extent feasible. If new roads are necessary, they shall be designed and constructed to the appropriate standard.
- Meteorological towers shall not be located in sensitive habitats or in areas where ecological resources known to be sensitive to human activities (e.g., sage grouse) are present. Installation of towers shall be scheduled to avoid disruption of wildlife reproductive activities or other important behaviors.

- Meteorological towers installed for site monitoring and testing shall be inspected periodically for structural integrity.

Plan of Development Preparation

General

- The BLM and operators shall contact appropriate agencies, property owners, and other stakeholders early in the planning process to identify potentially sensitive land uses and issues, administer rules that govern wind energy development locally, and address land use concerns specific to the region.
- Available information describing the environmental and sociocultural conditions in the vicinity of the proposed project shall be collected and reviewed as needed to predict potential impacts of the project.
- The Federal Aviation Administration (FAA)-required notice of proposed construction shall be made as early as possible to identify any air safety measures that would be required.
- To plan for efficient land use, necessary infrastructure requirements shall be consolidated wherever possible, and current transmission and market access shall be evaluated carefully.
- The project shall be planned to use existing roads and utility corridors to the maximum extent feasible, and to minimize the number and length/size of new roads, lay-down areas, and borrow areas.
- A monitoring program shall be developed to ensure that environmental conditions are monitored during the construction, operation, and decommissioning phases. The monitoring program requirements, including adaptive management strategies, shall be established at the project level to ensure that potential adverse impacts of wind energy development are mitigated. The monitoring program shall identify the monitoring requirements for each environmental resource present at the site, establish metrics against which monitoring observations can be measured, identify potential mitigation measures, and establish protocols for incorporating monitoring observations and additional mitigation measures into standard operating procedures and BMPs.
- "Good housekeeping" procedures shall be developed to ensure that during operation the site will be kept clean of debris, garbage, fugitive trash or waste, and graffiti; to prohibit scrap heaps and dumps; and to minimize storage yards.

Wildlife and Other Ecological Resources

- Operators shall review existing information on species and habitats in the vicinity of the project area to identify potential concerns.
- Operators shall conduct surveys for federal and/or state-protected species and other species of concern (including special status plant and animal species) within the project area and design the project to avoid (if possible), minimize, or mitigate impacts to these resources.
- Operators shall identify important, sensitive, or unique habitats in the vicinity of the project and design the project to avoid (if possible), minimize, or mitigate impacts to these habitats (e.g., locate the turbines, roads, and ancillary facilities in the least environmentally sensitive areas; e.g., away from riparian habitats, streams, wetlands, drainages, or critical wildlife habitats).
- The BLM will prohibit the disturbance of any population of federally listed plant species.
- Operators shall evaluate avian and bat use of the project area and design the project to minimize or mitigate the potential for bird and bat strikes (e.g., development shall not occur in riparian habitats and wetlands). Scientifically rigorous avian and bat use surveys shall be conducted; the amount and extent of ecological baseline data required shall be determined on a project basis.
- Turbines shall be configured to avoid landscape features known to attract raptors if site studies show that placing turbines there would pose a significant risk to raptors.

- Operators shall determine the presence of bat colonies and avoid placing turbines near known bat hibernation, breeding, and maternity/nursery colonies; in known migration corridors; or in known flight paths between colonies and feeding areas.
- Operators shall determine the presence of active raptor nests (e.g., raptor nests used during the breeding season). Measures to reduce raptor use at a project site (e.g., minimize road cuts, maintain either no vegetation or nonattractive plant species around the turbines) shall be considered.
- A habitat restoration plan shall be developed to avoid (if possible), minimize, or mitigate adverse impacts on vulnerable wildlife while maintaining or enhancing habitat values for other species. The plan shall identify revegetation, soil stabilization, and erosion reduction measures that shall be implemented to ensure all temporary use areas are restored. The plan shall require that restoration occur as soon as possible after completing the activities to reduce the amount of habitat converted at any one time and to speed up the recovery to natural habitats.
- Procedures shall be developed to mitigate potential impacts to special status species. Such measures could include avoidance, relocation of project facilities or lay-down areas, and/or relocation of biota.
- Facilities shall be designed to discourage their use as perching or nesting substrates by birds. For example, power lines and poles shall be configured to minimize raptor electrocutions and discourage raptor and raven nesting and perching.

Visual Resources

- The public shall be involved and informed about the visual site design elements of the proposed wind energy facilities. Possible approaches include conducting public forums for disseminating information, offering organized tours of operating wind developments, and using computer simulation and visualization techniques in public presentations.
- Turbine arrays and turbine design shall be integrated with the surrounding landscape. Design elements to be addressed include visual uniformity, use of tubular towers, proportion and color of turbines, nonreflective paints, and prohibition of commercial messages on turbines.
- Other site design elements shall be integrated with the surrounding landscape. Elements to address include minimizing the profile of the ancillary structures, burying cables, prohibiting commercial symbols, and using lighting. Regarding lighting, efforts shall be made to minimize the need for and amount of lighting on ancillary structures.

Roads

- An access road siting and management plan shall be prepared incorporating existing BLM standards regarding road design, construction, and maintenance, such as those described in the BLM 9113 Manual (BLM 1985) and the Surface Operating Standards for Oil and Gas Exploration and Development (RMRCC 1989) (e.g., the Gold Book).

Ground Transportation

- A transportation plan shall be developed, particularly for transporting turbine components, main assembly cranes, and other large pieces of equipment. The plan shall consider specific object sizes, weights, origin, destination, and unique handling requirements and shall evaluate alternative transportation approaches. In addition, the process to comply with unique state requirements and to obtain all necessary permits shall be clearly identified.
- A traffic management plan shall be prepared for the site access roads to ensure that no hazards would result from the increased truck traffic and that traffic flow would not be adversely impacted. This plan shall incorporate measures such as informational signs, flaggers when

equipment may result in blocked throughways, and traffic cones to identify any necessary changes in temporary lane configuration.

Noise

- Proponents of a wind energy development project shall take measurements to assess the existing background noise levels at a given site and compare them with the anticipated noise levels associated with the proposed project.

Noxious Weeds and Pesticides

- Operators shall develop a plan for controlling noxious weeds and invasive species, which could occur from new surface disturbance activities at the site. The plan shall address monitoring, educate personnel on weed identification, consider the manner in which weeds spread, and identify methods for treating infestations. The use of certified weed-free mulching shall be required. If trucks and construction equipment are arriving from locations with known invasive vegetation problems, a controlled inspection and cleaning area shall be established to visually inspect construction equipment arriving at the project area and to remove and collect seeds that may be adhering to tires and other equipment surfaces.
- If pesticides are used onsite, an integrated pest management plan shall be developed to ensure that applications would be conducted within the framework of BLM and DOI policies and entail only the use of Environmental Protection Agency (EPA)-registered pesticides. Pesticide use shall be limited to nonpersistent, immobile pesticides and shall be applied only in accordance with label and application permit directions and stipulations for terrestrial and aquatic applications.

Cultural/Historic Resources

- The BLM will consult with Indian Tribal governments early in the planning process to identify issues regarding the proposed wind energy development, including issues related to the presence of cultural properties, access rights, disruption of traditional cultural practices, and impacts to visual resources important to the tribe(s).
- The presence of archaeological sites and historic properties in the area of potential effect shall be determined based on a records search of recorded sites and properties in the area and/or, depending on the extent and reliability of existing information, an archaeological survey. Archaeological sites and historic properties present in the area of potential effect shall be reviewed to determine whether they meet the criteria of eligibility for listing on the National Register of Historic Places (NRHP).
- When any ROW application includes remnants of a National Historic Trail, is located within the viewshed of a National Historic Trail's designated centerline, or includes or is within the viewshed of a trail eligible for listing on the NRHP, the operator shall evaluate the potential visual impacts to the trail associated with the proposed project and identify appropriate mitigation measures for inclusion as stipulations in the POD.
- If cultural resources are present at the site, or if areas with a high potential to contain cultural material have been identified, a cultural resources management plan (CRMP) shall be developed. This plan shall address mitigation activities to be taken for cultural resources found at the site. Avoidance of the area is always the preferred mitigation option. Other mitigation options include archaeological survey and excavation (as warranted) and monitoring. If an area exhibits a high potential, but no artifacts were observed during an archaeological survey, monitoring by a qualified archaeologist could be required during all excavation and earthmoving in the high-potential area. A report shall be prepared documenting these activities. The CRMP also shall (1) establish a monitoring program, (2) identify measures to prevent potential looting/vandalism or

erosion impacts, and (3) address the education of workers and the public to make them aware of the consequences of unauthorized collection of artifacts and destruction of property on public land.

Paleontological Resources

- Operators shall determine whether paleontological resources exist in a project area based on the sedimentary context of the area, a records search for past paleontological finds in the area, and/or, depending on the extent of existing information, a paleontological survey.
- If paleontological resources are present at the site or if areas with a high potential to contain paleontological material have been identified, a paleontological resources management plan shall be developed. This plan shall include a mitigation plan for collecting the fossils; mitigation could include avoidance, removal of fossils, or monitoring. If an area exhibits a high potential but no fossils were observed during survey, monitoring by a qualified paleontologist could be required during all excavation and earthmoving in the sensitive area. A report shall be prepared documenting these activities. The paleontological resources management plan also shall (1) establish a monitoring program, (2) identify measures to prevent potential looting/vandalism or erosion impacts, and (3) address the education of workers and the public to make them aware of the consequences of unauthorized collection of fossils on public land.

Hazardous Materials and Waste Management

- Operators shall develop a hazardous materials management plan addressing storage, use, transportation, and disposal of each hazardous material anticipated to be used at the site. The plan shall identify all hazardous materials that would be used, stored, or transported at the site. It shall establish inspection procedures, storage requirements, storage quantity limits, inventory control, nonhazardous product substitutes, and disposition of excess materials. The plan shall also identify requirements for notices to federal and local emergency response authorities and include emergency response plans.
- Operators shall develop a waste management plan identifying the waste streams that are expected to be generated at the site. The plan shall address hazardous waste determination procedures, waste storage locations, waste-specific management and disposal requirements, inspection procedures, and waste minimization procedures. It shall also address all solid and liquid wastes that may be generated at the site.
- Operators shall develop a spill prevention and response plan identifying where hazardous materials and wastes are stored on site, determining spill prevention measures to be implemented, implementing training requirements, defining appropriate spill response actions for each material or waste, identifying the locations of spill response kits on site, using a procedure for ensuring that the spill response kits are adequately stocked at all times, and executing procedures for making timely notifications to authorities.

Storm Water

- Operators shall develop a storm water management plan for the site to ensure compliance with applicable regulations and prevent offsite migration of contaminated storm water or increased soil erosion.

Human Health and Safety

- A safety assessment shall be conducted to describe potential safety issues and the means that would be taken to mitigate them. These issues include site access, construction, safe work

practices, security, heavy equipment transportation, traffic management, emergency procedures, and fire control.

- A health and safety program shall be developed to protect both workers and the general public during construction, operation, and decommissioning of a wind energy project. Regarding occupational health and safety, the program shall identify all applicable federal and state occupational safety standards; establish safe work practices for each task (e.g., requirements for personal protective equipment and safety harnesses; Occupational Safety and Health Administration [OSHA] standard practices for using explosives and blasting agents; and measures for reducing occupational electric and magnetic fields [EMF] exposures); establish fire safety evacuation procedures; and define safety performance standards (e.g., electrical system standards and lightning protection standards). The program shall include a training program to identify hazard training requirements for workers for each task and establish procedures for providing required training to all workers. Documentation of training and a mechanism for reporting serious accidents to appropriate agencies shall be established.
- Regarding public health and safety, the health and safety program shall establish a safety zone or setback for wind turbine generators from residences and occupied buildings, roads, ROWs, and other public access areas that is sufficient to prevent accidents resulting from operating wind turbine generators. The program shall identify requirements for temporary fencing around staging areas, storage yards, and excavations during construction or decommissioning activities. It shall also identify measures to be taken during the operation phase to limit public access to hazardous facilities (e.g., permanent fencing would be installed only around electrical substations, and turbine tower access doors would be locked).
- Operators shall consult with local planning authorities regarding increased traffic during the construction phase. This consultation shall include an assessment of the number of vehicles per day, their size, and type. Specific issues of concern (e.g., location of school bus routes and stops) shall be identified and addressed in the traffic management plan.
- If operating the wind turbines is expected to cause significant adverse impacts to nearby residences and occupied buildings from shadow flicker, low-frequency sound, or EMF, site-specific recommendations for addressing these concerns shall be incorporated into the project design (e.g., establishing a sufficient setback from turbines).
- The project shall be planned to minimize electromagnetic interference (EMI) (e.g., impacts to radar, microwave, television, and radio transmissions) and comply with Federal Communications Commission (FCC) regulations. Signal strength studies shall be conducted when proposed locations have the potential to impact transmissions. Potential interference with public safety communication systems (e.g., radio traffic related to emergency activities) shall be avoided.
- The project shall be planned to comply with FAA regulations, including lighting regulations, and to avoid potential safety issues associated with proximity to airports, military bases or training areas, or landing strips.
- Operators shall develop a fire management strategy to implement measures to minimize the potential for a human-caused fire.

Construction

General

- All control and mitigation measures established for the project in the POD and the resource-specific management plans that are part of the POD shall be maintained and implemented throughout the construction phase, as appropriate.
- The area disturbed by construction and operation of a wind energy development project (e.g., footprint) shall be kept to a minimum.

- The number and size/length of roads, temporary fences, lay-down areas, and borrow areas shall be minimized.
- Topsoil from all excavations and construction activities shall be salvaged and reapplied during reclamation.
- All areas of disturbed soil shall be reclaimed using weed-free native grasses, forbs, and shrubs. Reclamation activities shall be undertaken as early as possible on disturbed areas.
- All electrical collector lines shall be buried in a manner that minimizes additional surface disturbance (e.g., along roads or other paths of surface disturbance). Overhead lines may be used in cases where burying lines would result in further habitat disturbance.
- Operators shall identify unstable slopes and local factors that can induce slope instability (such as groundwater conditions, precipitation, earthquake activities, slope angles, and the dip angles of geologic strata). Operators also shall avoid creating excessive slopes during excavation and blasting operations. Special construction techniques shall be used, where applicable, in areas of steep slopes, erodible soil, and stream channel crossings.
- Erosion controls that comply with county, state, and federal standards shall be applied. Practices such as jute netting, silt fences, and check dams shall be applied near disturbed areas.

Wildlife

- Guy wires on permanent meteorological towers shall be avoided; however, they may be necessary on temporary meteorological towers installed during site monitoring and testing.
- In accordance with the habitat restoration plan, restoration shall be undertaken as soon as possible after completing construction activities to reduce the amount of habitat converted at any one time and to speed up the recovery to natural habitats.
- All construction employees shall be instructed to avoid harassment and disturbance of wildlife, especially during reproductive (e.g., courtship and nesting) seasons. In addition, pets shall not be permitted onsite during construction.

Visual Resources

- Operators shall reduce visual impacts during construction by minimizing areas of surface disturbance, controlling erosion, using dust suppression techniques, and restoring exposed soils as closely as possible to their original contour and vegetation.

Roads

- Existing roads shall be used, but only if in safe and environmentally sound locations. If new roads are necessary, they shall be designed and constructed to the appropriate standard and be no higher than necessary to accommodate their intended functions (e.g., traffic volume and weight of vehicles). Excessive grades on roads, road embankments, ditches, and drainages shall be avoided, especially in areas with erodible soils. Special construction techniques shall be used, where applicable. Abandoned roads and roads that are no longer needed shall be recontoured and revegetated.
- Access roads and onsite roads shall be surfaced with aggregate materials wherever appropriate.
- Access roads shall be located to follow natural contours and minimize side hill cuts.
- Roads shall be located away from drainage bottoms and avoid wetlands, if practicable.
- Roads shall be designed so that changes to surface water runoff are avoided and erosion is not initiated.
- Access roads shall be located to minimize stream crossings. All structures crossing streams shall be located and constructed so that they do not decrease channel stability or increase water velocity. Operators shall obtain all applicable federal and state permits.

- Existing drainage systems shall not be altered, especially in sensitive areas such as erodible soils or steep slopes. Potential soil erosion shall be controlled at culvert outlets with appropriate structures. Catch basins, roadway ditches, and culverts shall be cleaned and maintained regularly.

Ground Transportation

- Project personnel and contractors shall be instructed and required to adhere to speed limits commensurate with road types, traffic volumes, vehicle types, and site-specific conditions. This adherence ensures safe and efficient traffic flow and reduces wildlife collisions and disturbance and airborne dust.
- Traffic shall be restricted to the roads developed for the project. Use of other unimproved roads shall be restricted to emergency situations.
- Signs shall be placed along construction roads to identify speed limits, travel restrictions, and other standard traffic control information. To minimize impacts on local commuters, consideration shall be given to limiting construction vehicles traveling on public roadways during the morning and late afternoon commute times.

Air Emissions

- Dust abatement techniques shall be used on unpaved, unvegetated surfaces to minimize airborne dust.
- Speed limits (e.g., 25 mph [40 km/h]) shall be posted and enforced to reduce airborne fugitive dust.
- Construction materials and stockpiled soils shall be covered if they are a source of fugitive dust.
- Dust abatement techniques shall be used before and during surface clearing, excavation, or blasting activities.

Excavation and Blasting Activities

- Operators shall gain a clear understanding of the local hydrogeology. Areas of groundwater discharge and recharge and their potential relationships with surface water bodies shall be identified.
- Operators shall avoid creating hydrologic conduits between two aquifers during foundation excavation and other activities.
- Foundations and trenches shall be backfilled with originally excavated material as much as possible. Excess excavation materials shall be disposed of only in approved areas or, if suitable, stockpiled for use in reclamation activities.
- Borrow material shall be obtained only from authorized and permitted sites. Existing sites shall be used in preference to new sites.
- Explosives shall be used only within specified times and at specified distances from sensitive wildlife or streams and lakes, as established by the BLM or other federal and state agencies.

Noise

- Noisy construction activities (including blasting) shall be limited to the least noise-sensitive times of day (e.g., between 7:00 a.m. and 10:00 p.m.) and shall be restricted to weekdays only.
- All equipment shall have sound-control devices no less effective than those provided on the original equipment. All construction equipment used shall be adequately muffled and maintained.
- All stationary construction equipment (e.g., compressors and generators) shall be located as far as practicable from nearby residences.

- If blasting or other noisy activities are required during the construction period, nearby residents shall be notified in advance.

Cultural and Paleontological Resources

- Unexpected discovery of cultural or paleontological resources during construction shall be brought to the attention of the responsible BLM Authorized Officer immediately. Work shall be halted in the vicinity of the find to avoid further disturbance to the resources while they are being evaluated and appropriate mitigation measures are being developed.

Hazardous Materials and Waste Management

- Secondary containment shall be provided for all onsite hazardous materials and waste storage, including fuel. In particular, fuel storage (for construction vehicles and equipment) shall be a temporary activity occurring only for as long as needed to support construction activities.
- Wastes shall be containerized properly and removed periodically for disposal at appropriate offsite permitted disposal facilities.
- In the event of an accidental release to the environment, the operator shall document the event, including a root cause analysis, appropriate corrective actions taken, and a characterization of the resulting environmental or health and safety impacts. Documentation of the event shall be provided to the BLM Authorized Officer and other federal and state agencies, as required.
- Any wastewater generated in association with temporary, portable sanitary facilities shall be removed periodically by a licensed hauler and introduced into an existing municipal sewage treatment facility. Temporary, portable sanitary facilities provided for construction crews shall be adequate to support expected onsite personnel and shall be removed once construction activities are completed.

Public Health and Safety

- Temporary fencing shall be installed around staging areas, storage yards, and excavations during construction to limit public access.

Operation

General

- All control and mitigation measures established for the project in the POD and the resource-specific management plans that are part of the POD shall be maintained and implemented throughout the operational phase, as appropriate. These control and mitigation measures shall be reviewed and revised, as needed, to address changing conditions or requirements at the site throughout the operational phase. This adaptive management approach would help ensure that impacts from operations are kept to a minimum.
- Inoperative turbines shall be repaired, replaced, or removed in a timely manner. Requirements to do so shall be incorporated into the due diligence provisions of the ROW authorization. Operators will be required to demonstrate due diligence in the repair, replacement, or removal of turbines; failure to do so could result in terminating ROW authorization.

Wildlife

- Employees, contractors, and site visitors shall be instructed to avoid harassment and disturbance of wildlife, especially during reproductive (e.g., courtship and nesting) seasons. In addition, any pets shall be controlled to avoid harassment and disturbance of wildlife.
- Observations of potential wildlife problems, including wildlife mortality, shall be reported to the BLM Authorized Officer immediately.

Ground Transportation

- Ongoing ground transportation planning shall be conducted to evaluate road use, minimize traffic volume, and ensure that roads are maintained adequately to minimize associated impacts.

Monitoring Program

- Site monitoring protocols defined in the POD shall be implemented. These protocols will incorporate monitoring program observations and additional mitigation measures into standard operating procedures and BMPs to minimize future environmental impacts.
- Results of monitoring program efforts shall be provided to the BLM Authorized Officer.

Public Health and Safety

- Permanent fencing shall be installed and maintained around electrical substations, and turbine tower access doors shall be locked to limit public access.
- In the event an installed wind energy development project results in EMI, the operator shall work with the owner of the impacted communications system to resolve the problem. Additional warning information may also need to be conveyed to aircraft with onboard radar systems so that echoes from wind turbines can be quickly recognized.

Decommissioning

General

- Prior to terminating the ROW authorization, the BLM shall develop and approve a decommissioning plan. The decommissioning plan shall include a site reclamation plan and monitoring program.
- All management plans, BMPs, and stipulations developed for the construction phase shall be applied to similar activities during the decommissioning phase.
- All turbines and ancillary structures shall be removed from the site.
- Topsoil from all decommissioning activities shall be salvaged and reapplied during final reclamation.
- All areas of disturbed soil shall be reclaimed using weed-free native shrubs, grasses, and forbs.
- The vegetation cover, composition, and diversity shall be restored to values commensurate with the ecological setting.

APPENDIX 16—SUMMARY OF MANAGEMENT OF NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS FOR THE RICHFIELD FIELD OFFICE PROPOSED RMP/FINAL EIS

Appendix 16 summarizes the management decisions for non-Wilderness Study Area (WSA) lands with wilderness characteristics to be included in the Richfield Field Office (RFO) Proposed Resource Management Plan/Final Environmental Impact Statement (PRMP/FEIS). It also includes a discussion of the interdisciplinary process that occurred before these decisions were made.

Twenty-nine non-WSA lands with wilderness characteristic units were proposed for wilderness characteristic management and analyzed within Alternative D of the PRMP/FEIS. (For more information about these 29 units, see Chapter 3 of the Draft RMP/EIS.) BLM staff reviewed the units and weighed the considerations of the wilderness characteristic values and the ability to manage and protect these values. Other resources and resource uses were considered, as were existing conflicts between resource uses. Proposed decisions within the RFO Proposed RMP that would provide alternative ways of protecting the wilderness characteristic values were also reviewed. Based on that review, portions of 12 of the 29 non-WSA lands with wilderness characteristics units (78,600 acres) would be managed for wilderness characteristic values and would be carried forward in the RFO PRMP/FEIS (Table A16-1).

Table A16-1. Non-WSA Lands with Wilderness Characteristics

Non-WSA Lands With Wilderness Characteristics Unit	County	Acres Found to Possess Wilderness Characteristics	Acres Proposed for Special Management of Wilderness Characteristic Values
Dirty Devil/French Spring	Garfield Wayne	133,100	6,100
Dogwater Creek	Garfield	3,500	3,100
Horseshoe Canyon South	Wayne	20,600	12,200
Jones Bench	Sevier	3,300	2,600
Labyrinth Canyon	Wayne	12,300	2,800
Little Rockies	Garfield	23,200	9,500
Mount Ellen-Blue Hills	Garfield Wayne	49,800	3,900
Mount Pennell	Garfield	65,600	4,700
Notom Bench	Wayne	8,000	8,200
Ragged Mountain	Garfield	25,900	7,900
Red Desert	Wayne	40,700	8,900
Wild Horse Mesa	Wayne	49,700	8,700
Total		**435,700**	**78,600**

PROPOSED MANAGEMENT PRESCRIPTIONS FOR NON-WSA LANDS WITH WILDERNESS CHARACTERISTICS CARRIED FORWARD IN THE PROPOSED RMP/FINAL EIS

The following management prescriptions would apply to the wilderness characteristics areas carried forward in the PRMP/FEIS. These prescriptions were developed to protect wilderness values, while allowing other resource uses as appropriate. These management prescriptions also would be consistent with other BLM Field Offices in southern Utah and with the Price Field Office (PFO), which shares management of one of the non-WSA units.

- Designate as Visual Resource Management (VRM) Class II
- Limit motorized use to designated routes
- Retain lands in public ownership
- Designate as an Avoidance Area for rights-of-way (ROW)
- Designate leasing category as no surface occupancy (NSO), no exceptions, waivers, or modifications
- Close to mineral material sales
- Designate as unavailable for further consideration for coal leasing
- Continue maintenance and use of existing facilities
- Prohibit private or commercial woodland harvest or seed collection
- Healthy Lands Initiative projects could be considered where they improve the overall goals and objectives for managing the wilderness characteristics of these areas.

Non-WSA Lands With Wilderness Characteristics Units to be Managed for Wilderness Characteristic Values

Dirty Devil/French Spring

There are 6,100 acres within the Dirty Devil/French Spring Non-WSA Lands with Wilderness Characteristics unit, directly adjacent to the Dirty Devil WSA, which would be managed for wilderness characteristic values.

The Dirty Devil/French Spring unit consists of many sub-parcels adjacent to the Dirty Devil and Happy Canyon/French Spring WSAs. The non-WSA parcels chosen for wilderness characteristics management are located on the northern portion of the unit between the WSA and motorized ways used for accessing the area. Management for wilderness characteristics would complement the WSA and overall management of the area. The routes provide not only easily recognizable boundaries for the sub-parcels but also extra protection from intrusions into the WSA.

Manageability issues and resource conflicts were identified within the remainder of the unit, which would make these areas more suitable for multiple-use management. Routes and state/private lands within the sub-parcels further segment areas and result in some areas that are not contiguous to the WSA. Some of the sub-parcels include a higher density of range developments and routes (150 miles of inventoried routes occur within this unit). Types of disturbances include allotment and riparian protection fencing, livestock troughs, water tanks, catchments, reservoirs, corrals, trend plots, seismic disturbances, overlooks, trailheads, dispersed camping locations, and other soil disturbances near routes (possibly related to road maintenance). Continued use and maintenance of these existing resources could detract from the wilderness experience expected by visitors, creating conflict between users. Portions of the unit, which include active mineral leases (23 percent) and claims, have been identified as having high potential

for minerals. New uranium drilling projects have been occurring in the southern portion of the area (Poison Springs) since 2007. Twenty-four state sections and one private parcel would be contained within the non-WSA lands with wilderness characteristics unit or become isolated between the WSA and the unit.

Decisions proposed in the Proposed RMP for other resources or values would provide additional protection for the portions of the Dirty Devil/French Spring unit managed for multiple use. There would be 38,700 acres designated as VRM Class II. This designation would retain the characteristic landscape, allowing for only minor changes to the landform and vegetation. Motorized use within the unit would be limited to designated routes on 105,600 acres and closed on the remaining 27,500 acres. There were 61,392 acres of this unit identified for avoidance or exclusion of ROWs. Oil and Gas Leasing would be allowed with minor constraints on 47,600 acres, restricted to NSO on 56,500 acres, and there would be no acres closed within the unit. Management actions pertaining to the Canyonlands Herd Management Area (HMA) would continue to present opportunities for viewing wild burros, which is often associated with primitive recreation experiences.

Dogwater Creek

There are 3,100 acres of the Dogwater Creek unit (Southern parcel), adjacent to Capitol Reef National Park (CRNP), which would be managed for wilderness characteristic values. The access route to the Sand Cove Reservoir would be designated as a motorized route within the unit and future maintenance of the reservoir authorized.

The Dogwater Creek unit consists of two separate parcels, which are adjacent to CRNP lands administratively endorsed for wilderness. The southern parcel was chosen for management of wilderness characteristics. The only developments identified in this unit are a reservoir with access via a two-track route. These developments, which were not noticed during the inventory phase, would continue to be unnoticeable within the unit, Management for wilderness characteristics would complement the management that the National Park Service (NPS) proposed.

Manageability issues and resource conflicts with private lands were identified within the remainder of the unit (northern parcel), which would make this area more suitable for multiple-use management. The parcel is bordered on three sides by private property, and access to the parcel is controlled by the private property owner. BLM would have no control over future disturbances on the private property and its effects to the wilderness characteristic values.

Decisions proposed in the Proposed RMP for other resources or values would provide additional protection for the portions of the Dogwater Creek unit managed for multiple use. The area would be designated as VRM Class II. Motorized use within the unit would be limited to designated routes. Oil and Gas Leasing would be allowed with minor constraints.

Horseshoe Canyon South

There are 12,200 acres of this unit, adjacent to Horseshoe Canyon South WSA, Horseshoe Canyon NPS and/or Glen Canyon National Recreation Area (NRA) units that would be managed for wilderness characteristic values. The three trailhead access routes for the Horseshoe Canyon NPS unit would be designated for motorized use, and the facilities at the main trailhead would continue to be managed through a general agreement between the BLM and NPS.

The Horseshoe Canyon unit consists of sub-parcels around the perimeter of the Horseshoe Canyon WSA. The parcels chosen for management of wilderness characteristics are located in the northern portion of the

unit. These parcels are also adjacent to NPS areas administratively endorsed for wilderness (Horseshoe Canyon Unit of Canyonlands NP and Glen Canyon NRA). Management for wilderness characteristics would complement the overall WSA and NPS management of this northern portion of the unit. The trailhead access routes and county maintained roads provide easily recognizable boundaries for the parcels.

Manageability issues and resource conflicts were identified within the remainder of the unit, which would make these areas more suitable for multiple-use management. Potential conflicts present include access to state land, Section 4 structures at Granary Spring, fencing, and a reservoir. Routes and state lands within the sub-parcels further segment areas and result in some areas that are not contiguous to the WSA. Western portions of the unit are adjacent to a County B road, pertinent to access to the Hans Flat Ranger Station and NPS lands. This road has become entrenched from decades of grading. Future road maintenance may include crowning and providing for proper drainage to prevent further entrenching. Wilderness characteristics management directly adjacent to the road may result in conflicts with those maintenance needs. The sub-parcels occurring between the county maintained road and the WSA also provide opportunities for dispersed camping and staging for hiking, "canyoneering," and horse use trips into the WSA. As interest and use of the area increases, use of these undeveloped sites will become more important for providing for camping and staging areas a safe distance from the main county road.

Decisions proposed in the Proposed RMP for other resources or values would provide additional protection for the portions of the Horseshoe Canyon South unit managed for multiple use. There would be 3,600 acres designated as VRM Class II. Motorized use within the unit would be limited to designated routes on 20,500 acres and closed on the remaining 100 acres. There were 3,606 acres of this unit identified for avoidance or exclusion of ROWs. Oil and Gas Leasing would be allowed with minor constraints on 7,100 acres and restricted to NSO on 13,500 acres of the unit. Management actions pertaining to the Canyonlands HMA would continue to provide opportunities for viewing of wild burros, which is often associated with primitive recreation experiences.

Jones Bench

There are 2,600 acres of the Jones Bench unit, adjacent to CRNP, which would be managed for wilderness characteristic values.

The Jones Bench unit shares its southern boundary with CRNP lands administratively endorsed for wilderness. A cherry-stemmed route providing access to CRNP occurs in the western portion of the unit and the Rock Spring pipeline bisects the northeastern portion of the unit. The majority of the unit, which occurs between these disturbances, is adjacent to CRNP and management for wilderness characteristics would complement the management proposed by the NPS.

The remainder of the unit would be managed for multiple use, including continued access to Forest Service lands to the west of the unit.

Decisions proposed in the Proposed RMP for other resources or values would provide additional protection for the portions of the Jones Bench unit managed for multiple use. Motorized use within the unit would be limited to designated routes. Oil and Gas Leasing with minor constraints would apply to 600 acres and restricted to NSO on 2,500 acres of the unit.

Labyrinth Canyon

There are 2,800 acres of the Labyrinth Canyon unit within the RFO, adjacent to Horseshoe Canyon North WSA and the Horseshoe Canyon NPS unit, which would be managed for wilderness characteristic values.

The Labyrinth Canyon unit consists of sub-parcels around the perimeter of the Horseshoe Canyon North WSA. The parcel chosen for management of wilderness characteristics is located in the southern portion of the unit and is adjacent to the WSA and/or the Horseshoe Canyon Unit of Canyonlands NP, which is administratively endorsed for wilderness. Management for wilderness characteristics would complement the overall WSA and NPS management of this portion of the unit.

The two remaining sub-parcels located within the RFO extend into BLM PFO administered lands. Management considerations were made for consistency with management decisions of the PFO. Establishing easily recognizable boundaries along the Emery/Wayne County line would be unfeasible and lead to confusion and conflict with wilderness characteristics management along the county line. Other considerations weighed for these sub-parcels included the size of the remaining western sub-parcel and high mineral potential within the eastern sub-parcel.

Decisions proposed in the Proposed RMP for other resources or values would provide additional protection for the portions of the Labyrinth Canyon unit managed under multiple use. Motorized use within the unit would be limited to designated routes. Oil and Gas Leasing would be allowed with minor constraints.

Little Rockies

There are 9,500 acres within the Little Rockies unit, directly adjacent to the Little Rockies WSA, which would be managed for wilderness characteristic values.

The Little Rockies unit consists of four separate parcels adjacent to the Little Rockies WSA. The areas chosen for management of wilderness characteristics are in the northern, second, and southern parcels of the unit. Boundaries have been adjusted to exclude intrusions, except for two routes, one north of Maidenwater Canyon and one originating from the southern boundary, that would be designated for motorized use to allow continued access for grazing management. Management for wilderness characteristics would complement the WSA and overall management of the area.

Manageability issues and resource conflicts were identified within the remainder of the unit, which would make these areas more suitable for multiple use management. Routes and state lands within the sub-parcels further segment areas and result in some areas that are not contiguous to the WSA. Types of disturbances are seismic lines, reservoirs, rain gauge, a spring development, rip rap pit, old uranium disturbances and vehicle-based camping. Continued use and maintenance of these existing resources could detract from the wilderness experience expected by visitors, creating conflict among users. The unit has been identified as having high potential for minerals. Uranium mining activities occur directly across Highway 276 from the third parcel (Del Monte Mine, Tony M Mine), and there is potential for conflicts with uranium development in this area. There are four state sections within the non-WSA lands with wilderness characteristics unit.

Decisions proposed in the Proposed RMP for other resources or values would provide additional protection for the portions of the Little Rockies unit managed for multiple use. There would be 16,900 acres designated as VRM Class II. Motorized use within the unit would be limited to designated routes. Oil and Gas Leasing with minor constraints would apply to 4,100 acres and restricted to NSO on 9,500 acres of the unit.

Mount Ellen-Blue Hills

There are 3,900 acres (three parcels) within the Mount Ellen-Blue Hills unit, directly adjacent to the Mount Ellen-Blue Hills WSA, which would be managed for wilderness characteristic values.

The Mount Ellen-Blue Hills unit consists of many sub-parcels adjacent to the Mount Ellen-Blue Hills WSA. The parcels chosen for management of wilderness characteristics include all northern and southern parcels and an area east of the Birch Creek access. Management for wilderness characteristics would complement the WSA and overall management of the area.

Manageability issues and resource conflicts were identified within the remainder of the unit, making these areas more suitable for multiple-use management. Routes and state lands within the sub-parcels further segment areas and result in some areas that are not contiguous to the WSA. Some of the sub-parcels include a higher density of range developments and routes (30 miles of inventoried routes and 9.91 miles of cherry-stemmed routes occur within this area). Types of disturbances include numerous fences, spring developments with pipelines and troughs, corrals, reservoirs, erosion control structures, and mining-related disturbances, and the western parcel is heavily used in support of commercial Special Recreation Permit (SRP) activities. Continued use and maintenance of these existing resources could detract from the wilderness experience expected by visitors, creating conflict among users. Portions of the unit include active mineral claims and have been identified as having high potential for minerals. There are seven state sections that would be contained within the non-WSA lands with wilderness characteristics unit or become isolated between the WSA and the unit.

Decisions proposed in the Proposed RMP for other resources or values would provide additional protection for the portions of the Mount Ellen-Blue Hills unit managed for multiple use. There would be 16,800 acres designated as VRM Class II. Motorized use within the unit would be limited to designated routes on 49,400 acres and closed on the remaining 400 acres. There were 2,261 acres of this unit identified for avoidance or exclusion of ROWs. Oil and Gas Leasing would be allowed with minor constraints on 18,000 acres and restricted to NSO on 4,100 acres of the unit.

Mount Pennell

There are 4,700 acres within the Mount Pennell unit, directly adjacent to the Mount Pennell WSA, which would be managed for wilderness characteristic values.

The Mount Pennell unit consists of several sub-parcels adjacent to the Mount Pennell WSA. The areas chosen for management of wilderness characteristics consist of six parcels adjacent to the WSA south of Tarantula Mesa. Management for wilderness characteristics would complement the WSA and overall management of the area.

Manageability issues and resource conflicts were identified within the remainder of the unit, which would make these areas more suitable for multiple-use management. Routes and state/private lands within the sub-parcels further segment areas and result in some areas that are not contiguous to the WSA. Some sub-parcels include a higher density of range developments and routes (31 miles of routes and additional miles of cherry-stemmed routes occur within this area). Types of disturbances are fencing, a proposed cattleguard, pipeline, reservoirs, erosion check dams, and habitat projects, which have been identified for retreatment and expansion, and the northwestern portion of the unit is heavily used in support of commercial SRP activities. Continued use and maintenance of these existing resources could detract from the wilderness experience expected by visitors, creating conflict between users. The unit has been identified as having high potential for minerals and recent uranium drilling projects have been occurring just to the east and south of the southern parcel. There are 10 state sections and two private parcels that would be contained within the non-WSA lands with wilderness characteristics unit or become isolated between the WSA and the unit.

Decisions proposed in the Proposed RMP for other resources or values would provide additional protection for the portions of the Mount Pennell unit managed for multiple use. There would be 13,000

acres designated as VRM Class II. Motorized use within the unit would be limited to designated routes. There were 2,309 acres of this unit identified for avoidance or exclusion of ROWs. Oil and Gas Leasing would be allowed with minor constraints on 44,200 acres and restricted to NSO on 4,600 acres of the unit.

Notom Bench

There are 8,200 acres within the Notom Bench non-WSA lands with wilderness characteristics unit, adjacent to the CRNP, which would be managed for wilderness characteristic values.

The Notom Bench unit consists of four separate parcels, which are adjacent to CRNP lands administratively endorsed for wilderness. All but the southern parcel would be managed for wilderness characteristics values. Routes would be designated to retain access to the Cottonwood Wash state section and the Oak Creek trailhead. As per coordination with Wayne County and CRNP, the user created route in Burro Wash would remain closed. Portions of the eastern boundary of these parcels follow the Notom Road and/or the powerline ROW. A 1,000-foot buffer would be afforded for the utility corridor along the Notom Road and powerline ROW.

Decisions proposed in the Proposed RMP for other resources or values would provide additional protection for the southern parcel of the Notom Bench unit. The parcel would be designated as VRM Class II. Motorized use within the unit would be limited to designated routes for administrative uses. Access to the parcel is restricted by the private land owner. Oil and Gas Leasing would be allowed with minor constraints on the unit.

Ragged Mountain

There are 7,900 acres within the Ragged Mountain unit, which would be managed for wilderness characteristic values.

The Ragged Mountain unit is a stand-alone unit located within the Henry Mountains range. New boundaries were identified that would provide for management of the wilderness characteristic values within the northwestern portion of the unit.

Manageability issues and resource conflicts were identified within the south and eastern portions of the unit that would make these areas more suitable for multiple-use management. Routes and a state section further segment the eastern portion of the unit. Types of disturbances are a BLM communication tower, spring development, protection fences, new catchments, and “chainings” related to the 2003 Bulldog Fire rehabilitation project. The western portion of the unit is heavily encroached by pinyon/juniper and is being considered for a fuels reduction project. Continued use and maintenance of these existing resources could detract from the wilderness experience expected by visitors, creating conflict among users. Portions of the unit include active mineral claims, and the unit has been identified as having high potential for minerals. The southeastern and eastern portions of the unit have an extensive network of historic mining roads related to uranium activities and gold exploration along Crescent Creek. New uranium drilling has been occurring and additional activity is proposed for these areas. One state section is located in the eastern portion of the unit.

Decisions proposed in the Proposed RMP for other resources or values would provide additional protection for the portions of the Ragged Mountain unit managed for multiple use. There would be 15,700 acres designated as VRM Class II. Motorized use within the unit would be limited to designated routes. There were 15,735 acres of this unit identified for avoidance or exclusion of ROWs. Oil and Gas Leasing would be allowed with minor constraints on 16,500 acres and restricted to NSO on 7,900 acres of the unit.

Red Desert

There are 8,900 acres within the Red Desert unit, adjacent to the CRNP, which would be managed for wilderness characteristic values.

The Red Desert unit consists of sub-parcels located between the Hartnet or Cathedral Valley roads and the CRNP boundary. The adjacent CRNP lands are administratively endorsed for wilderness. All of the sub-parcels adjacent to CRNP that are north of Highway 24 would be managed for wilderness characteristic values. Routes would be designated to retain access to CRNP lands at Temple of the Sun, Temple of the Moon, and Jailhouse Rock. Portions of the southern boundary of the sub-parcel adjacent to the Fremont River have been adjusted to exclude the power line for the communities of Hanksville and Caineville. A 1,000-foot buffer would be afforded for the utility corridor along this power line ROW.

The remainder of the Red Desert unit consists of one sub-parcel south of Highway 24 and the BLM lands bordered by the Hartnet Road, Highway 24, and the Cathedral Valley road. Manageability issues and resource conflicts were identified within these portions of the unit, which would make these areas more suitable for multiple-use management. Routes and state lands further segment these portions of the unit. Types of disturbances include reservoirs, vehicle camping spurs along the Cathedral Valley and Hartnet Roads, Fremont River gauging station, a proposed bentonite sale area, rain gauge, study exclosure, corrals, fencing, mining-related disturbances, well sites, culinary well and pipeline for the community of Caineville, a material stockpile area, new ROW to private property, and a pioneer cemetery. Many routes and camp areas are heavily used in support of commercial SRP activities. Continued use and maintenance of these existing resources could detract from the wilderness experience expected by visitors, creating conflict between users. Four state sections are located within the unit.

Decisions proposed in the Proposed RMP for other resources or values would provide additional protection for the portions of the Red Desert unit managed for multiple use. There would be 10,100 acres designated as VRM Class II. Motorized use within the unit would be limited to designated routes. Oil and Gas Leasing would be allowed with minor constraints.

Wild Horse Mesa

There are 8,700 acres of the Wild Horse Mesa unit within the RFO, which would be managed for wilderness characteristic values, consistent with management proposed by the PFO.

The Wild Horse Mesa unit is a stand-alone unit located partially within the RFO and partially within the PFO. New boundaries were identified to allow for a portion of the area to be managed for wilderness characteristic values consistently with the area proposed by the PFO. The identified routes on Big Wild Horse Mesa, which provide access to range improvements, would be designated for continued motorized use.

Manageability issues and resource conflicts were identified within the remainder of the RFO portion of the Wild Horse Mesa unit, which would make this area more suitable for multiple-use management. Routes and state lands further segment this portion of the unit. The unit includes 43 miles of inventoried routes, plus additional GPS routes identified during inventories conducted in preparation for the Draft RMP/EIS. Types of disturbances are fences, dispersed camp sites, stock ponds and reservoirs, mining related disturbances, and a guzzler. Continued use and maintenance of these existing resources could detract from the wilderness experience expected by visitors, creating conflict between users. Portions of the unit include active mineral leases and claims, and the unit has been identified as having high potential for minerals. There has been recent uranium interest and drilling occurring in the southern portion of the

unit since summer 2007. Six state sections are located within the unit, including one that is leased for the Mars Experiment Station.

Decisions proposed in the Proposed RMP for other resources or values would provide additional protection for the portions of the Wild Horse Mesa unit managed for multiple use. There would be 18,200 acres designated as VRM Class II. Motorized use within the unit would be limited to designated routes. Three acres of this unit were identified for avoidance or exclusion of ROWs. Oil and Gas Leasing with minor constraints would apply to 2,300 acres and restricted to NSO on 8,800 acres of the unit..

Non-WSA Lands With Wilderness Characteristics Units to be Managed for Multiple Use

BLM staff reviewed the following units and weighed the considerations of the wilderness characteristic values, as well as the ability to manage and protect these values. Other resources and resource uses were considered, as were existing conflicts between resource uses. Proposed decisions within the RFO Proposed RMP that would provide alternative ways of protecting the wilderness characteristic values were also reviewed. Based on these factors, the following non-WSA lands with wilderness characteristic units would be managed for multiple use.

The following proposed decisions would provide similar protection to all the non-WSA lands with wilderness characteristic units. Proposed decisions for riparian protection zones would protect the naturalness of those areas. Decisions for the allocation of cultural sites to scientific, public, conservation, and traditional and experimental uses would increase knowledge of cultural resources and enhance opportunities for primitive forms of recreation. Protection of cultural resources adds to the character of the setting that supports these recreational opportunities. Strategies that would be employed for avoiding or reducing fragmentation of special status species habitat (e.g., collocating communication and other facilities, employing directional drilling for oil and gas, and closing and reclaiming roads) would help consolidate surface disturbing activities and protect additional acres from loss of naturalness. Site-specific decisions that would provide management protection such as VRM Class and off-highway vehicle (OHV) designations, ROW avoidance/exclusion areas, and Oil and Gas Leasing categories are addressed individually for the units.

Bull Mountain

Manageability issues and resource conflicts were identified within the Bull Mountain unit, which would make this area more suitable for multiple-use management. Two reservoirs are within the unit and mining disturbances in and adjacent to the unit. Access to one of the reservoirs and portions of the mining disturbances were cherry stemmed out of the unit during inventory. The unit has been identified as having high potential for minerals; based on past activities, future mineral interest is likely. Areas within and adjacent to the Bull Mountain WSA and this non-WSA lands with wilderness characteristics unit contain chaining projects. The portions of the projects outside the WSA were maintained in 2002. The non-WSA lands with wilderness characteristics unit would isolate a state section between the unit and the WSA with no identified access. The Bull Mountain unit would continue to be managed for multiple use, including potential for mineral development and future access to state land.

Decisions proposed in the Proposed RMP for other resources or values would provide management protection for portions of the Bull Mountain unit. There would be 65 acres designated as VRM Class II. This designation would retain the characteristic landscape, allowing for only minor changes to the landform and vegetation. Motorized use within the unit would be limited to designated routes. There were

72 acres of this unit identified for avoidance or exclusion of ROWs. Oil and Gas Leasing with minor constraints would apply to 2,800 acres of the unit.

Bullfrog Creek

Manageability issues and resource conflicts were identified within the Bullfrog Creek unit, which would make this area more suitable for multiple-use management. Routes and state lands segment this stand-alone unit, creating sub-parcels that would reduce manageability for wilderness characteristic values. The area includes 21 miles of inventoried routes and 5.35 miles of cherry-stemmed routes. Types of disturbances are a spring development, reservoirs, drill hole, overlook, a gravel pit, and petrified wood collection area. Continued use and maintenance of these existing resources could detract from the wilderness experience expected by visitors, creating conflict among users. The unit has been identified as having high potential for minerals and is adjacent to the Tony M/Ticaboo uranium mining and milling projects. Uranium prospecting has occurred in the unit as reflected by the existing mining routes and adits, and future mineral interest is likely. Three state sections are located within the unit, two of which would be isolated with no identified access. Because of the proximity to the existing Ticaboo uranium projects and existing previous mining activity within the unit, the Bullfrog Creek unit would continue to be managed for multiple use, including potential for mineral development and future access to state land.

Fiddler Butte

Manageability issues and resource conflicts were identified within the Fiddler Butte unit, which would make this area more suitable for multiple-use management. Routes and state lands segment this unit, creating sub-parcels that would reduce manageability for wilderness characteristic values. Types of disturbances are spring developments and reservoirs with existing access and a corral. Numerous locations along the Poison Spring road are being used for dispersed vehicle camping with spur routes for access. Continued use and maintenance of these existing resources could detract from the wilderness experience expected by visitors, creating conflict among users. The unit has been identified as having high potential for minerals. Recent uranium drilling has been occurring adjacent to the Poison Spring road, including maintenance of access routes. Some previous mining activities are still noticeable. One state section is located within the unit, and one state section would be isolated between the Fiddler Butte WSA and the non-WSA lands with wilderness characteristics unit. The Fiddler Butte unit would continue to be managed for multiple use, including potential for mineral development, grazing administration, motorized recreational opportunities, and future access to state land.

Decisions proposed in the Proposed RMP for other resources or values would provide management protection for portions of the Fiddler Butte unit. There would be 11,000 acres of the unit designated as VRM Class II. Motorized use within the unit would be limited to designated routes. Oil and Gas Leasing with minor constraints would apply to 10,900 acres of the unit.

Flat Tops

Manageability issues and resource conflicts were identified within the Flat Tops unit, which would make this area more suitable for multiple-use management. The unit is partially located within the RFO, but extends into BLM PFO administered lands. Management considerations were made for consistency with the management decisions of the PFO to continue to manage this unit for multiple use. Routes and state lands within the RFO portion of the unit, create sub-parcels that would reduce manageability for wilderness characteristic values. Types of disturbances include allotment fences, ponds, seismic routes in various stages of rehabilitation, drill holes, and an equipment loading ramp. Continued use and maintenance of these existing resources could detract from the wilderness experience expected by visitors, creating conflict between users. The unit has been identified as having high potential for minerals

and 92 percent of the unit is currently leased. Three state sections are located within the unit. As a result of mineral potential and leases occurring within the unit, the Flat Top unit would continue to be managed for multiple use, including potential for mineral development and future access to state lands.

Fremont Gorge

Manageability issues and resource conflicts were identified within the Fremont Gorge unit, which would make this area more suitable for multiple-use management. Types of disturbances are numerous dispersed vehicle camping areas, reservoirs, study plot, wood cutting activities, sandstone quarry locations, mining disturbances, and chaining projects. The Parker Mountain Management Framework Plan (MFP) identified this area for wood products and in accordance with the MFP, this area has been the only area available for wood product sales on BLM lands within Wayne County, West of CRNP. Continued use and maintenance of these existing resources could detract from the wilderness experience expected by visitors, creating conflict among users. The unit has been identified as having high potential for minerals. Uranium mining has occurred in the past, and portions of the area are covered by copper claims. A Community Wildfire Protection Plan has been completed for Central Wayne County. The plan proposes fuels reduction treatments in Wildland Urban Interface (WUI) areas on private, state, Forest Service, and BLM lands within 1.5 miles of communities at risk. Two of the communities included in this plan are Torrey and Grover, which are located along the Western side of the unit. The Fremont Gorge unit would continue to be managed for multiple use, including potential for mineral development and WUI activities.

Decisions proposed in the Proposed RMP for other resources or values would provide management protection for portions of the Fremont Gorge unit. There would be 2,200 acres designated as VRM Class II. Management of the suitable Fremont Gorge wild and scenic river would provide protection from surface disturbance along the river corridor. Motorized use within the unit would be limited to designated routes on 14,500 acres and closed within 1,500 acres of the unit. There were 1,485 acres of this unit identified for avoidance or exclusion of ROWs. Oil and Gas Leasing would be allowed with minor constraints on 14,500 acres and restricted to NSO on 1,500 acres of the unit.

Kingston Ridge

Manageability issues and resource conflicts were identified within the Kingston Ridge unit, which would make this area more suitable for multiple-use management. Routes and state lands segment this unit, creating sub-parcels that would reduce manageability for wilderness characteristic values. Types of disturbances include fencing, spring, and pipeline developments. Continued use and maintenance of these existing resources could detract from the wilderness experience expected by visitors, creating conflict between users. Two state sections are located within the unit. The Kingston Ridge unit would continue to be managed for multiple use, including potential for mineral development, grazing administration, and future access to state land.

Decisions proposed in the Proposed RMP for other resources or values would provide management protection for portions of the Kingston Ridge unit. There would be 100 acres designated as VRM Class II. Motorized use within the unit would be limited to designated routes. Oil and Gas Leasing would be allowed with minor constraints.

Limestone Cliffs

Manageability issues and resource conflicts were identified within the Limestone Cliffs unit, which would make this area more suitable for multiple-use management. The unit is partially located within the RFO, but extends into BLM PFO administered lands. Management considerations were made for consistency with the management decisions of the PFO to continue to manage this unit for multiple use. Routes and

state/private lands segment this unit, creating sub-parcels that would reduce manageability for wilderness characteristic values. Inventories identified 17 miles of routes and 3.02 miles of cherry-stemmed routes within the area. Types of disturbances include allotment fencing, reservoirs, pipelines and storage, a Section 4 cabin, study exclosure, livestock trailing, and camping and mining disturbances. Continued use and maintenance of these existing resources could detract from the wilderness experience expected by visitors, creating conflict between users. The unit has been identified as having high potential for minerals. Two private parcels occur within the unit, along with associated fencing, water systems, and development. The Limestone Cliffs unit would continue to be managed for multiple use, including future access and infrastructure for private lands, potential for mineral development, and grazing administration.

Decisions proposed in the Proposed RMP for other resources or values would provide management protection for portions of the Limestone Cliffs unit. Motorized use within the unit would be limited to designated routes. Oil and Gas Leasing with minor constraints would occur on 24,700 acres of the unit.

Long Canyon

Manageability issues and resource conflicts were identified within the Long Canyon unit, which would make this area more suitable for multiple-use management. Routes segment this unit, creating sub-parcels, which would reduce manageability for wilderness characteristic values. Types of disturbances include reservoirs and the Halls Creek trailhead, which includes picnic tables, trailhead information, and dispersed vehicle camping sites. The Halls Creek Trailhead is and would continue to be managed under a memorandum of understanding with CRNP. Continued use and maintenance of these existing resources could detract from the wilderness experience expected by visitors, creating conflict between users. The unit has been identified as having high potential for minerals. Two state sections are isolated within the unit with no identified access. The Long Canyon unit would continue to be managed for multiple use, including potential for mineral development, grazing administration, and motorized access to recreational opportunities.

Mount Hillers

Manageability issues and resource conflicts were identified within the Mount Hillers unit, which would make this area more suitable for multiple-use management. The unit has been identified as having high potential for minerals. The northeastern portion of the parcel contains an extensive network of mining routes from previous uranium mining activities. The RFO has received drilling proposals north of this unit and expect to receive similar proposals to the south. The Mount Hillers unit would continue to be managed for multiple use, including potential for mineral development.

Decisions proposed in the Proposed RMP for other resources or values would provide management protection for the Mount Hillers unit. There would be 1,200 acres designated as VRM Class II. Motorized use within the unit would be limited to designated routes. There were 1,236 acres of this unit identified for avoidance or exclusion of ROWs. Oil and Gas Leasing would be allowed with minor constraints on 500 acres and restricted to NSO on 1,300 acres of the unit.

Muddy Creek/Crack Canyon

Manageability issues and resource conflicts were identified within the Muddy Creek/Crack Canyon unit, which would make this area more suitable for multiple-use management. The unit is partially located within the RFO, but the majority of the unit is located within BLM PFO administered lands. Management considerations were made for consistency with the management decisions of the PFO. The PFO would continue to manage the portion of unit adjacent to the RFO for multiple use. Routes and state lands segment this unit (31 miles of inventoried routes) creating sub-parcels that would reduce manageability

for wilderness characteristic values. Types of disturbances include reservoirs, mining-related disturbances, vehicle camping spurs along the Cathedral Valley Road and many routes, and camp areas are heavily used in support of commercial SRP activities. Portions of this unit near Factory Butte are proposed as a managed open area for motorized use with supporting infrastructure. Managing the adjacent areas for wilderness characteristics would create an expectation from non-motorized users that would likely create conflicts between them and motorized users. The unit has been identified as having high potential for minerals, and gypsum and uranium mining activities have occurred in the past. Seven state sections are located within the unit, two of which would be isolated with no identified access. The Muddy Creek/Crack Canyon unit would continue to be managed for multiple use, including motorized recreation opportunities, potential for mineral development, and future access to state land.

Decisions proposed in the Proposed RMP for other resources or values would provide management protection for portions of the Muddy Creek/Crack Canyon unit. There would be 8,100 acres designated as VRM Class II. Motorized use would be limited to designated routes on 50,352 acres and closed within 4,700 acres of the unit. Management prescriptions for the North Caineville Mesa Area of Critical Environmental Concern (ACEC) would provide protection for that portion of the unit. There were 3,840 acres of this unit identified for avoidance or exclusion of ROWs. Oil and Gas Leasing would be allowed with minor constraints on 10,400 acres and restricted to NSO on 3,800 acres of the unit.

Mussentuchit Badlands

The Mussentuchit Badlands unit is partially located within the RFO, but the majority of the unit is located within BLM PFO administered lands. Management considerations were made for consistency with the management decisions of the PFO. The PFO would continue to manage the portion of the unit adjacent to the RFO for multiple use. Therefore, the portion of the unit within the RFO would also be managed for multiple use.

Decisions proposed in the Proposed RMP for other resources or values would provide management protection for portions of the Mussentuchit Badlands unit. Motorized use within the unit would be limited to designated routes. Oil and Gas Leasing with minor constraints would apply to 100 acres of the unit.

Phonolite Hill

Manageability issues and resource conflicts were identified within the Phonolite Hill unit, which would make this area more suitable for multiple-use management. Routes and state lands segment this unit, creating sub-parcels that would reduce manageability for wilderness characteristic values. Types of disturbances are a cabin, mining-related disturbances, spring developments and protection fencing, allotment fencing, and a pipeline. Continued use and maintenance of these existing resources could detract from the wilderness experience expected by visitors, creating conflict between users. One state section is located within the unit. The Phonolite Hill unit would continue to be managed for multiple use, including grazing administration and access to state land.

Decisions proposed in the Proposed RMP for other resources or values would provide management protection for portions of the Phonolite Hill unit. There would be 1,000 acres designated as VRM Class II. Motorized use within the unit would be limited to designated routes. Oil and Gas Leasing would be allowed with minor constraints within the unit.

Pole Canyon/Hunter Spring

Manageability issues and resource conflicts were identified within the Pole Canyon/Hunter Spring unit, which would make this area more suitable for multiple-use management. Routes, some of which provide

access to Forest Service lands, segment the unit (13 miles of inventoried routes) creating sub-parcels that would reduce manageability for wilderness characteristic values. Types of disturbances are fencing, a communication tower, springs, and the culinary water pipeline for the Town of Antimony. Continued use and maintenance of these existing resources could detract from the wilderness experience expected by visitors, creating conflict between users. The Pole Canyon/Hunter Spring unit would continue to be managed for multiple use, including access to Forest Service lands and maintenance of the Antimony culinary water pipeline.

Decisions proposed in the Proposed RMP for other resources or values would provide management protection for portions of the Pole Canyon/Hunter Spring unit. Motorized use within the unit would be limited to designated routes. Oil and Gas Leasing would be allowed with minor constraints.

Rock Canyon

The Rock Canyon unit is partially located within the RFO, but the majority of the unit is located within BLM PFO administered lands. Management considerations were made for consistency with the management decisions of the PFO. The PFO would continue to manage the portion of the unit adjacent to the RFO for multiple use. Therefore, the portion of the unit within the RFO would also be managed for multiple use.

Decisions proposed in the Proposed RMP for other resources or values would provide management protection for portions of the Rock Canyon unit. Motorized use within the unit would be limited to designated routes. Oil and Gas Leasing with minor constraints would apply to 500 acres of the unit.

Rocky Ford

Manageability issues and resource conflicts were identified within the Rocky Ford unit, which would make this area more suitable for multiple-use management. Routes, including access to private lands, segment this unit creating sub-parcels that would reduce manageability for wilderness characteristics values. Types of disturbances include spring developments, pipelines to troughs, reservoirs, and mining related disturbance. Continued use and maintenance of these existing resources could detract from the wilderness experience expected by visitors, creating conflict between users. The Rocky Ford unit would continue to be managed for multiple use, including grazing administration and continued access to private land.

Decisions proposed in the Proposed RMP for other resources or values would provide management protection for portions of the Rocky Ford unit. There would be 400 acres designated as VRM Class II. Motorized use within the unit would be limited to designated routes. Oil and Gas Leasing would be allowed with minor constraints.

Sweetwater Reef

The Sweetwater Reef unit is partially located within the RFO, but the majority of the unit is located within BLM PFO administered lands. Management considerations were made for consistency with the PFO's management decisions. The PFO would continue to manage the portion of the unit adjacent to the RFO for multiple use. Therefore, the portion of the unit within the RFO also would be managed for multiple use. Manageability issues and resource conflicts were identified within the Sweetwater unit, which would make this area more suitable for multiple-use management. Types of disturbances are routes, range developments, and allotment fencing. The unit has been identified as having high potential for minerals and current leases are held within the unit. One state section is located within the RFO portion of the unit with no identified access.

Wildcat Knolls

Manageability issues and resource conflicts were identified within the Wildcat Knolls unit, which would make this area more suitable for multiple-use management. The Wildcat Knolls unit is partially located within the PFO, with the majority of this unit within the RFO. Coordination with the PFO indicated that they have a pending ROW application that would affect the lands within the PFO portion of the unit. The unit has been identified as having high potential for minerals and because of its proximity to existing mining operations, future interest for minerals development is likely. One state section is located within the unit with no identified access. The Wildcat Knolls unit would continue to be managed for multiple use, including potential for mineral development and future access to state land.

Decisions proposed in the Proposed RMP for other resources or values would provide management protection for portions of the Wildcat Knolls unit. Motorized use within the unit would be limited to designated routes. Oil and Gas Leasing with minor constraints would apply to 5,900 acres of the unit.

APPENDIX 17—UTAH PUBLIC LANDS STUDY: KEY SOCIAL SURVEY FINDINGS FOR GARFIELD, PIUTE, SANPETE, SEVIER, AND WAYNE COUNTIES

Utah State University conducted a statewide social survey in 2007 to assess the ways in which Utah residents use and value public land resources, and their views about public land management. Random samples of residential households were selected in each of the state's 29 counties. Sampled households were contacted by mail, and a randomly selected adult from the household was asked to participate in the survey. The university distributed self-completion questionnaires to potential survey participants using a multiple-wave survey administration procedure. The discussion that follows is focused on key survey results obtained for Garfield County (n=125 survey responses), Piute County (n=28), Sanpete County (n=133), Sevier County (n=139) and Wayne County (n= 41).[1]

The State of Utah Public Lands Policy Coordination Office has asked that BLM refer readers to its website at http://governor.utah.gov/publiclands where it posts updated State of Utah socioeconomic information from time to time. The BLM does not participate in collecting or compiling this information. For purposes of this PRMP/FEIS, BLM has only relied on information specifically cited in the PRMP/FEIS text and included in this Appendix.

ECONOMIC LINKAGES TO PUBLIC LANDS

One major focus of the survey questionnaire involved assessing the various ways in which Utah residents engage in economic activities that are linked directly or indirectly to public land resources in the state.

Permit-Based Economic Activities

As indicated in Table A17-1, a minority of survey respondents in each of the five counties considered in this summary reported that a portion of their household income is directly linked to activities that involve permitted uses of lands or resources administered by the U.S. Forest Service (USFS), the Bureau of Land Management (BLM), other federal agencies, or the State of Utah. The percentage of respondents indicating that some portion of their household income is derived from such permit-based activities was higher for each of the agency categories in Garfield, Piute, and Wayne counties than was the case in either Sevier County or Sanpete County. In Garfield and Piute counties, approximately one-fourth of the respondents indicated that a portion of their household income is linked to permitted activities that occur on lands administered by USFS. In Garfield, Piute, and Wayne counties, approximately one-fifth of respondents reported that household income is linked to activities that occur on BLM lands.

[1] *The numbers of respondents for Piute and Wayne counties are small in part because the commercial firm that provided random samples of residential mailing addresses for the statewide survey was able to identify only 92 potentially valid residential addresses in Piute County and 145 in Wayne County. In addition, 30 of the questionnaire packets that were mailed to addresses included in the Piute County sample and 62 of those mailed to addresses in Wayne County were returned as undeliverable. As a result of these unexpectedly small sample sizes, results for Piute and Wayne counties should be interpreted cautiously.*

Table A17-1. Percentage of survey respondents reporting that a portion of household income is directly linked to permitted use of public lands or resources.

Agency	Garfield County	Piute County	Sanpete County	Sevier County	Wayne County
USFS	22.4%	25.9%	7.5%	14.5%	17.1%
BLM	20.0%	18.5%	4.5%	11.6%	19.5%
Other federal agency	9.6%	7.4%	3.0%	1.5%	7.3%
State of Utah	11.2%	16.0%	4.5%	7.3%	12.5%

The figures reported in Table A17-2 represent the percentages of respondents reporting these types of permit-based economic linkages to public lands who indicated that 25 percent or more of their total household income is derived from those activities. In each of the five counties, substantial proportions of the respondents who reported involvement in permitted activities indicated that a quarter or more of their household incomes is linked to activities permitted by one or more federal or state land management agencies. Such levels of economic dependence on permitted activities were highest for Garfield County respondents, who reported permitted activities on lands administered by "other federal agencies" and USFS; among Piute County respondents who reported use of state lands; among Sanpete County respondents who reported use of BLM, other federal agency, and state lands; among Sevier County respondents who use USFS, state, or other federal agency lands; and among Wayne County respondents who engage in permitted uses of USFS, other federal agency, or state lands.

Table A17-2. Percentage of survey respondents reporting permit-based economic activities on public lands, who indicated that 25 percent or more of their household income is derived from those activities.

Agency	Garfield County	Piute County	Sanpete County	Sevier County	Wayne County
USFS	42.9%	14.3%	40.0%	68.4%	85.7%
BLM	32.0%	20.0%	50.0%	43.7%	37.5%
Other federal agency	66.7%	0.0%	50.0%	50.0%	75.0%
State of Utah	21.4%	50.0%	50.0%	60.0%	60.0%

Household Participation in Selected Commercial Activities

The next series of questions asked respondents to indicate whether they or members of their households participate in any of a number of commercial activities that are commonly associated with public land use, but can involve the use of either public or private lands. Results summarized in Table A17-3 indicate that only a minority of survey respondents in each of the five counties reported participation in any of these activities. Among Garfield County respondents, the activities reported most frequently were livestock grazing and related work (23.4% of respondents) and commercial firewood cutting (19.4%). In Piute County, participation was reported most frequently for livestock grazing and related work (29.6%) and commercial firewood cutting (25.0%). In Sanpete County, the activity reported most frequently was livestock grazing and related work (11.3%). In Sevier County, respondents most frequently reported

participation in mining coal, uranium, or other minerals (14.6%). In Wayne County, the activities reported most frequently were livestock grazing and related work (12.2%) and other miscellaneous commercial activities (19.4%).

Table A17-3. Percentage of survey respondents reporting that they or members of their households participate in selected resource-based commercial activities, on either public or private lands.

Economic Activity	Garfield County	Piute County	Sanpete County	Sevier County	Wayne County
Livestock grazing and related work	23.4%	29.6%	11.3%	8.8%	12.2%
Commercial firewood cutting	19.4%	25.0%	8.3%	8.0%	4.9%
Logging, post and pole cutting, or other timber-related work	8.9%	10.7%	2.3%	7.3%	7.3%
Mining coal, uranium, or other solid minerals	0.8%	7.1%	2.3%	14.6%	0.0%
Mining sand, gravel, or other construction materials	2.4%	3.6%	2.3%	5.8%	4.9%
Oil and gas exploration and development	2.4%	0.0%	4.5%	4.4%	0.0%
Operating an outfitting or guiding business	5.7%	0.0%	0.0%	2.2%	0.0%
Film making/commercial photography	0.8%	0.0%	2.3%	2.2%	0.0%
Other commercial activities	5.2%	4.8%	5.5%	2.4%	19.4%

Household Involvement in Businesses Linked to Recreation/Tourism

Survey respondents were also asked whether they or any member of their household operate or work in a business linked to recreation or tourism activity that is influenced by the presence of public lands and resources. The percentages of respondents who said “yes” to this question were highest in Wayne County (51.3%), in Garfield County (40.3%), and in Piute County (33.3%). Substantially lower percentages of respondents from Sevier (8.1%) and Sanpete (5.3%) counties indicated this type of economic linkage for their households. Respondents were also asked to assess how important activities and uses linked to public lands are to the success of this business. Among respondents who reported household involvement in such businesses, the proportions who said that the influence of public lands is “extremely important” to that business were 64.0% in Garfield County, 66.7% in Piute County, 44.4% in Sanpete County, 36.4% in Sevier County, and 75.0% in Wayne County.

Household Involvement in Businesses Linked to Commodity Production

A similar question asked about the involvement of survey participants and members of their households in businesses that provide services and supplies to farming or ranching operations, logging firms, or other commercial enterprises that use or process natural resources located on public lands. The percentage of

respondents reporting participation by a household member in such businesses was relatively low in each of the five counties: 13.8% in Garfield County, 22.2% in Piute County, 11.4% in Sanpete County, 7.3% in Sevier County, and 23.1% in Wayne County.

Ownership of Property or Assets With Values Influenced by Nearby Public Lands

When asked whether they own land, buildings, or other assets that they believe have a monetary value that is significantly influenced by the presence and condition of nearby public lands, 54.9% of respondents in Garfield County, 74.1% in Piute County, 22.7% in Sanpete County, 28.7% in Sevier County, and 61.5% in Wayne County said "yes." Those who did perceive the existence of such a relationship were then asked to identify specific types of assets that they own and that they believe have a value influenced by the close proximity of public lands. Respondents in all five of these counties most frequently cited the value of their permanent, year-round residential property (38.4% in Garfield County, 50.0% in Piute County, 15.8% in Sanpete County, 15.8% in Sevier County, and 48.8% in Wayne County) as being influenced by the presence and condition of nearby public lands.

PERCEIVED IMPORTANCE OF PUBLIC LANDS FOR OVERALL QUALITY OF LIFE

Survey participants were also asked to report how important they think 15 different types of public land resources and resource uses are for the overall quality of life experienced by people living in their communities. Table A17-4 summarizes response patterns to this series of questions for Garfield, Piute, Sanpete, Sevier, and Wayne counties, with a focus on the percentage of respondents from each county who indicated that they consider a particular type of resource use to be "very important" for local quality of life.

Table A17-4. Percentage of survey respondents indicating that selected public land resource uses are "very important" to the overall quality of life in their community.

Resource Use	Garfield County	Piute County	Sanpete County	Sevier County	Wayne County
Grazing of livestock on public lands	86.3%	80.8%	71.5%	67.2%	79.5%
Water resources used to irrigate crops and pastures	96.8%	92.6%	95.4%	92.6%	100.0%
Water resources used to supply homes and businesses	94.4%	77.8%	96.9%	91.9%	89.7%
Water resources that provide important fish/wildlife habitat	70.2%	84.6%	74.4%	79.1%	79.5%
Energy resources such as oil, gas, coal, or uranium	46.6%	47.4%	40.3%	68.2%	33.3%
Sand, gravel, or other minerals used in building and construction industries	40.5%	25.0%	25.2%	43.8%	41.7%

Resource Use	Garfield County	Piute County	Sanpete County	Sevier County	Wayne County
Forested areas that provide timber used by logging operations and lumber mills	71.8%	26.9%	47.6%	37.9%	55.3%
Areas in which trees or other vegetation provide important wildlife habitat	59.7%	63.0%	71.2%	73.5%	71.7%
Areas that attract tourism and recreational activity	75.4%	64.3%	48.1%	57.5%	76.9%
Opportunities to enjoy off-road vehicles, snowmobiling, or other motorized recreation	51.2%	78.6%	55.8%	59.6%	56.8%
Opportunities to enjoy hiking, backpacking, cross-country skiing, horseback riding, or other types of non-motorized recreation	64.5%	66.7%	55.4%	51.1%	74.4%
Opportunities to hunt for wild game	76.6%	75.0%	60.9%	69.9%	56.4%
Opportunities to fish in area lakes, streams, and rivers	77.4%	85.7%	65.9%	73.3%	64.1%
Undeveloped landscapes in which motorized access and resource development are restricted	26.7%	34.6%	34.7%	35.5%	33.3%
Areas managed to maintain biodiversity and protect habitat for sensitive or important plants or wildlife	32.2%	37.5%	41.9%	36.7%	34.2%

In Garfield County, 4 of the 15 types of public land resource use presented in this question were considered "very important" by fewer than one-half of respondents (energy resource development, sand/gravel or other construction-related mineral development, undeveloped landscapes in which motorized access and resource development are restricted, and areas managed to maintain biodiversity and protect habitat). At the same time, more than three-fourths of Garfield County respondents considered grazing of livestock on public lands; water resources used to irrigate crops and pastures; water resources used to supply homes and businesses; areas that attract tourism and recreation activity; opportunities to hunt for wild game; and opportunities to fish in area lakes, rivers, and streams to be "very important" to the local quality of life.

In Piute County, six of these resource uses were considered "very important" by fewer than one-half of the respondents (energy resources; sand, gravel, or other minerals; forested areas that provide timber for logging and lumber mills; areas that attract tourism and recreation; undeveloped landscapes in which motorized access and resource development are restricted; and areas managed to maintain biodiversity and to protect habitat). Conversely, three resource uses—water resources used to irrigate crops and pastures; water resources used to supply homes and businesses; and water resources that provide important fish or wildlife habitat—were considered "very important" to the local quality of life by more than three-fourths of Piute County respondents.

Six of these resource uses were considered "very important" by fewer than one-half of Sanpete County respondents: energy resources; sand, gravel, or other construction minerals; forested areas providing timber for logging and mill operations; areas that attract tourism and recreation; undeveloped landscapes in which motorized access and resource development are restricted; and areas managed to maintain biodiversity and protect habitat. At the same time, three-fourths or more of the respondents from Sanpete County considered water used for irrigation, water used to supply homes and business, and water providing important fish or wildlife habitat to be very important to the local quality of life.

In Sevier County, four resource uses were considered to be "very important" by fewer than one-half of respondents: sand, gravel, or other minerals; forested areas that provide timber for logging and lumber mills; undeveloped landscapes in which motorized access and resource development are restricted; and areas managed to maintain biodiversity and protect habitat. As was true in all of the counties, the three water resource categories (water used for irrigation, water used to supply homes and business, and water providing important fish or wildlife habitat) were considered very important to the local quality of life by 75 percent or more of Sevier County respondents.

Four of the resource use categories were considered to be very important to local quality of life by fewer than one-half of Wayne County respondents: energy resources; sand, gravel, or other construction minerals; undeveloped landscapes in which motorized access and resource development are restricted; and areas managed to maintain biodiversity and protect habitat. Five of the resource uses were considered very important by three-fourths or more of the respondents: grazing of livestock on public lands, water used for irrigation, water used to supply homes and business, water providing important fish or wildlife habitat, and areas that attract tourism and recreation activity.

RECREATIONAL USES OF PUBLIC LANDS

Survey participants were also asked to report whether they had participated in any of a broad range of outdoor recreation activities and other non-commodity use activities on Utah public lands during the previous 12 months. Results from this series of questions are reported in Table A17-5 and Table A17-6. These findings clearly indicate that there is widespread participation in many of these public land activities among residents of each of the five counties considered in this summary report.

Table A17-5 reports the extent of reported participation in 30 different outdoor recreation activities. Among survey participants living in Garfield County, one-half or more reported participation during the preceding 12 months in camping, picnicking, day hiking, wildlife viewing, hunting, fishing, visiting historical sites, all-terrain vehicle (ATV) riding, and driving for pleasure/sightseeing on public lands. In Piute County, one-half or more of the limited number of survey respondents reported that they had participated in camping, picnicking, day hiking, wildlife viewing, nature photography, motor boating, hunting, fishing, visiting historical sites, ATV riding, four-wheel driving, and driving for pleasure/sightseeing. Half or more of Sanpete County respondents reported participation in camping, picnicking, day hiking, wildlife viewing, fishing, visiting historical sites, ATV riding, and driving for pleasure/sightseeing. In Sevier County the activities reported by 50 percent or more of respondents included camping, picnicking, fishing, visiting historical sites, ATV riding, and driving for pleasure/sightseeing. Finally, one-half or more of Wayne County respondents reported that during the past 12 months, they has participated in camping, picnicking, day hiking, wildlife viewing, nature photography, hunting, fishing, rock hounding, visiting historical sites, ATV riding, four-wheel driving, and driving for pleasure/sightseeing.

Responses to a question focusing on participation in a variety of non-commodity use activities on public lands are summarized in Table A17-6. Among this list of activities, Garfield County respondents were

most likely to report that they participate in collecting firewood for home use, cutting Christmas trees, gathering pinyon nuts, and collecting rocks for home landscaping. In Piute County, respondents most frequently reported that they collect firewood for home use, cut Christmas trees, collect rocks for home landscaping, and gather pinyon nuts. Sanpete County respondents most frequently reported that they collect firewood for home use. Sevier County respondents most frequently reported that they cut Christmas trees. In Wayne County, respondents were most likely to report that they collect firewood for home use, cut Christmas trees, collect rocks for home landscaping, and gather pinyon nuts. On balance, reliance on public lands for these types of non-commodity activities appears to be higher in Garfield, Piute, and Wayne counties than is the case in Sanpete County or Sevier County.

Respondents were also asked to identify from the lists presented in these questions the one or two activities that they participate in most often, and to provide detail on where they engage in those activities. Response data for these questions are currently being processed for Sanpete and Wayne counties, and as a result are not yet available for inclusion in this summary report. Among Garfield County respondents, the first of these activities listed by respondents most often involved hunting (16.4%) or fishing (14.5%). In Piute County, the first listed activity most often involved either ATV riding (37.5%) or hunting (20.8%). In Sevier County, the first-listed activities most often involved camping (26.3%) or ATV riding (16.9%). When asked to indicate where they participate in the first-listed of their "most frequently pursued" activities, 84.7% of Garfield County respondents, 83.3% of Piute County respondents, and 80.2% of Sevier County residents identified a location within the county where they live.

Table A17-5. Percentage of survey respondents reporting participation in selected recreation activities on Utah public lands during the past 12 months.

Activity	Garfield County	Piute County	Sanpete County	Sevier County	Wayne County
Camping	64.7%	76.9%	69.5%	69.3%	73.2%
Picnicking	72.9%	84.6%	77.1%	74.3%	80.5%
Backpacking	22.6%	29.6%	21.6%	18.1%	39.5%
Day hiking	59.1%	50.0%	52.0%	46.9%	80.0%
Bird watching	33.9%	34.6%	30.2%	20.6%	39.5%
Wildlife viewing	75.0%	85.2%	65.1%	73.1%	80.0%
Nature photography	35.1%	50.0%	33.3%	39.1%	56.4%
Canoeing/kayaking	3.8%	19.2%	2.4%	3.2%	8.3%
River rafting	3.8%	11.5%	4.0%	8.7%	2.9%
Motor boating	20.4%	51.9%	24.2%	36.2%	32.4%
Jet skiing	5.8%	14.8%	9.7%	6.3%	5.4%
Swimming	30.8%	29.6%	35.5%	23.4%	24.3%
Rock climbing	13.2%	3.8%	12.1%	7.3%	25.7%
Mountain climbing	11.4%	7.4%	20.2%	22.2%	22.2%
Hang gliding	0.0%	3.8%	0.0%	0.0%	0.0%
Mountain bike riding	13.2%	7.7%	16.9%	13.5%	11.1%
Hunting	56.4%	81.5%	46.5%	47.0%	56.4%
Fishing	67.5%	81.5%	63.6%	63.8%	65.9%

Activity	Garfield County	Piute County	Sanpete County	Sevier County	Wayne County
Horseback riding	40.5%	37.0%	24.6%	22.1%	22.2%
Orienteering/geo-caching	7.8%	16.0%	9.6%	11.3%	11.1%
Rock hounding	24.3%	16.0%	22.4%	21.0%	50.0%
Visiting historical sites	60.7%	57.7%	65.4%	60.8%	66.7%
Resort skiing/snowboarding	14.2%	7.7%	15.3%	6.3%	13.5%
Backcountry skiing/snowboarding	3.8%	7.7%	11.3%	1.6%	8.1%
Snowshoeing	4.8%	7.7%	4.8%	4.0%	13.5%
Snowmobiling	9.5%	15.4%	16.0%	10.4%	16.2%
ATV riding	58.1%	92.9%	53.5%	58.6%	61.5%
Dirt bike riding	10.7%	19.2%	9.7%	12.7%	13.9%
Four-wheel driving/jeeping	40.0%	66.7%	45.3%	43.6%	59.5%
Sightseeing/pleasure driving	80.0%	88.9%	82.3%	86.7%	87.8%

Table A17-6. Percentage of survey respondents reporting participation in selected non-commodity use activities on Utah public lands during the past 12 months.

Activity	Garfield County	Piute County	Sanpete County	Sevier County	Wayne County
Collecting firewood for home use	56.1%	50.0%	33.6%	26.2%	53.8%
Cutting Christmas trees	46.2%	46.4%	23.6%	35.1%	51.3%
Collecting material for craft projects	24.5%	22.2%	16.7%	20.2%	28.2%
Collecting rocks for home landscaping	30.4%	34.6%	19.8%	28.5%	48.8%
Collecting plants for home landscaping	17.3%	7.7%	9.6%	8.7%	15.8%
Gathering wild mushrooms	1.9%	3.8%	0.0%	2.3%	5.3%
Gathering pinyon nuts	38.6%	38.5%	9.6%	15.6%	41.0%
Gathering berries, herbs, or wild foods	19.1%	22.2%	10.4%	9.4%	13.2%
Collecting fossils, rocks, or minerals	23.4%	29.6%	18.1%	22.7%	35.9%

ATTITUDES AND PREFERENCES REGARDING PUBLIC LAND MANAGEMENT

Two similar sets of survey questions focused on respondents' attitudes and preferences regarding the extent to which various natural resource use activities or management practices should be reduced or increased by those responsible for managing public lands in Utah. Response patterns to these questions are summarized in Table A17-7 and Table A17-8.

The data presented in Table A17-7 indicate that Garfield County respondents were considerably more likely to prefer an increase rather than a decrease in mineral exploration and extraction, timber harvest, exploration for and development of oil and gas resources, protection of fish and wildlife habitat, thinning of forested areas to reduce wildfire risk, livestock grazing, and development of water storage and delivery systems on Utah public lands. They were also more likely to prefer a reduction in the designation of wilderness areas and in protection of endangered species. As indicated in Table A17-8, Garfield County respondents were also more likely to prefer an increase rather than a reduction in provision of road access to recreation areas, provision of hunting opportunities, development of trails for off-highway motorized recreation, development of trails for non-motorized recreation, regulations that restrict motorized vehicles to designated trails, and development of visitor facilities to increase tourism.

As indicated in Table A17-7, Piute County respondents were considerably more likely to prefer an increase rather than a decrease in mineral exploration/extraction, timber harvest, oil and gas development, protection of fish and wildlife habitat, use of controlled burns to improve ecological conditions, thinning of forested areas to reduce wildfire risk, and development of water storage and delivery systems. They were also likely to express a preference for a reduction in the designation of wilderness areas, and a reduction in protection of endangered species. Table A17-8 reveals that Piute County respondents also were much more likely to prefer an increase rather than a decrease in the provision of road access to recreation areas, provision of hunting opportunities, development of trails for off-highway motorized recreation, and regulations to limit the noise and emissions from snowmobiles and ATVs.

Table A17-7 reveals that Sanpete County respondents were much more likely to express a preference for increased rather than decreased emphasis on mineral exploration/extraction, timber harvest, oil and gas development, protection of fish and wildlife habitat, use of controlled burns to improve ecological conditions, thinning of forested areas to reduce wildfire risk, and development of water storage and delivery systems. Interestingly, they were also somewhat more likely to prefer an increase rather than a decrease in protection of endangered species and in livestock grazing. As indicated in Table A17-8, respondents from Sanpete County were also considerably more likely to prefer an increase rather than a decrease in road access to recreation areas, hunting opportunities, development of trails for non-motorized recreation, regulations that would require motorized vehicles to stay on designated trails, regulations that would limit noise and emissions from snowmobiles and ATVs, and development of visitor facilities to increase tourism.

Sevier County respondents were considerably more likely to prefer an increase rather than a decrease in mineral exploration/extraction, timber harvest, oil and gas development, protection of fish and wildlife habitat, use of controlled burns to improve ecological conditions, thinning of forested areas to reduce wildfire risk, livestock grazing, and development of water storage and delivery systems (see Table A17-7). They were also much more likely to prefer an increase rather than a decrease in road access to recreation areas, hunting opportunities, trails for off-highway motorized recreation, trails for non-motorized recreation, regulations that require motorized vehicles to stay on designated trails, and visitor facilities to increase tourism (Table A17-8).

Finally, the data reported in Table A17-7 reveal that Wayne County respondents were substantially more likely to express a preference for increased emphasis on mineral exploration/extraction, timber harvest, oil and gas development, protection of fish and wildlife habitat, thinning of forested areas to reduce wildfire risk, livestock grazing, and development of water storage and delivery systems. They were also considerably more likely to prefer a decrease as opposed to an increase in designation of wilderness areas. In addition, as indicated in Table A17-8, Wayne County respondents were much more likely to prefer an increase rather than a decrease in road access to recreation areas, hunting opportunities, trails for non-motorized recreation, regulations that would require motorized vehicles to stay on designated trails, regulations to limit noise and emissions from snowmobiles and ATVs, and visitor facilities for tourists.

Table A17-7. Survey respondents' attitudes regarding the extent to which various activities occurring on Utah public land should be reduced or increased. [a]

Type of use/activity	Garfield County		Piute County		Sanpete County		Sevier County		Wayne County	
	Reduce	Increase	Reduce	Increase	Reduce	Increase	Reduce	Increase	Reduce	Increase
Mineral exploration/extraction	11.9%	63.5%	4.8%	38.1%	15.0%	35.0%	12.6%	39.5%	19.4%	44.4%
Timber harvest	5.8%	73.6%	0.0%	46.1%	11.2%	62.4%	11.8%	48.8%	21.1%	50.0%
Designation of wilderness areas	66.7%	14.2%	46.2%	7.7%	33.1%	26.8%	46.4%	15.2%	50.0%	22.5%
Exploration for/development of oil and gas resources	9.2%	70.6%	8.0%	56.0%	17.7%	46.0%	13.6%	48.8%	24.3%	40.5%
Protection of important fish and wildlife habitat	13.1%	36.9%	18.5%	37.0%	7.1%	47.7%	4.7%	47.6%	15.0%	50.0%
Protection of endangered species	50.4%	20.5%	42.3%	26.9%	22.2%	39.7%	31.2%	24.8%	33.3%	30.7%
Use of controlled burns to improve ecological conditions	42.9%	25.2%	20.0%	48.0%	19.5%	37.3%	14.9%	31.4%	28.9%	39.5%
Thinning of forested areas to reduce wildfire risk	8.3%	70.0%	0.0%	76.0%	8.8%	67.2%	4.8%	66.9%	5.4%	67.5%
Livestock grazing	7.4%	52.1%	18.5%	18.5%	14.3%	27.0%	14.5%	29.9%	7.5%	40.0%
Designation of wild and scenic rivers	38.8%	20.7%	34.8%	13.0%	24.1%	24.2%	20.7%	22.3%	31.6%	31.6%
Developing water storage and delivery systems to meet needs of nearby communities	3.3%	84.3%	3.8%	57.7%	2.3%	78.5%	2.3%	72.7%	2.6%	76.9%

a. Original response categories were "major reduction" and "moderate reduction" (combined to create "reduce") and "major increase" and "minor increase" (combined to create "increase"). "Stay about the same" responses are not reported here.

Table A17-8. Survey Respondents' Attitudes Regarding the Extent to Which the Emphasis Placed on Various Activities Occurring on Utah Public Land Should be Reduced or Increased by Public Land Managers. [a]

Type of use/activity	Garfield County		Piute County		Sanpete County		Sevier County		Wayne County	
	Reduce	Increase	Reduce	Increase	Reduce	Increase	Reduce	Increase	Reduce	Increase
Permitting of commercial guiding or outfitter services	14.8%	22.6%	19.2%	11.5%	19.7%	12.0%	25.4%	10.2%	5.3%	21.1%
Providing road access to recreation areas	7.4%	66.1%	10.7%	67.8%	12.8%	49.6%	8.3%	54.9%	12.5%	37.5%
Providing hunting opportunities	7.4%	52.9%	14.8%	44.4%	10.5%	40.3%	11.5%	50.0%	5.1%	46.1%
Developing trails for off-highway motorized recreation	21.5%	53.7%	17.9%	35.8%	28.3%	42.5%	20.9%	48.9%	30.8%	35.9%
Developing trails for hiking, biking, and other non-motorized recreation	11.7%	50.0%	11.1%	22.2%	12.1%	53.2%	17.6%	53.5%	5.0%	42.5%
Regulations that require motorized vehicles to stay on designated trails	21.3%	48.4%	18.5%	33.3%	12.5%	56.2%	13.0%	52.7%	20.0%	55.0%
Regulations that limit levels of noise and emissions from snowmobiles and ATVs	24.4%	36.1%	10.7%	39.3%	17.9%	45.5%	20.6%	37.3%	12.8%	51.2%
Developing visitor facilities to increase tourism	12.5%	51.7%	22.2%	33.3%	18.9%	36.0%	18.5%	38.5%	15.8%	42.1%

a. Original response categories were "major reduction" and "moderate reduction" (combined to create "reduce") and "major increase" and "minor increase" (combined to create "increase"). "Stay about the same" responses are not reported here.

APPENDIX 18—FACTORY BUTTE SRMA RMZs AND MANAGEMENT PRESCRIPTIONS

INTRODUCTION

The Proposed Resource Management Plan/Final Environmental Impact Statement (Proposed RMP/Final EIS) creates a special recreation management area (SRMA) in the Factory Butte Area, with three recreation management zones (RMZ) described in greater detail below. The three zones are: (1) Off-highway Vehicle (OHV) Play Areas RMZ, (2) Motorized Touring RMZ, and (3) Landmarks RMZ. For the entire SRMA, the market and market strategy are as follows:

Market Strategy: Destination Recreation—Tourism. The SRMA is isolated from major population centers; therefore, visitors to this general area usually include this particular area on their itinerary.

Market: International, national, regional, and local OHV user groups and families (including commercial groups) seeking an extreme OHV riding experience. Also includes photographers (commercial and non-commercial) and sight-seers along scenic Highway 24, who view the badlands topography, the Factory Butte landmark, and the desert vegetation.

SRMA Management Objectives: A SRMA plan to manage for visitors' activities and experiences would be completed within 5 years from the signing of the Richfield Field Office (RFO) RMP Record of Decision (ROD). Management prescriptions for kiosks and monitoring would apply to all the RMZs.

KIOSKS

Kiosks would be designed and placed to provide information and interpretation to SRMA users in a non-intrusive format. Kiosks and other facilities would be developed as generally shown on the Proposed Factory Butte SRMA map. Kiosks would be placed at either end of the Swing Arm City to Factory Butte Corridor, one at the gap in the fence toward the Swing Arm City Open Area side and one at the south boundary line of the Factory Butte Open Area. A kiosk would be placed where the fence begins next to Factory Butte Road. Two other kiosks would be strategically placed along the portion of Factory Butte Road that bounds the eastern and northeastern side of the open area around the Factory Butte. A kiosk would be placed in Swing Arm City Open Area and the Caineville Cove Inn Open Area. Suggested features of these kiosks are as follows:

- The kiosks should be developed, built, and put up in coordination and cooperation with local rider groups, and adoption or sponsorship by such groups should be encouraged. This will encourage their respect for the kiosks and decrease the likelihood of vandalism.
- Informational kiosks should educate riders about the importance of responsible ridership and of confining their cross-country riding to open areas.
- Informational kiosks should encourage riders to be aware of illegal cactus collecting and report any suspicious activity to law enforcement officials.
- Informational kiosks should encourage riders to be on the lookout for other riders who are not obeying the boundary signs and report them to law enforcement officials.
- Informational kiosks should educate riders about the importance of balanced use and respecting the boundary signs, as a way of preserving the opportunity for open cross-country riding in the Factory Butte area.

- Information in the Swing Arm City Open Area and the Factory Butte Open Area kiosks should clearly illustrate how riders may legally ride to and from each open area using the corridor.

MONITORING/MITIGATION

Regular monitoring is imperative to ensure the resources are able to be used in a renewable manner. Monitoring would occur for visual, soil, special status species, and recreational experiences.

Inventory and monitoring of the threatened and endangered (T&E) cactus species in the area has been occurring and that effort would continue. It is imperative that the Bureau of Land Management (BLM) continues to gain knowledge about these species, where populations are located, and what, if any, continued impacts are occurring to these populations. OHV area designations or routes may be revised in the future based on the findings from monitoring resource conditions and trends in the area. The effect of OHVs on soils in the Factory Butte area has been monitored through the use of collection pits and photo plots for several years and would continue.

Compliance with the new OHV designations for the Factory Butte area would mainly be accomplished by law enforcement Rangers. The improvements outlined below are instrumental in identifying boundaries, making compliance and enforcement more effective and efficient. Assistance from other agencies may be requested, especially during high-use periods (holiday weekends). Additional presence on the ground would be most beneficial during the first several years of the new designations, when visitors to the area are learning about the new designations and the areas that would best accommodate the recreational opportunity they seek. When the authorized officer determines through monitoring that OHVs are causing considerable adverse impacts to certain areas, the authorized officer shall close or restrict such areas and notify the public. BLM could impose limitations on the types of vehicles allowed on specific designated routes if monitoring indicates that a particular type of vehicle is causing disturbance to the soil, visual, special status species, or vegetative resources, by off-road travel.

Mitigation measures have been incorporated into the proposed action such as considering placement of structures on the landscape, use of previously disturbed areas and ensuring continued access for permitted uses. Potential negative impacts have been minimized to the extent practicable. For example, visual contrasts to the landscape have been addressed and would be consistent with management objectives. In addition, surveys and clearances would be conducted before specific trails and recreation facilities (e.g., fences, kiosks, bathrooms) would be developed.

ZONE 1. OHV PLAY AREAS RMZ

Recreation Niche: OHV users seeking the technical riding opportunities provided by the badland topography.

Recreation Management Objectives: By the year 2015, manage this zone to provide opportunities for site users to engage in sustainable, easy-to-access day-use and multi-day motorized recreation, providing no less than 75 percent of visitors and affected community residents at least a “moderate” realization of these benefits (i.e., 3.0 on a probability scale, where 1=not at all; 2=somewhat; 3=moderate; and 4=total realization).

Primary Activities: Driving among badlands, motorized hill climbing, camping along badland fringes, photography, spending time with friends and family.

Experiences: Savoring the sensory experience of an outdoor setting, relishing group togetherness, enjoying risk-taking adventures, appreciating nature, escaping everyday stress and boredom, and enjoying easy and convenient access to natural resources.

Benefits:

- Personal—Improved OHV skills, bonding with family and friends, stress relief, enhanced awareness and appreciation of natural resources, greater self-reliance, and renewed human spirit.
- Community—Stronger sense of community dependency on public lands and greater family/group bonding.
- Economic—Enhance local economy via purchases (gas, groceries, lodging, OHV/outdoor equipment).
- Environmental—Increased awareness and protection of natural landscapes.

Setting Characteristics:

- Physical—Mostly front country and middle country with regard to naturalness and facilities.
- Social—front country around dispersed campsites and staging areas; front country and middle country among badlands.
- Administrative—dispersed campsites and staging areas; informational kiosks, fencing and carsonite signage along the edges of the RMZ.

Specific Management Prescriptions:

The following areas would be designed as OHV open areas:

- Swing Arm City Open Area (2,600 acres)
- Swing Arm City to Factory Butte Corridor
- Factory Butte Open Area (5,300 acres)
- Caineville Cove Inn Open Area (100 acres).

Swing Arm City Open Area (2,600 acres)

The Swing Arm City Open Area boundary would be as shown on the Proposed Factory Butte SRMA map. Carsonite signs should be placed along this entire boundary, spaced close enough so that at least two signs are visible to riders at all times depending on type of terrain. The signs should advise riders which areas are and are not open to cross-country travel.

One formal entrance would be constructed into the Swing Arm City OHV Open Area from Highway 24. An Encroachment Permit would be obtained from the Utah Department of Transportation (UDOT) for this single entrance. A standard area sign would be located adjacent to this main entrance road identifying the area as the "Swing Arm City OHV Open Area." The access road would be upgraded for approximately three-fourths mile into the OHV area. Road base, proper drainage and a 24-inch x 20-inch culvert would be required to allow access during all weather conditions. For safety reasons, all other entrances from Highway 24 would be closed. At the north end of the access road, two or three OHV loading/unloading ramps would be constructed for the safety of visitors to the open riding area. Many accidents occur in conjunction with loading and unloading motorcycles and four-wheel vehicles from truck beds. The loading/unloading ramps would be wedge-shaped platforms that would enable a vehicle to back up to the ramp and load/unload on a level surface, thereby providing a safer option to visitors using the OHV open area.

A fence would be placed along the flat land situated above and to the northeast of Swing Arm City, in a direction roughly parallel to the northeast rim of Swing Arm City. The distance between the northeast rim of Swing Arm City and the fence itself should be approximately 500 feet. The approximate course of the fence would be as follows in Township 28 South, Range 9 East: Beginning at a point along the Factory Butte Road near the southeast quarter of Section 11, the fence would run in a northwesterly direction through the southeast quarter of Section 11, the northwest quarter of Section 11, the northeast quarter of Section 10, and the southwest quarter of Section 3 until it reaches the benches of North Caineville Mesa that are too steep for riders to pass. There would be a gap in the fence somewhere in the northwest quarter of Section 11 or the northeast quarter of Section 10. This gap in the fence would mark the beginning of the corridor through which riders would travel between the Swing Arm City Open Area and the Factory Butte Open Area.

Other improvements would be added to enhance visitor services and for the protection of health and safety. These improvements would include upgraded access into the open OHV area, improved parking areas at kiosk or trailhead locations if necessary, loading/unloading ramp(s), and a restroom. The upgraded access would consist of engineering proper drainage, installing culverts, and adding surface material (road base and gravel) to enable access during wet weather conditions. Parking areas would be improved only if necessary for the health and safety of visitors and would include leveling of the minimum area necessary and/or adding gravel. Initially, a double CXT vault toilet would be placed on Factory Bench Road near Highway 24. One toilet building would be located at the existing disturbed location on the east side of Factory Bench Road. The existing pull-out would be upgraded and used for the parking area. This would be a concrete building that is pre-cast and delivered ready to place at the site. The building would measure 12 feet x 17 feet. The surface disturbance and footprint on the ground would be the same. The ground disturbance during construction would be somewhat larger to facilitate excavation of the vaults and accommodate the use of heavy equipment to set the vaults and building. Vault toilets may be added for visitor convenience or if sanitation issues arise at other locations. The color and texture of the outside walls and roof of the buildings would be chosen to match the surrounding area. Parking barriers or two-rail post and pole fences would be placed around these structures to protect them from damage by vehicles. The barriers or fencing would be kept to the minimum necessary to protect the improvements.

Swing Arm City to Factory Butte Corridor

Riders passing through a narrow corridor would be more likely to cause rutting. A wider corridor means less likelihood of rutting from vehicle trails. Thus, the corridor between Swing Arm City and the open area around Factory Butte should be 30 feet wide. The corridor would commence at the gap in the fence, and run in a northerly direction until it reaches the above-described south boundary of the open area around Factory Butte. The course of the corridor would be as shown on the Proposed Factory Butte SRMA map, only the corridor should pass through the southeast quarter of Section 34, Township 27 South, Range 9 East when it crosses Neilson Wash. Carsonite signs would be placed along both sides of this corridor, spaced close enough so that at least two signs would be visible to riders at all times depending on type of terrain. The signs will advise riders which areas are and are not open to cross-country travel.

Factory Butte Open Area (5,300 acres)

The Factory Butte Open Area boundary would be as shown on the Proposed Factory Butte SRMA map. The proposed boundary starts at a point on the Factory Butte Road nearest the southeast corner of Township 27 South, Range 9 East Section 25 and runs northerly along Factory Butte Road until that road reaches a point approximately in the center of the southwest quarter of Section 11; thence it departs from Factory Butte Road and runs southwesterly along the edge of the bluegate shale through the southwest quarter of Section 11, the southeast quarter of Section 10, the northwest quarter of Section 15, and the

southeast quarter of Section 16; thence it runs south-southwesterly through the western half of Section 21, the northwestern quarter of Section 28, and the southeastern quarter of Section 29 until it reaches the south boundary line of Section 29; thence it runs east along the south boundary line of Sections 29, 28, 27, 26, and 25 until it reaches Factory Butte Road at the point of beginning. Carsonite signs should be placed along this entire boundary, spaced close enough so that at least two signs are visible to riders at all times depending on type of terrain. The signs should advise riders which areas are and are not open to cross-country travel. Approximately 1 mile of fencing would be constructed along the south boundary of the State Section 32 in Township 27 South, Range 9 East. This fence would provide additional protection and a controlled monitoring area between the North Caineville Mesa and North Caineville Reef.

Caineville Cove Inn Open Area (100 acres)

The Caineville Cove Inn Open Area boundary would be as shown on the Proposed Factory Butte SRMA map. This would entail portions of Sections 25, 26, and 27 in Township 28 South, Range 8 East. Many tourists who come to the general area stay at the motel, and they would be able to step outside their motel and recreate in the immediate vicinity. The north boundary of the Caineville Cove Inn Open Area would be fenced to limit use to the open area.

ZONE 2. MOTORIZED TOURING RMZ

Recreation Niche: Scenic and extensive auto-touring and OHV route network accessing badland scenery, badland landmarks, and desert flora and fauna.

Recreation Management Objectives: By the year 2015, manage this zone to provide opportunities for community residents and regional visitors to engage in sustainable, easy-to-access, primarily day-use motorized recreation, providing no less than 75 percent of visitors and affected community residents at least a "moderate" realization of these benefits (i.e., 3.0 on a probability scale, where 1=not at all; 2=somewhat; 3=moderate; and 4=total realization).

Primary Activities: Driving OHVs or auto-touring, viewing scenery and wildlife, photography, spending time with friends and family, participating in organized tours, and walking or hiking.

Experiences: Savoring the sensory experience of an outdoor setting, relishing group togetherness, enjoying moderate risk-taking adventures, appreciating nature, and escaping everyday stress and boredom.

Benefits:

- Personal—Improved OHV and driving skills, bonding with family and friends, stress relief, enhanced awareness and appreciation of natural resources, greater self-reliance, and renewed human spirit.
- Community—Stronger sense of community dependency on public lands and greater family/group bonding.
- Economic—Enhanced local economy via purchases (gas, groceries, lodging, OHV/outdoor equipment).
- Environmental—Increased awareness and protection of natural landscapes.

Setting Characteristics:

- Physical—Mostly middle country along routes, but backcountry away from routes with regard to naturalness and facilities.

- Social—Mostly middle country along routes with regard to group sizes and contacts, but generally backcountry away from routes.
- Administrative—Front country along routes and staging areas; middle and backcountry away from routes.

Specific Management Prescriptions:

All motorized use (OHV or auto-touring) would be limited to designated routes (Proposed Factory Butte SRMA map).

ZONE 3. LANDMARKS RMZ

Recreation Niche: Scenic use of these areas from a distance by OHV and auto-touring users, offering outstanding landmarks, views, and exceptionally scenic setting. Also includes non-motorized use of the North Caineville Mesa Area of Critical Environmental Concern (ACEC) and the Factory Butte, including hiking, scrambling, and climbing.

Recreation Management Objectives: By the year 2015, manage this zone to provide opportunities for community residents and regional visitors to engage in sustainable, primarily day-use non-motorized recreation, providing no less than 75 percent of visitors and affected community residents at least a "moderate" realization of these benefits (i.e., 3.0 on a probability scale, where 1=not at all; 2=somewhat; 3=moderate; and 4=total realization).

Primary Activities: Viewing scenery and wildlife, photography, spending time with friends and family, participating in and/or viewing organized tours, hiking, rock scrambling, and climbing.

Experiences: Savoring the sensory experience of an outdoor setting, relishing group togetherness, enjoying risk-taking adventures, appreciating nature, escaping everyday stress and boredom.

Benefits:

- Personal—Bonding with family and friends, stress relief, enhanced awareness and appreciation of natural resources, greater self-reliance, and renewed human spirit.
- Community—Stronger sense of community dependency on public lands and greater family/group bonding.
- Economic—Enhanced local economy via purchases (gas, groceries, lodging, outdoor equipment).
- Environmental—Increased awareness and protection of natural landscapes.

Setting Characteristics:

- Physical—Backcountry in the RMZ, but middle and front country and rural when viewing from routes.
- Social—Backcountry in the RMZ, but middle and front country and rural when viewing from routes.
- Administrative—Backcountry in the RMZ, but middle and front country and rural when viewing from routes.

Specific Management Prescriptions:

Close the North Caineville Mesa ACEC to OHV and other motorized travel.

APPENDIX 19—WILDLAND FIRE RESOURCE PROTECTION MEASURES AND REASONABLE AND PRUDENT MEASURES, TERMS AND CONDITIONS, AND REPORTING REQUIREMENTS IDENTIFIED THROUGH SECTION 7 CONSULTATION

The existing land use plans that comprise Alternative N (no action alternative) were amended September 26, 2005, with the *Finding of No Significant Impact and Decision Record (UT-USO-04-01) Utah Land Use Plan Amendment for Fire and Fuels Management*. The decisions from that document have been brought forward in their entirety. A majority of the decisions are located in the Management Common to All Alternatives section of the Proposed Resource Management Plan/Final Environmental Impact Statement (PRMP/FEIS) Chapter 2 under the Wildland Fire Ecology heading. This appendix contains the remainder of the decisions, in the form of resource protection measures and terms and conditions identified through Section 7 consultation, that were too long to be easily integrated into Chapter 2 of the PRMP/FEIS.

RESOURCE PROTECTION MEASURES IDENTIFIED IN THE UTAH LAND USE PLAN AMENDMENT FOR FIRE AND FUELS MANAGEMENT

Applicable Fire Management Practices:		
SUP: Wildfire Suppression WFU: Wildland Fire Use for Resource Benefit	RX: Prescribed Fire NF: Non-Fire Fuel Treatments	ESR: Emergency Stabilization and Rehabilitation
Air		
A-1 Evaluate weather conditions, including wind speed and atmospheric stability, to predict impacts from smoke from prescribed fires and wildland fire use. Coordinate with Utah Department of Environmental Quality for prescribed fires and wildland fire use. (RX, WFU)		
A-2 When using chemical fuels reduction methods, follow all label requirements for herbicide application. (NF)		
Soil and Water		
SW-1 Avoid heavy equipment use on highly erosive soils (soils with low soil loss tolerance), wet or boggy soils and slopes greater than 30%, unless otherwise analyzed and allowed under appropriate National Environmental Policy Act (NEPA) evaluation with implementation of additional erosion control and other soil protection mitigation measures. (SUP, WFU, RX, NF, ESR)		
SW-2 There may be situations where high intensity fire will occur on sensitive and erosive soil types during wildland fire, wildland fire use or prescribed fire. If significant areas of soil show evidence of high severity fire, evaluate the area for soil erosion potential and downstream values at risk and implement appropriate or necessary soil stabilization actions such as mulching or seeding to avoid excessive wind and water erosion. (SUP, WFU, RX)		
SW-3 Complete necessary rehabilitation on firelines or other areas of direct soil disturbance, including but not limited to waterbarring firelines, covering and mulching firelines with slash, tilling and/or subsoiling compacted areas, scarification of vehicle tracks, off-highway vehicles (OHV) closures, seeding and/or mulching for erosion protection. (SUP, WFU, RX)		
SW-4 When using mechanical fuels reduction treatments, limit tractor and heavy equipment use to periods of low soil moisture to reduce the risk of soil compaction. If this is not practical, evaluate sites, post treatment and if necessary, implement appropriate remediation, such as subsoiling, as part of the operation. (NF)		
SW-5 Treatments such as chaining, plowing, and roller chopping shall be conducted as much as practical on the contour to reduce soil erosion (BLM ROD 13 Western States Vegetation Treatment EIS 1991). (NF, ESR)		

Applicable Fire Management Practices:		
SUP: Wildfire Suppression WFU: Wildland Fire Use for Resource Benefit	RX: Prescribed Fire NF: Non-Fire Fuel Treatments	ESR: Emergency Stabilization and Rehabilitation
SW-6 When using chemical fuel reduction treatments follow all label directions, additional mitigations identified in project NEPA evaluation and the Approved Pesticide Use Proposal. At a minimum, provide a 100-foot-wide riparian buffer strip for aerial application, 25 feet for vehicle application and 10 feet for hand application. Any deviations must be in accordance with the label. Herbicides would be applied to individual plants within 10 feet of water where application is critical (BLM ROD 13 Western States Vegetation Treatment EIS 1991). (NF)		
SW-7 Avoid heavy equipment in riparian or wetland areas. During fire suppression or wildland fire use, consult a resource advisor before using heavy equipment in riparian or wetland areas. (SUP, WFU, RX, NF, ESR)		
SW-8 Limit ignition within native riparian or wetland areas. Allow low-intensity fire to burn into riparian areas. (RX)		
SW-9 Suppress wildfires consistently with compliance strategies for restoring or maintaining the restoration of water quality impaired [303(d) listed] water bodies. Do not use retardant within 300 feet of water bodies. (SUP, WFU)		
SW-10 Plan and implement projects consistent with compliance strategies for restoring or maintaining the restoration of water quality impaired [303(d) listed] water bodies. Planned activities shall take into account the potential impacts on water quality, including increased water yields that can threaten fisheries and aquatic habitat; improvements at channel crossings; channel stability; and downstream values. Of special concern are small headwaters of moderate to steep watersheds; erosive or saline soils; multiple channel crossings; at-risk fisheries; and downstream residents. (RX, NF, ESR)		
Vegetation		
V-1 When restoring or rehabilitating disturbed rangelands, non-intrusive, nonnative plant species are appropriate for use when native species: (1) are not available; (2) are not economically feasible; (3) cannot achieve ecological objectives as well as nonnative species; and/or (4) cannot compete with already established native species (Noxious Weeds Executive Order 13112 2/3/1999; BLM Manual 9015; BLM ROD 13 Western States Vegetation Treatment EIS 1991). (RX, NF, ESR)		
V-2 In areas known to have weed infestations, aggressive action will be taken in rehabilitating firelines, seeding and follow-up monitoring and treatment to reduce the spread of noxious weeds. Monitor burned areas and treat as necessary. All seed used will be tested for purity and for noxious weeds. Seed with noxious weeds will be rejected (ROD 13 Western States Vegetation Treatment EIS 1991). (SUP, WFU, RX, NF, ESR)		
Special Status Species		
SSS-1 Initiate emergency Section 7 consultation with United States Fish and Wildlife Service (USFWS) upon the determination that wildfire suppression may pose a potential threat to any listed threatened or endangered species or adverse modification of designated critical habitat. (SUP)		
SSS-3 Prior to planned fire management actions, survey for listed threatened and endangered and non-listed sensitive species. Initiate Section 7 consultation with USFWS as necessary if proposed project may affect any listed species. Review appropriate management, conservation and recovery plans and include recovery plan direction into project proposals. For non-listed special status plant and animal species, follow the direction contained in the BLM 6840 Manual. Ensure that any proposed project conserves non-listed sensitive species and their habitats and ensure that any action authorized, funded or carried out by the Bureau of Land Management (BLM) does not contribute to the need for any species to become listed. (RX, NF, ESR)		
SSS-4 Follow terms and conditions identified in the Biological Opinion (see section below). (SUP, WFU, RX, NF, ESR)		
Fish and Wildlife		
FW-1 Avoid treatments during nesting, fawning, spawning, or other critical periods for wildlife or fish. (RX, NF, ESR)		
FW-2 Avoid if possible or limit the size of, wildland fires in important wildlife habitats such as, mule deer winter range, riparian and occupied Greater sage-grouse habitat. Use resource advisors to help prioritize resources and develop Wildland Fire Situation Analyses and Wildland Fire Implementation Plans when important habitats may be impacted. (SUP, WFU)		

Applicable Fire Management Practices:		
SUP: Wildfire Suppression WFU: Wildland Fire Use for Resource Benefit	RX: Prescribed Fire NF: Non-Fire Fuel Treatments	ESR: Emergency Stabilization and Rehabilitation
FW-3 Minimize wildfire size and frequency in sagebrush communities where sage-grouse habitat objectives will not be met if a fire occurs. Prioritize wildfire suppression in sagebrush habitat with an understory of invasive, annual species. Retain unburned islands and patches of sagebrush unless there are compelling safety, private property and resource protection or control objectives at risk. Minimize burn-out operations (to minimize burned acres) in occupied sage-grouse habitats when there are no threats to human life and/or important resources. (SUP)		
FW-4 Establish fuel treatment projects at strategic locations to minimize size of wildfires and to limit further loss of sagebrush. Fuel treatments may include greenstripping to help reduce the spread of wildfires into sagebrush communities. (RX, NF)		
FW-5 Use wildland fire to meet wildlife objectives. Evaluate impacts to sage-grouse habitat in areas where wildland fire use for resource benefit may be implemented. (WFU, RX)		
FW-6 Create small openings in continuous or dense sagebrush (>30% canopy cover) to create a mosaic of multiple-age classes and associated understory diversity across the landscape to benefit sagebrush-dependent species. (WFU, RX, NF)		
FW-7 On sites that are currently occupied by forests or woodlands, but historically supported sagebrush communities, implement treatments (fire, cutting, chaining, seeding etc.) to re-establish sagebrush communities. (RX, NF)		
FW-8 Evaluate and monitor burned areas and continue management restrictions until the recovering and/or seeded plant community reflect the desired condition. (SUP, WFU, RX, ESR)		
FW-9 Utilize the Emergency Stabilization and Rehabilitation (ESR) program to apply appropriate post-fire treatments within crucial wildlife habitats, including sage-grouse habitats. Minimize seeding with non-native species that may create a continuous perennial grass cover and restrict establishment of native vegetation. Seed mixtures shall be designed to re-establish important seasonal habitat components for sage-grouse. Leks shall not be re-seeded with plants that change the vegetation height previously found on the lek. Forbs shall be stressed in early and late brood-rearing habitats. In situations of limited funds for ESR actions, prioritize rehabilitation of sage grouse habitats. (ESR)		
Wild Horses and Burros		
WHB-1 Avoid fencing that would restrict access to water. (RX, NF, ESR)"		
Cultural Resources		
CR-1 Cultural resource advisors shall be contacted when fires occur in areas containing sensitive cultural resources. (SUP)		
CR-2 Wildland fire use is discouraged in areas containing sensitive cultural resources. A programmatic agreement is being prepared to cover the finding of adverse effects to cultural resources associated with wildland fire use. (WFU)		
CR-3 Potential impacts of proposed treatment shall be evaluated for compliance with the National Historic Preservation Act (NHPA) and the Utah Statewide Protocol. This shall be conducted prior to the proposed treatment. (RX, NF, ESR)		
Paleontology		
P-1 Planned projects shall be consistent with BLM Manual and Handbook H-8270-1, Chapter III (A) and III (B) to avoid areas where significant fossils are known or predicted to occur or to provide for other mitigation of possible adverse effects.(RX, NF, ESR)		
P-2 In the event that paleontological resources are discovered in the course of surface fire management activities, including fires suppression, efforts shall be made to protect these resources. (SUP, WFU, RX, NF, ESR)		
Forestry		
F-1 Planned projects shall be consistent with Healthy Forest Restoration Act Section 102(e) (2) to maintain or contribute to the restoration of old-growth stands to a pre-fire suppression condition and to retain large trees contributing to old growth structure. (SUP, WFU, RX, NF)		

Applicable Fire Management Practices:		
SUP: Wildfire Suppression WFU: Wildland Fire Use for Resource Benefit	RX: Prescribed Fire NF: Non-Fire Fuel Treatments	ESR: Emergency Stabilization and Rehabilitation
F-2 During planning, evaluate opportunities to utilize forest and woodland products prior to implementing prescribed fire activities. Include opportunities to use forest and woodland product sales to accomplish non-fire fuel treatments. In forest and woodland stands, consider developing silvicultural prescriptions concurrently with fuel treatments prescriptions. (RX, NF)		
Livestock Grazing		
LG-1 Coordinate with permittees regarding the requirements for non-use or rest of treated areas. (SUP, WFU, RX, NF, ESR)		
LG-2 Rangelands that have been burned, by wildfire, prescribed fire or wildland fire use, will be ungrazed for a minimum of one complete growing season following the burn. (SUP, WFU, RX)		
LG-3 Rangelands that have been re-seeded or otherwise treated to alter vegetative composition, chemically or mechanically, will be ungrazed for a minimum of two complete growing seasons. (RX, NF, ESR)		
Recreation and Visitor Services		
Rec-1 Wildland fire suppression efforts will preferentially protect Special Recreation Management Areas and recreation site infrastructure in line with fire management goals and objectives. (SUP)		
Rec-2 Vehicle tracks created off established routes will be obliterated after fire management actions in order to reduce unauthorized OHV travel. (SUP, WFU, RX, NF, ESR)		
Lands and Realty		
LR-1 Fire management practices will be designed to avoid or otherwise ensure the protection of authorized rights-of-way and other facilities located on the public lands, including coordination with holders of major rights-of-way systems within rights-of-way corridors and communication sites. (WFU, RX, NF, ESR)		
LR-2 Fire management actions must not destroy, deface, change or remove to another place any monument or witness tree of the Public Land Survey System. (SUP, WFU, RX, NF, ESR)		
Hazardous Waste		
HW-1 Recognize hazardous wastes and move fire personnel to a safe distance from dumped chemicals, unexploded ordnance, drug labs, wire burn sites or any other hazardous wastes. Immediately notify BLM Field Office hazmat coordinator or state hazmat coordinator upon discovery of any hazardous materials, following the BLM hazardous materials contingency plan. (SUP, WFU, RX, NF, ESR)		
Mineral Resources		
M-1 A safety buffer shall be maintained between fire management activities and at-risk facilities. (SUP, WFU, RX)		
Wilderness and Wilderness Study Areas		
Wild-1 The use of earth-moving equipment must be authorized by the field office manager. (SUP, WFU, RX, ESR)		
Wild-2 Fire management actions will rely on the most effective methods of suppression that are least damaging to wilderness values, other resources and the environment, while requiring the least expenditure of public funds.(SUP, WFU)		
Wild-3 A resource advisor shall be consulted when fire occurs in Wilderness Areas and Wilderness Study Areas (WSA). (SUP, WFU)		

U. S. FISH AND WILDLIFE SERVICE INCIDENTAL TAKE STATEMENT, INCLUDING REASONABLE AND PRUDENT MEASURES, TERMS AND CONDITIONS, AND REPORTING REQUIREMENTS FOR ESA SPECIES OF THE BIOLOGICAL OPINION

The USFWS has completed a biological opinion on the Proposed Action alternative and terms and conditions have been identified as part of that opinion. Together, the resource protection measures and the terms and conditions were incorporated into the Proposed Action to reduce resource conflicts. Species that were addressed in the complete statement contained in the *Finding of No Significant Impact and Decision Record (UT-USO-04-01) Utah Land Use Plan Amendment for Fire and Fuels Management* that do not occur within the decision area or are not affected by management in the EIS alternatives are not include in the Incidental Take Statement below.

Incidental Take Statement

Section 9 of the Act, as amended, prohibits take (harass, harm, pursue, hunt, shoot, wound, kill, trap, capture or collect, or attempt to engage in any such conduct) of listed species of fish or wildlife without a special exemption. "Harm" is further defined to include significant habitat modification or degradation that results in death or injury to listed species by significantly impairing behavioral patterns such as breeding, feeding, or sheltering (50 CFR § 173). "Harass" is defined as actions that create the likelihood of injury to listed species to such an extent as to significantly disrupt normal behavior patterns which include, but are not limited to, breeding, feeding, or sheltering (50 CPR § 17.3).

No exemption from Section 9 of the Act is granted in this biological opinion. The Bureau of Land Management's (BLM) implementation of the Land Use Plan Amendment and Five Fire Management Plans is likely to adversely affect listed species. The likelihood of incidental take, and the identification of reasonable and prudent measures and terms and conditions to minimize such take, will be addressed in project-level, and possibly programmatic-level consultations. Any incidental take and measures to reduce such take cannot be effectively identified at the level of proposed action because of the uncertainty of wildland fire, broad geographic scope, and the lack of site-specific information. Rather, incidental take and reasonable and prudent measures may be identified adequately through subsequent actions subject to Section 7 consultations at the project and/or programmatic scale.

Even though actual take levels are unquantifiable, take will occur through harm and harassment. Therefore, we are providing the following Reasonable and Prudent Measures (RPMs) and terms and conditions to minimize overall take. Implementation of these RPMs and terms and conditions during project planning will also expedite site-specific Section 7 consultation.

Reasonable and Prudent Measures

The USFWS believes that the following RPMs are necessary and appropriate to minimize impacts of incidental take of Utah prairie dog, southwestern willow flycatcher, California condor, bald eagle, Mexican spotted owl, and Siler pincushion cactus:

1. The BLM shall implement measures to minimize mortality or injury of federally listed species due to proposed project activities without placing firefighter personnel at risk. The species that were determined to be "**likely to adversely affected**" by project activities included: Utah prairie dog, southwestern willow flycatcher, California condor, bald eagle, Mexican spotted owl, and Siler pincushion cactus.
2. The BLM shall implement measures to minimize harm to federally listed species through destruction of their suitable or designated critical habitats, without placing firefighter personnel at

risk. The species' habitats that were determined to be "**likely to adversely affected**" by project activities included: Utah prairie dog, southwestern willow flycatcher, California condor, bald eagle, Mexican spotted owl, and Siler pincushion cactus.

Terms and Conditions

In order to be exempt from the prohibitions of Section 9 of the Act, the BLM must comply with the following terms and conditions, which implement the RPMs described above and outline required reporting/monitoring requirements. These terms and conditions are non-discretionary. The following terms and conditions apply to all species covered under this biological opinion, and are to be implemented in addition to the Applicant Committed Measures described in the Proposed Action:

General Terms and Condition

1. To implement Reasonable and Prudent Measure 1:
    a. Before the beginning of each fire season, a threatened and endangered species education program will be presented to all personnel anticipated to be within federally listed species habitats during suppression activities. This program will contain information concerning the biology and distribution of listed species throughout the Fire Management Plan Planning Area, their legal status, fire suppression goals and restrictions within suitable and critical habitat. Following training, each individual will sign a completion sheet to be placed on file at the local BLM office.
    b. All project employees (including fire fighting personnel) shall be informed as to the definition of "take", the potential penalties (up to $200,000 in fines and one year in prison) for taking a species listed under the Endangered Species Act, and the terms and conditions provided in this biological opinion.
    c. A qualified resource advisor will be assigned to each wildfire that occurs in or threatens listed species habitat. The resource advisor's role is help define goals and objectives for fire suppression efforts and informs the Incident Commander (IC) of any restrictions, but does not get involved in specific suppression tactics. Resource advisors shall oversee fire suppression and suppression rehabilitation activities; to ensure protective measures endorsed by the Incident Commander are implemented.
    d. For pre-planned projects, the Authorized Officer shall designate an individual as a contact representative who will be responsible for overseeing compliance with the Applicant Committed Measures and terms and conditions contained in this biological opinion, and providing coordination with the USFWS. The representative will have the authority to halt activities which may be in violation of these conditions, unless human health and safety or structures are at risk.
    e. Project-related personnel shall not be permitted to have pets accompany them to the project site.
    f. If available, maps shall be provided to local dispatch centers showing general locations of listed species. Local BLM or Utah Division of Wildlife Resources (UDWR) biologists shall be consulted for specific locations if fires occur within or near the general locations delineated on the map.
    g. In occupied habitat, pre- and post-monitoring of federally listed species' responses to the pre-planned treatments will be conducted.
2. To implement Reasonable and Prudent Measure 2:
    a. Fingers or patches of unburned vegetation within burned areas shall not be burned out as a fire suppression measure unless required for safety concerns or due to high reburn potential.

b. Emergency stabilization and rehabilitation efforts must focus on areas where there is a potential of non-native species to spread, particularly within suitable habitat for federally listed species.
c. The specific seed mix and areas to be seeded within suitable habitat for federally listed and sensitive species wilt be determined through coordination and Section 7 consultation with the USFWS.
d. In occupied habitat burned by wildland fire, the recovery of vegetation shall be monitored, including establishment and monitoring of paired plots, inside and outside of the burned area unless the BLM and the USFWS concur that monitoring is not required.
e. Site-specific projects under the Land Use Plan Amendment and Fire Management Plans will maintain, protect, or enhance the primary constituent elements of designated critical habitat in all implementation activities.
f. The effectiveness of suppression activities and threatened and endangered species conservation measures shall be evaluated after a fire in coordination with the USFWS. Procedures shall be revised as needed.
g. In occupied habitat, pre- and post-monitoring of federally listed species' habitat responses to the pre-planned treatments will be conducted.
h. Temporarily close burned areas to off highway vehicles (OHV) within occupied habitat after a wildland fire event until vegetation and soils recover. Consultation with the USFWS may determine that an area may remain open if there is no threat to the species or habitat.
i. Consult with the USFWS to determine the need to obscure decommissioned trails and roads and illegal OHV trails within occupied habitat after a wildland fire event to prevent the trails and roads from re-opening.

Utah Prairie Dog

The following terms and conditions are in addition to the general terms and conditions listed above and apply to the Utah prairie dog:

1. To implement Reasonable and Prudent Measures 1 and 2:
    a. Wildfires will be suppressed before they reach a prairie dog colony ("prairie dog colony" refers to any occupied Utah prairie dog colony) or after they exit a colony. Active suppression efforts will not occur within a colony unless human health and safety or structures are at risk.
    b. Only hand lines will be authorized within colonies.
    c. Normally, only water shall be used on fires that occur within prairie dog colonies. If the fire Incident Commander decides that the situation requires use of chemical retardants in order to protect life and property, they may be used. The chemical composition will be supplied to the USFWS during emergency consultation.
    d. All vehicles shall stay on existing roads within colonies, except as stated in (e). Storage of equipment and materials shall not occur within 0.25 mile of colonies. Vehicle maintenance shall not occur within these areas.
    e. The resource advisor, biologist, or biological monitor (someone who is either qualified with a biological background or has been trained by the resource advisor) ensures that prairie dogs and their burrows are protected or avoided by walking in front of engines, tracked vehicles, or other firefighting-related vehicles within occupied prairie dog colonies.
    f. Vehicles shall not exceed a speed of 10 miles per hour (cross country) in occupied Utah prairie dog colonies unless a higher speed is determined to be prudent for safety reasons.
    g. Within colonies, precautions shall be taken to ensure that contamination of the site by fuels, motor oils, grease, etc. does not occur and that such materials are contained and properly disposed of off site. Inadvertent spills of petroleum-based or other toxic materials shall be

cleaned up and removed immediately, unless during an emergency event (wildfire suppression). In which case the spill shall be cleaned up as soon as practical after the emergency situation is controlled.

h. Camps associated with fire suppression activities shall be situated outside occupied habitat.
i. If a dead or injured Utah prairie dog is located, initial notification must be made to the USFWS Division of Law Enforcement, Cedar City, Utah at telephone 435-865-0861 or to the Cedar City office of the UDWR at telephone number 435-865-6100. Instruction for proper handling and disposition of such specimens will be issued by the Division of Law Enforcement. Care must be taken in handling sick or injured animals to ensure effective treatment and care and in handling dead specimens to preserve biological material in the best possible state.

Southwestern Willow Flycatcher

The following terms and conditions are in addition to the general terms and conditions listed above and apply to the southwestern willow flycatcher:

1. To implement the Reasonable and Prudent Measure 1:
    a. Prior to planned project activities, potentially affected habitat will be surveyed according to USFWS protocol *(A Southwestern Willow Flycatcher Natural History Summary and Survey Protocol; Technical Report NPS/NAUCPRS/NRTR-97/12*).
    b. Except where fires are active in occupied habitat, minimize unnecessary low-level helicopter flights during the breeding season (April 1–September 30). If safety allows, approach bucket dip sites at a 90-degree direction to rivers to minimize flight time over the river corridor and occupied riparian habitats. Locate landing sites for helicopters at least 0.25 mile from occupied flycatcher habitat unless human safety or property dictates otherwise.
    c. Minimize use of chainsaws or bulldozers to construct firelines through occupied or suitable habitat except where necessary to reduce the overall acreage of occupied habitat or other important habitat areas that would otherwise be burned.
    d. Implement activities to reduce hazardous fuels or improve riparian habitats (prescribed burning or vegetation treatments) within occupied or unsurveyed suitable habitat for southwestern willow flycatchers only during the non-breeding season (October 1 to March 31).
2. To implement Reasonable and Prudent Measure 2:
    a. Riparian fuel reduction actions shall be considered as experimental, and initially conducted only in unoccupied habitats until the success and ramifications are better understood. Efficacy of these actions as a fire management tool, and effects on bird habitat quality, shall be tested in a scientifically explicit, controlled fashion (Appendix L in U.S. Fish and Wildlife Service 2002).
    b. In occupied or suitable flycatcher habitat, creation of firebreaks might render the habitat unsuitable (Appendix L in U.S. Fish and Wildlife Service 2002). As long as human safety and property allows, firebreaks shall be conducted in unoccupied sites, outside of proposed critical habitat, or within proposed critical habitat under the following situations:
        i. The habitat does not meet the Primary Constituent Elements of the proposed critical habitat as listed in 69 FR 60706-60786, October 12, 2004;
        ii. Minimal fireline necessary to prevent unacceptable losses of occupied habitat; and
        iii. Between fuel concentrations and flycatcher breeding sites to prevent fires from spreading into breeding sites (Appendix L in U.S. Fish and Wildlife Service 2002).

c. Prescribed fire shall be avoided in occupied habitat and considered only as experimental management techniques if dealing with suitable unoccupied habitat (Appendix L in U.S. Fish and Wildlife Service 2002).
d. Fires in occupied habitat and adjacent buffer zones shall be rapidly suppressed if safety allows.

California Condor and Bald Eagle

The following terms and conditions are in addition to the general terms and conditions listed above and apply to the California condor and bald eagle:

1. To implement the Reasonable and Prudent Measure 1:
   a. If California condors or bald eagles are found inhabiting (nesting) within the action area of a pre-planned project, a buffer of 1 mile surrounding the nesting area will be designated as non-treatment zones (Romin and Muck 2002).
   b. If California condors are observed within 0.25 mile of an open water source, such as an inflatable storage tank or "pumpkin," the water storage tank will be covered when not in use.

Mexican Spotted Owl

The following terms and conditions are in addition to the general terms and conditions listed above and apply to the Mexican spotted owl:

1. To implement Reasonable and Prudent Measure 1:
   a. Pre-planned fuels reduction projects within Mexican spotted owl designated critical habitat shall be designed to enhance habitat requirements for the Mexican spotted owl as well as for the valuable prey species they rely upon.
2. To implement Reasonable and Prudent Measure 2:
   a. Fire suppression shall be considered for wildfires in designated critical habitat.

Threatened or Endangered Plants

The following terms and conditions are in addition to the general terms and conditions listed above and apply to the federally listed plants:

1. To implement Reasonable and Prudent Measure 1:
   a. Do not allow wildland fire use within occupied habitat unless agreed to by the BLM and the USFWS.
   b. When feasible (human life or property are not at risk) firebreaks shall be constructed down slope of plants and populations; if firebreaks must be sited upslope, buffers of 100 feet minimum between surface disturbances and plants and populations will be incorporated.
2. To implement Reasonable and Prudent Measure 2:
   a. Do not allow wildland fire use within occupied habitat unless agreed to by the BLM and the USFWS.
   b. For pre-planned projects within known or potential habitat, site inventories shall be conducted to determine habitat suitability prior to initiation of project activities, at a time when the plant can be detected.
   c. For riparian/wetland-associated species, avoid loss or disturbance of riparian habitats.
   d. Limit disturbances to and within suitable habitat by staying on designated routes where feasible.

e. Limit new access routes created by the project.
f. Following a wildland fire event, place signing to limit ATV travel in sensitive burned areas.

Siler Pincushion Cactus

The following terms and conditions are in addition to the general terms and conditions listed above as well as the terms and conditions for threatened and endangered plant species. These terms and conditions apply specifically to the Siler pincushion cactus:

1. To implement Reasonable and Prudent Measures 1 and 2:
    a. Follow and implement the restrictions to pesticide use within suitable Siler pincushion cactus habitat developed by the Environmental Protection Agency (EPA). These limitations were excerpted from the EPA's Pesticides: Endangered Species Protection Program (http://www.epa.gov/oppfead l/endanger/arizona/cocon.htm#brady):
        i. If the active ingredient is 2,4-D (all forms), ATRAZINE, CLOPYRALID, DICAMBA (all forms), DICHLORPROP (2,4-DP), HEXAZINONE, MCPA (all forms), PARAQUAT, PICLORAM (all forms), or TEBUTHIURON, then do not apply this pesticide in the species habitat. For ground applications do not apply within 20 yards of the habitat, or within 100 yards for aerial applications.
        ii. If the active ingredient is OXYFLUORFEN (granular or non-granular), then do not apply this pesticide in the species habitat. For ground applications do not apply within 100 yards of the habitat, or within ¼ mile for aerial applications.
        iii. If the active ingredient is either METRIBUZIN or SULFOMETURON METHYL, then do not apply this pesticide on rights-of-way in the species habitat.

Closing

The USFWS believes that an unquantifiable amount of incidental take will occur in the form of harm and harassment as a result of the proposed actions. The reasonable and prudent measures, with their implementing terms and conditions, are designed to minimize the impact of incidental take that might otherwise result from the proposed actions. The BLM must immediately provide an explanation of the causes of the taking and review with the USFWS the need for possible modification of the reasonable and prudent measures.

Reporting Requirements

Upon locating dead, injured, or sick listed species, immediate notification must be made to the USFWS Salt Lake City Field Office at (801) 975-3330 and the USFWS Division of Law Enforcement, Ogden, Utah, at (801) 625-5570. Pertinent information including the date, time, location, and possible cause of injury or mortality of each species shall be recorded and provided to the USFWS. Instructions for proper care, handling, transport, and disposition of such specimens will be issued by the USFWS Division of Law Enforcement. Care must be taken in handling sick or injured animals to ensure effective treatment and care, and in handling dead specimens to preserve biological material in the best possible state.

The BLM shall submit a report to the USFWS on or before (December 1) of each year in which fire management activities occurred within occupied habitat. For the listed and candidate species covered under this consultation, the report shall include: 1) the amount of potential and/or occupied habitat affected by wildfire (i.e. stream miles burned, percentage of drainage burned, fire severity map); 2) to the extent possible, the number of individuals killed from direct and indirect effects of wildfire; 3) any habitat and/or population monitoring efforts from past wildfire events; 4) a copy of the burned area emergency stabilization and rehabilitation plan; 5) implementation and effectiveness monitoring of burned area

emergency stabilization and rehabilitation treatments; 6) implementation and effectiveness monitoring of the standard operating procedures; 7) recommendations for enhancing the effectiveness of the standard operating procedures; and 8) any recommendations for additional standard operating procedures. The first report shall be due to the USFWS on (December 1, 2005). The address for the Utah Fish and Wildlife Office is:

Field Supervisor, U.S. Fish and Wildlife Service
2369 West Orton Circle, Suite 50
West Valley City, Utah 84119
Telephone: (801) 975-3330

ADDITIONAL RESOURCE PROTECTION MEASURES DEVELOPED BY THE BLM AND THE U. S. FISH AND WILDLIFE SERVICE

In addition to the resource protection measures listed in the land use plan amendment, the following conservation measures were developed through the Section 7 consultation process. These resource protection measures were identified in the U.S. Fish and Wildlife Service's Biological Opinion (p. 42). That document states that "the BLM has incorporated these measures…by reference to their [Biological Assessment]." Species that were addressed in these measures that do not occur within the decision area or are not affected by management in the EIS alternatives are not included. Additional resource protection measures are as follows:

- Manage natural and prescribed fire regimes to protect or improve Utah prairie dog habitat.
- Within Utah prairie dog habitat, reseeding would be implemented according to the Utah Prairie Dog Recovery Plan.
- Manage prescribed fire and wildland fire use within Mexican spotted owl Protected Activity Centers (PAC) to ensure protection of nesting, roosting, and foraging habitats.
- Wildland fire suppression would be prioritized for use in Mexican spotted owl PACs. When feasible, fire camps associated with suppression efforts would be built outside of the PACs and nest protection areas.
- For treatments within suitable habitat for listed species, pre- and post-monitoring would take place as determined on a case-by-case basis.
- Incorporate the standards and guidelines recommended by the Inland Native Fish Strategy (USFS 1995).
- As per the decision of the resource advisor, avoid construction of firelines using mechanized equipment across the stream channel. If used, the mechanized equipment would terminate at, and not cross, the stream channel.
- Avoid transferring water from one watershed into another for the purpose of water drops, as this could aid in the spread of water-borne diseases such as whirling disease.
- Avoid retardant use in any riparian wetland communities.
- Restricted use of mechanical treatments and hand tools.
- Per-burn acreage limitations of 5-100 acres, as long as human life or property are not threatened.
- Prior to planned fire management actions, survey for listed threatened and endangered and non-listed sensitive species. Review appropriate management, conservation, and recovery plans and include recovery plan direction into project proposals, if listed. Ensure that any proposed project conserves non-listed sensitive species and their habitats and ensure that any action authorized, funded, or carried out by the BLM does not contribute to the need for any species to become listed.

In addition to the Resource Protection Measures listed under the LUP, the Richfield Support Center had instituted the following measures into their FMP.

Measures designed to protect threatened, endangered, or candidate species (plant and animals) include:

- END-4 A Resource Advisor must coordinated with the plant specialist in the Fillmore field office in order to authorize any dozer use. (SUP, WFU0)
- END-5 Contact the Resource Advisor for all fire management activities that may affect the Utah Prairie Dog (SUP, WFU, RX, NF, ESR)
- END-6 Contact the Resource Advisor for all fire management activities that may affect the southwestern willow flycatcher. Manage fires according to the conservation plan. (SUP, WFU, RX, NF, ESR)
- END-7 Protect Mexican spotted owl habitat. Manage fires according to the Mexican spotted owl recovery plan and "Suggestions for the Management of Mexican Spotted Owls." Contact the Resource Advisor for all fire management activities.
- END-8 Suppress all wildland fires in critical sage grouse, prairie dog, or pygmy rabbit habitat. (SUP)
- END-9 Contact the Resource Advisor for fire management activities in Bonneville cutthroat trout or Boreal toad habitat. (SUP, WFU, RX, NF, ESR)

APPENDIX 20—SUMMARY OF CHANGES FROM THE DRAFT RMP/EIS TO THE PROPOSED RMP/FINAL EIS

Table A20-1. Summary of Changes from the Draft RMP/EIS to the Proposed RMP/Final EIS

Chapter	Description of the Change	Rationale
All	Revised the PRMP/FEIS to place focus on the Proposed RMP.	To clearly identify the Proposed RMP to the reader.
All	Removed the DRMP/DEIS Alternative B (the Preferred Alternative) into the PRMP/FEIS Proposed RMP.	The Proposed RMP consists of a combination of all the alternatives, including Alternative B in response to public comments and internal review.
1	Updated Chapter 1 to identify additional meetings with Native American Tribes.	To document additional meetings with Native American Tribes.
1	Revised the language regarding tar sands based on the Programmatic Environmental Impact Statement on Oil Shale and Tar Sands Leasing	Consistency with Final Programmatic Environmental Impact Statement on Oil Shale and Tar Sands Leasing.
1	Revised the language regarding RS 2477.	Based on legal review.
1	Added a section to describe the changes from the DRMP/DEIS to the PRMP/FEIS.	To document changes made to the PRMP/FEIS.
2	Italicized and added an asterisk and footnote to identify implementation level decisions.	To provide clarification between RMP and implementation level decisions.
2	Revised the air quality common to all management actions to include management actions to work cooperatively with state, local, and tribal entities to address regional air quality issues.	Based upon discussions with the State of Utah
2	Added temporary non-renewable use of grazing to reduce site-specific fuels (i.e. cheat grass). This is an implementation level action that will be determined on a case-by-case basis under the terms and conditions of the grazing permit.	Based on public comment and/or further BLM review. Biological treatments were considered in the range of alternatives in the DRMP/DEIS.
2	Adjusted the riparian buffer zone to include the 100-year floodplain or a 330 foot buffer whichever is greater.	To protect the sensitive resources around riparian areas. Alternative N provided a 500 foot buffer which covered the 100-year floodplains.
2	Revised the Vegetation common to all management actions to implement noxious weed and invasive species control actions as per national guidance and local weed management plans.	To be consistent with national guidance and local weed management plans.
2	Manage Bull Creek Archaeological District (4,800 acres) as open	To protect the cultural resources of the site that is listed on the

Chapter	Description of the Change	Rationale
	with major constraints (NSO)	National Register of Historic Areas.
2	Removed the cultural resource site use allocations table.	Based on further BLM review and discussions with the State of Utah.
2	Revised VRM Classes based on other management decisions. • VRM Class I: no change • VRM Class II: 40,800 acre increase • VRM Class III:17,700 acre decrease • VRM Class IV: 23,100 acre decrease	VRM Class I acres did not change because these areas consist of WSAs. VRM Class II, III, and IV acres changed due to management decisions associated with non-WSA lands with wilderness characteristics and the Factory Butte SRMA. These changes to non-WSA lands with wilderness characteristics were made to preserve, protect, and maintain wilderness characteristics. The VRM Class for the OHV Play Areas RMZ in the Factory Butte SRMA would be designated as VRM IV.
2	Moved the sage grouse management actions from the fish and wildlife section to the special status species section.	To be consistent with the status of the sage grouse.
2	Added a sage grouse seasonal restriction for 2 miles around leks and added a no surface occupancy stipulation of 1/2 miles around sage grouse leks. Allow no surface disturbing or otherwise disruptive activities in greater sage-grouse winter habitat from December 15 through March 14.	Oil and gas leasing would be limited to a year-round, half-mile NSO around Greater sage grouse leks with a no surface disturbance timing restriction (March 15–July 15) for 2 miles. Previously, a 2-mile timing restriction would have taken effect on March 15 and lasted through June 1. However, at the suggestion of the State of Utah, the half-mile NSO provides a strategy to prevent the sage grouse from becoming a threatened or endangered species. This change would affect only four identified sage grouse leks in the RFO and would result in only 2 miles of NSO (replacing the previous CSU restriction), which could still be accessed through directional drilling. Additionally, this change would affect only an area of very low development potential. This was a change that was outside the range of alternatives in the DRMP/DEIS.
2	Changed the acreages of wildlife habitats to reflect the revised Utah Division of Wildlife Resources (UDWR) winter crucial habitat. • Mule Deer: 225,400 acre increase • Elk: 55,300 acre increase • Pronghorn: 51,900 acre increase • Bighorn Sheep: 122,700 acre decrease • Bison: 7,700 acre increase	Based on updated UDWR winter crucial habitat.
2	Revised the Wildlife management actions to allow for compensatory mitigation on an “as appropriate” basis where it can	Based on public comments and further BLM review.

Chapter	Description of the Change	Rationale
	be performed onsite, and on a voluntary basis where it is performed offsite, or, in accordance with current guidance.	
2	Clarified that coordination with the National Park Service would occur if grazing use by the burro herd increases on the Glen Canyon National Recreation Area.	Based on comments from the National Park Service.
2	Included management actions for approximately 78,600 acres of non-WSA lands with wilderness characteristics in the Proposed RMP. Protect the 12 areas (78,600 acres) of non-WSA lands with wilderness characteristics through the following land allocations and prescriptions: • Designate as Visual Resource Management (VRM) Class II • Limit motorized use to designated routes • Retain lands in public ownership • Designate as an Avoidance Area for rights-of-way (ROW) • Designate leasing category as no surface occupancy (NSO), no exceptions, waivers, or modifications • Close to mineral material sales • Designate as unavailable for further consideration for coal leasing • Continue maintenance and use of existing facilities • Prohibit private or commercial woodland harvest or seed collection Healthy Lands Initiative projects could be considered where they improve the overall goals and objectives for managing the wilderness characteristics of these areas	To preserve, protect, and maintain wilderness characteristics.
2	Allow commercial and non-commercial live plant and seed collecting by permit, except in WSAs, non-WSA lands with wilderness characteristics, and the Fremont Gorge wild and scenic river.	To preserve, protect, and maintain wilderness characteristics and to protect outstanding remarkable values.
2	Increased the size of the Factory Butte SRMA by 21,800 acres with 8,500 acres open to cross-country OHV use.	Based on public comment and further BLM review.
2	Decreased the size of the Big Rocks SRMA by 175 acres.	Based on public comment and to protect cultural resources.
2	Removed the two hour criterion from SRP requirements for organized groups.	Based on public comment and consistency with adjoining field offices.
2	Revised the OHV use areas as follows:	To provide unique motorized recreational opportunities.

Chapter	Description of the Change	Rationale
	• Open: 990 acre increase • Limited: 490 acre decrease • Closed: 500 acre decrease.	
2	Revised the OHV open areas as follows: • Factory Butte Play Area: 5,900 acre increase • Big Rocks Trials Area: 180 acre decrease • Glenwood Play Area: 2,300 acre decrease • Aurora Play Area: 10 acre decrease • Mayfield Open Area: Eliminated.	The Factory Butte Play Areas boundary was increased based on public comments. The Big Rocks Trials Area boundary decreased due to cultural resource concerns. The Glenwood Play Area boundary decreased to protect special status species. The Mayfield Open Area was eliminated to protect special status species.
2	Revised the OHV route designations as follows: • Designated routes: 46 mile increase • Designated routes with seasonal closures or size/width restriction: 55 mile increase • Closed routes: 141 mile increase.	Revisions to the OHV route designations were made in the Proposed RMP based on comments received on the Draft RMP, as well as continued work to finalize BLM GIS data and Interdisciplinary Team review. Factors that resulted in changes to the route designations were: • Coordination and consistency with adjacent NPS, FS and BLM PFO travel designations: Comments were received regarding the inconsistency of some route designations and seasonal or size/width restrictions with these adjacent federal agencies. These routes were re-assessed and adjustments made for consistency in the designations of these routes. Although these consistency reviews made slight changes to all route designation categories, the majority of the changes resulted in slight increases in designated route miles or designated routes with seasonal closures or size/width restrictions. • Data errors or inconsistencies identified within Public Comments: A variety of public comments were received regarding route designations. Some of these comments pointed out data errors which were resolved. Other comments identified specific conflicts or resource issues related to whether the route should be designated or closed. These comments were reviewed and resolved in those cases where there was sufficient supporting information and GIS data. This resulted in some additional designated route miles, as well as an increase in closed route miles. • Incorporation of GPS data analyzed during Route Designation Meetings and quality review: In some of the more remote portions of the Richfield Field Office, GPS data analyzed

Chapter	Description of the Change	Rationale
		during route designation meetings was still being incorporated and was unavailable in map form at the time of the Draft RMP. This work to identify the existing route system has been completed and has been included to provide a more accurate Travel Management Plan. Many seismic routes within this area were identified by BLM staff during GPS data collection as abandoned or naturally rehabilitating and no longer receiving use. This resulted in an increase in the total closed route miles within the Proposed RMP.
2	Revised the lands and realty management decisions to give land exchanges with the State of Utah priority consideration to resolve inholdings issues.	Based on discussions with the State of Utah.
2	Increased the ROW avoidance areas to 153,600 acres.	Based on management prescriptions for non-WSA lands with wilderness characteristics.
2	Revised the oil and gas leasing categories as follows: • Areas open to leasing with standard lease terms: 63,700 acre increase • Areas open to leasing subject to controlled surface use and/or timing limitations (CSU): 104,100 acre decrease • Areas open to leasing subject to no surface occupancy (NSO): 43,600 acre increase • Areas closed to leasing: 3,200 acre decrease.	Based on management prescriptions for non-WSA lands with wilderness characteristics, Bull Creek Archaeological District, the Old Woman Front ACEC, and the Fremont Gorge suitable wild and scenic river with a tentative “wild” classification. Changes in the crucial habitat boundaries for wildlife and spatial and seasonal stipulations for sage grouse habitat also adjusted the oil and gas leasing category acreages.
2	Clarified the wording for the no leasing alternative and the livestock grazing adjustments alternative that were considered but eliminated from detailed analysis.	Based on public comment and further BLM review.
2	Revised the minerals and energy common to all management actions to address air quality concerns.	Based upon discussions with the State of Utah.
2	Decreased the areas closed to mineral material disposals by 3,200 acres.	Based on management prescriptions for non-WSA lands with wilderness characteristics.
2	Revised the travel management common to all management actions to allow limitations on types of vehicles allowed on specific designated routes if monitoring indicates that a particular type of vehicle is causing disturbance to the soil, wildlife habitat, cultural or vegetative resources, especially by off-road travel in an area that is limited to designated routes.	Based on public comment and further BLM review.
2	Revised the Transportation common to all management actions to grant the State of Utah reasonable access to State lands for	Based on discussions with the State of Utah.

Chapter	Description of the Change	Rationale
	economic purposes, on a case-by-case basis.	
2	A decrease of 1 (45 originally) mile of inventoried vehicle ways would be designated for use subject to the IMP.	
2	Revised the Wild and Scenic River common to all management actions to work with upstream and downstream water users and applicable agencies to ensure that water flows are maintained at a level sufficient to sustain the values for which affected river segments were designated.	Based on public comments and further BLM review.
2	The Dirty Devil segment (54 miles) was not found suitable for inclusion in the National Wild and Scenic River System.	The Dirty Devil segment was not found suitable because management prescriptions for other resources, resource uses, and special designations (i.e. WSAs, SRMAs, travel management, VRM Class II, oil and gas stipulations).
2	Added management prescriptions for the Old Spanish Trail to work in cooperation with Utah State Parks and Recreation, counties, the Old Spanish Trail Association, and the National Park Service on interpretive and recreation opportunities.	The Old Spanish Trail was recently designated by Congress as a National Historic Trail.
2	Added management prescriptions to coordinate with the NPS and the State of Utah for management and interpretation of scenic byway and backway corridors.	Based on public comments and further BLM review.
3	Added an evaluation of seven proposals for non-WSA lands with wilderness characteristics in the area west of Capitol Reef National Park.	Based on public comment.
3	Clarified that the Cotter decision would apply in providing access to SITLA lands.	Based on public comment and further BLM review.
3	Added language to recognize the importance of climate change and the potential effects it may have on the natural environment.	Based on public comment and further BLM review.
3	Manage under the Bald and Golden Eagle Act instead of the Endangered Species Act.	The bald eagle was delisted and is managed under the Bald and Golden Eagle Act.
3	Acknowledged that there are pygmy rabbits and that there are colonies present in the field office and that the habitat covers less than 1% of field office.	Based on public comment and further BLM review.
3	Clarified the limitation of the application of the size criteria for non-WSA lands with wilderness characteristics.	Based on further BLM review.
3	Added a description of the National Mormon Pioneer Heritage Area.	This area was recently designated by Congress as a National Heritage Area.

Chapter	Description of the Change	Rationale
3	Added descriptions of the scenic byways and highways.	Based on public comment and to make the description of the affected environment more complete.
4	Conducted emissions calculations for each of the Alternatives and the Proposed RMP.	Based on public comment and further BLM review.
4	Revised the non-WSA lands with wilderness characteristics impact analysis to address lands carried forward in the Proposed RMP and those lands not being carried forward in the Proposed RMP.	To address non-WSA lands with wilderness characteristics management prescriptions in the Proposed RMP.
4	Revised the ACEC section to clarify other resource decisions that provide protection to relevant and important values of potential ACECs. In addition, this section was formatted to be consist with other sections in Chapter 4.	Based on public comment and to provide clarification on the protection of relevant and important values of potential ACECs from management actions of other resources and resource uses.
4	Revised the cumulative impact analysis section to clarify incremental effects from past, present and future actions.	Based on public comment and further BLM review.
4	Moved the sage grouse impact analysis from the fish and wildlife section to the special status species section.	To be consistent with the status of the sage grouse.
4	Added language to address global climate change.	Based on public comment and further BLM review.
4	Added to the socioeconomic section an impact analysis from non-WSA lands with wilderness characteristics to Utah School and Institutional Trust Lands Administration (SITLA) lands.	Based on public comments and discussions with the State of Utah.
5	Included a description of the public outreach efforts after the release of the DRMP/DEIS.	Based on additional public outreach activities.
5	Included tables to identify consistency with County Plans and State Law.	To clarify the consistency between the Proposed RMP and County Plans and State Law.
5	Included comments from county and state governments and responses to the comments.	Based on their cooperating agency status.
5	Clarified the text regarding Section 7 consultation with the U.S. Fish and Wildlife.	To provide additional explanation on the Section 7 consultation process.
5	Clarified the text regarding Section 106 consultation with the State Historic Preservation Office.	To provide additional explanation on the Section 106 consultation process.
Appendix 1	Clarified the summary statements for each of the existing and potential ACECs.	To state how the relevant and important values would be protected under management actions for other resources and resource uses.
Appendix 3	Clarified the alternative protection methods for wild and scenic rivers.	To state how the outstandingly remarkable values would be protected under management actions for other resources and resource uses.

Chapter	Description of the Change	Rationale
Appendix 5	Revised the land disposal list.	Based on public comments and further BLM review.
Appendix 9	Added the Travel Management Route Designation Process Appendix.	To describe the process for developing the travel management system.
Appendix 10	Manage under the Bald and Golden Eagle Act instead of the Endangered Species Act.	The bald eagle was delisted and is managed under the Bald and Golden Eagle Act.
Appendix 11	Updated and clarified Appendix 11 - Oil and Gas Leasing Stipulations for the Proposed RMP based upon comments and internal review. New lease notices for threatened and endangered (T & E) species created by U.S. Fish and Wildlife Service have been included.	To be consistent with the BLM Gold Book and in response to U.S. Fish and Wildlife Service comments, public comments, and internal BLM review.
Appendix 11	Replace the "Other Scenic Lands" no surface occupancy (NSO) stipulation with a CSU stipulation for VRM Class 2.	The "Other Scenic Lands" no surface occupancy (NSO) stipulation has been replaced with a CSU stipulation for VRM Class 2. This change was made to specify the scenic resources that would be protected and is within the existing range of alternatives. This change resulted from BLM internal comment and review.
Appendix 11	Clarified the stipulation for surface disturbing proposals involving construction on slopes greater than 30%.	Previously, slopes greater than 40% would have been subject to NSO for DRMP/DEIS Alternatives A through D. Slopes from 21% to 40% would have been subject to a CSU stipulation for all alternatives in the DRMP/DEIS. However, after further review of the soil types and watersheds, BLM determined that a CSU stipulation for slopes greater than 30% would be a more appropriate under the certain conditions. The stipulation has been rewritten to read, "Surface disturbing proposals involving construction on slopes greater than 30% would be avoided. If the action cannot be avoided, rerouted, or relocated then a proposed project should include an erosion control strategy, reclamation and a site plan with a detailed survey and design completed by a certified engineer. This proposal must be approved by the BLM prior to construction and maintenance." This change resulted from BLM internal comment and review. The NSO for slopes greater than 40% was not based on resource conditions, such as evaluating soils, bedrock competency, bedding attitudes, deformation of bedrock (faults or folding), mass movement, slope aspects, climatic conditions, and other factors that could warrant the need to impose such a restriction. The CSU restriction for 30% slope is consistent with the BLM reclamation standard as identified in the Gold Book and in consistent with other plans in the State.
Appendix 11	Specified the conditions for waivers and modifications for wildlife habitat.	These revisions are within the existing range of alternatives considered in the DRMP/DEIS. These revisions reflect current BLM

Chapter	Description of the Change	Rationale
		philosophy on oil and gas leasing stipulations and provide clarification on the purpose and intent of the earlier written stipulations. This change resulted from BLM internal comment and review.
Appendix 11	Added lease notices for the California Condor, Barneby Reed Mustard, Last Chance Townsendia, and Wright Fishhook Cactus, and Winkler Pincushion Cactus	To be current with the latest species lease notices.
Appendix 16	Added the Summary of Management of Non-WSA Lands with Wilderness Characteristics for the Richfield Field Office Proposed RMP/Final EIS Appendix.	To summarize the management decisions for non-WSA lands with wilderness characteristics to be included in the RFO PRMP/FEIS. It also includes a discussion of the interdisciplinary process that occurred before these decisions were made.
Appendix 17	Added the Utah Public Lands Study: Key Social Survey Findings for Garfield, Piute, Sanpete, Sevier, and Wayne Counties Appendix.	To identify research conducted by Utah State University in 2007 to assess the ways in which Utah residents use and value public land resources, and their views about public land management.
Appendix 18	Added the Factory Butte SRMA RMZs and Management Prescriptions Appendix.	To provide additional information and a detailed description of the management prescriptions for the Factory Butte SRMA RMZs.
Appendix 19	Added the Wildland Fire Resource Protection Measures and Reasonable and Prudent Measures, Terms and Conditions, and Reporting Requirements Identified through Section 7 Consultation Appendix.	To be consistent with the latest wildland fire resource protection measures.
Appendix 20	Added the Summary of Changes from the Draft RMP/EIS to the Proposed RMP/Final EIS Appendix.	Based on further BLM review.
Appendix 21	Added the State of Utah Air Quality Letter Appendix.	Based on discussions with the State of Utah.
Maps	A disclaimer was added to the wildlife habitat maps to provide the UDWR data publication dates and a reference to the exceptions, waivers, and modifications listed in Appendix 11.	Based on further BLM review.
Maps	Revised the PRMP/FEIS based on the UDWR wildlife habitat maps.	In August of 2005, the UDWR changed its wildlife habitat classification system. Prior to 2005, the UDWR classification system distinguished between “critical” habitat (an area that provides for biological or behavioral requisites necessary to sustain the existence or perpetuation of a wildlife population) and “high value” (an area that provides for intensive use by the species). The UDWR has been criticized for using the term “critical” because the same term refers to habitat that is federally designated by the United States Fish and Wildlife Service (USFWS) as required by the Endangered Species Act (ESA). “Crucial” habitat boundaries appear larger on the wildlife maps in

<table>
<tr><th>Chapter</th><th>Description of the Change</th><th>Rationale</th></tr>
<tr><td></td><td></td><td>this Proposed RMP because they are a combination of UDWR's old "critical" habitat and "high value" habitat, with some minor modifications. Timing stipulations for each of the species now apply to the whole crucial habitat area. However, it is important to note that the application of waivers, exceptions, and modifications, as outlined in Appendix 11, will be taken into consideration and used where and when applicable for all surface-disturbing activities in these areas. The range of alternatives in the DRMP/DEIS considered both previous UDWR's classifications of "critical" and "high value" habitat. Minor boundary modifications have been made by UDWR, prior to incorporating them into "crucial" habitat boundaries. Because this information was taken into consideration and analyzed in the DRMP/DEIS, these minor changes are not considered significant in terms of resource uses or analysis in this PRMP/FEIS, and therefore a supplement to this EIS is not necessary for this purpose.

BLM accepted these updated boundaries and has incorporated them into the Proposed RMP. Incorporating this information converted more area to Controlled Surface Use (CSU) with wildlife timing restrictions. Oil and gas leasing would still occur in these areas as identified in the DRMP/DEIS, if the exception, modifications, and waiver criteria are met (see Appendix 11).

Changes in Wildlife Habitat Boundaries from the DRMP/DEIS to the PRMP/FEIS

APPENDIX 21—STATE OF UTAH LETTER ADDRESSING AIR QUALITY

State of Utah

JON M. HUNTSMAN, JR.
Governor

GARY R. HERBERT
Lieutenant Governor

June 6, 2008

Selma Sierra
State Director
BLM Utah State Office
P.O. Box 45155
Salt Lake City, Utah 84145-0155

Dear Director Sierra:

This letter addresses air quality mitigation strategies for the six proposed Resource Management Plans being updated within the State of Utah. The state appreciates BLM's interest in this important issue.

It is the policy of the State of Utah to protect public health and the environment from the harmful effects of air pollution, to ensure that the air in Utah meets standards established under federal and state law, and to maintain an environment that is conducive to continued economic vitality and growth.

The Department of Interior monitors ozone at National Parks in the intermountain west, including: Mesa Verde National Park in Colorado, Grand Canyon National Park in Arizona, Great Basin National Park in Nevada, and Canyonlands National Park in Utah. These sites reflect conditions in areas that have not been subject to intensive development and are therefore generally indicative of background conditions. Monitoring data at these locations demonstrates a gradual upward trend in ozone levels, raising questions about ozone levels region-wide. The state believes additional information is needed regarding current conditions and the potential impacts from increasing development activity, including oil and gas activity. This information should inform future BLM decision making, but managers should not defer management actions in anticipation of better information.

Fortunately, ozone related impacts can be reduced if certain mitigation measures are required on new oil and gas related emission sources. In fact, several neighboring states currently encourage application of just such measures. BLM should include interim nitrogen oxide control measures provided by the state as a required condition of lease approval. These control measures are consistent with control measures suggested by neighboring states and jurisdictions. The state recognizes that performance standards will continue to evolve and supports technological flexibility, provided control measures are at least as effective as those in place elsewhere within the region at the time of site-specific authorization. Performance standards representing the current regional standard can be found in the *Four Corners Air*

Quality Task Force Report of Mitigation Options, DRAFT: Version 7, June 22, 2007. These standards are 2 g/bhp-hr for engines less than 300 HP and 1 g/bhp-hr for engines over 300 HP.

The State of Utah will continue to work with the BLM and others through efforts such as the Four Corners Task Force to address these issues. The state appreciates your cooperation in working to protect air quality related values. If you have any questions about our position, please contact me at (801) 537-9802.

Sincerely,

John Harja
Director
